

Numerical tools for the design of fibre-based ships of large lengths

Participants: CIMNE, COMPASSIS, ULIM, VTT, TWI, LR, BV, RINA, TUCO, IXBLUE, TSI

- **CHARACTERIZATION AND SIMULATION OF FIBRE-BASED MATERIALS**

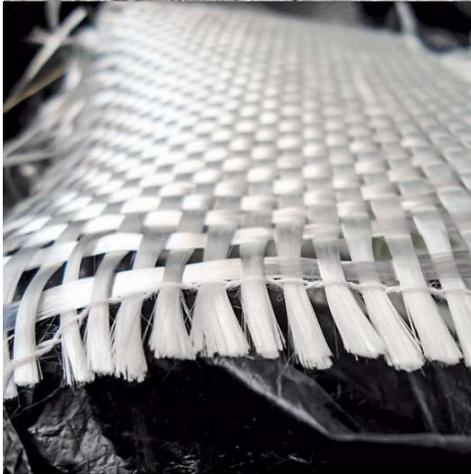

- Simulation of mechanical performance of composites.
- Calibration process.
- Fatigue performance of composites.

- **NUMERICAL TOOLS TO DESIGN AND ANALYZE FIBRE-BASED SHIPS OF LARGE LENGTH**

- Coupled seakeeping-FEA tool
- GUI for materials definition, hull girder analysis and collapse assessment.

CHARACTERIZATION AND SIMULATION OF FIBRE-BASED MATERIALS

INTRODUCTION. What's a composite material?

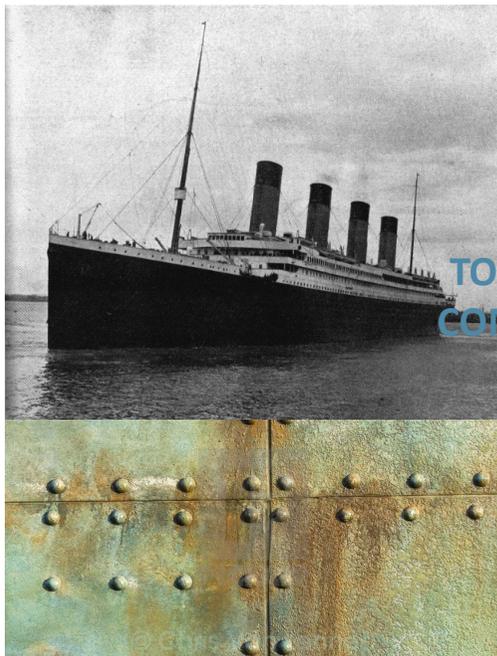

TASK: Development of numerical models

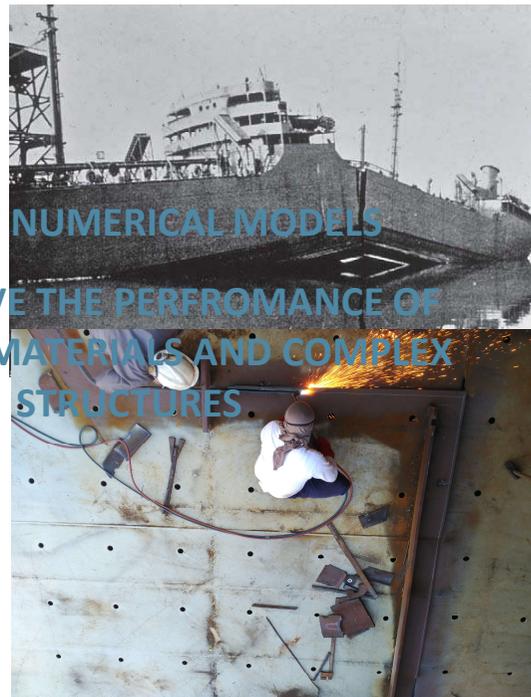

INTRODUCTION. Use of composite materials on naval industry

SOLUTIONS ON NAVAL INDUSTRY ARE BECOMING MORE SPECIFIC, AS WELL AS THE MATERIALS USED TO DEAL WITH ARE BECOMING MORE COMPLEX.

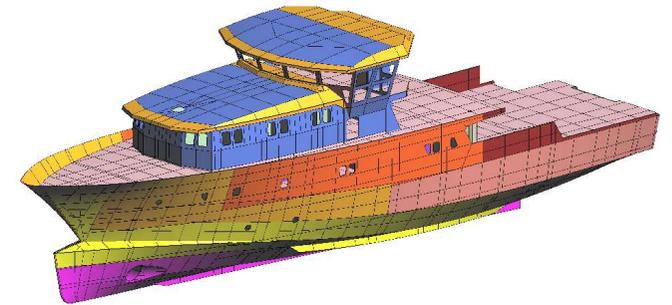

COMPLEX SOLUTIONS REQUIRE SPECIFIC TOOLS

USE OF NUMERICAL MODELS
TO RESOLVE THE PERFORMANCE OF
COMPLEX MATERIALS AND COMPLEX
STRUCTURES

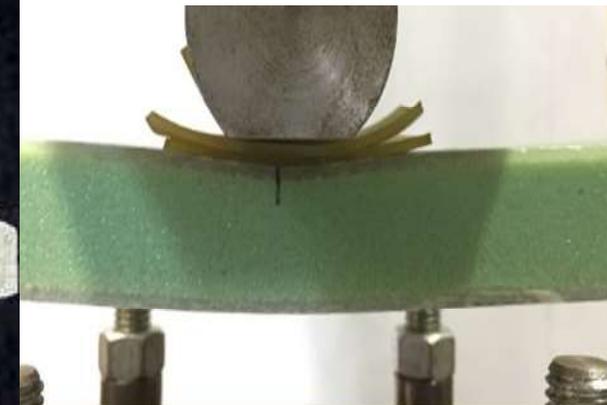

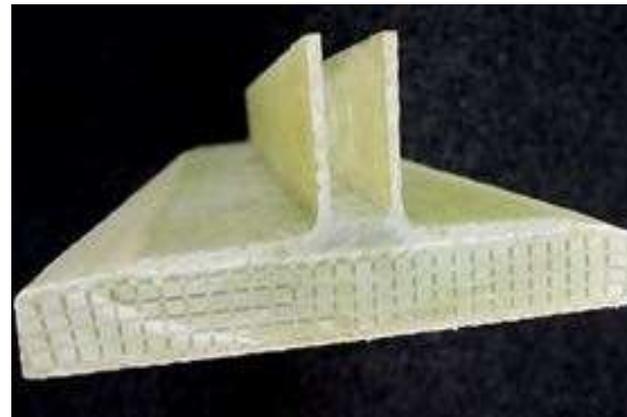

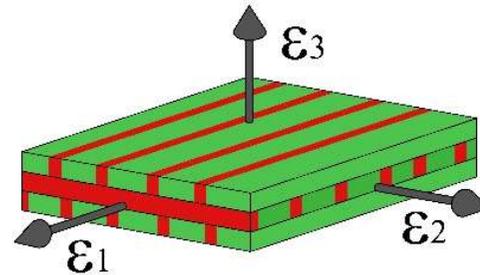

FIBRESHIP, 27th February 2019

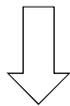

TASK: Development of numerical models

INTRODUCTION. Challenges with composites

- Anisotropic behavior: material properties are orientation-dependency.
- Different failure modes (delamination, matrix cracking, fiber breakage,...)
- Lack of experimental data compared with other materials.

