Search for supersymmetry using final states with one lepton, jets, and missing transverse momentum with the ATLAS detector in $\sqrt{s} = 7$ TeV pp collisions

The ATLAS Collaboration

This Letter presents the first search for supersymmetry in final states containing one isolated electron or muon, jets, and missing transverse momentum from $\sqrt{s} = 7$ TeV proton-proton collisions at the LHC. The data were recorded by the ATLAS experiment during 2010 and correspond to a total integrated luminosity of 35 pb^{-1} . No excess above the standard model background expectation is observed. Limits are set on the parameters of the minimal supergravity framework, extending previous limits. For $A_0 = 0$ GeV, $\tan\beta = 3$, $\mu > 0$ and for equal squark and gluino masses, gluino masses below 700 GeV are excluded at 95% confidence level.

PACS numbers: 12.60.Jv, 14.80.Ly

Many extensions of the standard model predict the existence of new colored particles, such as the squarks (\tilde{q}) and gluinos (\tilde{g}) of supersymmetric (SUSY) theories [1], which could be accessible at the LHC. The dominant SUSY production channels are squark-(anti)squark, squark-gluino, and gluino-gluino pair production. Squarks and gluinos are expected to decay to quarks and gluons and the SUSY partners of the gauge bosons (charginos, $\tilde{\chi}^\pm$, and neutralinos, $\tilde{\chi}^0$), leading to events with energetic jets. In R-parity conserving SUSY models [2], the lightest supersymmetric particle (LSP) is stable and escapes detection, giving rise to events with significant missing transverse momentum. In decay chains with charginos ($\tilde{q}_L \rightarrow q\tilde{\chi}^\pm$, $\tilde{g} \rightarrow q\tilde{q}'\tilde{\chi}^\pm$), chargino decay to the LSP can produce a high-momentum lepton. Currently, the most stringent limits on squark and gluino masses come from the LHC [3] and from the Tevatron [4–6].

This Letter reports on a search for events with exactly one isolated high-transverse momentum (p_T) electron or muon, at least three high- p_T jets, and significant missing transverse momentum. An exact definition of the signal region will be given elsewhere in this Letter. From an experimental point of view, the requirement of an isolated high- p_T lepton suppresses the QCD multijet background and facilitates triggering on interesting events. In addition to the signal region, three control regions are considered for the most important standard model backgrounds. A combined fit to the observed number of events in these four regions, together with an independent estimate of jets misidentified as leptons in QCD multijet events, is used to search for an excess of events in the signal region.

The analysis is sensitive to any new physics leading to such an excess, and is not optimized for any particular model of SUSY. The results are interpreted within the MSUGRA/CMSSM (minimal supergravity/constrained minimal supersymmetric standard model) framework [7, 8] in terms of limits on the universal scalar and gaugino

mass parameters m_0 and $m_{1/2}$. These are presented for fixed values of the universal trilinear coupling parameter $A_0 = 0$ GeV, ratio of the vacuum expectation values of the two Higgs doublets $\tan\beta = 3$, and Higgs mixing parameter $\mu > 0$, in order to facilitate comparison with previous results.

The ATLAS detector [9] is a multipurpose particle physics apparatus with a forward-backward symmetric cylindrical geometry and near 4π coverage in solid angle [10]. The inner tracking detector (ID) consists of a silicon pixel detector, a silicon microstrip detector (SCT), and a transition radiation tracker (TRT). The ID is surrounded by a thin superconducting solenoid providing a 2 T magnetic field, and by high-granularity liquid-argon (LAr) sampling electromagnetic calorimeters. An iron-scintillator tile calorimeter provides hadronic coverage in the central rapidity range. The end-cap and forward regions are instrumented with LAr calorimetry for both electromagnetic and hadronic measurements. The muon spectrometer (MS) surrounds the calorimeters and consists of three large superconducting toroids, a system of precision tracking chambers, and detectors for triggering.

