Abstract

1. Study of the infrared spectra of products of reaction of bromoacetone, of 3-bromo-2-butanone, and of 1-bromo-2-butanone with triethyl phosphite confirmed that they are β -keto phosphonic esters (carbonyl absorption band at 5.84-5.85 μ). 2. The spectra of the products of reaction of bromoacetone and of 3-bromo-2-butanone with sodium diethyl phosphite indicate that they are epoxy phosphonic esters (absence of a carbonyl absorption band and presence of absorption bands characteristic of the epoxy grouping at 11.80 and 11.98 μ , respectively). 3. The infrared spectra do not enable us to come to definite conclusions regarding the occurrence of enolization in the β -keto phosphonic esters studied. © 1960 Consultants Bureau Inc.
