## **Outline**

• Carbon Nanofiber (CNF) Nanoelectrode Array for Biosensors

CNF Nanoelectrode Array for Deep Brain Stimulation

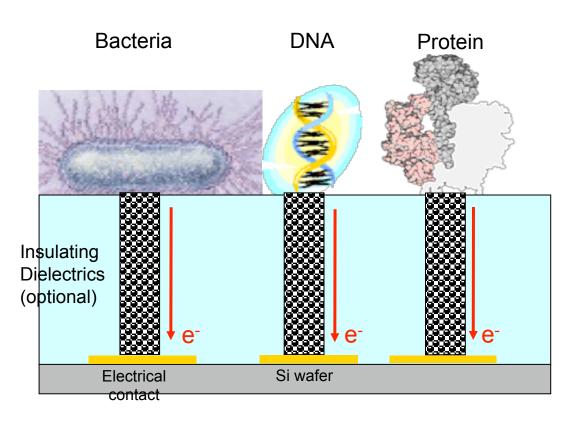

Gas/Vapor Sensors for Medical Diagnosis

CNT in Ophthalmological Applications

### **Nanoelectrode Array for Biosensors**

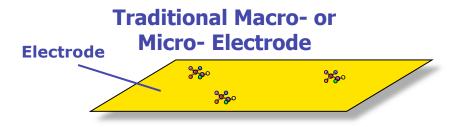

Directly interface solid-state electronics with DNAs, RNAs, proteins, and microbes in a miniaturized multiplex chip for quick detection (Lock and Key approach)

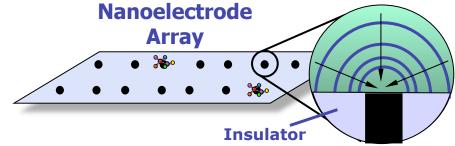

### **Nanoelectrode for Sensors**

Nanoscale electrodes create a dramatic improvement in signal detection over traditional electrodes

- Scale difference between macro-/ micro- electrodes and molecules is tremendous
- Background noise on electrode surface is therefore significant
- Significant amount of target molecules required

- CNT tips are at the scale close Electrode
   to molecules
- Dramatically reduced background noise
- Multiple electrodes result in magnified signal and desired redundance for statistical reliability.