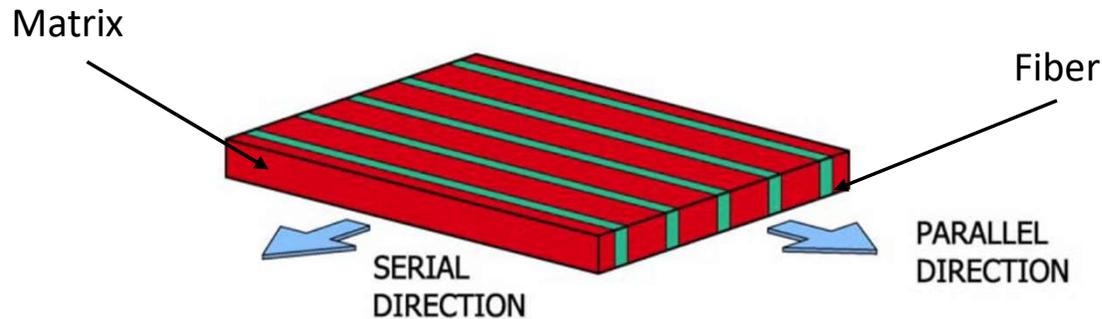

HOW TO DEAL WITH THESE CHALLENGES?

Standardization of tests and calibration methods

Serial/Parallel Mixing Theory

This formulation is a constitutive equations manager that provides the response of the composite by coupling the constitutive equations of its components.

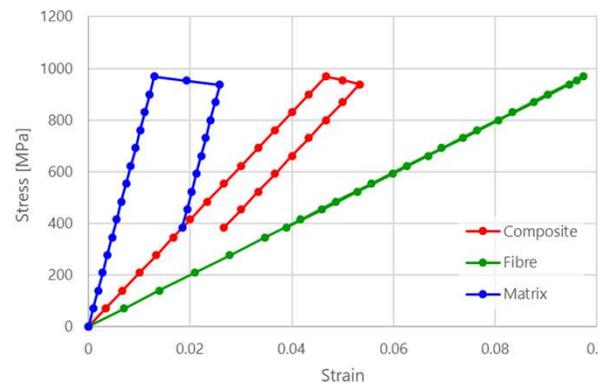

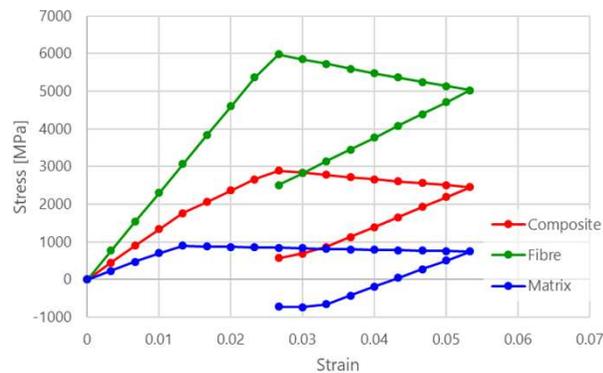

Compatibility equations

Parallel behavior

$$\begin{cases} {}^c \boldsymbol{\varepsilon}_P = {}^m \boldsymbol{\varepsilon}_P = {}^f \boldsymbol{\varepsilon}_P \\ {}^c \boldsymbol{\sigma}_P = {}^m k^m \boldsymbol{\sigma}_P + {}^f k^f \boldsymbol{\sigma}_P \end{cases}$$

Serial behavior

$$\begin{cases} {}^c \boldsymbol{\varepsilon}_S = {}^m k^m \boldsymbol{\varepsilon}_S + {}^f k^f \boldsymbol{\varepsilon}_S \\ {}^c \boldsymbol{\sigma}_S = {}^m \boldsymbol{\sigma}_S = {}^f \boldsymbol{\sigma}_S \end{cases}$$

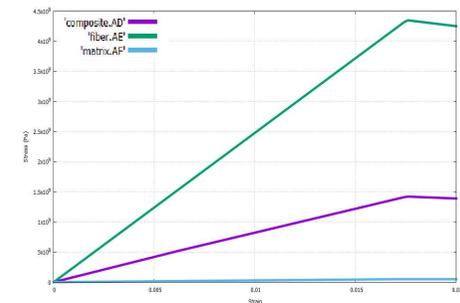

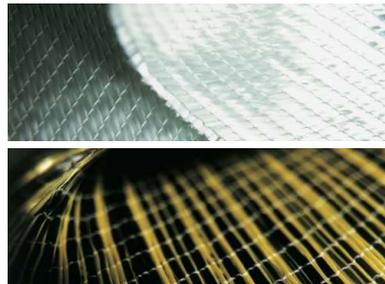

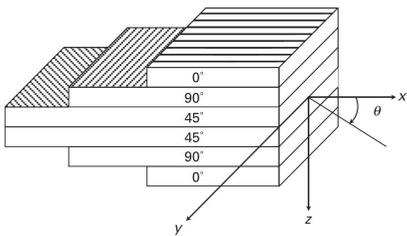

Check for convergence:

$$[\Delta \boldsymbol{\sigma}_S]^k = [{}^m \boldsymbol{\sigma}_S]^k - [{}^f \boldsymbol{\sigma}_S]^k \approx 0$$

TASK: Development of numerical models

ADVANTAGES OF USE S/P MIXING THEORY

- Any stacking sequence, no matter fiber orientation or fiber volume fraction.
- Formulation is able to couple different fiber/matrix systems, different constitutive laws.
- Non-linear performance of the composite can be defined from its constituents.

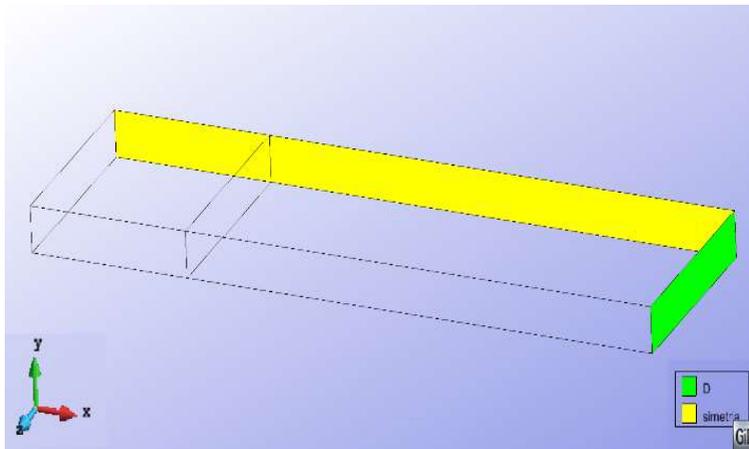

WHAT DATA DO WE REQUIRE?

- Stacking sequence of the laminate and volumetric participation.
- Elastic properties of the constituents.
- Non-linear properties of the constituents.

