# COHOMOLOGY OPERATIONS IN THE LOOP SPACE OF THE COMPACT EXCEPTIONAL GROUP F4

Dedicated to Professor A. Komatu on his 70-th birthday

## TAKASHI WATANABE

#### (Received April 14, 1978)

#### 1. Introduction

Let  $F_4$  be the compact, simply connected, exceptional Lie group of rank 4. In [6] we have described the Hopf algebra structure of  $H_*(\Omega F_4;Z)$ . Using this thoroughly, we can compute the action of the mod p Steenrod algebra  $\mathcal{A}_p$ on  $H^*(\Omega F_4;Z_p)$  for every prime p. But here we deal with the cases p=2 (Theorem 4) and p=3 (Theorem 5) only, because in the other cases the result follows immediately from a spectral sequence argument for the path fibration  $\Omega F_4 \rightarrow$  $PF_4 \rightarrow F_4$ .

Let  $C(=C_s)=T^1 \cdot Sp(3)$  in the notation of [3], which is a closed connected subgroup of  $F_4$ . Then in [6] the homogeneous space  $F_4/C$  has been found to be a generating variety for  $F_4$ . That is, there exists a map  $f_s: F_4/C \to \Omega F_4$  such that the image of  $f_{s^*}: H_*(F_4/C; Z) \to H_*(\Omega F_4; Z)$  generates the Pontrjagin ring  $H_*(\Omega F_4; Z)$ . In this situation Bott [1, §6] asserted that the Steenrod operations in  $H^*(\Omega F_4; Z_p)$  can be deduced from their effect on  $H^*(F_4/C; Z_p)$ . This is the motive of our work.

Throughout the paper X will always denote any connected space such that  $H_*(X; Z)$  is of finite type.

#### 2. The generating variety

In this section we shall compute the  $\mathcal{A}_p$ -module structure of  $H^*(F_4/C; Z_p)$  for p=2 and 3.

First since C contains a maximal torus T of  $F_4$ , we have a commutative diagram

We require the following notations and results (2.2)-(2.6), whose details can be found in  $[3, \S4]$ :

(2.2)  $H^*(BT; Z) = Z[t, y_1, y_2, y_3]$  where deg  $t = \deg y_i = 2$  (i=1, 2, 3).

Put  $z_i = y_i(t-y_i) \in H^4(BT; Z)$  and let  $q_i = \sigma_i(z_1, z_2, z_3) \in H^{4i}(BT; Z)$  for i=1, 2, 3 where  $\sigma_i$  denotes the *i*-th elementary symmetric function. Then we have

- (2.3)  $H^*(BC; Z) = Z[t, q_1, q_2, q_3]$  where deg t=2 and deg  $q_i=4i$  (i=1, 2, 3).
- (2.4)  $\rho^{*}(t) = t \text{ and } \rho^{*}(q_i) = q_i \ (i=1, 2, 3)$ .

On the other hand we have

(2.5)  $H^*(F_4/C; Z) = Z[t, u, v, w]/(t^3 - 2u, u^2 - 3t^2v + 2w, 3v^2 - t^2w, v^3 - w^2)$  where deg t=2, deg u=6, deg v=8 and deg w=12.

(2.6) 
$$j^{*}(t) = t, j^{*}(q_1) = t^2, j^{*}(q_2) = 3v \text{ and } j^{*}(q_3) = w$$
.

We shall say that an  $\mathcal{A}_p$ -action on  $H^*(X; Z_p)$  is *non-trivial* if it does not follow directly from the axioms 1), 4) or 5) of [4, p.1 and p.76]. With these preliminaries we have

**Proposition 1.** The non-trivial  $A_2$ -action on

$$H^*(F_4/C; Z_2) = Z_2[t, u, v, w]/(t^3, u^2 - t^2v, v^2 - t^2w, v^3 - w^2)$$

is given by:

(1)  $Sq^2(t) = t^2$ .

(2) 
$$Sq^{2}(u) = v$$
,  $Sq^{4}(u) = tv$  and  $Sq^{6}(u) = t^{2}v$ .

