VERSLAG VAN:

Seventh Inter-Agency Meeting, Boedapest, 1988-11-10/11

Sixteenth Session Codex Committee on Methods of Analysis and Sampling,
Boedapest, 1988-11-14/19

INTER-AGENCY MEETING

De Inter-Agency meeting wordt traditiegetrouw voorafgaande aan de CC/MAS vergadering gehouden. Het is een ontmoetingsplaats van organisaties, die zich bezig houden met de analyse van voedingsmiddelen.

Aanwezig waren vertegenwoordigers van CAC, ISO, AOAC, IUPAC, EOQC (European Organization for Quality Control) en van organisaties voor zivel (IDF), granen (ICC), suikers (ICUMSA) en fruit juices (IFJU).

Aan de orde kwamen o.a. de volgende onderwerpen.

- Ringonderzoeken. Door de verschillende organisaties werden tal van ringonderzoeken aangekondigd. Omdat sommigen hiervan voor het RIKILT ook van belang kunnen zijn, zijn de opgaven in een bijlage van dit verslag verzameld (Bijlage 2).

- Verbetering van internationale samenwerking op het gebied van genormaliseerde analysemethoden.

- Toepassing van statistische methoden. Hier werd het werk van ISO/TC69 besproken, in het bijzonder de herziening van ISO 5725. Ook ISO 3534:1977 kwam aan de orde.

- Harmonisatie van ringonderzoeken. Een AOAC/IUPAC/ISO werkgroep heeft een concept—"Protocol for the design, conduct and interpretation of collaborative studies" gepubliceerd. In Nederland (NNI, Zwart) bestond de vrees dat de eindversie van juli 1988 in deze IAM-vergadering zou worden aanvaard en daarmee een officiële status zou krijgen. Er waren echter nog een aantal Nederlandse bedenkingen tegen, die weliswaar opgestuurd waren, maar Zwart was er niet gerust op, dat dit commentaar te bestemder plaatse was gekomen. Hij had daarom gevraagd alert te zijn en, indien mogelijk, aanvaarding te voorkomen. Op de vergadering

bleek het Nederlandse commentaar er te zijn; het werd zelfs als voorbeeld voor de andere organisaties gesteld. Commentaar is nog tot december mogelijk en het is de bedoeling de eindversie in mei 1989 te valideren.

(Dit Protocol is ook voor het RIKILT van groot belang; het geeft een stramien waaraan ringonderzoeken zullen moeten voldoen. Eenmaal geaccepteerd, zal het ongetwijfeld een dwingend karakter krijgen, waaraan het RIKILT en het hele controlerend onderzoek gebonden zal zijn. Gezien recente ervaringen met de BDR kan een ringonderzoek een cruciale rol spelen in het forensisch onderzoek.

In dit verband ontbreekt o.i. aan het Protocol een paragraaf die de waarde van een ringonderzoek relativeert. Een dergelijke aanvulling is op ons initiatief thans alsnog opgestuurd door NNI Commissie 390 69 03).

Er werd opgeroepen tot praktische samenwerking bij ringonderzoeken.

- **Validering van analysemethoden.** Er werd gewezen op een Brits ontwerp protocol, dat van belang is voor de EEG na 1992. Ook werd aandacht besteed aan referentiematerialen, o.a. van BCR.

Door mij werd validering door middel van Criteria naar voren gebracht en uitgelegd aan de hand van foto's.

- **Analysemethoden.** De verschillende organisaties presenteren hun analysemethoden (*Bijlage 2*).

- **Bemonsteringsmethoden.** Het belang van alle kanten onderstreept.

Er is echter nog geen internationaal geaccepteerde genormaliseerde aanpak.

- USSR voorstel voor genormaliseerde methode voor verassing van voedingsmiddelen voorafgaande aan de bepaling van zware metalen. Dit voorstel zal binnenkort in JAOAC verschijnen. Van verschillende kanten is commentaar binnengekomen. (Gegevens doorgestuurd aan ACON.)

CC/MAS

Voor een volledig verslag van de vergadering zij verwezen naar het Verslag van de Nederlandse delegatie en het officiële Codex verslag. Daarom kan hier worden volstaan met enkele persoonlijke impressies. Als gewoonlijk werd ook dit keer een groot deel van de week vergaderd in twee werkgroepen: een Analyse- en een Bemonsteringsgroep. Dit maal heb ik mij aangesloten bij de laatste groep.