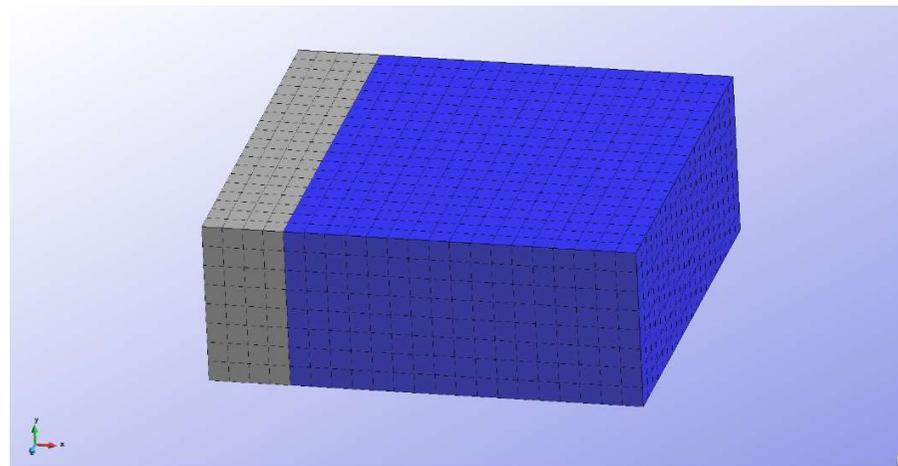

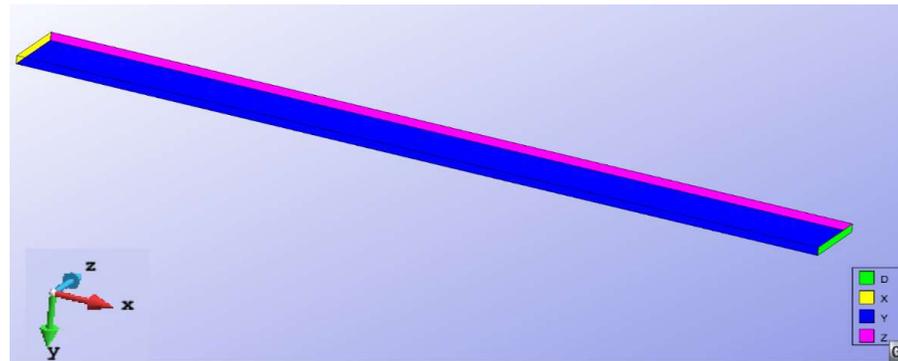

TASK: Development of numerical models

RESULTS. Numerical model

Flexure test model

Tensile test model

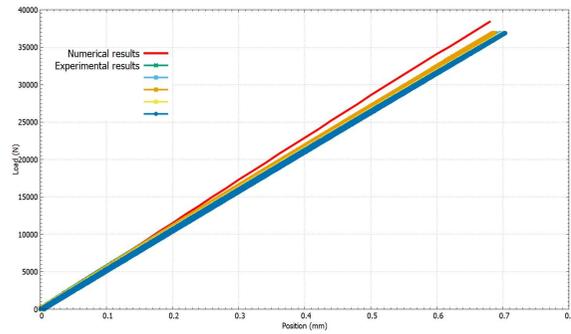

Shear test model

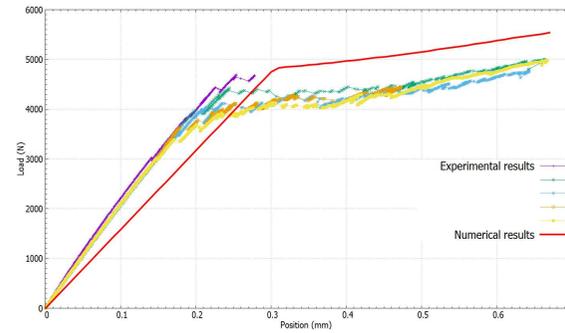

TASK: Development of numerical models

RESULTS. Load-Position curves.

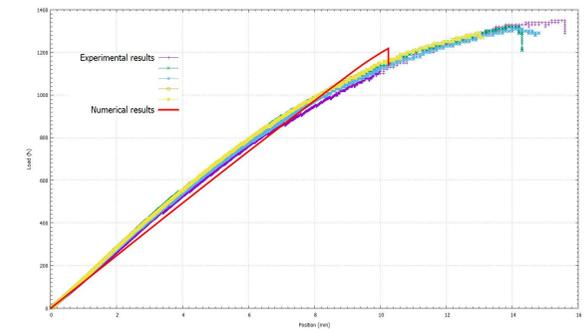

Longitudinal tensile test

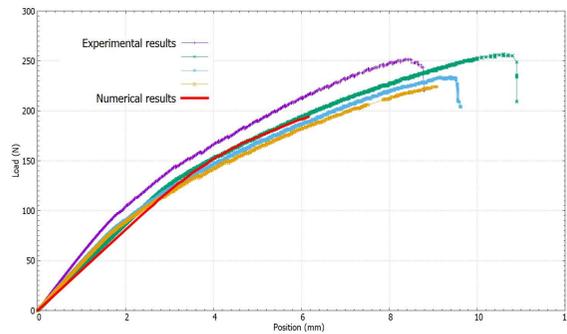

Transversal tensile test

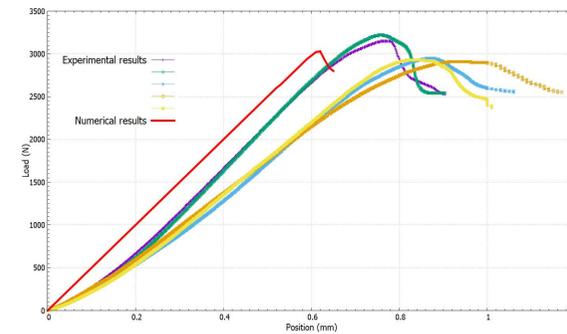

Longitudinal flexure test

Trasversal flexure test

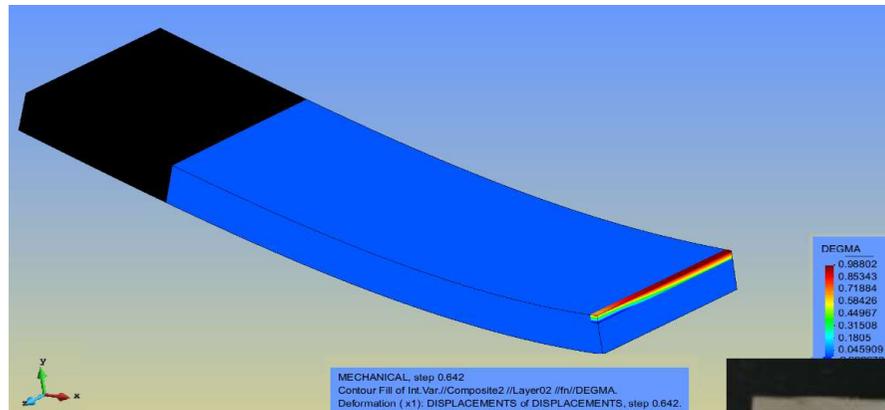

Shear test

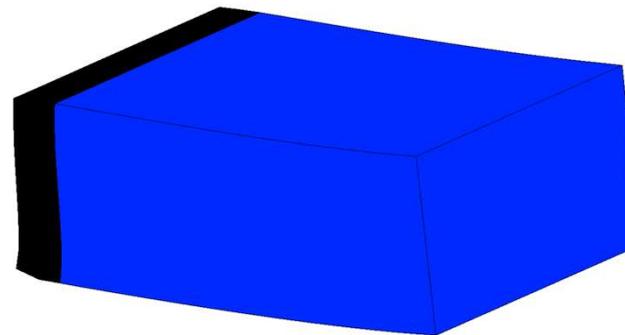

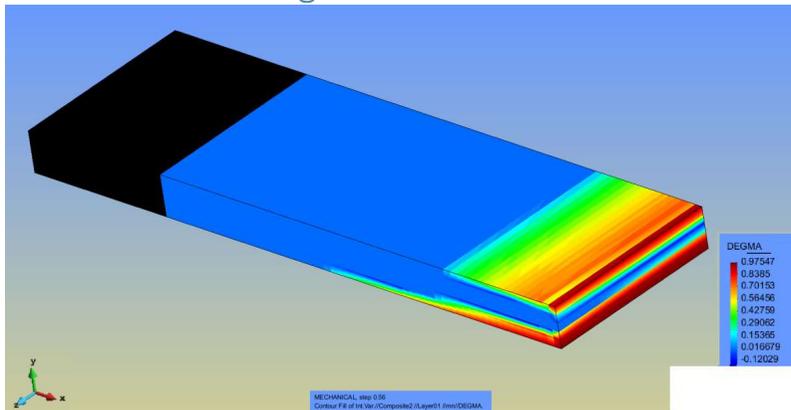

TASK: Development of numerical models

3P Bending perpendicular to fibre direction

RESULTS FEM MODEL. Failure modes.