- (3)  $Sq^{2}(v) = 0$ ,  $Sq^{4}(v) = w$ ,  $Sq^{6}(v) = tw$  and  $Sq^{8}(v) = v^{2}$ .
- (4)  $Sq^2(w) = tw, Sq^4(w) = 0, Sq^6(w) = 0, Sq^8(w) = vw, Sq^{10}(w) = tvw$ and  $Sq^{12}(w) = w^2$ .

Proof. (1) and the last equalities in (2), (3) and (4) are immediate from the axiom 3) of [4, p.1].

First we consider (3) and (4). Since  $v=j^*(q_2)$  and  $w=j^*(q_3)$  in  $H^*(F_4/C; Z_2)$  by (2.6), it suffices to determine  $Sq^i(q_2)$  and  $Sq^i(q_3)$  in  $H^*(BC; Z_2)$ . To do so, by (2.4), it suffices to compute  $Sq^i(q_2)$  and  $Sq^i(q_3)$  in  $H^*(BT; Z_2)$ . But this is a direct calculation, for  $H^*(BT; Z_2)$  is multiplicatively generated by the elements of degree 2 (see (2.2)).

Finally we show the remaining part of (2). By [3, Corollary 4.5] we may set

$$Sq^2(u) = k \cdot tu + l \cdot v$$
 and  $Sq^4(u) = m \cdot t^2 u + n \cdot tv$ 

for some  $k, l, m, n \in \mathbb{Z}_2$ . Then from the Adem relations  $Sq^2Sq^2 = Sq^3Sq^1$ ,  $Sq^2Sq^4 = Sq^6 + Sq^5Sq^1$  and  $Sq^4Sq^4 = Sq^7Sq^1$ , it follows that kl = 0, lm + n = 1 and l = n respectively. Hence k = m = 0 and l = n = 1, which proves (2).

Next we turn to the case p=3. To begin with we need some preparations. As in [6, §3], put x=t/2 and  $x_i=x-y_i$  for i=1, 2, 3. Thus  $x, x_i \in H^2$ (BT; Z[1/2]) (i=1, 2, 3). Furthermore put

$$(2.7) \quad t_1 = -x_1 + x_2, \ t_2 = x_1 + x_2, \ t_3 = -x_3 - x \ and \ t_4 = -x_3 + x$$

Note that  $t_i \in H^2(BT; Z)$  (i=1, 2, 3, 4). For later convenience we introduce the notation:

$$c_i = \sigma_i(t_1, t_2, t_3, t_4) \in H^{2i}(BT; Z);$$
  
 $p_j = \sigma_j(x_1^2, x_2^2, x_3^2) \in H^{4j}(BT; Q),$ 

where  $1 \le i \le 4$  and  $1 \le j \le 3$ . A straightforward calculation using (2.7) yields:

(2.8) 
$$c_1^2 - 2c_2 = 2(p_1 + x^2);$$
  
 $c_2^2 - 2c_3c_1 + 2c_4 = (p_1 + x^2)^2 + 2(p_2 + p_1x^2 - 3x_1^2x_2^2 - 3x_3^2x^2).$ 

We also need:

$$(2.9) \quad p_1 = -q_1 + 3x^2; \quad p_2 = q_2 - 2q_1x^2 + 3x^4.$$

This follows from [6, (3.6)].

Now put  $\gamma_1 = c_1/2$ . From the discussion in [3, §4.2] we observe that

$$H^{*}(BT; Z) = Z[t_{1}, t_{2}, t_{3}, t_{4}, \gamma_{1}]/(c_{1}-2\gamma_{1})$$

on which the Weyl group  $\Phi(F_4)$  acts as follows:

	Ĩ	$R_1$	$R_2$	$R_{3}$	$R_4$
$t_1$			$t_2$	$-t_{1}$	$t_1 - \gamma_1$
$t_2$		$t_3$	$t_1$		$t_2 - \gamma_1$
$t_3$	$t_4$	$t_2$			$t_3 - \gamma_1$
$t_4$	t <sub>3</sub>				$t_4 - \gamma_1$

