# Dielectric Properties and Metamaterials

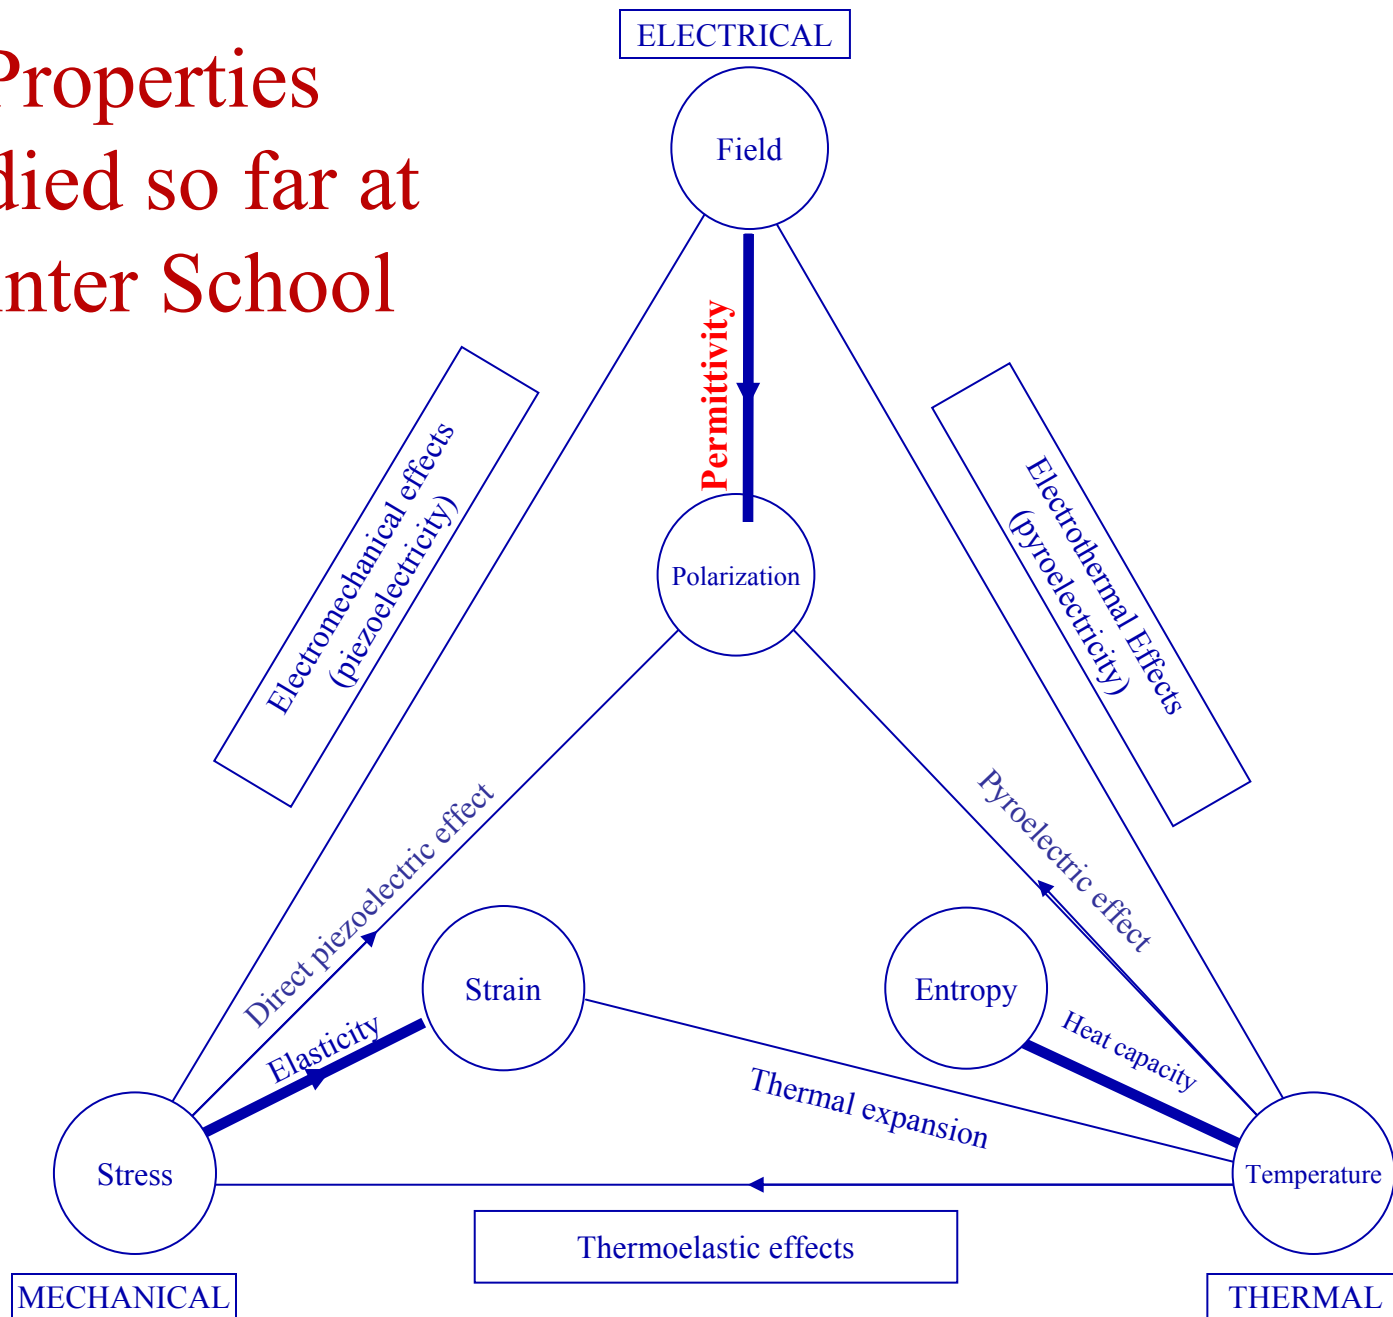

Mike Lanagan  
Materials Research Institute  
Penn State University

US-Japan Winter School on New Functionality in Glass  
January 15, 2008  
Kyoto Japan

