Annex 1 Input maps for DIMO

DIMO needs six input maps

1. a barrier map,
2. a water height map,
3. a water velocity map,
4. a seedbank map,
5. a species occurrence map,
6. a habitat suitability map.

All maps may be based on field data or derived from other models. All maps in DIMO are grid based. The model is independent from the grid size, but often the model is run on a 250 by 250m grid size.

Barrier map

The barrier map describes impermeable barriers and divides the modeled area into separate areas where in between no seed transport is possible. In DIMO this is only implemented for dispersal with animals. Barriers that cannot be crossed, such as high ways or rivers, divide the landscape in different parts. The barrier map is species specific and can change during a model run by submitting a new map to the model, e.g. as the result of the realization of an overpass for animals over a highway.

Seed bank map

Plant species can 'reappear' from the seed bank that was built up in the past. New seeds that arrive from outside a grid due to dispersal also end up in the seed bank. The initial seed bank map can be left empty, but ideally information from field inventories is used to fill the seed bank map. The data needed from the inventory is not only the presence of the species, but also when it was found. If the last finding was five years before the start of the model run the seed bank age is set to the maximum seedbank age minus five years. The presence of a species in the seed bank depends on the period the seed can survive in the seed bank. This varies per species and is one of the species-specific parameters that has to be given. Data on the maximum seed bank age is retrieved from the LEDA (Thompson et al. 1997, Knevel et al. 2003) database and the TRY database (Kattge et al. 2011). Each year the seedbank becomes one year older, unless new seed enters the seed bank. When the maximum seed bank age is reached, the species is removed from the seed bank.

Water height map

The height of the water level is used to determine the direction of water flow between cells. Water heights are based on the Dutch national height map (AHN, Rijkswaterstaat-AGI, 2005). Conflicts in the map (water flowing to higher grounds) is solved by hand.

Water velocity map

The water velocity map is used in combination with the water height map. The map is used to determine the time it will take to cross a cell. The time is based on the slope of the stream and derived from the Dutch national height map.

Species occurrence map

Dispersal of seeds is based on the presence of reproducing species in a grid. The model is initialized with the present occurrence (or occurrence at the start of the model run). The occurrence can be derived from (national) inventories, e.g. in our case often from the Dutch vegetation databank (Hennekens & Schaminee 2001).

Habitat suitability map

A key map for DIMO is the habitat suitability map for a species. This map may be based on several sources of information, e.g. abiotic suitability, climate preference, vegetation type or management. The end result is a map that indicates whether or not a species potentially can be present (0-1). This map may be changed during the model run; a new map is given during the model run when appropriate. A new habitat can be given every run year.

Data may also be derived from another species simulation model, e.g. MOVE (van Adrichem et al. 2010), GBMOVE (Smart et al. 2010) or VEG (Belyazid et al. 2006). These models provide DIMO with the potential occurrence of a species that DIMO uses, based on dispersal capacity and seed bank, to calculate if the species actually can be present.

Output maps

DIMO produces several maps. The most important is the age-map that gives the number of years that a species is present in a grid as a reproductive plant. A map containing the suitability for the species is used to support the age-map. Another important map is the seed bank map, which keeps track of the remaining number of years a seed is still able to germinate. A seed rain map is produced to support seed bank map and contains grids where seeds were dispersed in the previous year. The maps are adjusted after every time step.

Annex 2 Decisions made to build the DIMO model

For each decision we give the topic, the assumption and the effect on the model result.

The simulation is grid cell size independent.

1. Outcome: The set of input maps defines the grid cell size. Input maps must have the same grid cell size. Beware, in principle it is therefore possible to use senseless grid cell sizes, e.g. square cm or 100 * 100 km. It is up to the user to choose the grid cell size.
2. Reason: the model is more flexible and easier to apply on different landscape scales, e.g. regional versus pan European.
3. Effect: No effect on the calculations and outcome of the model.

The seed bank map and the actual presence of species are based on data from Dutch national inventories (FLORON, www.floron.nl; National Data Base; Schaminée et al. 2012). Both have a different grid cell size than the standard grid cell size used for the modelling (250*250m).