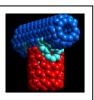

Candidates: SWNTs, MWNTs, Vertical CNFs or Vertical SiNWs

Nano-

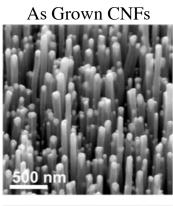

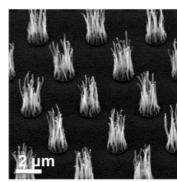

## **Nanoelectrode Array Fabrication**

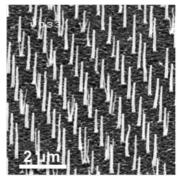

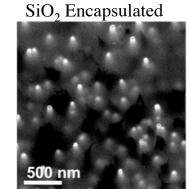

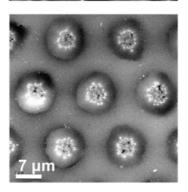

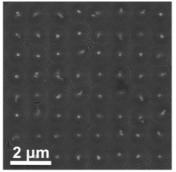

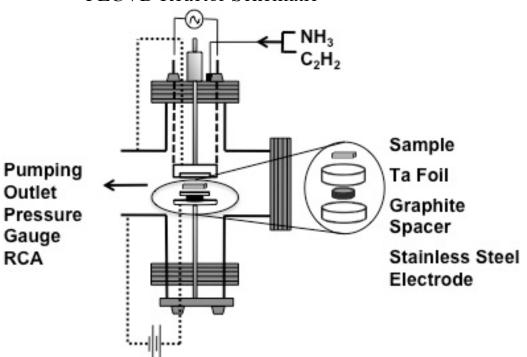

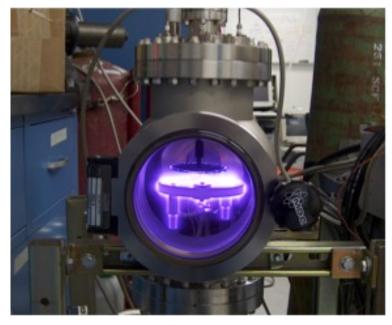

## CNF Growth by Plasma Enhanced Chemical Vapor Deposition (PECVD)

#### **PECVD Reactor Schematic**

#### Custom Built PECVD Reactor

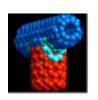

#### **Growth Process**

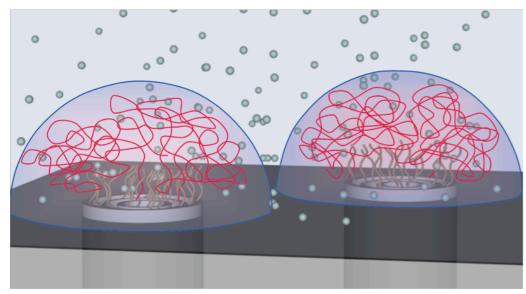

- Heated to 650 C
- Plasma discharge 500 W, 530 V, 0.97 A
- 150 sccm  $NH_3/50$  sccm  $C_2H_2$ , 5-6 torr
- Growth rate- 1000 nm/min
- Quality is good, alignment is good

## **Potential for Cancer Diagnostics**

- Probe molecule that would serve as signature for specific cancer cells to be attached to CNF ends
- Current flow upon hybridization through CNF electrode to signal processing IC chip.

CNF-based biosensor for cancer diagnostics

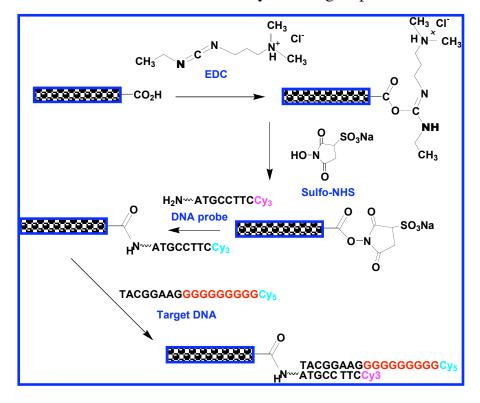

## **CNF Functionalization**

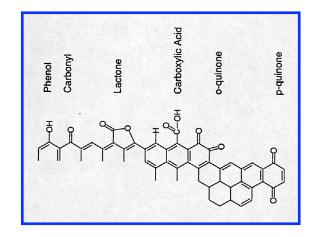

Electrochemically produce carboxylic acid groups on the surface in 1M NaOH (1.5 V 60 sec etch)

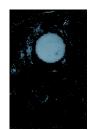

Highly selective reaction of primary amine with surface carboxylic acid group

Cy3 Scan: Probe DNA

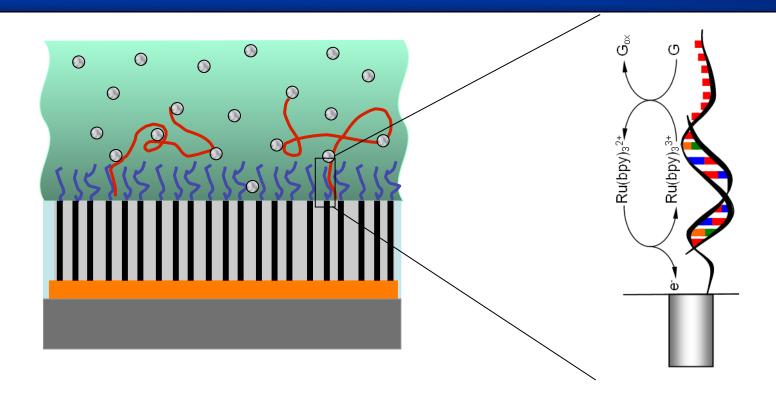

Cy5 Scan: Target DNA

## **Electrochemical Detection Methodology**

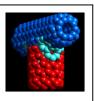

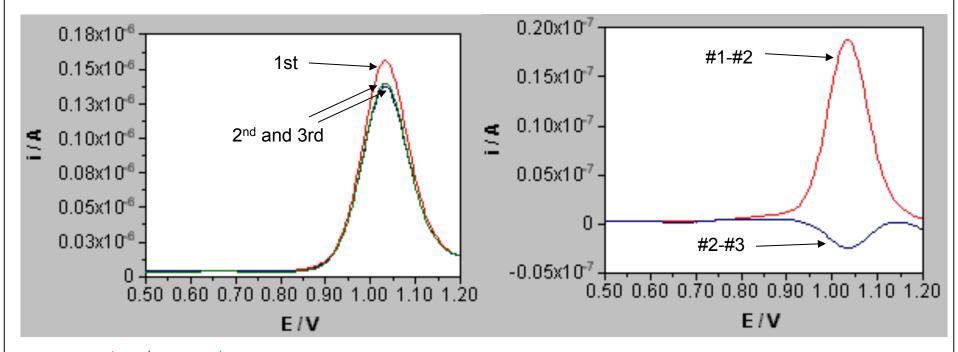

- □ CNF array electrode functionalized with DNA probe as an ultrasensitive sensor for detecting the hybridization of target DNA from the sample.
  - Signal from redox bases (Guanine) in the excess DNA single strands
- The signal can be amplified with metal ion mediator.