3P Bending in fibre direction

st

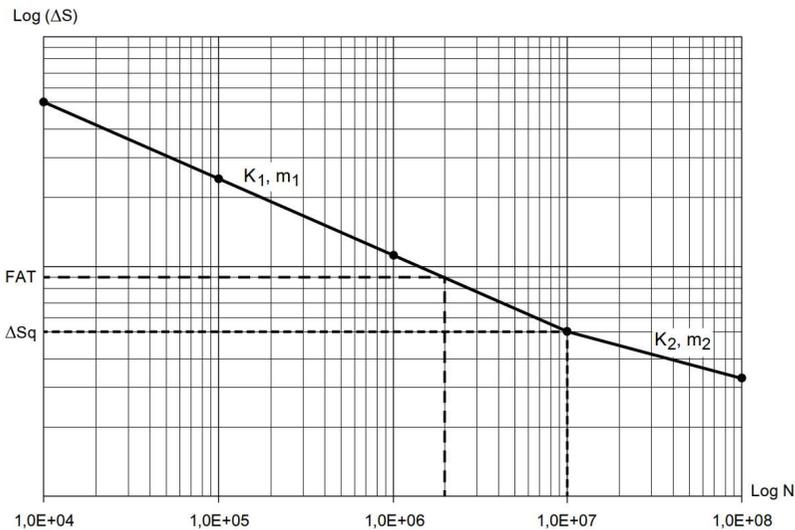

! A numerical simulation not only has to represent the global performance correctly, besides has to show the equivalent failure mechanism

TASK: Fatigue performance of composites

INTRODUCTION. Fatigue phenomenon

ASTM E1823 standard: “The process of permanent, progressive and localized structural change which occurs to a material point subjected to strains and stresses of variable amplitudes which produces cracks which lead to total failure after a certain number of cycles”.

Importance of the fatigue in naval structures. Prove of it is the existence of specific rules on Class Societies

DNV-RP-C203

ShipRight FDA

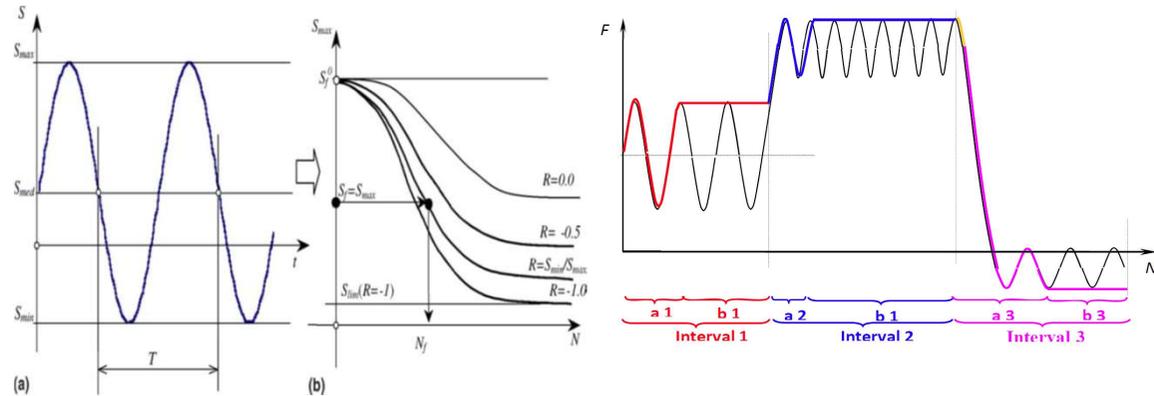

NI 611 DT R00 E

TASK: Fatigue performance of composites

FATIGUE FORMULATION

- Fatigue damage formulation initially developed for metallic materials
- The constitutive law is modified by means of a reduction function, to account for the cyclic behaviour of the load.
- The formulation can take into account different block loading sequence.

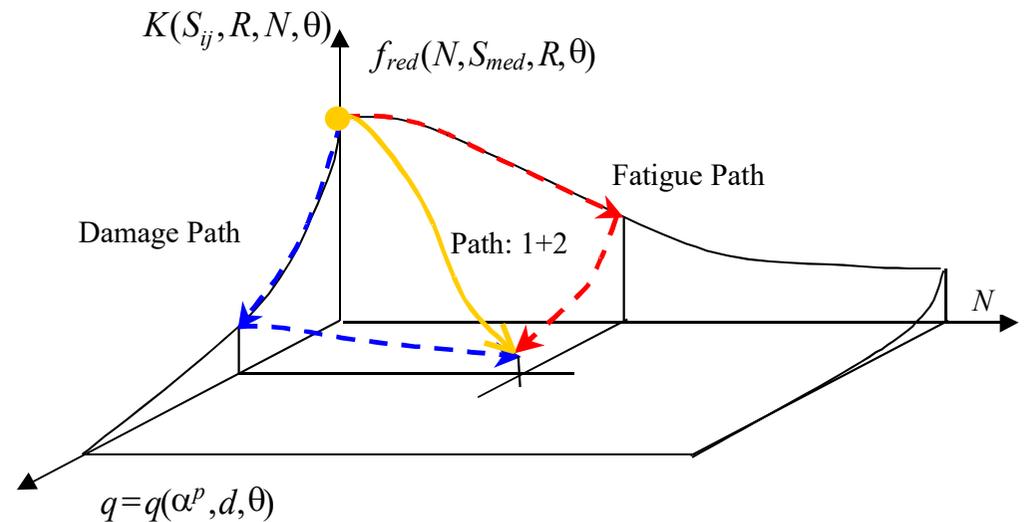

Non-fatigue constitutive equation: $f(\sigma) - K(\sigma_{th}) \leq 0$

Fatigue application: $f(\sigma) - f_N(N, \sigma_m, R) \cdot K(\sigma_{th}) \leq 0$

Influence of N_c strength reduction (HCF)

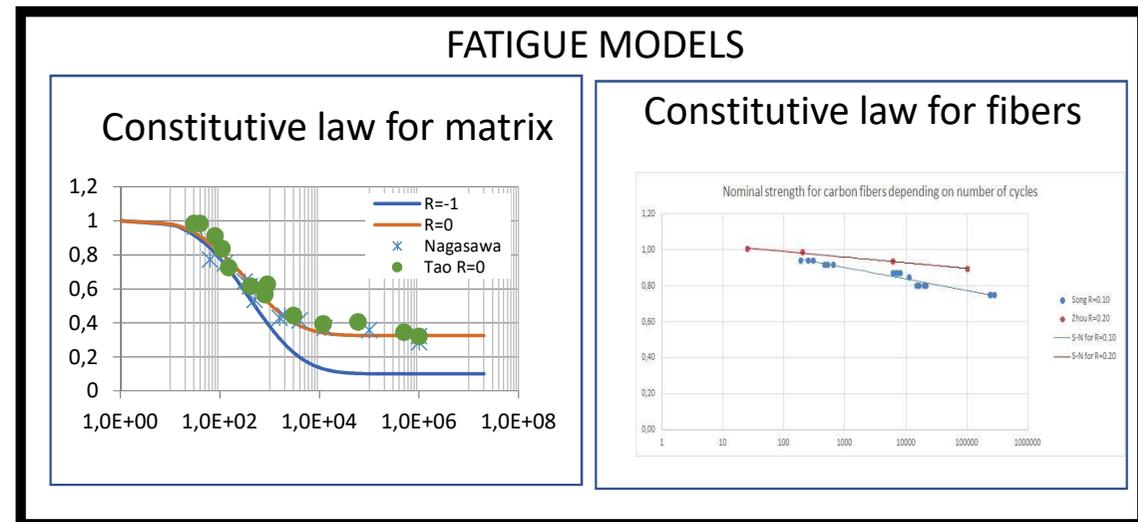

Influence of *Quasi-Static* strength reduction.