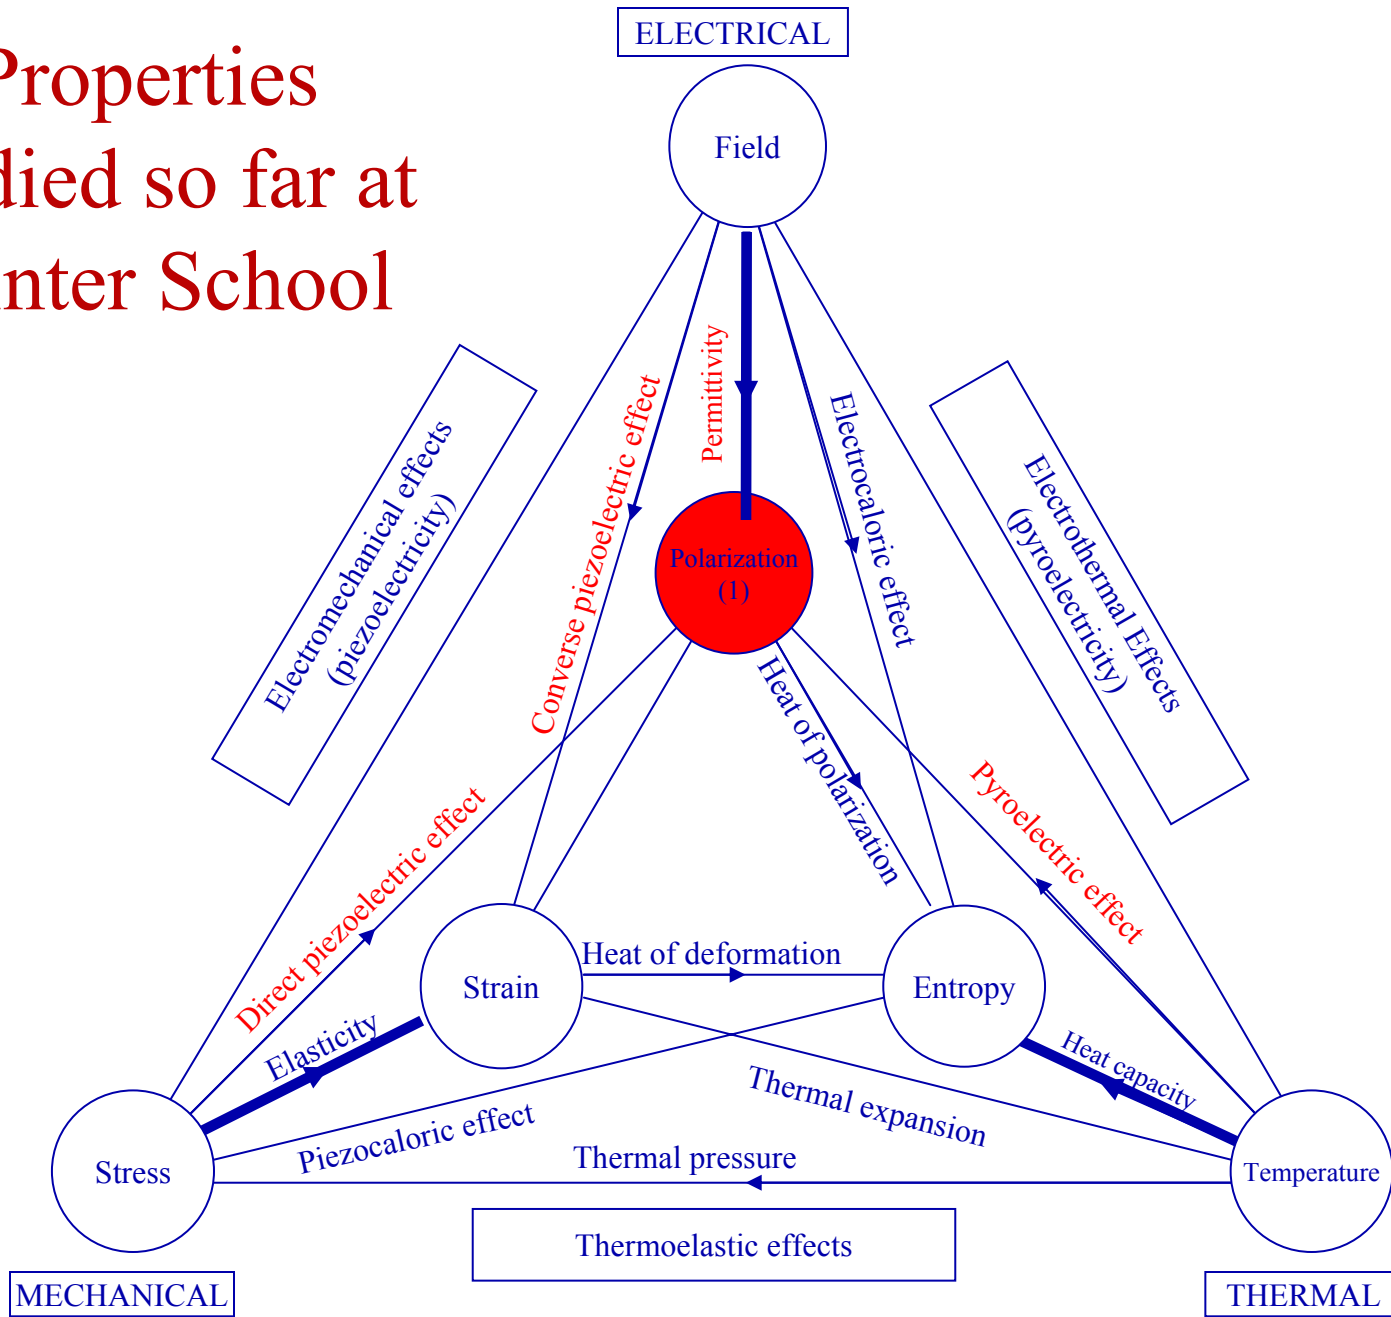

# Dielectric Properties and Metamaterials

- Dielectric Properties (i.e Permittivity)
  - Fundamental frequency dependence
- Metamaterials
  - Negative permittivity and refractive index
  - Based on resonance response
  - Discussion on the potential of glass as a meta-material