This allows us to identify the  $t_i$  with that given in [5, §4(A)]. Then by [5, Theorem A] we have

(2.10) 
$$\begin{aligned} H^*(F_4/T;Z) &= Z[t_1, t_2, t_3, t_4, \gamma_1, \gamma_3, w_4]/(c_1 - 2\gamma_1, c_2 - 2\gamma_1^2, c_3 - 2\gamma_3, c_4 - 2c_3\gamma_1 \\ &+ 2\gamma_1^4 - 3w_4, -c_4\gamma_1^2 + \gamma_3^2, 3c_4\gamma_1^4 - \gamma_1^8 + 3c_3\gamma_1w_4 + 3w_4^2, w_4^3) \end{aligned}$$
where  $\deg t_i = \deg \gamma_1 = 2$  (i=1, 2, 3, 4),  $\deg \gamma_3 = 6$  and  $\deg w_4 = 8$ .

(By abuse of notation we have written  $t_i$ ,  $c_i$ , etc. for their images under  $\iota^*$ .)

It is well known that Spin(9) is a closed connected subgroup of  $F_4$ , and

the homogeneous space  $F_4$ /Spin(9) can be identified with the Cayley projective plane  $\Pi$ , whose integral cohomology is given by:

(2.11) 
$$H^*(\Pi; Z) = Z[w]/(w^3)$$
 where deg  $w = 8$ .

Since  $T \subset \text{Spin}(9) \subset F_4$ , we have a natural map

$$F_4/T \xrightarrow{p} F_4/\text{Spin} (9) = \Pi$$

Then it follows from [5, (6.9)] that

(2.12)  $p^*(w) = w_4$ .

The following result may be of independent interest.

Lemma 2.  $q^{*}(v) = w_4 + x_1^2 x_2^2 + x_3^2 x^2 + 2x^4$  in  $H^{*}(F_4/T; Z)$ .

Proof. From (2.6), the commutativity of (2.1), and (2.4) we see that  $q^*(v) = q_2/3 \in H^8(F_4/T; Z)$ . (2.10), together with (2.8) and (2.9), gives:

$$w_4 = \frac{1}{3} (c_4 - c_3 c_1 + \frac{1}{2} c_2^2)$$
  
=  $\frac{1}{3} (p_2 + p_1 x^2 - 3x_1^2 x_2^2 - 3x_3^2 x^2)$   
=  $\frac{1}{3} q_2 - x_1^2 x_2^2 - x_3^2 x^2 - 2x^4$ .

Combining these we get the result. (It is easy to verify that  $x_1^2x_2^2+x_3^2x^2+2x^4$  is in fact an integral class.)

**Proposition 3.** The non-trivial  $A_3$ -action on

$$H^{*}(F_{4}/C; Z_{3}) = Z[t,v]/(t^{8}, v^{3})$$

is given by:

(1) 
$$\mathcal{O}^{1}(t) = t^{3}$$
.  
(2)  $\mathcal{O}^{1}(v) = -t^{6}, \mathcal{O}^{2}(v) = 0, \mathcal{O}^{3}(v) = 0$  and  $\mathcal{O}^{4}(v) = 0$ 

Proof. (1) and the last equality in (2) are immediate from the axiom 3) of [4, p.76].

To show (2), we must compute  $\mathcal{O}^i(v)$  for i=1,2,3. Since  $q^*: H^*(F_4/C; Z) \rightarrow H^*(F_4/T; Z)$  is a split monomorphism (see [3, §3]) and its image is known with  $Z_3$ -coefficients (see Lemma 2), it suffices to determine  $q^*(\mathcal{O}^i(v))$  in  $H^*(F_4/T; Z_3)$ . (2.10) and the same calculation as in (2.8) yield:

