doaashokry@zu.edu.eg

Abstract

The main purpose of this work is to use the Chelyshkov-collocation method for the solution of three-dimensional Fredholm integral equations. The method is based on the approximate solution in terms of Chelyshkov polynomials with unknown coefficients. This method transforms the integral equation to a system of linear algebraic equations by means of collocation points. Finally, numerical results are included to show the validity and applicability of the method and comparisons are made with existing results.

Keywords: Three-Dimensional Integral Equations, Chelyshkov Polynomials, Collocation Points.

Mathematics Subject Classification: 45L05, 65R10, 45A05.

1. Introduction

Consider the following three-dimensional linear Fredholm integral equation of the second kind:

\[ u(x, y, z) = f(x, y, z) + \lambda \int_a^b \int_c^d \int_a^b K(x, y, z, r, s, t) u(r, s, t) \, dr \, ds \, dt, \quad (x, y, z) \in D \]  \hspace{1cm} (1)

where \( f \) and \( K \) are known functions, \( u(x, y, z) \) is the unknown function to be determined, \( \lambda \) is a constant and \( D \) is a cubic domain.

Equation (1) has been studied in [1] by Radial basis functions method, in [2] by Adomian decomposition method, in [3] by Jacobi polynomials method. In this paper we will study the approximate solution of equation (1) by using a new orthogonal polynomial (Chelyshkov polynomials).

The orthogonal Chelyshkov polynomials are introduced in [4]. These polynomials have been used in the solution integral equations of one and two-dimensional in [5,6,7], differential equations in [8]. Recently, Sezer et al. [9] derived the matrix method based on Chelyshkov polynomials for solving a class of mixed functional integro-differential equations. On the other hand, Talaei in [10] proposed the Chelyskov matrix formulation based on collocation method for numerical solution of the multi-order fractional differential equations.

The main purpose of this paper is to extend the application of the Chelyshkov polynomials to solve three-dimensional Fredholm integral equation (1).

2. Some properties of Chelyshkov polynomials

Chelyshkov [4] has introduced sequences of polynomials which are orthogonal in the interval \([0, 1]\) with the weight function 1. These polynomials are explicitly defined by:

\[ C_{N,n}(x) = \sum_{j=0}^{N-n} (-1)^j \binom{N-n}{j} \binom{N+n+j+1}{N-n} x^{n+j}, \quad n = 0, 1, \ldots, N. \]  \hspace{1cm} (2)
This gives the Rodrigues formula

\[ C_{N,n}(x) = \frac{1}{(N - n)!} \frac{1}{x^{n+1}} \frac{d^{N-n}}{dx^{N-n}} [x^{N+n+1}(1-x)^{N-n}], \quad n = 0, 1, \ldots, N, \quad (3) \]

and the orthogonality condition of Chelyshkov polynomials \cite{4} is

\[ \int_0^1 C_{N,j}(x) C_{N,k}(x) \, dx = \begin{cases} 0, & k \neq j \\ \frac{1}{j+k+1}, & k = j, \quad k = 0, 1, \ldots, N, N+1, \end{cases} \quad (4) \]

it follows from (3) that

\[ \int_0^1 C_{N,n}(x) \, dx = \int_0^1 x^n \, dx = \frac{1}{n+1}. \quad (5) \]

Making use of formula (3) and Cauchy integral formula for derivatives of an analytic function, we can get the integral relation:

\[ C_{N,n}(x) = \frac{1}{2\pi i} \frac{1}{x^{n+2}} \int_C \frac{z^{-(N+n+2)}(1-z)^{N-n}}{(z-x)^{N-n+1}} \, dz, \quad (6) \]

where \( C \) is a closed curve, which inclose the point \( z = x^{-1} \).

3. Solution of Three-dimensional Integral Equation

In this section, we solve three-dimensional Fredholm integral equation of the second kind of the form (1) by using Chelyshkov polynomials.

A three-dimensional function \( u(x, y, z) \) can be approximated by the expansion:

\[ u(x, y, z) \approx u_N(x, y, z) = \sum_{i=0}^{N} \sum_{j=0}^{N} \sum_{k=0}^{N} a_{i(N+1)^2+j(N+1)+k} C_{N,i}(x) C_{N,j}(y) C_{N,k}(z), \quad (7) \]

where \( i, j, k = 0, 1, \ldots, N, a_{i(N+1)^2+j(N+1)+k} \) are unknown Chelyshkov coefficients and \( C_{N,i}(x), C_{N,j}(y), C_{N,k}(z) \) are Chelyshkov orthogonal polynomials of degree \( N \).