1. Outcome: The inventories from FLORON are downscaled from 1*1 km to 250*250m. The occurrence of a species in a 1*1km cell is appointed to all 16 250*250m cells. A relevé from the National Data Base is appointed to the grid cell it occurs in.
2. Reason: The mostly used grid cell size is 250*250m.
3. Effect: Overestimation of the actual and seed bank occurrence of species.

For the data provided by FLORON there is the possibility to fill in the gaps in plant species occurrence, based on accompanying species.

1. Outcome: We did not use this option for DIMO.
2. Reason: The uncertainty is too high.
3. Effect: Possible underestimation of actual species occurrence and seed bank occurrence.

The species occurrence data are merged to one final map, if one source acknowledges the occurrence; it is assumed the species occurs.

1. Outcome: Different sources provide extra information
2. Reason: The occurrence of species is simulated better.
3. Effect: A more complete seed bank map and actual occurrence map.

The number of starting years for the model with standard input maps will be limited. Note it is possible to make your own input maps, for every start year.

1. Outcome: Not every year is available for a model run start.
2. Reason: Too many input maps are needed.
3. Effect: None on the model results.

The actual occurrence map will only be used in the initial year.

1. Outcome: Realistic simulation of dispersal.
2. Reason: After the first year the situation may already be changed and is the initial map outdated.
3. Effect: None.

The seed bank map is partly based on the same data as the Actual occurrence map.

1. Outcome: maps are not totally independent.
2. Reason: data are used in a consistent way and in line with each other and lack of sufficient independent data.
3. Effect: seed bank map and actual occurrence map are consistent, but not independent.

The seed bank map is dynamic.

-
1. Outcome: The seed bank map is adjusted every year based on seed bank age and dispersal of seeds.
 2. Reason:
 3. Effect: Seed bank age and map may change every year

The centre of a cell is the starting point for dispersal in the first year of the model run.

1. Outcome: On average the dispersal in the first year is underestimated. This effect is larger for smaller cells.
2. Reason: Practical reasons to keep the model simple. Also it is often not known where the species is exactly located within a cell.
3. Effect: A small underestimation in the first years of the model run. The effect depends on the grid cell size and the dispersal distance of the species.

Species that never form seeds are never present in the seed bank.

1. Outcome: Species can only disperse vegetative.
2. Reason: No seed forming.
3. Effect: These species cannot reappear from the seed bank.

Seed bank longevity according LEDA database.

1. Outcome: Up till now only three different classes available.
2. Reason: knowledge is limiting; when more information gets available this can be adjusted.
3. Effect: Unknown, seed bank longevity may be over- and underestimated.

The seed bank is every year supplied with new seed as long as the species is present. The seed bank age is every time step set back to one year.

1. Outcome: We assume that every year seeds are produced and end up in the seed bank.
2. Reason: Unknown what good and what bad years of seed setting will be.
3. Effect: Overestimation of the seed in the seed bank, bad years are not accounted for.

The seed bank can be supplied every year due to dispersal; again the seed age is set to one year.

1. Outcome: Seed bank is refilled with new seeds.
2. Reason: Unknown what good and what bad years of seed setting will be.
3. Effect: Overestimation of the seed in the seed bank, bad years are not accounted for.

The amount of seed produced or the vitality of the seed.

1. Outcome: They are both neglected in the model
2. Reason: simplicity of the model and lack of data to incorporate this. In the future a factor for the vitality could be incorporated.
3. Effect: Overestimation of the seed bank vitality, age and amount of seed. Thus overestimation of the dispersal speed.

A seed will germinate as long as the habitat is suitable.

1. Outcome:
2. Reason: Simplification of the model and lack of data. In the future a factor for predation could be incorporated.
3. Effect: Overestimation of germination and thus occurrence of the species.

Predation of seeds.

1. Outcome: No seed predation of the seeds included.
2. Reason: Simplification of the model and lack of data. In the future a factor for predation could be incorporated.
3. Effect: If all seeds would be eaten an overestimation of the dispersal.

Effect of groundwater table on the germination or seed longevity.