Allerwegen wordt de noodzaak van een verantwoorde bemonstering erkend. Het is dan ook verbazingwekkend, dat er op dit gebied nog zo weinig geregeld is. "We lopen 25 jaar achter". De respons van de Commodity committee's op een oproep van de vorige CC/MAS bijeenkomst was bedroevend. Er werd daarom gesteld, dat CC/MAS meer leidinggevend moet optreden. Als eerste aanzet werd daarvoor een stuk opgesteld.

Nederland merkte op dat in de zuivelwereld wél veel gedaan is aan (ISO/IDF/AOAC) normen voor bemonsteringsschema's (mede door activiteiten binnen het RIKILT).

De analysewerkgroep heeft een document geproduceerd met de actuele situatie ten aanzien van een lange lijst analysemethoden. Een aantal methoden werd (al dan niet tijdelijk) geëndosseerd.

Andere agendapunten waren o.a.:

Er werd uitvoerig gediscussieerd over de type-indeling van Codex methoden van onderzoek. De vraag werd opgeworpen, of een eenvoudige indeling in routine- en referentiemethoden niet voldoende zou zijn. UK zal een ontwerp-richtlijn maken; intussen wordt commentaar van de regeringen ingewonnen.

Limit of Detection - Limit of Determination. Op eerdere voorstellen was commentaar binnengekomen; het secretariaat had echter niet de regeringen geënqueteerd, omdat men vond dat het opstellen van een definitie beter aan deskundigen (IUPAC, ISO, AOAC) kan worden overgelaten. NL wees in dit verband op een Engelse aanbeveling, waarin de noodzaak tot twee definities ontkend wordt. Er kon nu verder geen besluit worden genomen; dit werd doorgeschoven naar de volgende vergadering. Ook de discussie over dit onderwerp zal consequenties voor het RIKILT hebben.

Bij de besprekking van het IAM verslag kwam het al even aan de orde, maar bij "Andere zaken" kreeg ik ook in deze vergadering gelegenheid validering van analysemethoden door middel van criteria aan de orde te stellen. Er was behoorlijke belangstelling, ook in de wandelgangen. Door de voorzitter werd gesteld, dat chemometrie een opkomende discipline is, die in de naaste toekomst ook voor de Codex van grote waarde zal blijken te zijn. Wat de criteria betreft, sprak hij uit, dat het vooralsnog zaak is, in de wetenschappelijke wereld hiervoor belangstelling op te wekken en dat hij bereid was persoonlijk hieraan mee te werken.

Remarks on "Protocol for the design, conduct and interpretation of collaborative studies"

by NNI Commission 390 69 03.

We sometimes notice a tendency to interpret a successful collaborative study as implying a guarantee for the correctness of a result obtained by the method studied, irrespective of the nature of the sample examined.

To prevent the unjustified extrapolation of the results of collaborative studies to areas neither aimed at nor covered by the study, a cautionary clause should be added, pointing out the limitation inherent to a collaborative study.

Such a clause could read as follows:

1. A collaborative study gives information about the precision of a method. As such, in most cases it cannot give information about the bias of the method.
2. The results of a collaborative study are valid only for the sampled population, or proven similar ones, in terms of parameters like matrix effects, interfering components, concentration ranges, etc. It does not warrant correctness of the results when the method is applied to other populations with different parameters.

Item 7.n

INTER-AGENCY MEETING
ANALYSIS OF MILK AND MILK PRODUCTS

INTERLABORATORY STUDIES UNDER IDF/ISO/AOAC AUSPICES

Note prepared by IDF General Secretariat

According to the information available in IDF General Secretariat the following interlaboratory studies are planned or in hand in the various IDF/ISO/AOAC groups of experts :

E5 Water content

Total solids in yogurt	Study to be started shortly
Total solids in ice cream	Study completed: report accepted for publication in Bulletin of IDF
Total solids in caseins and caseinates (IDF Standard 78B)	Study planned
Total solids in cheese and processed cheese (IDF Standard 4A)	Study planned
Total solids in sweetened condensed milk (IDF Standard 15A)	Study completed: report accepted publication in Bulletin of IDF
Water content in Butteroil (IDF Standard 23)	Study completed: report accepted for publication in Bulletin of IDF
Water content of dried milk (IDF Standard 26)	Study planned

E8 Nitrate, nitrite, phosphorous, chloride etc..