# **Electrochemical Detection of DNA Hybridization By AC Voltammetry**

1st, 2nd, and 3rd scan in AC voltammetry

1<sup>st</sup> – 2<sup>nd</sup> scan: mainly DNA signal 2<sup>nd</sup> – 3<sup>rd</sup> scan: Background

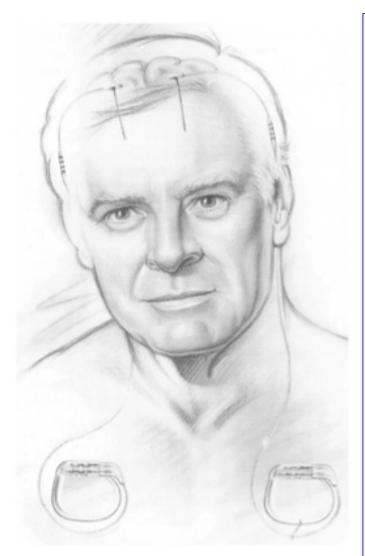

**Lower CNF Density** ⇒ **Lower Detection Limit** 

J. Li, H.T. Ng, A. Cassell, W. Fan, H. Chen, J. Koehne, J. Han, M. Meyyappan, NanoLetters, 2003, Vol. 3, p. 597.

### **Deep Brain Stimulation**

Medtronic

#### **Deep Brain Stimulation (DBS)**

Has been demonstrated to be an effective neurosurgical treatment for several pathologies including:

- Parkinson's disease (30,000-40,000 patients)
- chronic pain (1500-2000 patients)
- tremor (500-1000 patients)
- epilepsy (20-50 patients)
- depression (20-50 patients)
- Tourette syndrome (10-50 patients)

Expert Rev Med Devices 4:591-603, 2007

#### **How: Four Interrelated Hypotheses**

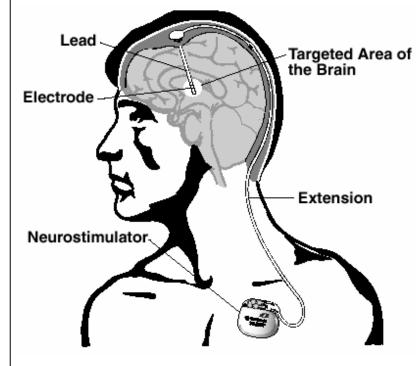

Paradox of similar effects to lesioning of target structure is explained by the following:

- Depolarization Blockage
- Synaptic Inhibition
- Synaptic Depression
- Stimulation Induced Modulation of Pathways

### **Current Techniques for Deep Brain Stimulation**

Medtronic

### PROBLEMS: Indiscriminate Activation

- Stimulation indiscriminately affects all tissue around the electrode (size: 1.27mm diameter with four 1.5mm contacts)
- Crude method without feedback

#### **IMPROVEMENTS:**

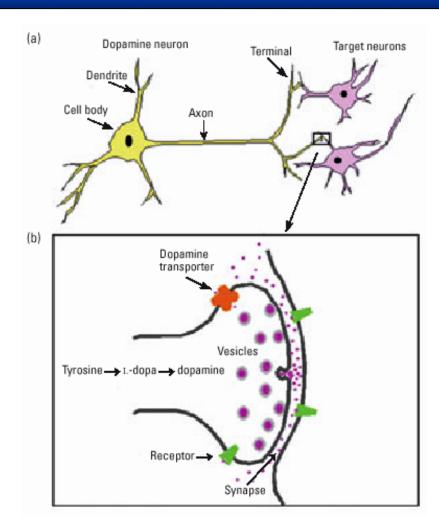

Targeted Activation to specific location down to sub mm scale

Obtain feedback information – such as neurotransmitter levels

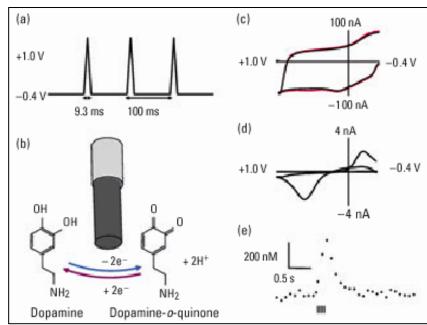

# **Current Techniques for Electrochemical Monitoring of Neurotransmitters with Carbon Fiber Electrodes**

R.Mark Wightman, *Analytical Chemistry*, **414A** (Oct. 2003).