# Properties studied so far at Winter School

# Properties studied so far at Winter School

# Dielectric Polarization

- Contributes to Permittivity
- 4 basic mechanisms
  - Electronic
  - Ionic
  - Rotational or Dipolar
  - Space charge

# External Electric Field Polarizes a Material

Polarization charge density on the surface of a polarized medium is related to the normal component of the polarization vector.

Fig 7.6

From *Principles of Electronic Materials and Devices, Third Edition*, S.O. Kasap (© McGraw-Hill, 2005)

# Relative Permittivity and Polarizability

$$\epsilon_r = 1 + \frac{N\alpha_e}{\epsilon_0}$$

$\epsilon_r$  = relative permittivity

$N$  = number of molecules per unit volume

$\alpha_e$  = electronic polarizability

$\epsilon_0$  = permittivity of free space

Assumption: Only electronic polarization is present

# Electronic Polarization

(a) Valence electrons in covalent bonds in the absence of an applied field.

(b) When an electric field is applied to a covalent solid, the valence electrons in the covalent bonds are shifted very easily with respect to the positive ionic cores. The whole solid becomes polarized due to the collective shift in the negative charge distribution of the valence electrons.

Fig 7.8

From *Principles of Electronic Materials and Devices*,  
Third Edition, S.O. Kasap (© McGraw-Hill, 2005)

# Ionic Polarization

moment per ion is zero.

- (b) In the presence of an applied field the ions become slightly displaced which leads to a net average dipole moment per ion.

Fig 7.9

From *Principles of Electronic Materials and Devices*,  
Third Edition, S.O. Kasap (© McGraw-Hill, 2005)

# Rotational or Dipolar Polarization

- (a) A HCl molecule possesses a permanent dipole moment  $p_o$ .
- (b) In the absence of a field, thermal agitation of the molecules results in zero net average dipole moment per molecule.
- (c) A dipole such as HCl placed in a field experiences a torque that tries to rotate it to align  $p_o$  with the field  $E$ .
- (d) In the presence of an applied field, the dipoles try to rotate to align with the field against thermal agitation. There is now a net average dipole moment per molecule along the field.

# Complex Relative Permittivity (related to time response)

$$\epsilon_r = \epsilon'_r - j\epsilon''_r$$

$\epsilon_r$  = dielectric constant

$\epsilon'_r$  = real part of the complex dielectric constant

$\epsilon''_r$  = imaginary part of the complex dielectric constant

$j$  = imaginary constant  $\sqrt{-1}$

# Dielectric Loss Factor

**Loss Tangent (related to energy loss)**

$$\tan \delta = \frac{\epsilon_r''}{\epsilon_r'}$$

$\tan \delta$  = loss tangent or loss factor,  $\epsilon_r'$  = real part of the complex dielectric constant,  
 $\epsilon_r''$  = imaginary part of the complex dielectric constant

# Time Response of Dielectric Polarization

- (a) An ac field is applied to a dipolar medium. The polarization  $P(P = Np)$  is out of phase with the ac field.
- (b) The relative permittivity is a complex number with real ( $\epsilon_r'$ ) and imaginary ( $\epsilon_r''$ ) parts that exhibit frequency dependence.

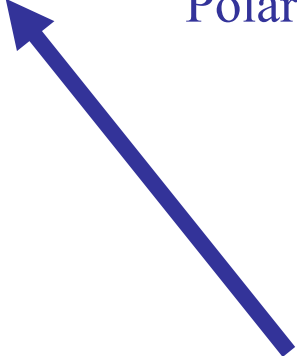

Fig 7.13

From *Principles of Electronic Materials and Devices, Third Edition*, S.O. Kasap (© McGraw-Hill, 2005)

# Example: Water Molecule

Polarization

# Microwave Dielectric Relaxation of Liquid Water

- Dielectric relaxation indicated by:
  - Decrease in real permittivity
  - Peak in imaginary permittivity
- Maximum  $\epsilon''$  corresponds to maximum conversion from EM energy to thermal energy.
- High  $\epsilon''$ 
  - good for microwave oven
  - Bad for device

Relaxation spectrum of water as function of frequency and temperature: (a) dispersion; (b) absorption.