Salt content of butter (IDF Standard 12A)	Study completed: report submitted for publication in Bulletin of IDF
Polyphosphates in cream, evaporated milk and processed cheese (by HPTLC and paper chromatography)	Study in hand at present
Nitrate in milk powder and whey powder	Preliminary study completed
Nitrate in preserved grated cheese (amino-bonded HPLC column)	Pilot study completed: full study planned

E9 Lactic acid and lactates

Calcium in milk and dried milk	Study completed: report submitted for publication in the Bulletin of IDF
--------------------------------	--

E11 Analysis of caseins and caseinates

Ammonia in ammonium caseinates	Study launched, November 1988
--------------------------------	-------------------------------

E15 Heavy metals and other elements

Tin in canned milk products	New study planned
Zinc in milk	Study planned for late 1988

E17 Characterization of d.m. by heat treatment and usage

Cysteine number method	Poor results of study have lead to new approach
Heat class of milk powder-HPLC method	New study launched August 1988

. / ...

2

Inter-Agency meeting-page 3

E55 continued

Viscosity Study planned

E56 Lactulose content

Lactulose in heated milk (HPLC and enzymic methods) Study completed: submitted for publication in the Bulletin of IDF

E57 Oxygen in milkfat

Photoelectric method Preliminary study launched May 1988

E64 Listeria monocytogenes

Detection and enumeration Preliminary studies in hand

Reports of interlaboratory studies may be published in the Bulletin of IDF (see, for example, Bulletin of IDF 1986 No 207), Journal of the AOAC, Deutsche Lebensmittelrundschau etc. IDF Standard 135A gives guidance on the organization, planning and statistical analysis of such studies.

Inter-Agency Meeting IDF/ISO/AOAC

Methods of analysis for FAO/WHO Code of Principles concerning Milk and Milk Products

Immediate review of the latest list (in Appendix 2 of 1986 Milk Committee report) shows the following position. All standard methods are reviewed 5 years after publication to determine whether they need revision or can be confirmed.

Product	Collab. study	FAO/WHO	IDF	ISO	AOAC (14th Ed)
<u>Acid casein</u>					
ash (fixed)	-	B18:1978	88:1979 (confirmed)	5544:1978	
<u>Ammonium caseinate</u>					
ash (fixed)	-	B18:1978	89:1979 (confirmed)		
<u>Butter</u>					
acid value: free fatty acid index	+	B4:1967	68:1989	1740:1980	16.237-16.239
salt (chloride)	+	B8:1967	12A:1969 (confirmed)	1738:1980	16.235
fat	+	B9:1978	80:1977	3727:1977	16:232
refractive index (butterfat)	+	B5:1967	7A:1979 (confirmed)	1739:1975	16.240
sampling	-	B1:1982	50B:1985	707:1985	16.012-16.014
solids-not-fat	+	B9:1978	80:1977	3727:1977	16.231
total solids (water)	+	B9:1978	80:1977	3727:1977	16.231
<u>Caseins</u>					
acidity (fat acidity)	-	B26:1982	91:1979 (confirmed)	5547:1978	
<u>Caseins and caseinates</u>					
ash (fixed ash)	-	B24:1982	89:1979	5544:1978	
lactose	-	B38:1982	106:1982	5548:1980	
nitrogen (protein)	-	B25:1982	92:1979	5549:1978	
pH value	-	B37:1982	115:1982	5546:1979	
scorched particles	-	B34:1982	107:1982	5739:1983	
total solids (water)	-	B22:1982	78B:1980 (confirmed)	5550:1978	
<u>Cheese</u>					
chloride	+	B18:1978	88:1979 (confirmed)	5943:1978	
citric acid	+	B13:1972	34B:1971	2963:1974	16/292-16.296

Year 7. 9

I U P A C COMMISSION VI.3 - OILS, FATS AND DERIVATIVES
WORKING PROGRAMME FOR 1987 - 1988

WG No.	Title of Working Group	Principle of methods	Co-ordinator (assistant)
3/78	Determination of benzo-a-pyrene	column and HPLC	P Hendrikse G Osterman
3/79 ad hoc	Determination of mineral oil (middle fraction)	capillary glc	P Hendrikse
1/80	Determination of the colour of lecithins	Lovibond (auto) and spectrometry	R Ohlson (A Nasner)
1/83	Determination of n-3 and n-6 fatty acids in vegetable oils	capillary glc	A Dieffenbacher (J Beare-Rogers)
2/83	Determination of lead	AAS (graphite furnace)	P Hendrikse
1/85	Determination of triglycerides according to their ECN's	reversed phase HPLC	J P Wolff (F Mordret)
2/85	Determination of polymerized tri- glycerides	gel-permeation HPLC	J P Wolff (F Mordret)
1/87	Determination of phospholipids in commercial lecithins	HPLC	J Beare-Rogers (A Nasner)
2/87	Determination of total satd., total trans, and n-3 & n-6 fatty acids animal oils and fats	capillary glc	A Dieffenbacher (J Beare-Rogers)
3/87	Determination of benzo-a-pyrene	column & HPLC	P Hendrikse (G Ostermann)