The data used in this analysis were recorded in 2010 at the LHC at a center-of-mass energy of 7 TeV. Application of beam, detector, and data-quality requirements results in a total integrated luminosity of 35 pb^{-1} , with an estimated uncertainty of 11% [11]. The data have been selected with single lepton (e or μ) triggers. The detailed trigger requirements vary throughout the data-taking period, but the thresholds are always low enough to ensure that leptons with $p_T > 20$ GeV lie in the efficiency plateau.

Fully simulated Monte Carlo event samples are used to develop and validate the analysis procedure, compute detector acceptance and reconstruction efficiency, and aid in the background determination. Samples of events for background processes are generated as described in detail in Ref. [12]. For the major backgrounds, top quark pair and W +jets production, MC@NLO [13] v3.41 and

ALPGEN [14] v2.13 are used. Further samples include QCD multijet events, single top production, diboson production, and Drell-Yan dilepton events.

Monte Carlo signal events are generated with Herwig++ [15] v2.4.2. The SUSY particle spectra and decay modes are calculated with ISAJET [16] v7.75. The SUSY samples are normalized using next-to-leading order (NLO) cross sections as determined by Prospino [17] v2.1. All signal and background samples are produced using the ATLAS MC09 parameter tune [18] and a GEANT4 based [19] detector simulation [20].

Criteria for electron and muon identification closely follow those described in Ref. [21]. Electrons in the signal region are required to pass the “tight” selection criteria, with $p_T > 20$ GeV and $|\eta| < 2.47$. Events are always vetoed if a “medium” electron is found in the electromagnetic calorimeter transition region, $1.37 < |\eta| < 1.52$.

Muons are required to be identified either in both ID and MS systems (combined muons) or as a match between an extrapolated ID track and one or more segments in the MS. The ID track is required to have at least one pixel hit, more than five SCT hits, and a number of TRT hits that varies with η . For combined muons, a good match between ID and MS tracks is required, and the p_T values measured by these two systems must be compatible within the resolution. The summed p_T of other ID tracks within a distance $\Delta R = \sqrt{(\Delta\eta)^2 + (\Delta\phi)^2} < 0.2$ around the muon track is required to be less than 1.8 GeV. Only muons with $p_T > 20$ GeV and $|\eta| < 2.4$ are considered. For the final selection, the distance between the z coordinate of the primary vertex and that of the extrapolated muon track at the point of closest approach to the primary vertex must be less than 10 mm.

Jets are reconstructed using the anti- k_t jet clustering algorithm [22] with a radius parameter $R = 0.4$. The inputs to this algorithm are clusters of calorimeter cells seeded by cells with energy significantly above the measured noise. Jets are constructed by performing a four-vector sum over these clusters, treating each cluster as an (E, \vec{p}) four-vector with zero mass. Jets are corrected for calorimeter non-compensation, upstream material and other effects using p_T - and η -dependent calibration factors obtained from Monte Carlo and validated with extensive test-beam and collision-data studies [23]. Only jets with $p_T > 20$ GeV and $|\eta| < 2.5$ are considered. If a jet and a “medium” electron are both identified within a distance $\Delta R < 0.2$ of each other, the jet is discarded. Furthermore, identified “medium” electrons or muons are only considered if they satisfy $\Delta R > 0.4$ with respect to the closest remaining jet. Events are discarded if they contain any jet failing basic quality selection criteria, which reject detector noise and non-collision backgrounds [24].

The calculation of the missing transverse momentum, E_T^{miss} , is based on the modulus of the vectorial sum of the p_T of the reconstructed objects (jets with $p_T > 20$ GeV,

but over the full calorimeter coverage $|\eta| < 4.9$, and the selected lepton), any additional non-isolated muons and the calorimeter clusters not belonging to reconstructed objects.