A. Von Hippel, IEEE Trans. Insul, 1988

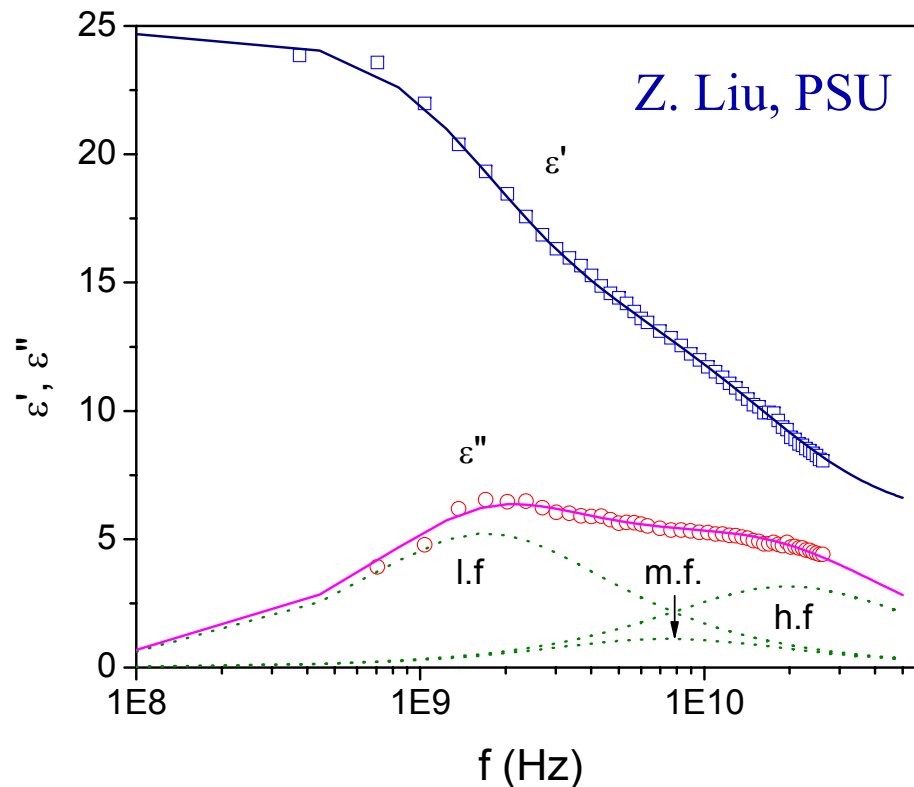

# Why not 20 GHz operation for a microwave oven?

- Open bands
  - 915 MHz (not all countries)
  - 2.45 GHz
  - 5.8 GHz
  - 24.1 GHz
- Cost constraints

# Water in a proton exchange membrane

- *Current PEM fuel cells are based on PSA membranes, e.g. Nafion. The essential feature of Nafion is the nano-separation of hydrophilic/hydrophobic domains*

K.D. Kreuer, *J. Membr. Sci.*, **185**, 29 (2001)

Why not characterize water in porous glass in this way?

# Space Charge Polarizability

(a) A crystal with equal number of mobile positive ions and fixed negative ions. In the absence of a field, there is no net separation between all the positive charges and all the negative charges.

(b) In the presence of an applied field, the mobile positive ions migrate toward the negative charges and positive charges in the dielectric. The dielectric therefore exhibits interfacial polarization.

(c) Grain boundaries and interfaces between different materials frequently give rise to Interfacial polarization.