1. Outcome: Seeds may germinate under non favourable conditions. This effect may be partly solved by the habitat suitability map.
2. Reason:
3. Effect: Overestimation of germination and thus occurrence of species.

The model will include wind, water and animal dispersal, self-inflicted dispersal and vegetative dispersal.

The model will not include human dispersal.

1. Outcome: All natural courses of dispersal are included in the model.
2. Reason: For a general model as ours, it is impossible to incorporate the dispersal of plant species via garden centres, gardens and humans disposing of plant species in natural areas.
3. Effect: We cannot model invasive species dispersal inflicted by humans.

A barrier map can be included in DIMO.

1. Outcome: A more realistic modelling of dispersal. A barrier map can be used as an extra map layer for every means of dispersal.
2. Reason: Animal dispersal can be blocked by roads, rivers etc., but also wind dispersal may be blocked by forest.
3. Effect: Dispersal can be blocked by barriers.

Species can have more than one way of dispersal in the model.

1. Outcome: Species have often several means of dispersal, e.g. wind floating in water. Sometimes one mean is blocked by a barrier but can the other still make dispersal possible beyond the barrier.
2. Reason:
3. Effect: More realistic simulation of plant dispersal

We use the LDD for dispersal.

1. Outcome: LDD is the dispersal way in the model.
2. Reason: We choose to model the long distance dispersal events, rather than the distance where the bulk of the seeds are deposited. We assume that LDD is responsible for the real dispersal and that from these newly established sites near distance dispersal takes place to fill up the possible gaps between the sites.
3. Effect: Simulation of the rare dispersal events, thus longer dispersal distances, which may lead to an overestimation of the dispersal.

If there are no measurements available in the LEDA database.

1. Outcome: We fall back on expert knowledge on dispersal distance. See Appendix * for the data and the method used (LDD is partly based on traits of the seed/species and on expert knowledge and comparison with similar species with similar traits).
2. Reason: We wanted to make a model that is able to calculate the dispersal for many species in a simple way. For this lots of information is necessary, but not always measurements are available.
3. Effect: We can simulate many species, but the uncertainty in the LDD and other characteristics may be larger for species based on expert knowledge than for species characteristics based on LEDA data.

Effect of (abiotic) conditions is not included in the model.

1. Outcome: Seed quality and seed amount does not depend on abiotic conditions and does not change between the years. Note that the establishment of species can depend on habitat quality, via the habitat suitability map.
2. Reason: Lack of information and the complexity of the model. In principle the models that could simulate abiotic conditions, also for the future, are available.
3. Effect: Seed amount and quality is constant, we assume thus that there will always be enough seed of sufficient quality to give LDD.

Annex 3 Input data for DIMO

Dispersal distances, for wind (including self-inflicted, rain-water, raindrop ballists, geocarpie, stolons and turionen) and animal dispersal, seed bank longevity and germination delay. The last four columns give the (literature) source of the value with:

1. Ozinga, W.A., 2008. Assembly of plant communities in fragmented landscapes: the role of dispersal. Alterra, Wageningen. Thesis.
2. Grashof-Bokdam, C.J., 1997. Colonization of forest plants: the role of fragmentation. Thesis Leiden University.
3. Alterra, 2001. Handboek Robuuste Verbindingen; ecologische randvoorwaarden. Wageningen, Alterra, Research Instituut voor de Groene Ruimte. Data behind this and estimation method are given in Appendix 4.
4. LEDA. Kleyer, M., Bekker, R.M., Knevel, I.C., Bakker, J.P, Thompson, K., Sonnenschein, M., Poschlod, P., Van Groenendaal, J.M., Klimes, L., Klimesová, J., Klotz, S., Rusch, G.M., Hermy, M., Adriaens, D., Boedeltje, G., Bossuyt, B., Dannemann, A., Endels, P., Götzenberger, L., Hodgson, J.G., Jackel, A-K., Kühn, I., Kunzmann, D., Ozinga, W.A., Römermann, C., Stadler, M., Schlegelmilch, J., Steendam, H.J., Tackenberg, O., Wilmann, B., Cornelissen, J.H.C., Eriksson, O., Garnier, E., Peco, B., 2008. Annex 4 Estimation of species characteristics for the dispersal model

For species without data in the LEDA database we estimated the characteristics for LDD, seed bank longevity and seed disperser. We first made an estimation based on seed characteristics, following these criteria (for the classes see table below).