Events are required to have at least one reconstructed primary vertex with at least five associated tracks. The selection criteria for signal and control regions are based on Monte Carlo studies prior to examining the data. The signal region is defined as follows. At least one identified electron or muon with $p_T > 20$ GeV is required. Events are rejected if they contain a second identified lepton with $p_T > 20$ GeV, because they are the subject of a future analysis. At least three jets with $p_T > 30$ GeV are required, the leading one of which must have $p_T > 60$ GeV. In order to reduce the background of events with fake E_T^{miss} from mismeasured jets, the missing transverse momentum vector \vec{E}_T^{miss} is required not to point in the direction of any of the three leading jets: $\Delta\phi(\text{jet}_i, \vec{E}_T^{\text{miss}}) > 0.2$ ($i = 1, 2, 3$). The transverse mass between the lepton and the missing transverse momentum vector, $m_T = \sqrt{2 \cdot p_T^\ell \cdot E_T^{\text{miss}} \cdot (1 - \cos(\Delta\phi(\ell, E_T^{\text{miss}})))}$, is required to be larger than 100 GeV. E_T^{miss} must exceed 125 GeV and must satisfy $E_T^{\text{miss}} > 0.25 m_{\text{eff}}$, where the effective mass m_{eff} is the scalar sum of the p_T of the three leading jets, the p_T of the lepton, and E_T^{miss} . Finally, a cut is applied on the effective mass: $m_{\text{eff}} > 500$ GeV. The efficiency for the SUSY signal in the MSUGRA/CMSSM model defined earlier varies between 0.01% for $m_{1/2} = 100$ GeV and 4% for $m_{1/2} = 350$ GeV, with a smaller dependence on m_0 , for the electron channel and the muon channel separately. The inefficiency is dominated by the leptonic branching fractions in the SUSY signal.

Backgrounds from several standard model processes could contaminate the signal region. Top quark pair production and W +jets production backgrounds are estimated from a combined fit to the number of observed events in three control regions, using Monte Carlo simulations to derive the background in the signal region from the control regions. The background determination of QCD multijet production with a jet misidentified as an isolated lepton is purely data driven. Remaining backgrounds from other sources are estimated with simulations.

The three control regions have identical lepton and jet selection criteria as the signal region. The top control region is defined by a window in the two-dimensional plane of $30 \text{ GeV} < E_T^{\text{miss}} < 80 \text{ GeV}$ and $40 \text{ GeV} < m_T < 80 \text{ GeV}$ and by requiring that at least one of the three leading jets is tagged as a b -quark jet. For the b -tagging, the secondary vertex algorithm SV0 [25] is used, which, for $p_T = 60$ GeV jets, provides an efficiency of 50% for b -quark jets and a mistag rate of 0.5% for light-quark jets. The W control region is defined by the same window in the $E_T^{\text{miss}} - m_T$ plane, but with the requirement that none of the three hardest jets is b -tagged. The QCD mul-

tijet control region is defined by demanding low missing transverse momentum, $E_T^{\text{miss}} < 40$ GeV, and low transverse mass, $m_T < 40$ GeV. This QCD control region is only used to estimate the QCD multijet background contribution to other background regions but not to the signal region. Instead, the electron and muon identification criteria are relaxed, obtaining a “loose” control sample that is dominated by QCD jets. A loose-tight matrix method, in close analogy to that described in Ref. [12], is then used to estimate the number of QCD multijet events with fake leptons in the signal region after final selection criteria: $0.0_{-0.0}^{+0.5}$ in the muon channel and $0.0_{-0.0}^{+0.3}$ in the electron channel.

Data are compared to expectations in Figure 1. The standard model backgrounds in the figure are normalized to the theoretical cross sections, except for the multijet background which is normalized to data in the QCD multijet control region. The data are in good agreement with the standard model expectations. After final selection, one event remains in the signal region in the electron channel and one event remains in the muon channel. Figure 1 also shows the expected distributions for the MSUGRA/CMSSM model point $m_0 = 360$ GeV and $m_{1/2} = 280$ GeV.