Fig 7.11

From *Principles of Electronic Materials and Devices*,  
Third Edition, S.O. Kasap (© McGraw-Hill, 2005)

# Space Charge in Ceramic Capacitors with Glass

- Need long enough time for charge to move to boundary

Relaxation Time

$$\tau \propto \frac{d}{\sigma}$$

Grain Size

Grain Conductivity

# Role of Glasses in MLCC

ELECTRO-MECHANICS

Fig. Cut-away view of MLCC

Glass is of major importance as an bond between ceramic and metal, and a filler.

Glass is of major importance as an additive to ceramics in order to promote sintering at low temperature.

# BaTiO<sub>3</sub> Ceramics with Glass boundaries

Relaxation time = 0.0001 s

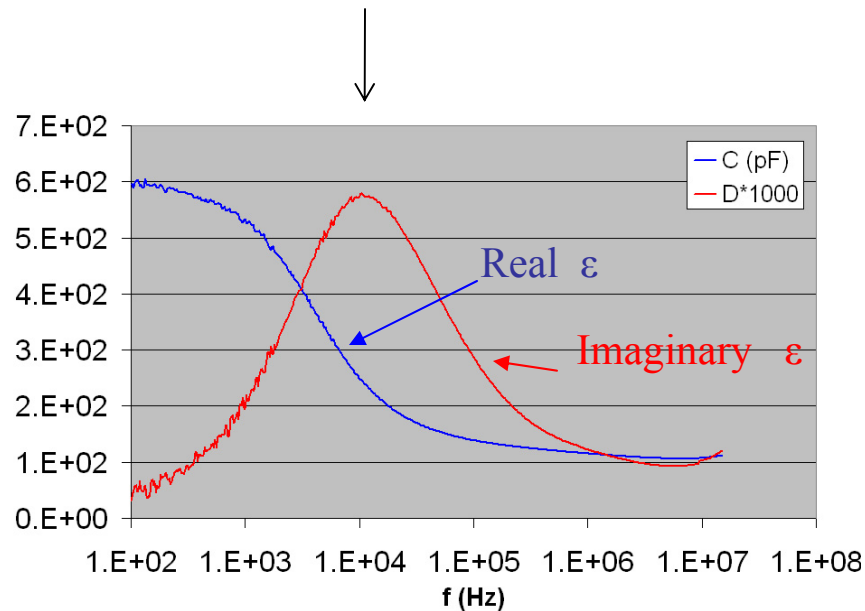

Figure shows dielectric response of a BaTiO<sub>3</sub> – Glass composite

From the relaxation time and microstructure, we can determine the grain conductivity

## Microstructure Schematic

- Conductive grain and insulating grain boundary
- Maxwell-Wagner relaxation

# Frequency Response of Dielectric Polarization

Fig 7.15

**Table 7.2** Typical examples of polarization mechanisms

Example	Polarization	Static $\epsilon_r$	Comment
Ar gas	Electronic	1.0005	Small $N$ in gases: $\epsilon_r \approx 1$
Ar liquid ( $T < 87.3$ K)	Electronic	1.53	van der Waals bonding
Si crystal	Electronic polarization due to valence electrons	11.9	Covalent solid; bond polarization
NaCl crystal	Ionic	5.90	Ionic crystalline solid
CsCl crystal	Ionic	7.20	Ionic crystalline solid
Water	Orientational	80	Dipolar liquid
Nitromethane (27 °C)	Orientational	34	Dipolar liquid
PVC (polyvinyl chloride)	Orientational	7	Dipole orientations partly hindered in the solid

BaTiO<sub>3</sub>

permittivity (dielectric constant) = 1,000

From *Principles of Electronic Materials and Devices, Third Edition*, S.O. Kasap (© McGraw-Hill, 2005)

# Permittivity of Amorphous Materials

Permittivity values are related to the electron density and ionic charge

- $\text{SiO}_2$   $\epsilon_r = 4$
- Commercial flat panel Ba-Si-O  $\epsilon_r = 8$
- 40%Ba-20%Ti-40%Si-O  $\epsilon_r = 15$
- $\text{Ta}_2\text{O}_5$   $\epsilon_r = 25$
- $\text{Nb}_2\text{O}_5$   $\epsilon_r = 40$
- Mainly electronic and ionic contributions