Rule	disperser	class
Seed spread by humans	humans	1
Orchid seed	wind	3
Seed dispersed internal by animals	Large mammals	3
Small seeds with an internal fine-meshed bag	wind	4
spores	wind	4
Seed dispersed internal by animals	(forest) birds	5
The seed has hooks or thorns. Value is based on the characteristics per species.	animal	5 or 6
Is dispersed by animals on the outside, but the seed has no special adjustments.	Animal	6
Sticky seeds	Animal	6
The seeds have hairs or plumes, plants are taller than 0.5m and the seeds are small.	wind	6
Seed dispersed internal by animals	Small mammals	6
Ants disperses the seeds	Animal	7
The seed has (small) wings	wind	7
The seed has hairs or plumes but has relatively heavy seeds or plants are smaller than 0.5m	wind	7
The seed is dispersed by the wind, but with no special adjustments.	wind	7
Wind-ballistics (Note when the seed has special adjustments, it may be placed in another category, e.g. orchids)	wind	8
Raindrop-ballists	Rain	8
Self dispersal	other	8

After the classification the results were reviewed by two experts (P.A. Slim and G.W.W. Wamelink, both Alterra) and a final class was given to the species.

The classes are given here below, the first table defines the dispersal classes, the second table gives the dispersal class the disperser, the species or method and the medium the dispersion takes place.

class	LDL
	km
1	>35
2	25 - 35
2	15 - 25
3	7-15
4	3-7
5	1-3
6	0.1-1
7	0.01-0.1
8	0.001-0.01
9	< 0.001

<i>Utricularia minor</i>	*	water		water
<i>Utricularia ochroleuca</i>	*	water		water
<i>Sisymbrium supinum</i>	*	water		water
<i>Althaea officinalis</i>	*	water		water
<i>Valeriana dioica</i>	*	water		water
<i>Anagallis minima</i>	8		Raindrop-ballist	land
<i>Caltha palustris</i> subsp. <i>araneosa</i>	8		Raindrop-ballist	land
<i>Campanula glomerata</i>	8		Rain water	land
<i>Campanula patula</i>	8		Rain water	land
<i>Campanula rapunculus</i>	8		Rain water	land
<i>Chrysosplenium oppositifolium</i>	8		Raindrop-ballist	land
<i>Euphorbia cyparissias</i>	8		Self-inflicted	land
<i>Euphorbia palustris</i>	8		Self-inflicted	land
<i>Euphorbia stricta</i>	8		Self-inflicted	land
<i>Illecebrum verticillatum</i>	8		Rain water	land
<i>Lepidium heterophyllum</i>	8		Raindrop-ballist	land
<i>Scutellaria minor</i>	8		Raindrop-ballist	land
<i>Sedum reflexum</i>	8		Raindrop-ballist	land
<i>Sedum sexangulare</i>	8		Raindrop-ballist	land
<i>Vicia tenuifolia</i>	8		Self-inflicted	land
<i>Vicia tetrasperma</i> subsp. <i>gracilis</i>	8		Self-inflicted	land
<i>Orobanche reticulata</i>	8		Rain water	land
<i>Orobanche lutea</i>	8		Rain water	land
<i>Parnassia palustris</i>	8		Rain water	land
<i>Sanguisorba minor</i>	8		Rain water	land
<i>Geranium columbinum</i>	8		Self-inflicted	land
<i>Lathyrus linifolius</i>	8		Self-inflicted	land
<i>Lathyrus niger</i>	8		Self-inflicted	land
<i>Lathyrus nissolia</i>	8		Self-inflicted	land
<i>Lathyrus sylvestris</i>	8		Self-inflicted	land
<i>Salvia pratensis</i>	8		Self-inflicted	land
<i>Viola canina</i>	8		Self-inflicted	land
<i>Viola persicifolia</i>	8		Self-inflicted	land
<i>Antennaria dioica</i>	9		stolones	land
<i>Circaea alpina</i>	9		turionen	land
<i>Circaea x intermedia</i>	9		turionen	land
<i>Trifolium subterraneum</i>	9		geocarpie	land