#### **HOW: Cyclic Voltammetry (CV)**

Carbon fiber micro-electrodes (10um dia.)

Best detection is 500nM with temporal resolution of tens of milliseconds

Most neurotransmitters are electrochemically active (i.e. dopamine & glutamate)

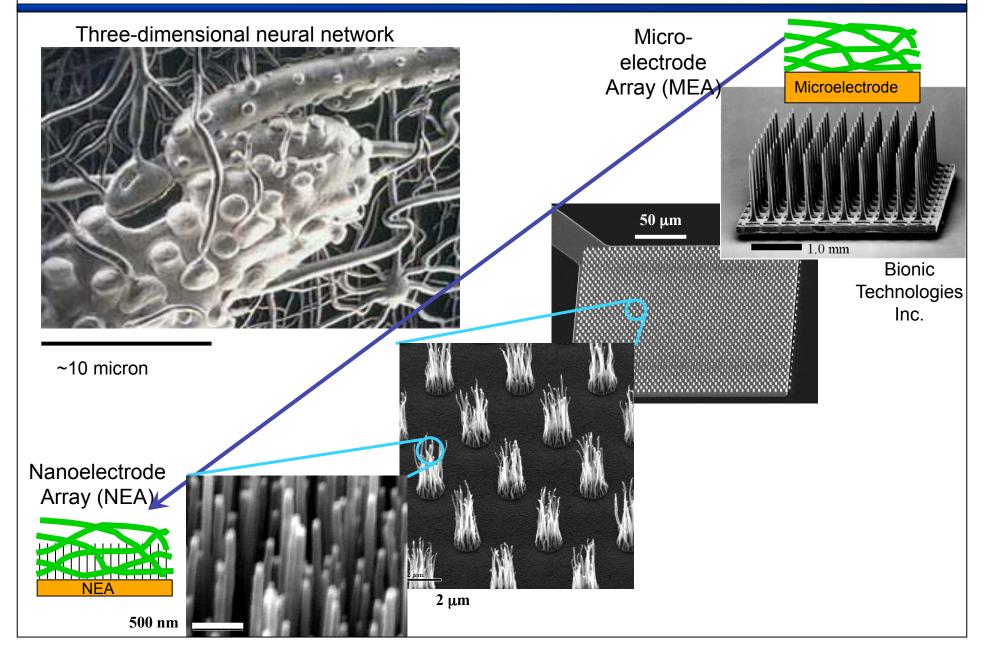

#### **IMPROVEMENTS: Requirements for Electrodes**

- (1) Ultrahigh sensitivity: ~ 1 nM
- (2) Fast speed: ~ 10 ms resolution
- (3) Good for long-term implantation