A combined fit to the number of observed events in the signal and control regions is performed. The assumption that the Monte Carlo is able to predict the backgrounds in the signal region from the control regions is validated by checking additional control regions at low m_T and at low E_T^{miss} . The defined control regions are not completely pure, and the combined fit takes the expected background cross-contaminations into account. The likelihood function of the fit can be written as: $L(\mathbf{n}|s, \mathbf{b}, \boldsymbol{\theta}) = P_S \times P_W \times P_T \times P_Q \times C_{\text{Syst}}$, where \mathbf{n} represents the number of observed events in data, s is the SUSY signal to be tested, \mathbf{b} is the background, and $\boldsymbol{\theta}$ represents the systematic uncertainties, which are treated as nuisance parameters with a Gaussian probability density function. The four P functions in the right hand side are Poisson probability distributions for event counts in the defined signal (S) and control regions (W, T, and Q for W, top pair and QCD multijets respectively), and C_{Syst} represents the constraints on systematic uncertainties, including correlations.

The dominant sources of systematic uncertainties in the background estimates arise from Monte Carlo modeling of the shape of the E_T^{miss} and m_T distributions in signal and control regions. These uncertainties are determined by variation of the Monte Carlo generator, as well as by variations of internal generator parameters. Finite statistics in the background control regions also contributes to the uncertainty. Experimental uncertainties are varied within their determined range and are dominated by the jet energy scale uncertainty [26], b -tagging uncertainties, and the uncertainty on the luminosity. Systematic uncertainties on the SUSY signal are esti-

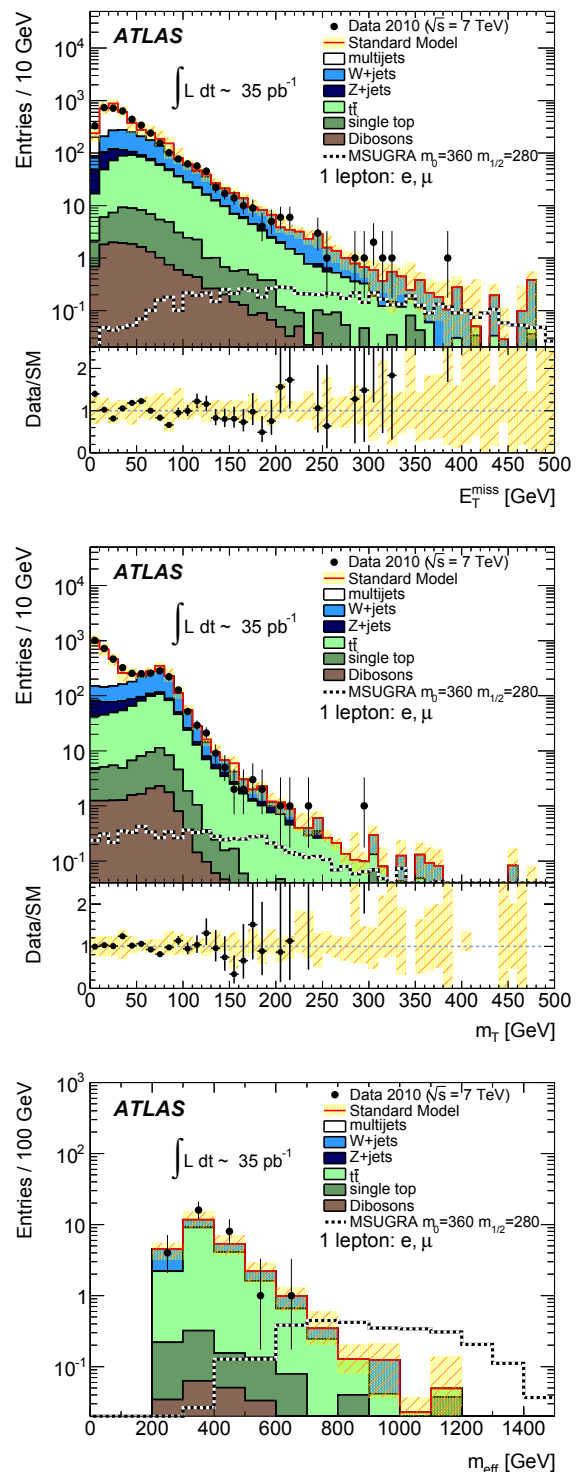

FIG. 1: Top: E_T^{miss} distribution after lepton and jet selection. Center: m_T distribution after lepton and jet selection. Bottom: Effective mass distribution after final selection criteria except for the cut on the effective mass itself. All plots are made for the electron and muon channel combined. Yellow bands indicate the uncertainty on the Monte Carlo prediction from finite Monte Carlo statistics and from the jet energy scale uncertainty.

