Juvenile *Hippocampus guttulatus* from a neuston tow at the French-Belgian border

Belgian Journal of Zoology 135(1): 101-102

SHORT NOTE

The long-snouted seahorse *Hippocampus guttulatus* Cuvier, 1829 occurs mostly in shallow inshore waters among algae and eel grass (*Zostera* or *Posidonia*) and also in littoral lagoons (Lelong, 1995). The species can be found in the Eastern Atlantic from the British Isles to Morocco, including the Canary Islands, Madeira and the Azores (Lourie et al, 1999). The presence of the long-snouted seahorse in Belgian waters was already suspected (see CITES appendix II) but never confirmed. *Hippocampus ramulosus* Leach, 1814 is regarded as an invalid synonym of this species, although this name is still widely used for what is now *H. guttulatus* (Lourie et al, 1999).

where The sampling station Hippocampus guttulatus was found is situated between the sandbanks Buiten Ratel en Oost Dyck (UTM 5674450 -460236.7), on the French-Belgian border (Fig. 1). This station was investigated during sampling campaign on August 20th (2003) with the research vessel 'Zeeleeuw'. The sample was taken with a rectangular neuston net (2m x 1m, 1mm mesh) from which only the lower 50cm is immersed, thereby sampling the upper 50cm of the water column. Identifications of the specimens, which 10% were preserved in formaldehyde-seawater solution, are based on characteristics described by Lourie et al (1999).

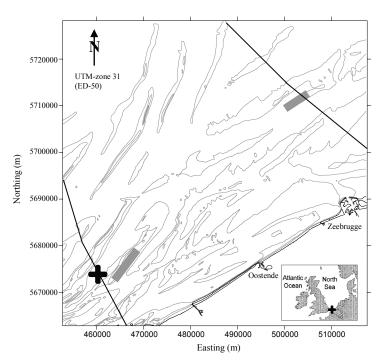

Fig. 1. - Sampling station *Hippocampus guttulatus* (black cross) and fishermen's catches of *Hippocampus hippocampus* (grey areas) in Belgian marine waters (border represented by black lines)

The neuston sample contained two well-preserved juveniles (approximately 3 to 4 weeks old) of the species *Hippocampus guttulatus*. Most of the examined characteristics (Table 1) are within the range for both *Hippocampus guttulatus* and *H. hippocampus* (i.e. number of trunk rings, number of tail rings, number of pectoral fin rays, number of dorsal fin rays). However, the ratio of snout length to head length (> 1/3) certainly suggests that these specimens are *H. guttulatus* or the European long-snouted seahorse, and the number of pectoral fins on one of the specimens is consistent with it being *H. guttulatus*. Both specimens lack a mane of thick skin fronds on neck and head, usually seen in adults (Fig. 2).

	Specimen 1	Specimen 2	
Overall height	2.93 cm	3.51 cm	
Number of trunk rings	11	11	
Number of tail rings	36	37	
Snout length / head length	0.42	0.42	
Coronet	Rounded knobs		
Spine development	Blunt and well-developed		
Pectoral fin rays	15	16	
Dorsal fin rays	18	18	
Cheek spine	Low and blunt		
Eye spine	Prominent, rounded

Year	Date	Number	Method of capture / vessel	Capture site	Destination of sea horses	remarks
1997	May	4	Coastal fisheries	-	Oostende North Sea Aquarium	alive
1998	14-20 March	1	-	3 nautical miles from Zeebrugge	-	-
1998	24 July	1	Shrimp fisheries / O.211	-	Died and was discarded	During night
1998	22 September	7			released	
1998	23 September	14	Gill net / N.95	Between 51 12.70 N- 02 29.70E and 51	Aquarium of skipper- ship owner Oostende North Sea	Associated with Alcyonidium
1998	24 September	33		15.43N – 02 32.99E	Aquarium	111cy omanum
1998	25 September	66			Sealife Blankenberge	
1999	24 June	1	Coastal fisheries / O.101	-	-	-
1999	10 July	1	Coastal fisheries / O.152	-	-	Dead but no signs of decay
1999	14 July	1	O.20	-	-	Pregnant male
1999	-	-	N.95	Between 51 12.70 N- 02 29.70E and 51 15.43N – 02 32.99E	-	Skipper is convinced of the presence of a local population
2000	28 September	1	O.190	Westpit fishing grounds	-	Dead
2001	17 February	1	Gill net / O.369	-	-	-
2001	18 August	1	Coastal fisheries / O.190	-	-	-
2001	25 September	1	Coastal fisheries / O.190	-	-	male
2002	11 September	1	O.191	Fishing grounds near Oostendebank	-	-
2004	20 April	1	O.190	Wenduinebank	-	-
2004	21 May	1	O.20	3 nautical miles from Oostende	-	alive

Table 2. Recent seahorse catches (Hippocampus hippocampus) by local fishermen in Belgian marine waters

This is the first reported catch of *Hippocampus guttulatus* for the Belgian waters, and the origin of the specimens is unclear. Although there are numerous records for southern Britain, it is unlikely that specimens could reach the Belgian coast due to their poor swimming ability and the lack of assisting currents (Garrick-Maidment, 1998). On the other hand, the presence of a local population seems unlikely because from 1997 onwards, only *Hippocampus hippocampus* was occasionally caught by local fishermen (Table 2, Fig. 1). As the specimens were caught near the sea surface, it is likely that they were carried to the Belgian coastal zone through the English Channel in association with floating debris (the sample contained decaying duckweed, plant seeds and pieces of plastic). However, the presence of seahorses (and their fry) in the neuston is quite uncommon. Only *Hippocampus erectus*

has already been reported from the neuston in association with floating debris and vegetation (Powell et al, 2000; Castro et al, 2001; Teixeira & Musick, 2001).

As the entire genus *Hippocampus* is listed in Appendix II of CITES (Convention on International Trade in Endangered Species of Wild Fauna and Flora) and both *H. guttulatus* and *H. hippocampus* are listed as Data Deficient by IUCN (World Conservation Union), it is most important to gather information on the presence and persistence of local populations of seahorse species to form the basis of legal protection and conservation. Hopefully, this note will be the starting point for a detailed record of Belgian seahorse catches.

ACKNOWLEDGEMENTS

First, the authors would like to show their gratitude to Neil Garrick-Maidment, Sara Lourie and Janelle Curtis for their assistance with the species identifications and to Hans Hillewaert for editing the fotograph. The list of seahorse catches by fishermen was composed by Eddy Eneman from the Oostende North Sea Aquarium. Special thanks go to André Cattrijsse of the Flanders Marine Institute (VLIZ) and to the crewmembers of the research vessel Zeeleeuw. The first author acknowledges a specialisation grant from the 'Flemish Institute for the Promotion of Scientific-Technological Research' (IWT).

ERRATUM

The statement that this is the first reported catch of *Hippocampus guttulatus* for the Belgian waters is not correct: Holly (1936) already mentioned the presence of one individual of *H. guttulatus* from a shrimp net tow near Oostende. With thanks to Simon Claus for bringing this reference to the author's attention.