Future work:

Four new Working Groups will be organized:

- trans-isomer content determination to control cold pressed oils
- phosphorus content by AAS
- solvent residues (different types) in vegetable oils
- revision of the methods for acid value and peroxide value determination

Current Projects

FINLAND

Esbo, 30 December 1987

To the organizations
participating in the
Inter-Agency Meeting

ANNOUNCEMENTS OF NMKL COLLABORATIVE ANALYTICAL STUDIES OF METHODS OF ANALYSIS

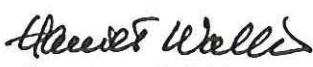

Please find enclosed information on collaborative analytical studies of methods of analysis scheduled for spring 1988 within the Nordic Committee on Food Analysis (NMKL):

- * Fat. Determination in meat and meat products according to SBR (Schmid-Bondzynski-Ratslaff)
- * Campylobacter jejuni/coli. Detection in foods
- * Aspartame and diketopiperazine. Liquid chromatographic determination
- * Metals. Determination by atomic absorption

For your information a recent list of all published NMKL methods is enclosed and also a news-sheet presenting recently published NMKL methods.

NMKL wishes everyone a Happy New Year 1988.

Sincerely;

Harriet Wallin
Secretary General

Generalsekretariatet

Date 30.12.1987

Organization Nordic Committee on Food Analysis

Analyte Fat (according to Schmid-Bondzynski-Ratslaff, SBR)

Commodity Meat and meat products

Principle of Method SBR: Fat extraction with a mixture of ether and petroleum ether after treatment of food with hydrochloric acid and addition of alcohol.
Distillation of solvent and weighing of residue

Approx. Concentration-
Range 2-50 g fat/100 g

No. of Samples per
Participant 12

Purpose of Trial Revision of existing NMKL method no 88 Fat.
Determination in meat and meat products according to SBR (Schmid-Bondzynski-Ratslaff). (Samples to be analysed with both no 88 and with proposed revised method)

Month of Distribution of
Samples January 1988

Time Allowed for Analysis
of Samples (in Weeks) 4

Expected Date of Report 30.5.1988

Contact - Address for trials
open to Other Participants Trial not open to others (sufficient number of laboratories within Nordic countries has already registered)

Generalsekretariatet

Date 30.12.1987

Organization Nordic Committee on Food Analysis

Analyte Campylobacter coli/jejuni

Commodity Foods (chicken liver)

Principle of Method Enrichment in broth containing antibiotics, plating on solid selective medium, incubation at 42°C for 48 h in microaerophilic conditions, biochemical verification

Approx. Concentration- 0-1000 per gram
Range

No. of Samples per 8
Participant

Purpose of Trial To validate published proposed NMKL method nr 119 (1986) "Campylobacter jejuni/coli. Detection in foods"

Month of Distribution of April 1988. Pretest including 3 samples scheduled
Samples for March 1988

Time Allowed for Analysis 3
of Samples (in Weeks)

Expected Date of Report 31.7.1988

Contact - Address for trials Trial not open to participants outside the Nordic
open to Other Participants countries due to problems with shipping of
biological tissues

NEW NMKL-METHODS

The following eight methods of analysis for food have been published by the Nordic Committee on Food Analysis in 1987 and are available through NMKL's office in Finland:

- * **Ash. Determination in grain and flour**
(NMKL no 7, 2nd ed)

This method, which replaces the first edition of the method published in 1952, has been collaboratively studied. Kaj Michaelsen (Denmark) was responsible for the study, and Claus Brenøe (Denmark) has assisted NMKL in working out the final text.

- * **Preservatives. Detection by TLC. Proposed method**
(NMKL no 60, 2nd Ed)

NMKL no 60 (1987) replaces the first edition of no 60 published in 1967 and has been elaborated first by Astri Rogstad (Norway) later by Ingegerd Beckman (Sweden). Since the method in its present form has not been subjected to a collaborative study, it is published as an NMKL proposed method. All users are invited to submit comments on the performance of this proposed method.