mated by variation of the factorization and renormalization scales in Prospino and by including the parton density function (PDF) uncertainties using the eigenvector sets provided by CTEQ6 [27]. Uncertainties are calculated separately for the individual production processes. Within the relevant kinematic range, typical uncertainties resulting from scale variations are 10–16%, whereas PDF uncertainties vary from 5% for $\tilde{q}\tilde{q}$ production to 15–30% for $\tilde{g}\tilde{g}$ production.

The result of the combined fit to signal and control regions, leaving the number of signal events free in the signal region while not allowing for a signal contamination in the other regions, is shown in Table I. The observed number of events in data is consistent with the standard model expectation.

Limits are set on contributions of new physics to the signal region. These limits are obtained from a second combined fit to the four regions, this time allowing for a signal in all four regions, and leaving all nuisance parameters free. The limits are then derived from the profile likelihood ratio, $\Lambda(s) = -2(\ln L(\mathbf{n}|s, \hat{\mathbf{b}}, \hat{\boldsymbol{\theta}}) - \ln L(\mathbf{n}|\hat{s}, \hat{\mathbf{b}}, \hat{\boldsymbol{\theta}}))$, where \hat{s} , $\hat{\mathbf{b}}$ and $\hat{\boldsymbol{\theta}}$ maximize the likelihood function and $\hat{\mathbf{b}}$ and $\hat{\boldsymbol{\theta}}$ maximize the likelihood for a given choice of s . In the fit, s and \hat{s} are constrained to be non-negative. The test statistic is $\Lambda(s)$. The exclusion p -values are obtained from this using pseudo-experiments and the limits set are one-sided upper limits [28].

From the fit to a model with signal events only in the signal region, a 95% CL upper limit on the number of events from new physics in the signal region can be derived. This number is 2.2 in the electron channel and 2.5 in the muon channel. This corresponds to a 95% CL upper limit on the effective cross section for new processes in the signal region, including the effects of experimental acceptance and efficiency, of 0.065 pb for the electron channel and 0.073 pb for the muon channel.

Within the MSUGRA/CMSSM framework, the results are interpreted as limits in the $m_0 - m_{1/2}$ plane, as shown in Figure 2. For the model considered and for equal squark and gluino masses, gluino masses below 700 GeV are excluded at 95% CL. The limits depend only moderately on $\tan\beta$.

In summary, the first ATLAS results on searches for supersymmetry with an isolated electron or muon, jets, and missing transverse momentum have been presented. In a data sample corresponding to 35 pb^{-1} , no significant deviations from the standard model expectation are observed. Limits on the cross section for new processes within the experimental acceptance and efficiency are set. For a chosen set of parameters within MSUGRA/CMSSM, and for equal squark and gluino masses, gluino masses below 700 GeV are excluded at 95% CL. These ATLAS results exceed previous limits set by other experiments [3–6].

We wish to thank CERN for the efficient commission-

FIG. 2: Observed and expected 95% CL exclusion limits, as well as the $\pm 1\sigma$ variation on the expected limit, in the combined electron and muon channels. Also shown are the published limits from CMS [3], CDF [4], and D0 [5, 6], and the results from the LEP experiments [29].

ing and operation of the LHC during this initial high-energy data-taking period as well as the support staff from our institutions without whom ATLAS could not be operated efficiently.

TABLE I: Numbers of observed events in the signal and background control regions, as well as their estimated values from the fit (see text), for the electron (top part) and muon (bottom part) channels. The central values of the fitted sum of backgrounds in the control regions agree with the observations by construction. For comparison, nominal Monte Carlo expectations are given in parentheses for the signal region, the top control region and the W control region.