### **Vertical Aligned CNF Array: A Novel Electrical Neural Interface**

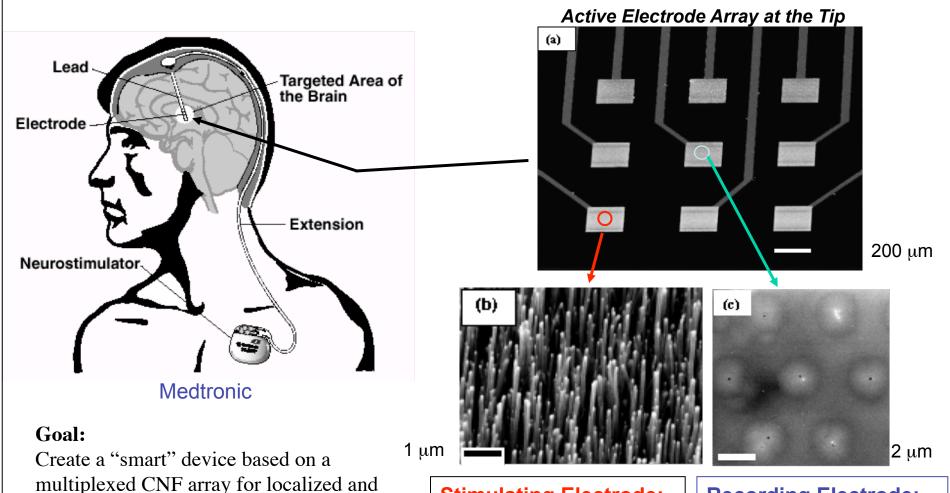

recording

efficient stimulation and neurochemical

# Goal: To Develop an Integrated Multiplex Chip as an Implantable Device for DBS and Electrochemical Recording

Stimulating Electrode: uncoated CNFs with large surface area

Recording Electrode: embedded in SiO<sub>2</sub> with ultrahigh sensitivity

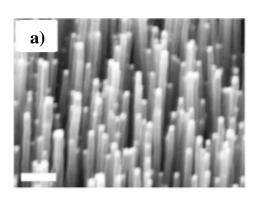

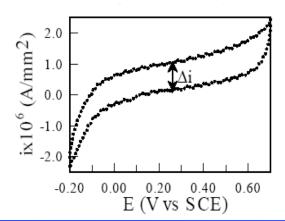

## Polypyrrole Coated Vertically Aligned CNF Array for Neurostimulation

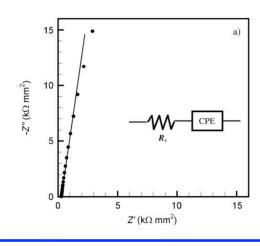

Polypyrrole coating applied to increase the capacitance and decrease the impedance

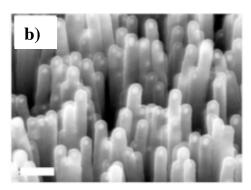

As-grown CNF Array

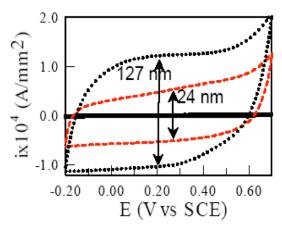

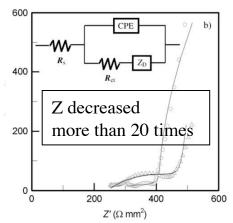

Polypyrrole Coated CNF Array

High Capacitance ( $C_0 = \Delta i/2\nu$ ) Noble metal  $\sim 20~\mu F/cm^2$ As-grown CNF array:  $0.4~mF/cm^2$ Ppy-coated CNF array:  $40~to~100~mF/cm^2$ 

Low Impedance

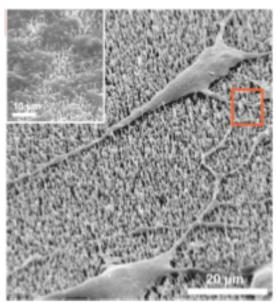

At 1 kHz, the impedance is negligible compared to the solution resistance

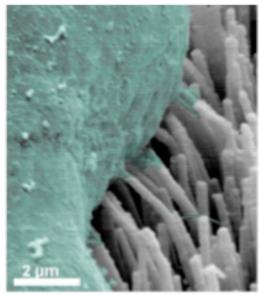

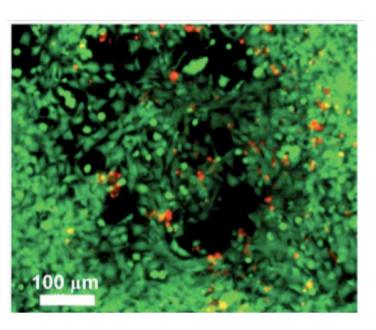

## Biocompatability of Polypyrrole Coated Vertically Aligned CNF Array

### PC12 Cell on Polypyrrole Coated CNFs

- Brush-like polypyrrole coated CNFs make intimate physical contact with PC12 cells
- PC12 cells observed to spread and differentiate on CNF array
- Polypyrrole coated CNFs support cell growth and proliferation

