INTRODUCTION

An important window onto the study of mathematical difficulties (MD) is provided by research on the cognitive phenotype of children with a clearly defined genetic disorder at risk for developing MD. The present study examined MD in children with Velo-Cardio-Facial Syndrome (VCFS) or 22q11 deletion syndrome. It has been consistently demonstrated that these children have difficulties in mathematics, compared to relatively normal reading and spelling achievement (De Smedt et al., 2006). However, these studies were mostly restricted to the assessment of general standardized achievement tests and did not provide information about the strengths and weaknesses of children with VCFS within the broad multidimensional domain of mathematics. Therefore, we aimed to delineate more carefully the math impairment in primary school children with VCFS (age range 6 – 12 years) and compared their performance with that of an individually matched control group.

METHOD

PARTICIPANTS:

<table>
<thead>
<tr>
<th></th>
<th>N</th>
<th>Age</th>
<th>IQ</th>
</tr>
</thead>
<tbody>
<tr>
<td>VCFS</td>
<td>25</td>
<td>9.8</td>
<td>93.5</td>
</tr>
<tr>
<td>Controls</td>
<td>25</td>
<td>9.2</td>
<td>107.9</td>
</tr>
</tbody>
</table>

- All children had normal intellectual abilities (IQ > 70).
- Controls were selected from the same class within the same school.
- Both groups were of equal socioeconomic status.

MATERIALS:

- Number processing
- Number reading, Number writing, Number comparison
- Counting
- Verbal counting, Dot counting
- Single-digit arithmetic
- Addition, Subtraction, Multiplication
- Multidigit arithmetic
- Addition, Subtraction
- Word problems
- Word problem solving

Note: Number domain 1 to 100. Accuracy and response times were registered per task. *Strategy use was also recorded.

ANALYSIS: Group differences were evaluated by means of mixed models to account for the clustered nature of the data (matched pairs). We also analyzed the data at the individual level to determine on which math variable a particular child did show abnormal performance, i.e. 1.65SD below the control group mean (Pc 5). All analyses were controlled for age and IQ.

RESULTS

Analyses at the individual level revealed that 19/25 children with VCFS performed abnormally on at least one math task, which provides significant (p<.01) evidence for MD in VCFS.

NUMBER READING AND WRITING

Accuracy was high (> 99%). There were no group differences in the speed of reading numbers. This indicates that subsequent group differences are not due to a slower or less accurate number identification.

DISCUSSION

- Children with VCFS showed preserved number reading and fact retrieval. These children were significantly slower in number comparison and dot counting, pointing to difficulties in low-level number processing (Landier et al., 2004). They also performed more poorly on executing procedural strategies and multidigit arithmetic, which might indicate that these children have some kind of procedural MD (Geary, 2004).
- A follow-up study on the same sample showed that children with VCFS did not differ from controls on working memory, speed of retrieving information from long-term memory, processing speed and reading; none of these general cognitive skills was related to math in children with VCFS (De Smedt et al., 2008b).
- It has been proposed that MD emerge due to impairments in basic number processing (Landier et al., 2004). Our data showed that children with VCFS have difficulties in number comparison. Moreover, number comparison emerged as significant and unique predictor of the MD in VCFS (De Smedt et al., 2008b). This indicates that the MD in VCFS are due to a specific deficit in the representation of quantities, which suggests underlying abnormalities in the intraparietal sulcus and fits the inferior parietal abnormalities reported in VCFS.
- Our data stress the need for early interventions that foster the development of representations of quantities, as typically developing children acquire these skills already before formal instruction and these are not explicitly taught at school.