- * **Mould. Determination in food. Proposed method**
(NMKL no 98, 2nd ed)

This proposed method has been prepared by botanist Kerstin Åkerstrand at the National Food Administration in Uppsala, Sweden. Note that this method replaces the first edition of no 98 from 1980: 'Mould. Determination in cereals and cereal products'.

- * **Yersinia enterocolitica. Detection in food**
(NMKL no 117, 2nd ed)

The first edition of this method was issued in 1986 as an NMKL proposed method. Subsequently, Georg Kapperud and Truls Nesbakken (Norwegian College of Veterinary Medicine) conducted a collaborative study of the method. The second edition of the method has been revised according to experience gained during the interlaboratory study; it includes new instructions for biochemical and serological characterization of suspected Y. enterocolitica colonies.

- * **Saccharin. Liquid chromatographic determination in beverages and sweets**
(NMKL no 122)

An LC method for the determination of saccharin has been collaboratively tested. Anna-Maija Sjöberg at the Food Research Laboratory of

the Technical Research Centre of Finland coordinated the study and the collaborative study report appeared in the 1987 January/February edition of the Journal of the Association of Official Analytical Chemists (JAOAC 70(1987)58).

* **Cyclamate. Spectrophotometric determination in foods**
(NMKL no 123)

NMKL no 123 was developed to replace the gravimetric NMKL method no 42 from 1972. Anna-Maija Sjöberg at the Food Research Laboratory of the Technical Research Centre of Finland arranged the collaborative study of the method. This showed the relative standard deviation for repeatability to be 4.1 % for soft drinks and 3.2 % for jams. The corresponding reproducibility parameters were 6.7 and 4.4 %, respectively. The study report appears in the 1987 May/June edition of the Journal of the Association of Official Analytical Chemists (JAOAC 70(1987)588).

* **Benzoic acid, sorbic acid and p-hydroxybenzoates. Liquid chromatographic determination** (NMKL no 124)

Chemist Barbro Halén of the National Food Agency, Uppsala, Sweden has developed this method and arranged its collaborative testing. The test included the sample matrices mayonnaise, fish, cheese and apple juice. A total of sixteen samples with varying analyte levels and combinations were analyzed in eleven laboratories. The statistical evaluation revealed no interlaboratory variation for any of the five preservatives.

* **Thermotolerant coliform bacteria. Determination in foods after pre-incubation** (NMKL no 125)

This new method which replaces former NMKL method no 62 (1966) is applicable to all types of food products with the exception of fish products. It was especially developed to obtain a more reliable determination of "stressed" or sublethally injured coliform bacteria, which will not grow in violet red bile agar without suitable pre-incubation. Frits Vagn Jensen and Bjørn Fredebo Thomsen in Denmark prepared the revised method.

ORDERING OF METHODS

All NMKL methods are published in a Scandinavian language (Danish, Norwegian or Swedish) and in English. Since 1985 all new methods are also available in a Finnish-English edition. NMKL methods are available through the office of the Secretary General and cost FIM 25 or US \$ 6 each.

The address is: Nordic Committee on Food Analysis, c/o Technical Research Centre of Finland, Food Research Laboratory, SF-02150 ESBO, Finland. NMKL can be reached through telex: 122972 vttha sf or via telefax: +358-0-462382.

Generalsekretariatet

NEW NMKL METHODS

The following methods of analysis for food have been published by the Nordic Committee on Food Analysis in 1988 and are available through NMKL's office in Finland:

Collaboratively Studied Chemical Methods

- * **Histamine. Qualitative thin-layer chromatographic screening method for fish** (NMKL no 118), 2nd ed.

NMKL no 118 (1988) replaces the first edition of the method, which was published as a proposed method in 1986. The method has now been collaboratively studied and is issued as an official NMKL method. Benedicte Hald at the Royal Veterinary and Agricultural University in Denmark, coordinated the collaborative test. Twelve laboratories participated in the collaborative study, which included 5 samples containing histamine at levels from 0 mg/kg to 1000 mg/kg. At the lowest tested level, 100 mg histamine/kg, eight laboratories found from 60 to 250 mg histamine/kg while the rest of the collaborators reported "less than 100 mg/kg". No laboratory reported "not detected" or zero at this level. The method has a sensitivity of 200 mg histamine/kg and a recovery of 90 % on this level.

The method can be applied to fish products and has only been tested on such products. If it is intended to apply the method to foods other than fish products, it should be noted that it may be necessary to introduce modifications.

