

*Microna saxatilis* (Reynies, 1843)  
NEW FOR THE BALEARIC ISLANDS

R. G. MOOLENBEEK<sup>1</sup>

Two small Hydrobiids were found amongst some mollusks collected by Prof. Dr. J. H. Stock at the island of Mallorca. Dr. H. D. Boeters kindly identified them as *Microna saxatilis* (Reynies, 1843). The specimens have been collected on the island of Mallorca in a well, marked «1860» which is situated at the westside of the C 719 road (= south of Andratx near Camp de Mar) on 28 december 1977. As the species was not mentioned by GASULL (1963, 1969, 1972) this is the first record for *M. saxatilis* on the Balears. BOETERS (1970) mentioned 15 subspecies of *M. saxatilis*, which are distributed from northwest Spain to south France and from Austria to Jugoslavia.

The specimens are in the collection of the Zoological Museum Amsterdam.