TASK: Fatigue performance of composites

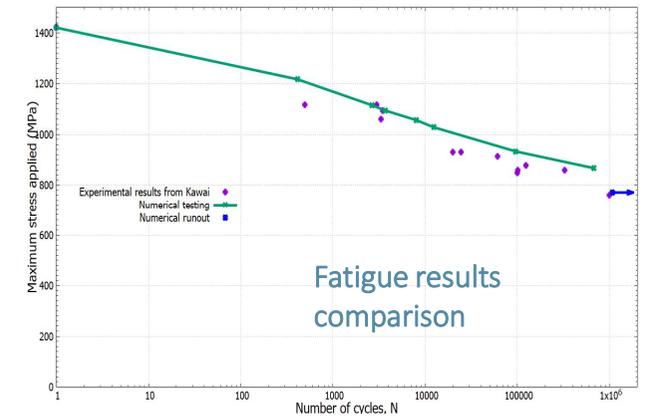

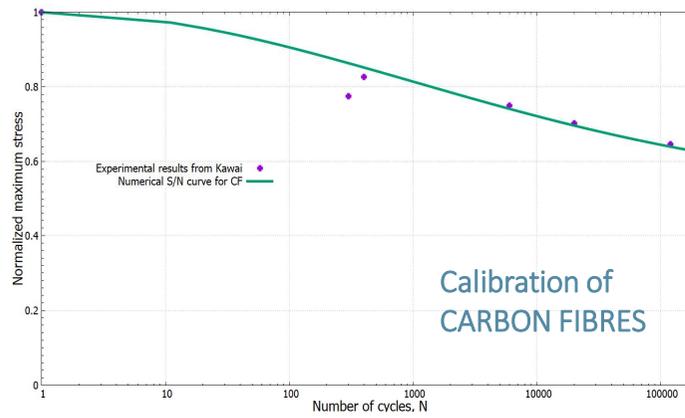

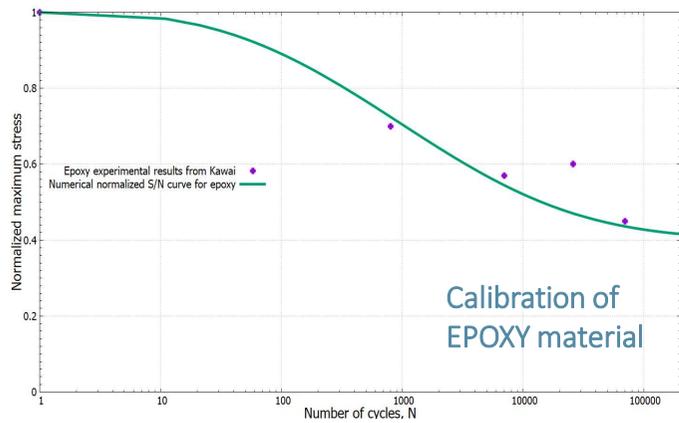

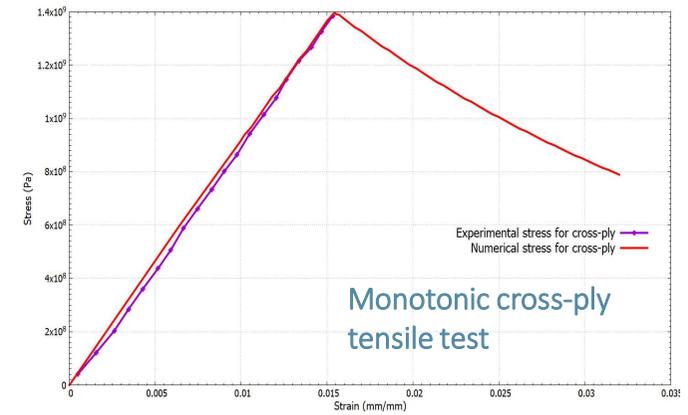

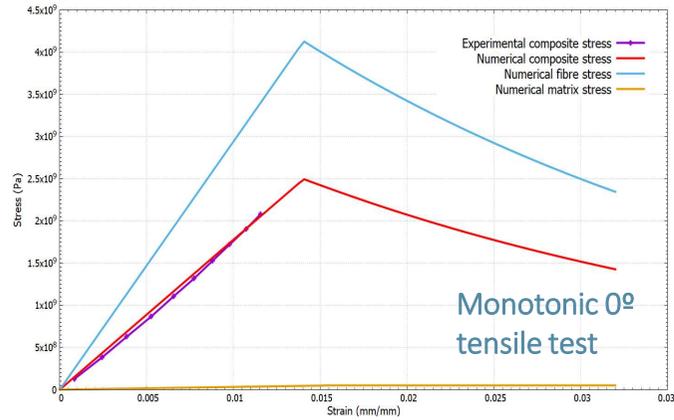

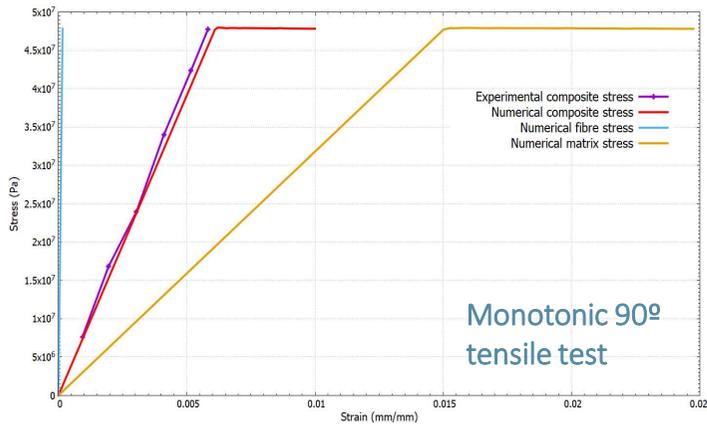

ADAPTATION OF THE FORMULATION TO COMPOSITES

- Require to establish fatigue models for fibre and matrix.
- S/P Mixing Theory couples both materials to obtain fatigue behaviour of composite.
- **Fibre and matrix performance, both static and fatigue, are obtained by tests on UD laminates.**
 - UD loaded at longitudinal direction has a fibre-dominated performance.
 - UD loaded at transverse direction has a matrix-dominated performance.
- Failure of the laminate is supposed when damage appears on fibre for longitudinal ply.

