The influence of synthesis conditions on the structure of  $SnO_2$  has been studied. Base hydrolysis of Sn(II) and Sn(IV) salts ( $SnSO_4$  and  $SnCl_4$ ) was carried out to obtain  $SnO_2$  products. Thus generated precipitates were transformed to  $SnO_2$  by two ways: 1) thermal dehydration of  $Sn(OH)_2$  and  $SnO_2 \cdot nH_2O$  hydroxides; 2)  $sol \rightarrow gel \rightarrow xerogel$  transformation of the precipitate and further thermal dehydration. The precipitates were peptized with various chemical agents:  $HNO_3$ ,  $NH_3 \cdot H_2O$ ,  $H_2SO_4$  under ultrasonic treatment. The samples were heated at 500-800 °C in air and in oxygen flow. The structural features of the  $SnO_2$  samples were studied by XRD, EM, ESR and IR-spectroscopy. The influence of the valence state of tin and the nature of the anion ( $SO_4^{2-}$ ) on the structure of the samples, grain size and on concentration of point defects was revealed.