Annex 5 Wind speed for the wind stations in the Netherlands

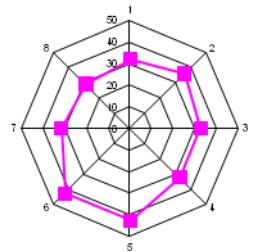

Data were provided by KNMI (www.knmi.nl), direction and strength were based on daily measurements. Given here below are wind strength and direction per station, situated all over the Netherlands. Values are averages per year over the period 1991-2000 and are given in 0.1 m/s.

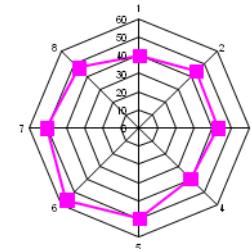

De Kooy

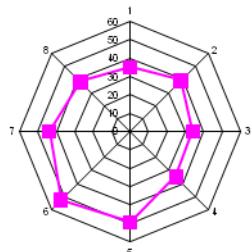

Schiphol

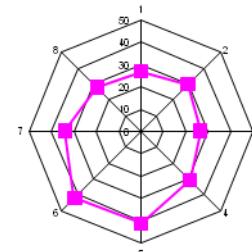

De Bilt

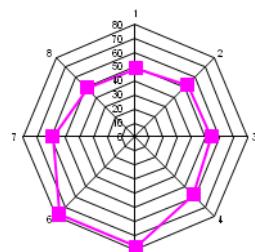

Leeuwarden

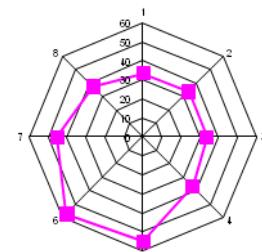

Eelde

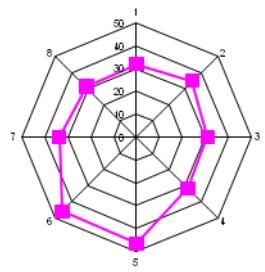

Twenthe

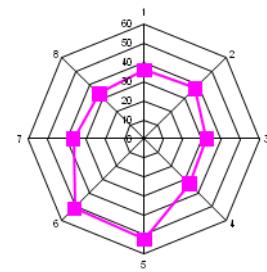

Vlissingen

Rotterdam

Eindhoven

Maastricht (Beek)

Annex 6 Parameter combinations examined in the sensitivity analyses

Each set is designed to examine the sensitivity of the model for one parameter.