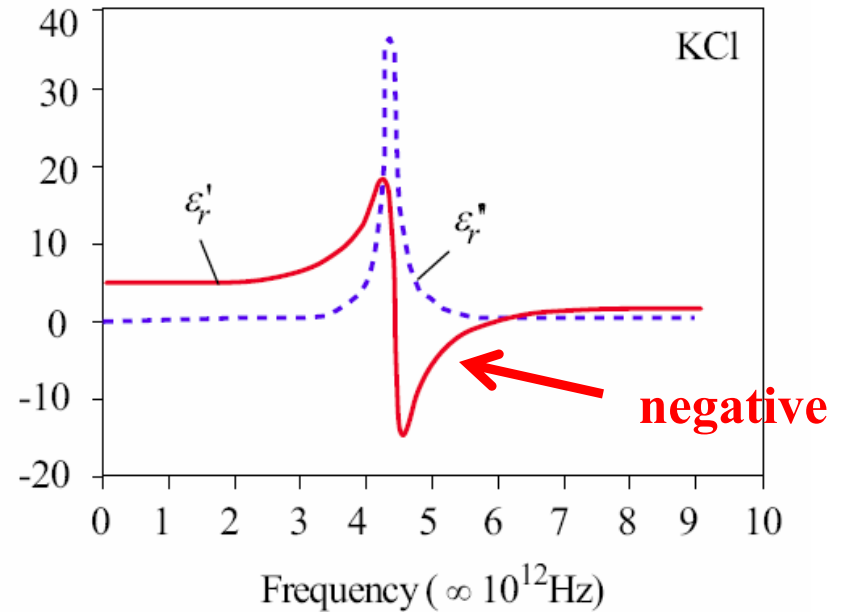

# Frequency (or time) Response

- Relaxation Response
  - Based on diffusion mechanisms
  - Significant damping in oscillations
  - Describes Dipolar and Space charge mechanisms
- Resonance Response
  - High frequency response
  - Not as much damping as relaxation response

# Relaxation vs Resonant Response

(a)

(b)

(a) Real and imaginary part is of the dielectric constant,  $\epsilon_r'$  and  $\epsilon_r''$  versus frequency for (a) a polymer, PET, at 115 °C and (b) an ionic crystal, KCl, at room temperature. both exhibit relaxation peaks but for different reasons.

## SOURCE:

(b) from C. Smart, G.R. Wilkinson, A. M. Karo, and J.R. Hardy, International Conference on lattice Dynamics, Copenhagen, 1963, as quoted by D. G. Martin, "The Study of the Vibration of Crystal Lattices by Far Infra-Red Spectroscopy," *Advances in Physics*, 14, no. 53-56, 1965, pp. 39-100.

From *Principles of Electronic Materials and Devices, Third Edition*, S.O. Kasap (© McGraw-Hill, 2005)

# Summary of Dielectric Response

- 4 basic mechanisms with each mechanism having a characteristic frequency response
- Glasses potentially have electronic, ionic and space charge contributions
- Highest permittivity for a glass is less than 20
- Discussion point – is rotational polarization possible in glass?

# Quiz

- What material property affects the resonator frequency?
- What other parameter affects resonance?
- Why would we NOT want to make the resonator too small?
- What functionalities of glass are potentially important for metamaterials?

# Metamaterials in Magnetic Resonance Imaging?

- Overview of how MRI works
- Use of resonators in MRI (not metamaterials yet)
- Case Study: Glass Metamaterials for MRI