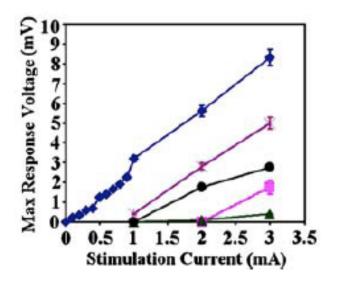

# Stimulation of Rat Hippocampal Slice by Polypyrrole Coated Vertically Aligned CNF Array

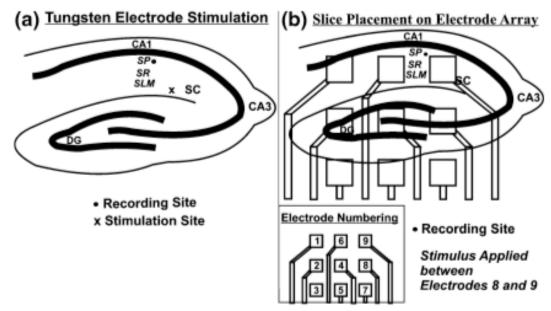

**Experiment:** Measure voltage for a given stimulation current

### Stimulation by:

- •W wire
- Pt Microelectrode
- CNFs
- PPy coated CNFs

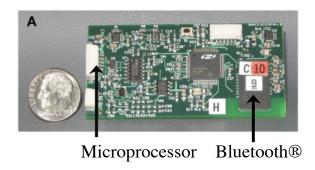

- 1) Only PPy coated CNFs were able to stimulate tissue under 1 mA stimulation current.
- 2) Only PPy coated CNFs did not induce the electrolysis of water (less than 1 mA and 1V)

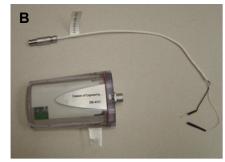

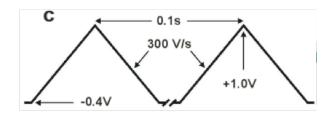

# Dopamine Detection by CNF Array and Wireless Instantaneous Neurotransmitter Concentration Sensor (WINCS)

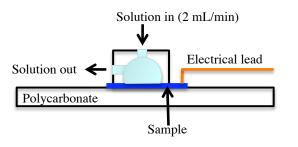

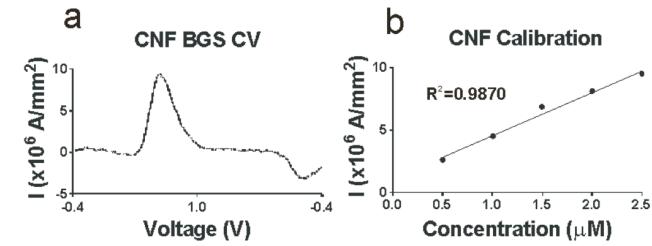

### Mayo Clinic's Sterilizable WINCS Unit

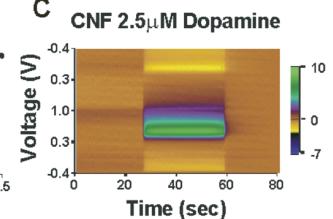

Koehne, J. E., et al. Analyst, 2011, 136, 1802-1805.

# Gas/Vapor Sensors in Biomedical Applications

• Some diseases have specific markers which show up in excess concentration in the breath of sick people relative to normal people.

Examples: Acetone in diabetes patients
NO in asthma patients

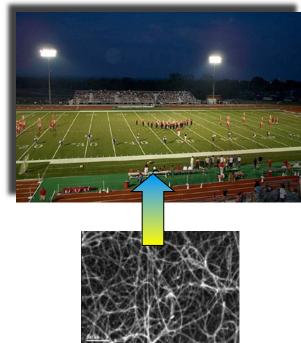

• In these cases, simple chemical sensors with pattern recognition can be valuable.

## Why Nanomaterials/Nanosensors?

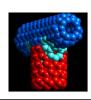

- Compared to existing systems, potential exists to improve sensitivity limits, and certainly size and power needs
- Why? Nanomaterials have a large surface area. Example: SWCNTs have a surface area ~1600 m<sup>2</sup>/gm which translates to the size of a football field for only 4 gm.
- Large surface area large adsorption rates for gases and vapors changes some measurable properties of the nanomaterial basis for sensing
  - Dielectric
  - Capacitance
  - Conductance
  - Deflection of a cantilever

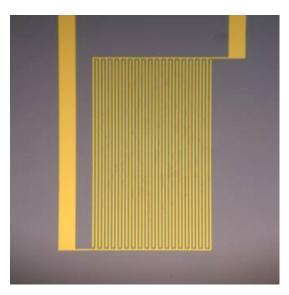

4 grams

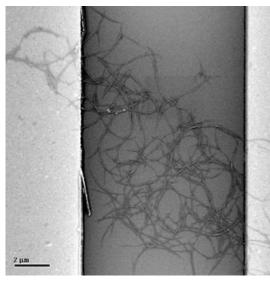

### **SWCNT Chemiresistor**

- Easy production using simple microfabrication
- 2 Terminal I-V measurement
- Low energy barrier Room temperature sensing
- Low power consumption: 50-100 μW/sensor