Inserting (7) into equation (1) we obtain:

\[ \sum_{i=0}^{N} \sum_{j=0}^{N} \sum_{k=0}^{N} a_{i(N+1)^2+j(N+1)+k} [C_{N,i}(x) C_{N,j}(y) C_{N,k}(z) - \int_0^1 \int_0^1 \int_0^1 k(x, y, z, r, s, t) \ C_{N,i}(r) C_{N,j}(s) C_{N,k}(t) dr ds dt = f(x, y, z). \quad (8) \]

By using the collocation points

\[ x_l = \frac{2l - 1}{2N + 1}, \quad y_m = \frac{2m - 1}{2N + 1}, \quad z_n = \frac{2n - 1}{2N + 1}, \quad l, m, n = 1, 2, \ldots, N + 1. \quad (9) \]

We get

\[ \sum_{i=0}^{N} \sum_{j=0}^{N} \sum_{k=0}^{N} a_{i(N+1)^2+j(N+1)+k} [C_{N,i}(x_l) C_{N,j}(y_m) C_{N,k}(z_n) - \int_0^1 \int_0^1 \int_0^1 k(x_l, y_m, z_n, r, s, t) \ C_{N,i}(r) C_{N,j}(s) C_{N,k}(t) dr ds dt = f(x_l, y_m, z_n). \]
\[ -\lambda \int_{c}^{d} \int_{c}^{b} K(x_{1}, y_{m}, z_{n}, r, s, t) \ C_{N,i}(r) \ C_{N,j}(s) \ C_{N,k}(t) dr ds dt = f(x_{l}, y_{m}, z_{n}). \] (10)

Clearly, the obtained system of linear algebraic equations contains \((N+1)^3\) equations in the same number as unknowns. Solving this system we obtain the value of the constants \(a_{i(N+1)^2+j(N+1)+k}\) such that \(i, j, k = 0, \ldots, N.\)

4. Numerical Examples

In this section, we illustrate the presented method by giving some examples. The results are compared with the exact solutions by calculating the following absolute error

\[ e(x, y, z) = |u(x, y, z) - u_{N}(x, y, z)| \]

where, \(u(x, y, z)\) denotes the exact solution of the given examples, and \(u_{N}(x, y, z)\) is the approximate solution by the presented method. It should be mentioned that all calculations are done by Maple.

**Example 1** [1]:

Consider the following three dimensional Fredholm integral equation:

\[ u(x, y, z) = xyz \ e^{-x^2-y^2-z^2} - \frac{1}{16} (1 - e^{-1})^3 \ xy^2z - \frac{1}{2} \int_{0}^{1} \int_{0}^{1} \int_{0}^{1} \ xyz \ u(r, s, t) \ dr \ ds \ dt, \] (11)

with the exact solution \(u(x, y, z) = xyz \ e^{-x^2-y^2-z^2} .\)

Applying Chelyshkov polynomials for equation (11) when \(N = 2,\) and by using the collocation points (9) we obtain a system of linear algebraic equations contains 27 equations in the same number as unknowns. Solving this system we obtain the approximate solution which is given by:

\[ u_{N}(x, y, z) = 0.0007873128x + 0.0007873126z + 0.944605983xyz^2 - 1.37306981x^2yz + 0.94460599x^2y^2z^2 + \]
\[ 0.94460599x^2y^2z - 0.64984347x^2y^2z^2 - 1.373069821xy^2z^2 + 1.37306981xy^2z + 0.0007873129y + 0.027270882x^2y^2z \]
\[ -0.018761055x^2y^2 + 0.027270882x^2y^2 - 0.039640682x^2 + 0.027270882x^2 + 0.0272708857x^2z - \]
\[ 0.018761055x^2z^2 - 0.039640682y^2 + 0.027270882y^2z^2 + 0.0272708816y^2z - 0.018761055y^2z^2 - 0.0000156371 \]
\[ +1.99583869x^2y - 0.0005416339y^2 - 0.0005416339z^2 - 0.0005416333x^2 - 0.039640683xy. \]

The Absolute error of example 1 given in Table 1, Figs 1,2 and 3 represented the exact solution, the approximate solution and the Absolute error respectively when \(z = 0.2.\)

**Table 1. Numerical results of example 1**
Similarly as in example 1 applying Chelyshkov polynomials for equation (12) when unknowns. Solving this system we obtain the value of the constants, and we obtain the approximate solution which is location points (9) we obtain a system of linear algebraic equations contains 27 equations in the same number as with the exact solution

\[

\end{array}
\]

Example 2 [1]:
Consider the following three dimensional Fredholm integral equation:

\[
u(x, y, z) = f(x, y, z) + \frac{1}{2} \int_{-1}^{1} \int_{-1}^{1} \int_{-1}^{1} \frac{xyz}{1 + x + y + z} u(r, s, t) \, dr \, ds \, dt,
\]

where \( f(x, y, z) = \sin^2 x \sin^2 y \sin^2 z + \frac{1}{2} \frac{xyz (\cos(1) \sin(1) - 1)}{1 + x + y + z} \)

with the exact solution \( u(x, y, z) = \sin^2 x \sin^2 y \sin^2 z \).