Electron channel	Signal region	Top region	W region	QCD region

8888 University Drive, CA - Burnaby, BC V5A 1S6, Canada

¹⁴⁴ SLAC National Accelerator Laboratory, Stanford, California 94309, United States of America

¹⁴⁵ Comenius University, Faculty of Mathematics, Physics & Informatics^(a), Mlynska dolina F2, SK - 84248 Bratislava; Institute of Experimental Physics of the Slovak Academy of Sciences, Dept. of Subnuclear Physics^(b), Watsonova 47, SK - 04353 Kosice, Slovak Republic

¹⁴⁶ ^(a)University of Johannesburg, Department of Physics, PO Box 524, Auckland Park, Johannesburg 2006; ^(b)School of Physics, University of the Witwatersrand, Private Bag 3, Wits 2050, Johannesburg, South Africa, South Africa

¹⁴⁷ Stockholm University: Department of Physics^(a); The Oskar Klein Centre^(b), AlbaNova, SE - 106 91 Stockholm, Sweden

¹⁴⁸ Royal Institute of Technology (KTH), Physics Department, SE - 106 91 Stockholm, Sweden

¹⁴⁹ Stony Brook University, Department of Physics and Astronomy, Nicolls Road, Stony Brook, NY 11794-3800, United States of America

¹⁵⁰ University of Sussex, Department of Physics and Astronomy Pevensey 2 Building, Falmer, Brighton BN1 9QH, United Kingdom

¹⁵¹ University of Sydney, School of Physics, AU - Sydney NSW 2006, Australia

¹⁵² Insitute of Physics, Academia Sinica, TW - Taipei 11529, Taiwan

¹⁵³ Technion, Israel Inst. of Technology, Department of Physics, Technion City, IL - Haifa 32000, Israel

¹⁵⁴ Tel Aviv University, Raymond and Beverly Sackler School of Physics and Astronomy, Ramat Aviv, IL - Tel Aviv 69978, Israel

¹⁵⁵ Aristotle University of Thessaloniki, Faculty of Science, Department of Physics, Division of Nuclear & Particle Physics, University Campus, GR - 54124, Thessaloniki, Greece

¹⁵⁶ The University of Tokyo, International Center for Elementary Particle Physics and Department of Physics, 7-3-1 Hongo, Bunkyo-ku, JP - Tokyo 113-0033, Japan

¹⁵⁷ Tokyo Metropolitan University, Graduate School of Science and Technology, 1-1 Minami-Osawa, Hachioji, Tokyo 192-0397, Japan

¹⁵⁸ Tokyo Institute of Technology, Department of Physics, 2-12-1 O-Okayama, Meguro, Tokyo 152-8551, Japan

¹⁵⁹ University of Toronto, Department of Physics, 60 Saint George Street, Toronto M5S 1A7, Ontario, Canada

¹⁶⁰ TRIUMF^(a), 4004 Wesbrook Mall, Vancouver, B.C. V6T 2A3; ^(b)York University, Department of Physics and Astronomy, 4700 Keele St., Toronto, Ontario, M3J 1P3, Canada

¹⁶¹ University of Tsukuba, Institute of Pure and

Applied Sciences, 1-1-1 Tennoudai, Tsukuba-shi, JP - Ibaraki 305-8571, Japan

¹⁶² Tufts University, Science & Technology Center, 4 Colby Street, Medford, MA 02155, United States of America

¹⁶³ Universidad Antonio Narino, Centro de Investigaciones, Cra 3 Este No.47A-15, Bogota, Colombia

¹⁶⁴ University of California, Irvine, Department of Physics & Astronomy, CA 92697-4575, United States of America

¹⁶⁵ INFN Gruppo Collegato di Udine^(a); ICTP^(b), Strada Costiera 11, IT-34014, Trieste; Università di Udine, Dipartimento di Fisica^(c), via delle Scienze 208, IT - 33100 Udine, Italy

¹⁶⁶ University of Illinois, Department of Physics, 1110 West Green Street, Urbana, Illinois 61801, United States of America

¹⁶⁷ University of Uppsala, Department of Physics and Astronomy, P.O. Box 516, SE -751 20 Uppsala, Sweden