TASK: Fatigue performance of composites

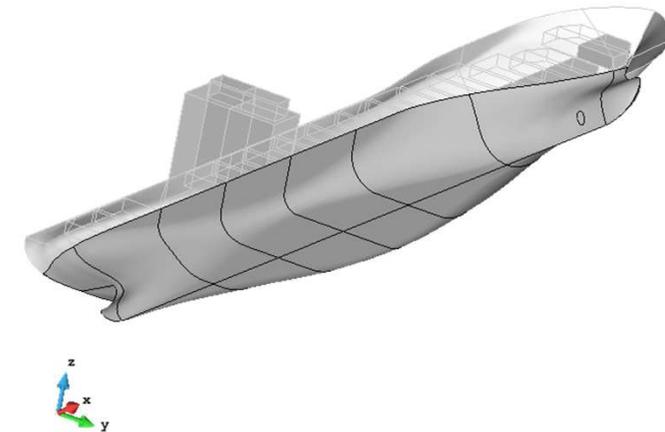

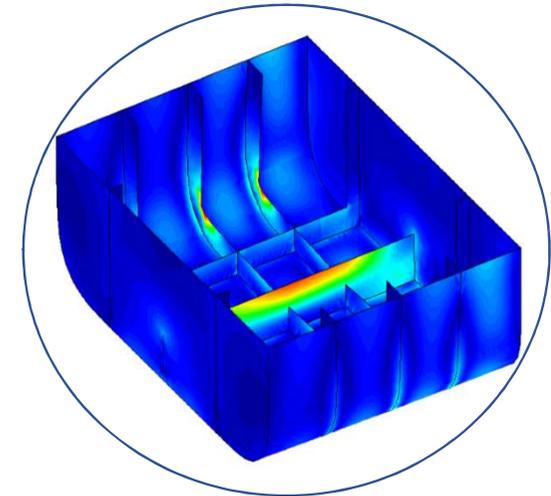

VALIDATION OF THE FORMULATION

CONCLUSIONS ABOUT NUMERICAL MODELS

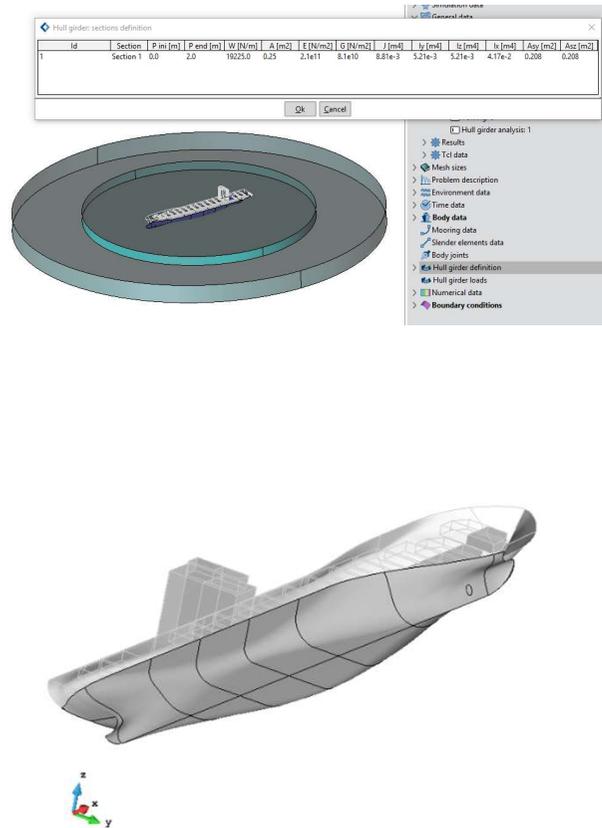

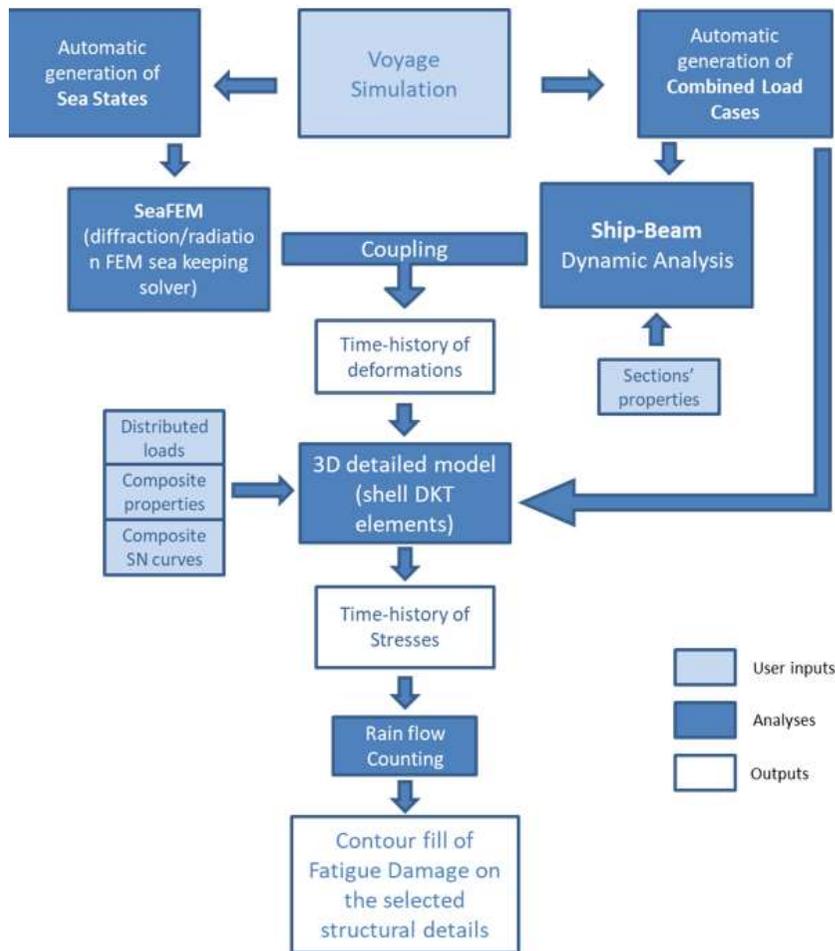

RELEVANT ASPECTS

- Composite performance is obtained by means of fiber and matrix behavior, regardless fiber orientation or fiber participation, what reduces number of tests to be done.
- A process to calibrate the numerical model is constructed.
- Failure modes of the composite can be obtained.
- S/P Mixing Theory is compatible with known failure criteria (Tsai-Hill, first ply failure, etc).
- A composite fatigue model is introduced in order to simulate any kind of laminate.
- Better understanding of fatigue performance of composite structures.
- Reduction of uncertainty means structure optimization.

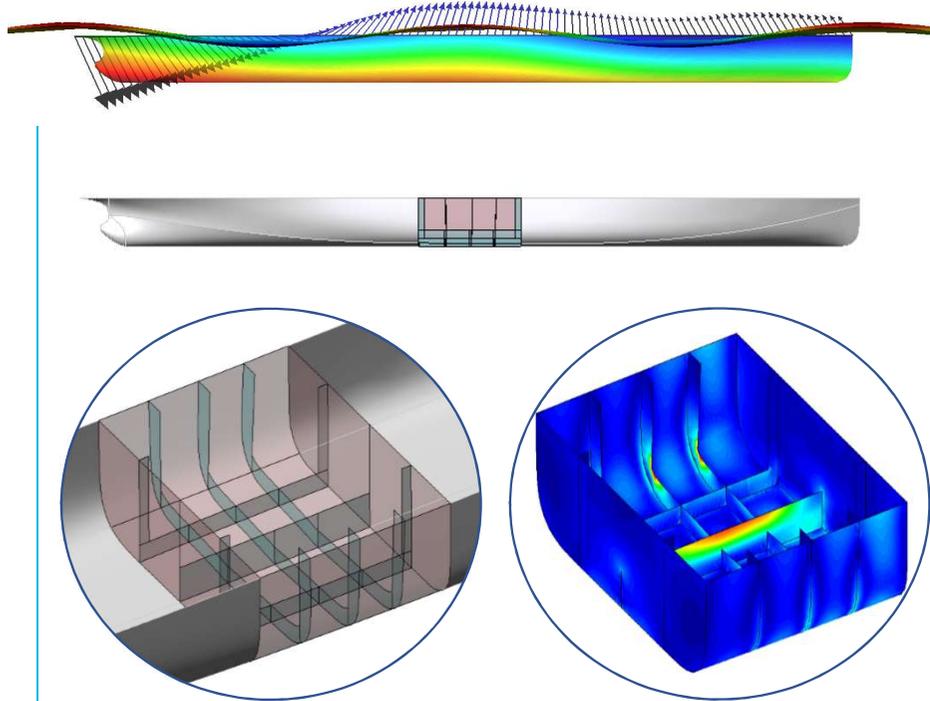

NUMERICAL TOOLS TO DESIGN AND ANALYZE FIBRE-BASED SHIPS OF LARGE LENGTH

Hull girder analysis tool

✓ **Hull girder model:** Simple 3D dynamic beam coupled with FEM seakeeping solver. It allows to analyse quickly long time series of the coupled problem.

