In the manuscript published in Atmospheric Measurement Techniques:

"Broadband Cavity Enhanced Differential Optical Absorption Spectroscopy (CE-DOAS) – applicability and corrections" published in Atmos. Meas. Tech., 2, 713–723, 2009 by U. Platt et al., due to a communication problem the captions of the first three figures are permutated:

- Caption printed under Fig. 1 should be under Fig. 3
- Caption printed under Fig. 2 should be under Fig. 1
- Caption printed under Fig. 3 should be under Fig. 2

In the following the Figs. 1–3 of the above paper are reproduced with the correct captions:

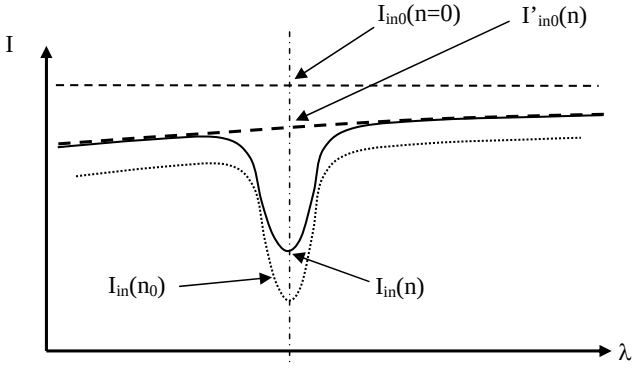

Fig. 1. Sketch of intensities vs. wavelength: $I_{in0}(n_0)$: intensity (after n_0 passes through the cavity) in the pure air filled cavity without any absorbers, $I'_{in0}(n)$: intensity (after n passes through the cavity) after any continuous absorption (due to gases or aerosol) has taken place. $I_{in}(n)$: Intensity after n passes through the cavity including also differential absorptions (note that n varies with wavelength since the trace gas absorption cross section varies with wavelength). $I_{in}(n_0)$: Theoretical intensity for the same absorptions if the number of traverses were not reduced.

Published by Copernicus Publications on behalf of the European Geosciences Union.

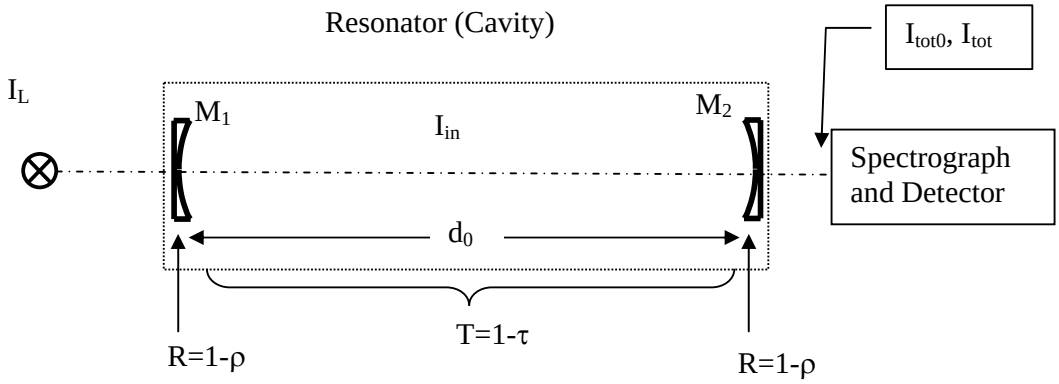

Fig. 2. Sketch of CEAS set-up. The optical resonator is formed by two concave mirrors M_1 and M_2, both with the same reflectivity $R = 1-\rho$. The transmission factor for one traverse through the cavity is $T = 1-\tau = 1-\varepsilon d_0$. The intensity of the radiation emitted by the source is I_L (transfer optics between light source and resonator is not shown).

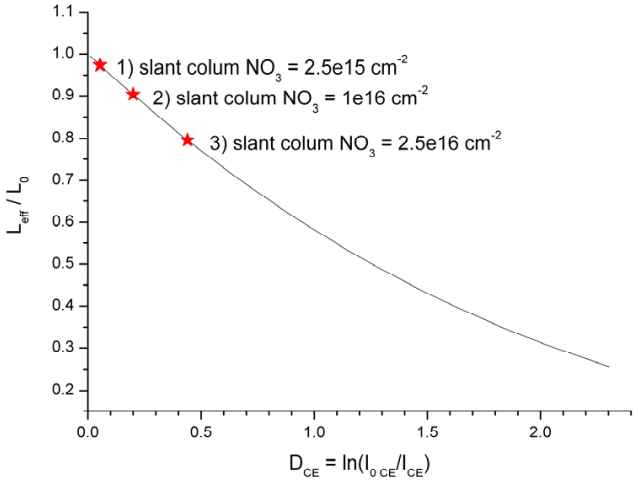

Fig. 3. Reduction of the light path L_{eff} in a cavity due to extinction in the cavity (expressed as optical density D_{CE}). Plotted is the ratio L_{eff}/L_0, where L_0 denotes the average light path in an empty (air filled) cavity as described in the text. For illustration the effective light paths at 662 nm (peak of the NO_3 absorption band) for three realistic NO_3 total column densities (in cm^{-2}) in the cavity are also shown (see Meinen et al., 2009).