### **Processing Steps**

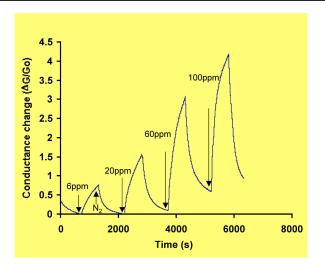

- 1. Interdigited microscale electrode device fabrication
- 2. Disperse purified nanotubes in DMF (dimethyl formamide)
- 3. Solution casting of CNTs across the electrodes

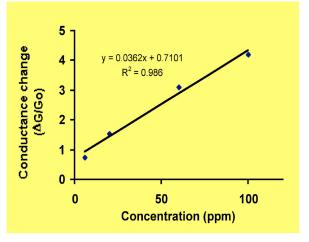

Jing Li et al., Nano Lett., **3**, 929 (2003)

### **SWCNT Sensor Testing**

Detection limit for NO<sub>2</sub> is 4 ppb.

• Test condition:

Flow rate: 400 ml/min

Temperature: 23 °C

Purge gas: N<sub>2</sub> & Carrier gas: Air

• Measure response to various concentrations, plot conductance change vs. concentration

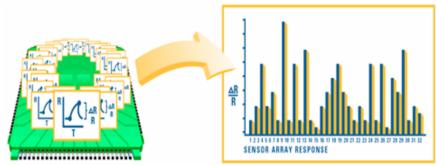

Preliminary tests show a sensitivity of 10 ppm for acetone. Further studies are needed for interfering chemicals and pattern recognition.

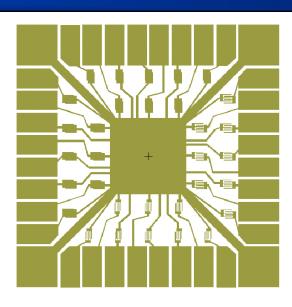

### **Nanosensing Approach: Selectivity**

- Use a sensor array
- Variations among sensors
  - physical differences
  - coating
  - doping

Using pattern matching algorithms, the data is converted into a unique response pattern

#### Operation:

- 1. The relative change of current or resistance is correlated to the concentration of analyte.
- 2. Array device "learns" the response pattern in the *training* mode.
- 3. Unknowns are then classified in the *identification* mode.
- 4. Sensor can be "refreshed" using UV LED, heating or purging

### **CNTs in Ophthalmological Applications**

### Retinal Cell Transplantation

- In the early stage of macular degeneration, retinal pigment epithelial (RPE) cells die, which leads to loss of photoreceptors. Solution?—replace the cells that are lost.
- RPE cells and iris pigment epithelial (IPE) cells can be harvested from the eye, grown in culture, then put back into the eye ("autologous transplantation").

Courtesy: David Loftus

### **Problems with Retinal Cell Transplantation**

• Transplantation of suspensions of epithelial cells into the sub-retinal space fails to re-establish the proper architecture of the RPE layer. Instead of a sheet of uniformly oriented cells, you get a "jumble" of cells.

### Solution:

• Establish the proper orientation of the epithelial cells prior to transplantation, by growing them in culture on a physical support:

# Current Status, Problems and a Possible Solution

- The Obvious Strategy: Natural Substrates for Retinal Transplantation
  - •Anterior Lens Capsule (basal lamina)
  - Descemet's Membrane (posterior cornea)

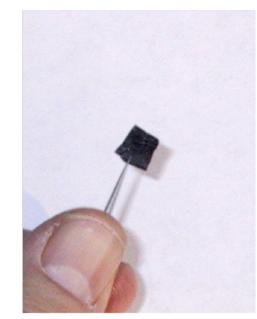

Excellent growth of retinal epithelial cells, assembly of true "epithelial architecture."

**Problem!:** Membranes with attached epithelial cells cannot be easily implanted into the eye, because the membranes are flimsy and tend to "curl up." They lack the mechanical properties necessary for surgical handling.