✓ **3D detailed local model:** information from the hull girder model may be used to enforce the boundary conditions needed for a detailed analysis of a local ship structure.

- Applied loads and boundary conditions:
 - Distributed cargo pressure loads must be specified
 - Seakeeping wave load calculated during the hull girder analysis
 - Enforce hull girder displacements at the end boundaries of the local section under analysis
- Results:
 - Time history of local displacements and stresses in the detailed structure of the section under analysis

Hull girder graphic user interface

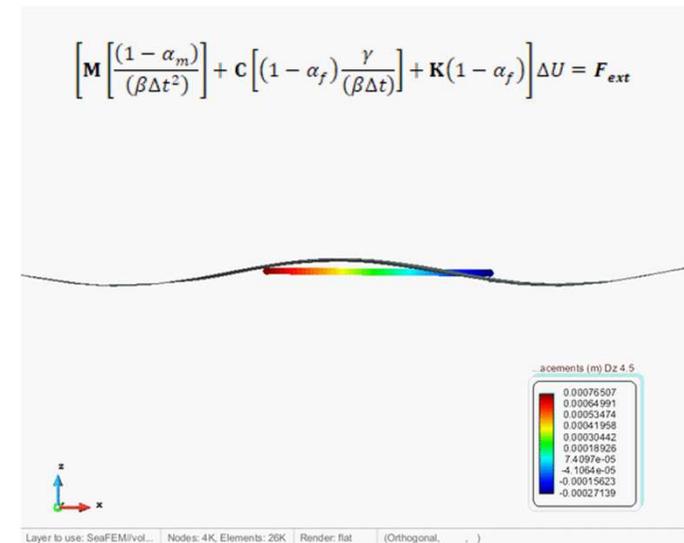

Hull girder: loads definition

Id	Name	Total Mass [T]	Aft. limit [m]	Fwd. limit [m]	Pos. X [m]	Pos. Y [m]	Pos. Z [m]
1	Ballast Br	200	0.0	0	-15	-5	0.0
2	Cargo 1	1500	-10	10	0.0	0.0	0.0
3	Cargo 2	1500	10	20	15.0	0.0	0.0
4	Ballast Er	200	0	0	-15	5	0.0

GUI for the definition and assignement of laminates

Assign beam

Assign shell properties

Coupled analysis for collapse assessment

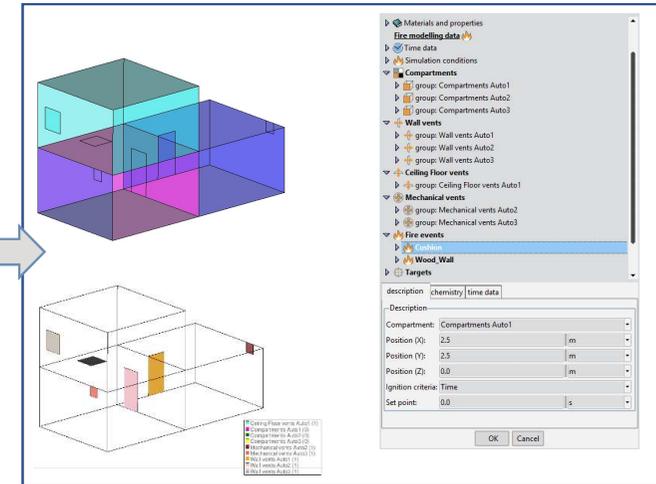

FDS GUI (based on GiD-Ramseries)

SOME CHARACTERISTICS

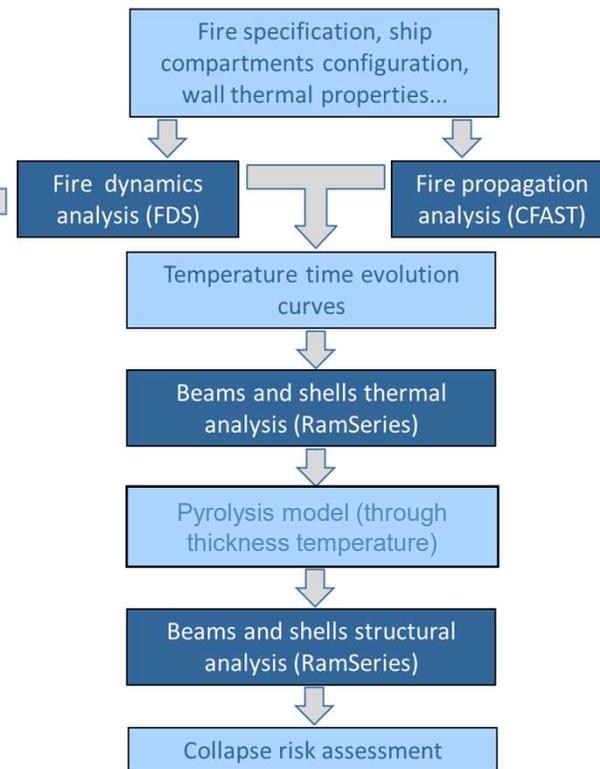

- New GUI tools allow to define the main namelist groups of FDS (obstacles, vents, reactions, fire events ...) directly in GiD-RamSeries and to run FDS solver.
- Geometrical information is shared with the structural model and can be used for the definition of the FDS model.
- Importation tools (STEP and IGES, including XML's FORAN data)

CFAST GUI (based on GiD-Ramseries)

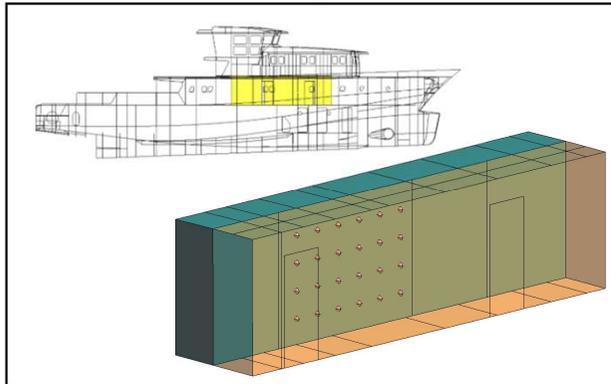

SOME CHARACTERISTICS

- New GUI tools also allow to define compartments, vents, fire events and targets directly in RamSeries and to run the CFAST solver.
- Geometrical information from the structural model can be used for the definition of the CFAST model if necessary..
- Importation tools (STEP and IGES, including XML's FORAN data)