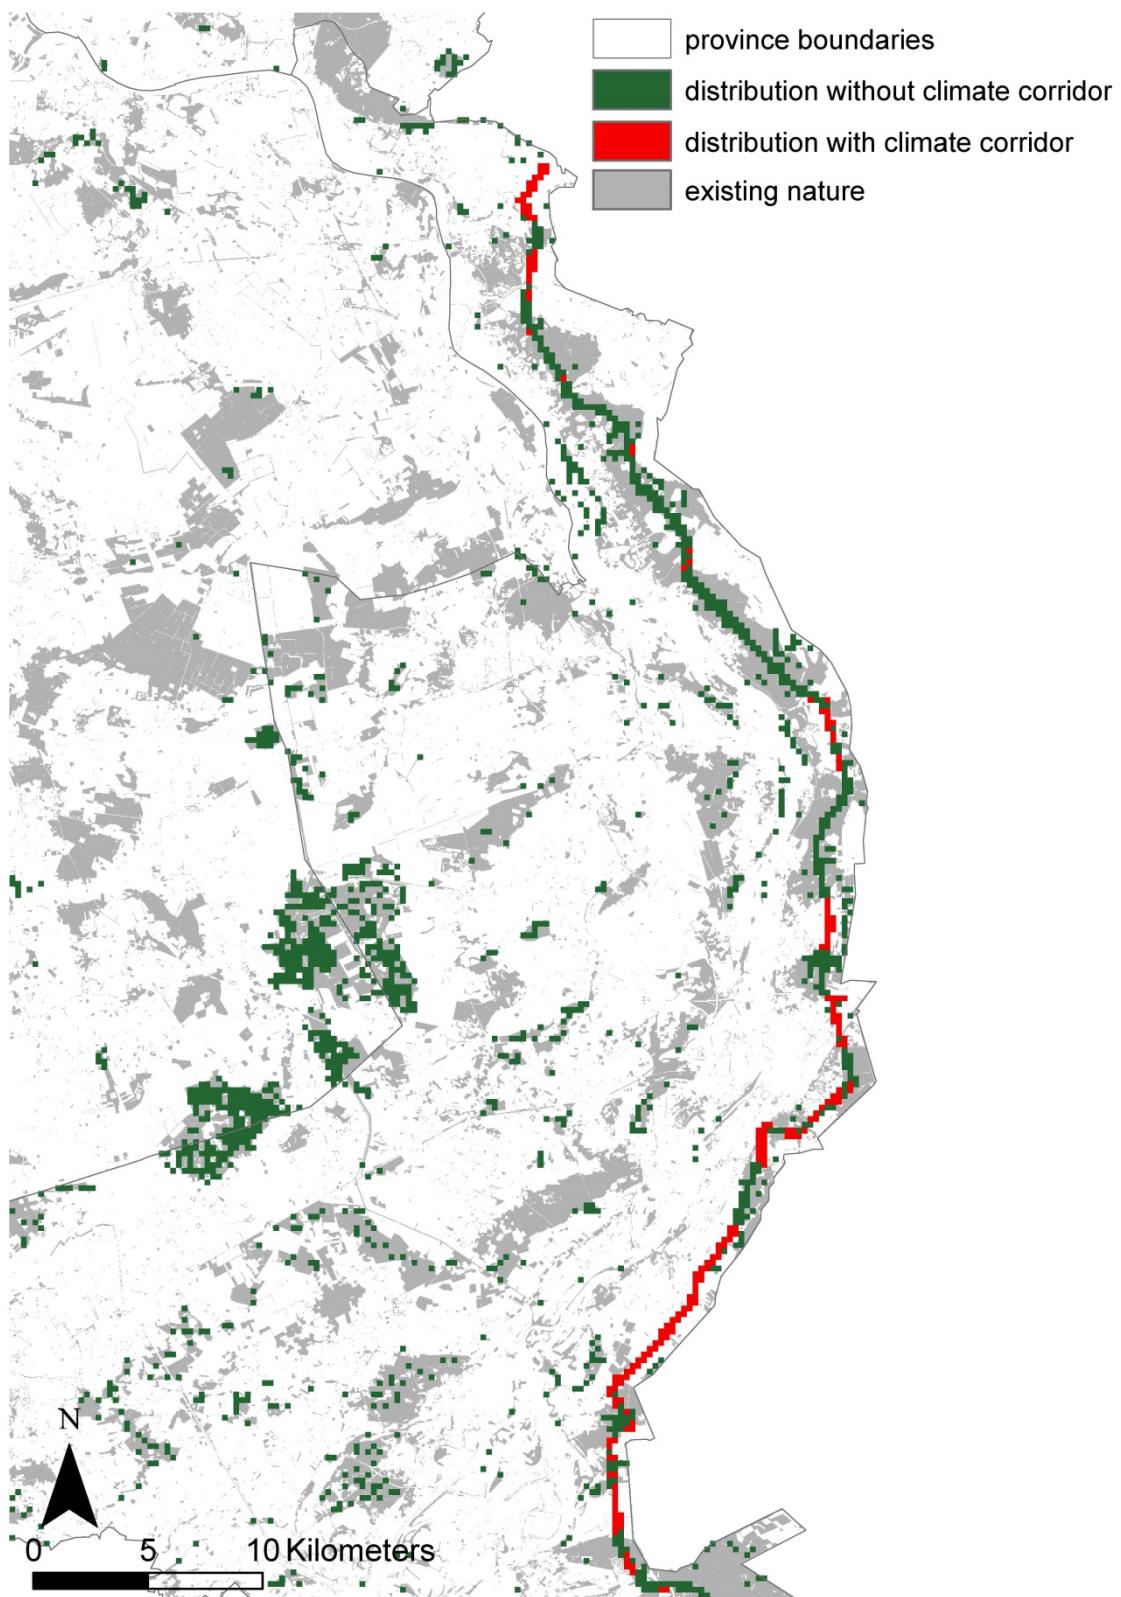

Dispersal distance for wind (m)	Wind force (-)	Dispersal distance for animal (m)	germination delay (y)	Barrier (-)	Grid cell size (m)
set 1 wind dispersal					
0.1	1	0	0	1	250
200	1	0	0	1	250
400	1	0	0	1	250
800	1	0	0	1	250
1600	1	0	0	1	250
set 2 wind force					
1000	1	0	0	1	250
1000	1.5	0	0	1	250
1000	2	0	0	1	250
1000	2.5	0	0	1	250
set 3 animal dispersal					
0	1	0.1	0	1	250
0	1	50	0	1	250
0	1	200	0	1	250
0	1	1000	0	1	250
0	1	10000	0	1	250
set 4 germination delay					
200	1	200	0	1	250
200	1	200	1	1	250
200	1	200	5	1	250
200	1	200	10	1	250
200	1	200	25	1	250
set 5 barrier					
200	1	1000	0	1	250
200	1	1000	0	2	250

Annex 7 Case

Dispersal of *Dactylorhiza maculata* (L.) Soó, *Eriophorum angustifolium* Honckeny, *Maianthemum bifolium* (L.) F.W. Schmidt and *Primula veris* L. in the South of the Netherlands as a result of a planned corridor. The first figure gives the study area in Dutch perspective.