T. WATANABE

$$\begin{split} H^*(F_4/T;Z_3) &= Z_3[t_1,t_2,t_3,t_4,w_4]/(c_2+c_1^2,c_4-c_3c_1-c_1^4, \\ & c_3^2-c_4c_1^2,c_1^8,w_4^3) \\ &= Z_3[x_1,x_2,x_3,x,w_4]/(x_1^2+x_2^2+x_3^2+x^2,x_2^4+x_2^2x_3^2+x_3^4+x_2^2x_3^2+x_3^2x_2^2+x_3^2x_2^2+x_3^2x_3^2+x_3^4+x_3^6+x_3^4x_2^2+x_3^2x_4^4+x_6^6,x^8,w_4^3) \,. \end{split}$$

Moreover (2.12) and (2.11) imply that  $\mathcal{O}^{i}(w_{4})=0$  for all  $i \geq 1$ . Therefore we have

$$egin{aligned} q^*(\mathcal{O}^1(v)) &= \mathcal{O}^1(q^*(v)) \ &= \mathcal{O}^1(x_1^2x_2^2 + x_3^2x^2 - x^4) \ &= -x_1^4x_2^2 - x_1^2x_2^4 - x_3^4x^2 - x_3^2x^4 - x^6 \ &= -x^6 \,. \end{aligned}$$

So since  $q^*(t) = -x$  it follows that  $\mathcal{O}^1(v) = -t^6$ . Using the Adem relation  $\mathcal{O}^2 = -\mathcal{O}^1 \mathcal{O}^1$ , we also get  $\mathcal{O}^2(v) = 0$ . Finally we consider  $\mathcal{O}^3(v)$ . By [3, Corollary 4.5] we may set

$$\mathcal{O}^{3}(v) = k \cdot t^{6}v + l \cdot t^{2}v^{2}$$

for some  $k, l \in Z_3$ . Then  $q^*(\mathcal{O}^3(v)) = k \cdot x^6 w_4 + l \cdot x^2 w_4^2 + \cdots$ . On the other hand notice that  $\mathcal{O}^3(q^*(v))$  does not involve  $x^6 w_4$  or  $x^2 w_4^2$ , and they are linearly independent in  $H^{20}(F_4/T; Z_3)$ . This implies that k = l = 0 as required.

### 3. Main results

As seen in [6], the algebraic description of  $H_*(\Omega F_4; Z)$  is much easier than that of  $H^*(\Omega F_4; Z)$ . For this reason we shall treat the right  $\mathcal{A}_p$ -action on  $H_*(X; Z_p)$  which dualizes to the usual left  $\mathcal{A}_p$ -action on  $H^*(X; Z_p)$ .

We first consider the case p=2 and follow the notation of [2]. For  $i \ge 0$  let ()Sq<sup>i</sup> be the dual to Sq<sup>i</sup>(). Then these operations have the following properties (cf. [4, p. 1]):

- (3.1) ()  $Sq^i: H_n(X; Z_2) \to H_{n-i}(X; Z_2)$ .
- (3.2) If deg  $\alpha < 2i$ ,  $(\alpha)Sq^i = 0$ .
- (3.3) If deg  $\alpha = 2i$ ,  $(\alpha)Sq^i = \sqrt{\alpha}$  where  $\sqrt{-}$  is the dual of the squaring map for  $Z_2$ -algebras.
- (3.4) (diagonal Cartan formula) Let  $\psi: H_*(X; Z_2) \rightarrow H_*(X; Z_2) \otimes H_*(X; Z_2)$ be the coproduct (induced from the diagonal map  $\Delta: X \rightarrow X \times X$ ). If  $\psi(\alpha) = \sum \alpha' \otimes \alpha''$ , then

$$\psi((\alpha)Sq^k) = \sum_{i+j=k} (\alpha')Sq^i \otimes (\alpha'')Sq^j.$$

Suppose now that X is an H-space, and  $\alpha \cdot \beta$  denotes the Pontrjagin product of  $\alpha$  and  $\beta$  in  $H_*(X; Z_2)$ . Then one can readily check:

(3.5) (internal Cartan formula)

$$(\alpha \cdot \beta)Sq^k = \sum_{i+j=k} (\alpha)Sq^i \cdot (\beta)Sq^j$$
.