¹⁶⁸ Instituto de Física Corpuscular (IFIC) Centro Mixto UVEG-CSIC, Apdo. 22085 ES-46071 Valencia, Dept. Física At. Mol. y Nuclear; Dept. Ing. Electrónica; Univ. of Valencia, and Inst. de Microelectrónica de Barcelona (IMB-CNM-CSIC) 08193 Bellaterra, Spain

¹⁶⁹ University of British Columbia, Department of Physics, 6224 Agricultural Road, CA - Vancouver, B.C. V6T 1Z1, Canada

¹⁷⁰ University of Victoria, Department of Physics and Astronomy, P.O. Box 3055, Victoria B.C., V8W 3P6, Canada

¹⁷¹ Waseda University, WISE, 3-4-1 Okubo, Shinjuku-ku, Tokyo, 169-8555, Japan

¹⁷² The Weizmann Institute of Science, Department of Particle Physics, P.O. Box 26, IL - 76100 Rehovot, Israel

¹⁷³ University of Wisconsin, Department of Physics, 1150 University Avenue, WI 53706 Madison, Wisconsin, United States of America

¹⁷⁴ Julius-Maximilians-University of Würzburg, Physikalisches Institute, Am Hubland, 97074 Würzburg, Germany

¹⁷⁵ Bergische Universität, Fachbereich C, Physik, Postfach 100127, Gauss-Strasse 20, D- 42097 Wuppertal, Germany

¹⁷⁶ Yale University, Department of Physics, PO Box 208121, New Haven CT, 06520-8121, United States of America

¹⁷⁷ Yerevan Physics Institute, Alikhanian Brothers Street 2, AM - 375036 Yerevan, Armenia

¹⁷⁸ Centre de Calcul CNRS/IN2P3, Domaine scientifique de la Doua, 27 bd du 11 Novembre 1918, 69622 Villeurbanne Cedex, France

^a Also at LIP, Portugal

^b Also at Faculdade de Ciencias, Universidade de Lisboa, Lisboa, Portugal

^c Also at CPPM, Marseille, France.

^d Also at TRIUMF, Vancouver, Canada

^e Also at FPACS, AGH-UST, Cracow, Poland

^f Also at Department of Physics, University of Coimbra, Coimbra, Portugal

^g Also at Università di Napoli Parthenope, Napoli, Italy

^h Also at Institute of Particle Physics (IPP), Canada

ⁱ Also at Louisiana Tech University, Ruston, USA

^j Also at Universidade de Lisboa, Lisboa, Portugal

^k At California State University, Fresno, USA

^l Also at Faculdade de Ciencias, Universidade de Lisboa and at Centro de Física Nuclear da Universidade de Lisboa, Lisboa, Portugal

^m Also at California Institute of Technology, Pasadena, USA

ⁿ Also at University of Montreal, Montreal, Canada

^o Also at Baku Institute of Physics, Baku, Azerbaijan

^p Also at Institut für Experimentalphysik, Universität Hamburg, Hamburg, Germany

^q Also at Manhattan College, New York, USA

^r Also at School of Physics and Engineering, Sun Yat-sen University, Guangzhou, China

^s Also at Taiwan Tier-1, ASGC, Academia Sinica,

Taipei, Taiwan

^t Also at School of Physics, Shandong University, Jinan, China

^u Also at Rutherford Appleton Laboratory, Didcot, UK

^v Also at Departamento de Física, Universidade de Minho, Braga, Portugal

^w Also at Department of Physics and Astronomy, University of South Carolina, Columbia, USA

^x Also at KFKI Research Institute for Particle and Nuclear Physics, Budapest, Hungary

^y Also at Institute of Physics, Jagiellonian University, Cracow, Poland

^z Also at Centro de Física Nuclear da Universidade de Lisboa, Lisboa, Portugal

^{aa} Also at Department of Physics, Oxford University, Oxford, UK

^{ab} Also at CEA, Gif sur Yvette, France

^{ac} Also at LPNHE, Paris, France

^{ad} Also at Nanjing University, Nanjing Jiangsu, China