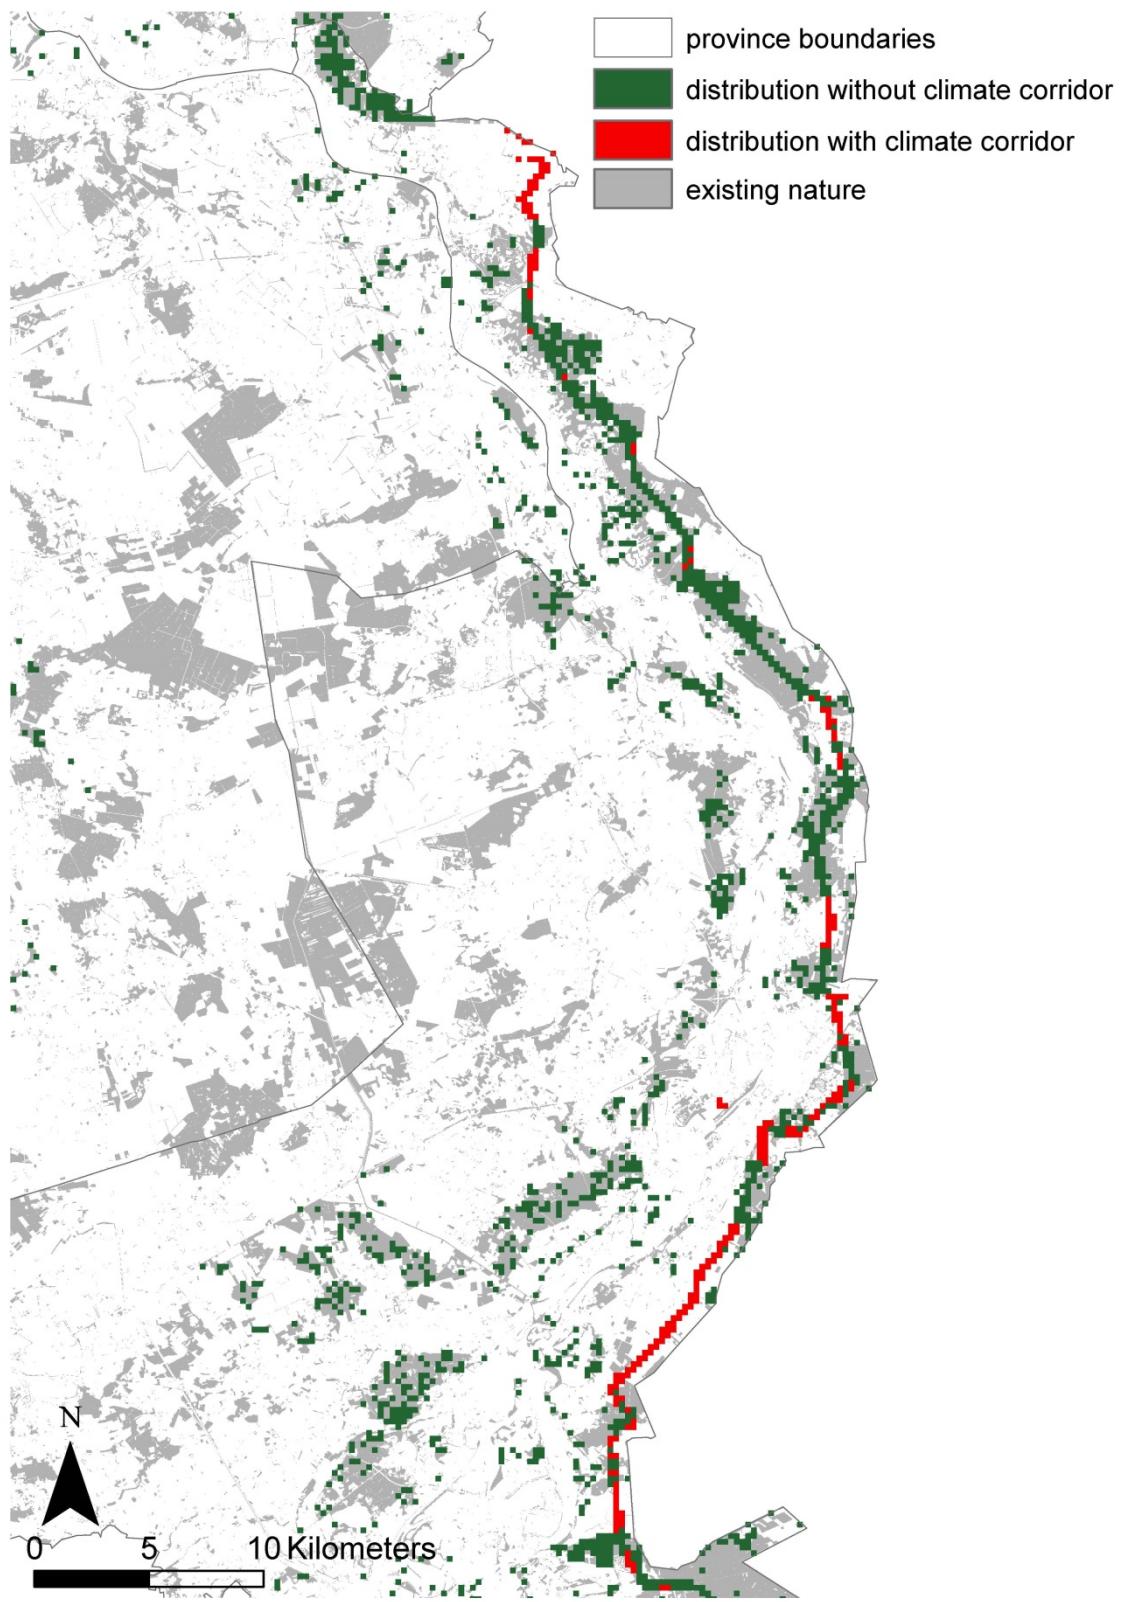

The rectangular gives the study area in the south of the Netherlands.

Dactylorhiza maculata (L.) Soó

Eriophorum angustifolium Honckeny

Maianthemum bifolium (L.) F.W. Schmidt

Primula veris L. Note that the climate corridor does not result in extra occupied cells for this species, thus the colour red is missing in the figure.