# Background on Magnetic Resonance Imaging (MRI)

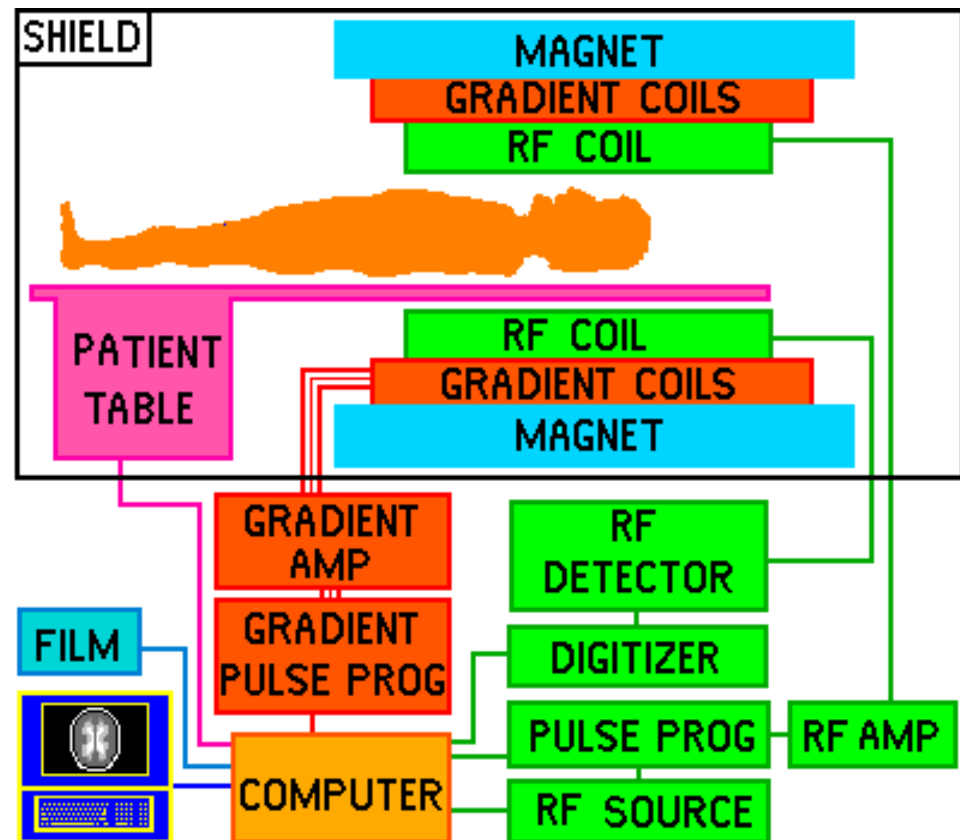

**Magnetic resonance imaging is based on the absorption and emission of energy in the radio frequency range of the electromagnetic spectrum. Radio Frequency (RF) Coils are used to transmit and receive energy from the samples.**

## Background on MRI contd.

- MRI is based on spatial variations in the phase and frequency of the radio frequency energy being absorbed and emitted by the imaged object.
- Important microscopic property responsible for MRI is the spin property within hydrogen nuclei
- The human body is primarily fat and water. Fat and water have many hydrogen atoms which make the human body approximately 63% hydrogen atoms

- What will be size of the glass resonator
  - How do we shrink the size
  - Do you think that loss is important?

# Frequency Response of Dielectric Polarization

The frequency dependence of the real and imaginary parts of the dielectric constant in the presence of interfacial, orientational, ionic, and, electronic polarization mechanisms.

Fig 7.15

From *Principles of Electronic Materials and Devices, Third Edition*, S.O. Kasap (© McGraw-Hill, 2005)

# How do we make a high permittivity glass?

$$\epsilon_r = 1 + \frac{N\alpha_e}{\epsilon_0}$$

$\epsilon_r$  = relative permittivity

$N$  = number of molecules per unit volume

$\alpha_e$  = electronic polarizability

$\epsilon_0$  = permittivity of free space

Assumption: Only ionic and electronic polarization is present

# Summary of glass as a dielectric

- Dielectric response for glass occurs over a wide frequency range
- New applications for dielectrics could involve glass
- Functionality of glass
  - Related to dielectric properties (permittivity and loss)
  - Formability and cost

# Dielectric Loss and Q Factor

**Loss Tangent**       $\tan \delta = \frac{\epsilon_r''}{\epsilon_r'}$

## **Q Factor**

$$Q = \frac{1}{\tan \delta} = \frac{\text{energy}_{\text{stored}}}{\text{energy}_{\text{dissipated}}}$$

$\epsilon_r'$  = real part of the complex dielectric constant,  $\epsilon_r''$  = imaginary part of the complex dielectric constant