Coupled analysis for collapse assessment

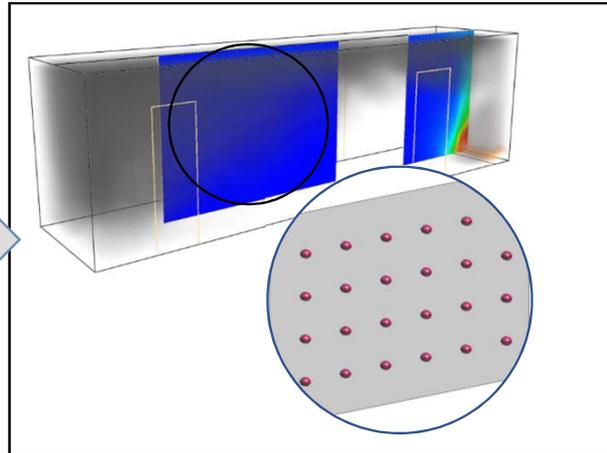

• FDS / CFAST GUI ()

SOME CHARACTERISTICS

- FDS: Temperature maps over structural components (beams, decks and bulkheads) are calculated
- CFAST: Two-zones temperature evolution is calculated.
- FDS/CFAST: Furthermore, time evolution of (adiabatic) temperature in a distributed network of control points

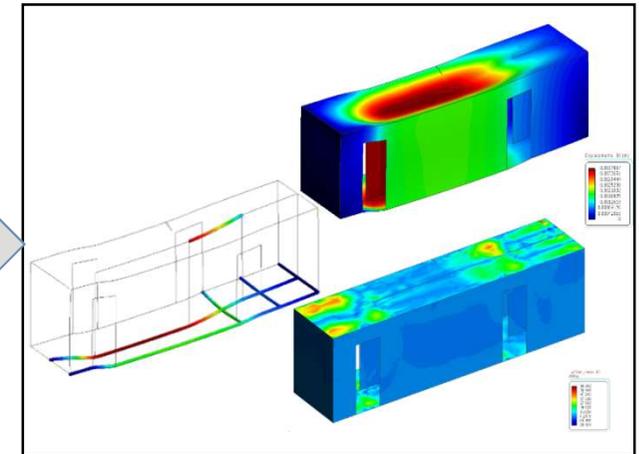

• 1D/2D Pyrolysis model

SOME CHARACTERISTICS

- Transfer temperature (heat flux) information from control points to the structural solver.
- The structural solver includes a pyrolysis model for composites (1D -through thickness- model for shell elements and a 2D model for beam elements), which calculated temperature distribution (per layer).

Thermo-mechanical analysis

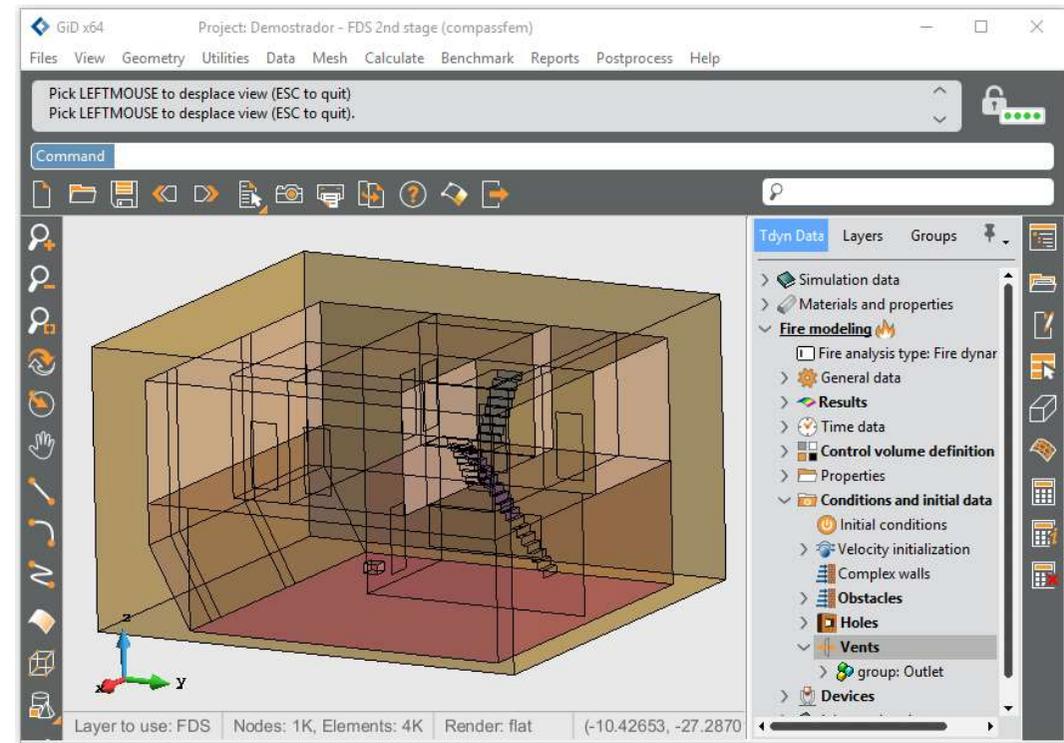

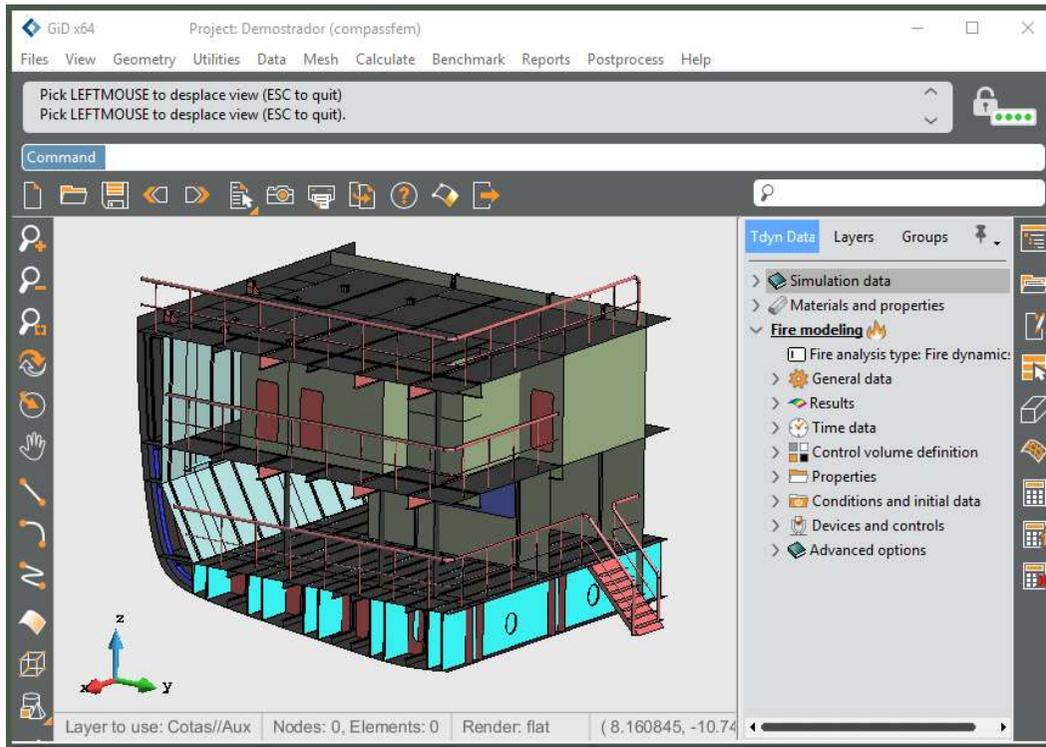

SOME CHARACTERISTICS

- Displacements, strains and stresses are calculated on structural components using a thermo-mechanical composites constitutive model (collapse of the structure is assessed).

Collapse assessment of complex and large structures

- Start the validation and demonstration of fire analysis tools by simulating a fire scenario in the FIBRESHIP's demonstrator of the fishing research vessel