Similarly as in example 1 applying Chelyshkov polynomials for equation (12) when \( N = 2 \), and by using the collocation points (9) we obtain a system of linear algebraic equations contains 27 equations in the same number as unknowns. Solving this system we obtain the value of the constants, and we obtain the approximate solution which is given by:

\[
u_2(x, y, z) = 0.001429524699x + 0.00142952472y + 0.001429524672y - 0.0112888601xy - 0.00820966506xy^2 - 0.008209663633x^2y - 0.007180000558x^2y^2 - 0.01128885993yz - 0.008209665051y^2z - 0.008209664561y^2z^2 - 0.007180000y^2z^2 - 0.011288860xz - 0.008209664920x^2z - 0.008209664x^2z - 0.007180000461x^2z^2 - 0.0002179117715 + 0.00123025165xz + 0.0012302521y^2 + 0.0012302519x^2 + 0.0318514693xyz + 0.0739536993xyz^2 + 0.07395369738x^2yz + 0.04511383x^2yz^2 + 0.07395367978x^2yz + 0.04511384x^2yz^2 + 0.04511384x^2yz^2 + 0.04278394949x^2yz^2.
\]

The Absolute error of example 2 given in Table 2, Figs 4 and 5 represented the exact solution and the Absolute error respectively when \( z = 0.1 \).

Example 3 [1]:

Consider the following three dimensional Fredholm integral equation:

$$u(x, y, z) = x^2y^2z^2 - \frac{8}{27} \sin(xyz) + \frac{1}{2} \int_0^1 \int_0^1 \int_{-1}^1 \sin(xyz) \ u(r, s, t) \ dr \ ds \ dt,$$

(13)

with the exact solution $u(x, y, z) = x^2y^2z^2$.

Applying Chelyshkov polynomials for equation (13) when $N = 2$, and by using the collocation points (9) we obtain a system of linear algebraic equations contains 27 equations in the same number as unknowns. Solving this system we obtain the value of the constants as follows:

$$a_0 = 0, a_1 = 0, a_2 = 0, a_3 = 0, a_4 = 0, a_5 = 0, a_6 = 0, a_7 = 0, a_8 = 0, a_9 = 0, a_{10} = 0, a_{11} = 0, a_{12} = 0, a_{13} = 0,$$

$$a_{14} = 0, a_{15} = 0, a_{16} = 0, a_{17} = 0, a_{18} = 0, a_{19} = 0, a_{20} = 0, a_{21} = 0, a_{22} = 0, a_{23} = 0, a_{24} = 0, a_{25} = 0, a_{26} = 1,$$

and we obtain the approximate solution which is the same as the exact solution.

Example 4 [2]:

Consider the following three dimensional Fredholm integral equation:

$$u(x, y, z) = \frac{1}{180} + xy(z - y) + \int_0^1 \int_0^1 \int_0^1 \frac{1}{5} r \ u(r, s, t) \ dr \ ds \ dt,$$

(14)

with the exact solution $u(x, y, z) = xy(z - y)$. 

167
Applying Chelyshkov polynomials for equation (14) when \( N = 2 \), and by using the collocation points (9) we obtain a system of linear algebraic equations contains 27 equations in the same number as unknowns. Solving this system we obtain the value of the constants as follows:

\[
\begin{align*}
a_0 &= 0, \quad a_1 = 0, \quad a_2 = 0, \quad a_3 = 0, \quad a_4 = 0, \quad a_5 = 0, \quad a_6 = 0, \quad a_7 = 0, \quad a_8 = 0, \quad a_9 = 0, \quad a_{10} = 0, \quad a_{11} = 0, \quad a_{12} = 0, \quad a_{13} = 1/64, \\
a_{14} &= 5/64, \quad a_{15} = -1/12, \quad a_{16} = -11/64, \quad a_{17} = -5/192, \quad a_{18} = 0, \quad a_{19} = 0, \quad a_{20} = 0, \quad a_{21} = 0, \quad a_{22} = 5/64, \\
a_{23} &= 25/64, \quad a_{24} = -5/12, \quad a_{25} = -55/64, \quad a_{26} = -25/192,
\end{align*}
\]

and we obtain the approximate solution which is the same as the exact solution.

Figure 1: Exact solution of example 1
Figure 2: Approximate solution of example 1

Figure 3: Absolute Error of example 1
Figure 4: Exact solution of example 2

Figure 5: Absolute Error of example 2
Conclusion

This paper concerns the approximate solution of three-dimensional Fredholm integral equations of the second kind by using Chelyshkov polynomial method. The authors in [1] study the same examples 1, 2 and 3 by using Radial basis functions method when \( N = 27, \ N = 64, \ N = 125, \ N = 216 \), but we apply our method for \( N = 2 \). We show that the results of our method is better than the results of the method which used in [1]. Also example 4 has been studied in [2] by using Adomian decomposition method and we obtain the same results.