#### Solution:

### **Carbon Nanotube Bucky Paper**

A meshwork of carbon nanotubes formed into a paper-like structure

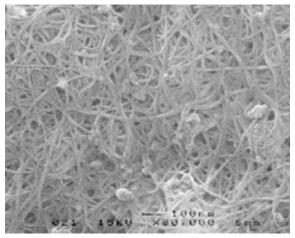

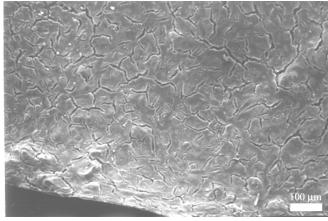

## RPE cells grown on Carbon Nanotube Bucky Paper

#### As-prepared bucky paper

SEM Image after growth of RPE results

Light micrograph/histological staining of RPE grown on bucky paper

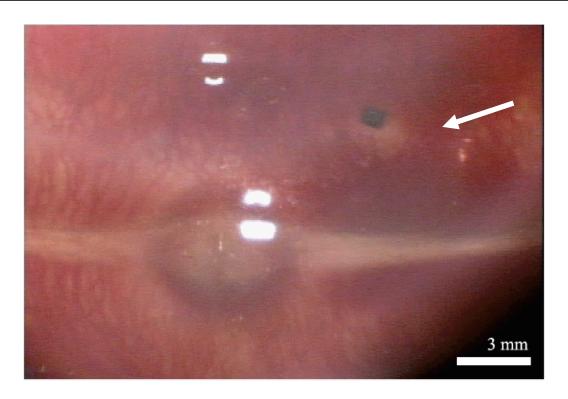

- Confluent monolayer, with uniform orientation of cells
- Excellent attachment of RPE cells to the Bucky Paper surface; confirmation of correct apical/basolateral orientation

## Implantation of Carbon Nanotube Bucky Paper into the Sub-Retinal Space of an Albino Rabbit

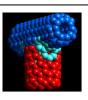

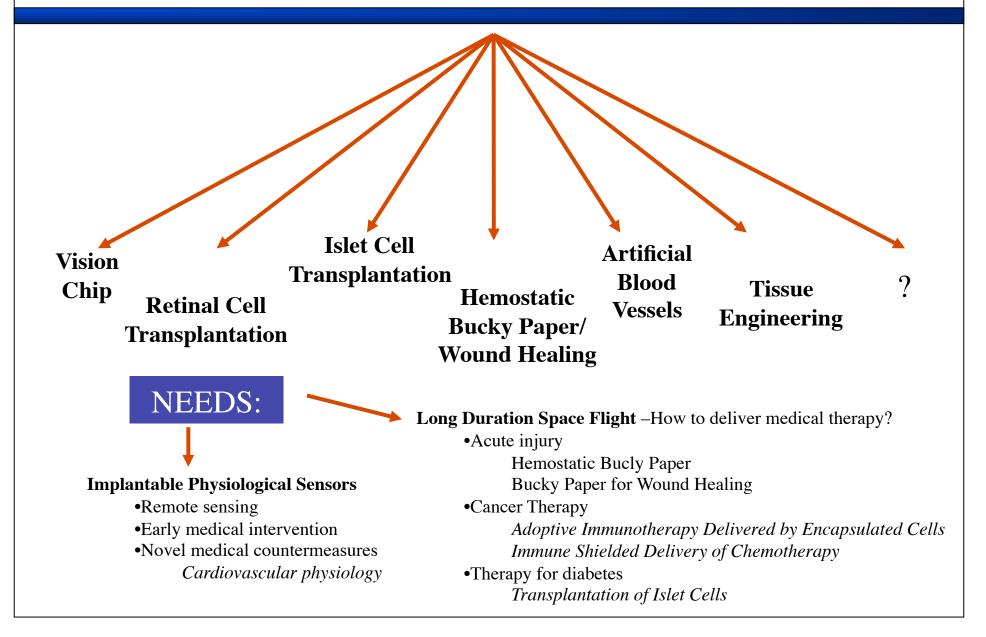

Result: Bucky paper is easily manipulated during surgery (does not tear and stays flat), and is immunologically well-tolerated by the eye.

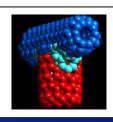

### Carbon Nanotube Biocompatibility

## **Summary**

- Nanotechnology is an enabling technology that will impact almost all economic sectors: one of the most important and with great potential is the health/medical sector.
  - Nanomaterials for drug delivery
  - Early warning sensors
  - Implantable devices
  - Artificial parts with improved characteristics
- Carbon nanotubes and nanofibers show promise for use in sensor development, electrodes and other biomedical applications.