- * **Tin. Determination by atomic absorption in fruits and vegetables** (NMKL no 126)

This collaboratively studied method is applicable to the determination of tin in fruits and vegetables in the concentration range 10 to 500 mg/kg. It is a rapid method, especially suitable for routine determinations of tin in canned fruits and vegetables contaminated with migrated tin from the can. Rolando Mazzone, Erik Frandsen (PLM Hastrup, Odense) and Knud Voldum-Clausen (National Food Agency, Copenhagen) from Denmark have each in turn contributed to the elaboration, collaborative testing and final editing of this method.

BANKFÖRBINDELSE

POSTGIRO
2238-9

In the collaborative testing of the method two samples of tomato soup and two samples of apple sauce were analyzed in 13 laboratories. The repeatability relative standard deviations were 4.3 and 2.4 % in the tomato soup samples and 7.7 and 2.9 % in two samples of apple sauce. The corresponding parameters for reproducibility were 12.0 and 7.6 % for tomato soup and 9.4 and 4.0 % for apple sauce. The coordinators of the collaborative study are working on a report of the study, aiming at publishing it shortly in a scientific journal.

* **Hydroxyproline. Colorimetric determination as a measure of collagen in meat and meat products (NMKL no 127)**

This method, which describes the quantitative determination of hydroxyproline and an estimation of the amount of collagenous connective tissue in meat and meat products, has been collaboratively studied in 18 laboratories. Eight samples were included.

Kurt Kolar of the Swedish Meat Research Institute in Kävlinge, Sweden, coordinated the study. The final report of the study is expected to be published soon. As determined in the collaborative study, the within laboratory precision of the method, its repeatability, allows the hydroxyproline content of a sample containing the analyte at the 0.50 g/100 g level, to be determined with a precision of $\sqrt{0.03}$ g/100 g. The corresponding between laboratory parameter, the reproducibility of the method, predicts that results from different laboratories at the level 0.50 g hydroxyproline/100 g will vary within ± 0.05 g/100 g.

Proposed method

* **Polyphosphates. Detection by paper chromatography in meat products etc. (NMKL no 76, 2nd Ed)**

NMKL no 76 (1988) replaces the first edition of no 76 published in 1970 and has been elaborated by Per Joner of the Norwegian College of Veterinary Medicine in Norway. It has been revised according to experiences of the Oslo Board of Health Dept of Food Control where ca 1000 polyphosphate determinations are performed each year. The method has not been subjected to a full collaborative study and is therefore published as an NMKL proposed method, not an NMKL method.

Compared to the first edition of this method, the following changes have been made:

1. For greater accuracy in reading of chromatograms and for increased sensitivity the developers have been changed.

2. To reduce the consumption of trichloroacetic acid, which is a toxic compound, the sample preparation has been simplified: meat samples are extracted with warm water only. It has been found, that the trichloroacetic acid present in the chromatography solvent is sufficient to achieve precipitation of proteins present in meats. Only milk powder, caseinates and blood plasma samples are extracted with 20 % trichloroacetic acid. For confirmation of results meat samples found to be positive for polyphosphates when extracted with water are re-chromatographed after trichloroacetic acid extraction.

Microbiological Method

* Pretreatment of foods for microbiological examination (NMKL no 91, 2nd Ed)

NMKL no 91 (1988) replaces the first edition of the method published in 1975. This method describes a routine technique for sampling and further pretreatment of samples for subsequent determination of microorganisms. The method can be used with solid, semi-solid and liquid foods. In solid foods both surface flora and depth flora may be determined. The method does not take into account obligatory anaerobic Gram negative non-spore forming microorganisms. Mette Nyborg and Bjørn Fredebo Thomsen (Denmark) have been responsible for the elaboration of these instructions.

Most microbiological NMKL methods include no pretreatment instructions but contain a reference to NMKL no 91. Please make sure that this new edition of the method for sampling and further pretreatment is always used in connection with microbiological NMKL-methods.

ORDERING OF METHODS

All NMKL methods are published in a Scandinavian language (Danish, Danish, Norwegian or Swedish) and in English. Since 1985 all new methods are also available in a Finnish-English edition. NMKL methods cost FIM 25 or US \$ 6 each and are available through NMKL's office:

Nordic Committee on Food Analysis, c/o Technical Research Centre of Finland, Food Research Laboratory, SF-02150 ESBO, Finland. NMKL can also be reached through telex: 122972 vttha sf or via telefax: +358-0-4552103.