We shall say that an  $\mathcal{A}_2$ -action on  $H_*(X; \mathbb{Z}_2)$  is *non-trivial* if it does not follow from (3.1), (3.2) or (3.5).

Let us now consider the case  $X = \Omega F_4$ . Hereafter we shall use the notations and results of [6] without specific reference.

First we have

(3.6)  $H_*(\Omega F_4; Z_2) = Z_2[\sigma_1, \sigma_2, \sigma_5, \sigma_7, \sigma_{11}]/(\sigma_1^2)$  where deg  $\sigma_i = 2i (i=1, 2, 5, 7, 11)$ . Moreover  $\sigma_1$ ,  $\sigma'_5 = \sigma_5 + \sigma_2^2 \sigma_1$ ,  $\sigma_7$  and  $\sigma'_{11} = \sigma_{11} + \sigma_5^2 \sigma_1 + \sigma_7 \sigma_2^2$  are primitive, and  $\tilde{\psi}(\sigma_2) = \sigma_1 \otimes \sigma_1$ .

Therefore (by (3.5)) we have only to determine the ()  $Sq^i$  on the elements  $\sigma_1, \sigma_2, \sigma'_5, \sigma_7$  and  $\sigma'_{11}$ . On the other hand, (3.4) implies that for  $i \ge 1$  ()  $Sq^i$  sends a primitive element to another primitive element. In view of (3.6), the primitive elements of  $H_*(\Omega F_4; Z_2)$  which appear in degrees  $\le 22$  are:

These, together with (3.1) and (3.2), show that possible non-zero operations (among non-trivial operations) are:

Let us compute these operations. First by (3.3) we have  $(\sigma_2)Sq^2 = \sigma_1$ . Next we want to determine the coefficient  $k \in \mathbb{Z}_2$  in the equation  $(\sigma_5')Sq^2 = k \cdot \sigma_2^2$ . By use of (3.5) we have  $(\sigma_5')Sq^2 = (\sigma_5)Sq^2 + (\sigma_2^2\sigma_1)Sq^2 = (\sigma_5)Sq^2$  and so  $(\sigma_5)Sq^2 = k \cdot \sigma_2^2$ . Dualizing this gives  $Sq^2(a_4) = k \cdot b_5 + l \cdot a_5$  for some  $l \in \mathbb{Z}_2$ . Since  $f_s^*(Sq^2(a_4)) = Sq^2(f_s^*(a_4)) = Sq^2(tu) = t^2u + tv$  by use of (1) and (2) of Proposition 1, and since  $f_s^*(b_5) = t^2u + tv$  and  $f_s^*(a_5) = tv$ , it follows that k=1 (and also l=0). Thus we obtain  $(\sigma_5')Sq^2 = \sigma_2^2$ .

Instead of proceeding further, we state here a pattern of computation: The problem is to determine the coefficient  $k' \in \mathbb{Z}_2$  in the equation

$$(\alpha')Sq^i = k' \cdot \beta$$

where  $\alpha'$  and  $\beta$  are primitive. In particular  $\alpha' = \alpha + \text{decomposables and } \alpha$  is

476

the image under the mod 2 reduction of an integral class which is indecomposable. Using (3.5) we get

$$(\alpha)Sq^i = k \cdot \beta + \cdots$$

where  $k \in Z_2$  and k' determine each other. Dualizing this gives

$$Sq^i(b) = k \cdot a + \cdots$$

where a and b are dual to  $\alpha$  and  $\beta$  respectively. In particular a is the image under the mod 2 reduction of an integral class which is primitive. Since the composite

$$PH^*(\Omega F_4; Z) \xrightarrow{\subset} H^*(\Omega F_4; Z) \xrightarrow{f_s^*} H^*(F_4/C; Z)$$

is a split monomorphism, it is sufficient to consider (\*) in  $H^*(F_4/C; Z_2)$  via  $f_s^*$ . But in [6, §4] the cohomology ring  $H^*(\Omega F_4; Z)$  and its image under  $f_s^*$  have been described, and by Proposition 1 we already know the  $\mathcal{A}_2$ -action on  $H^*(F_4/C; Z_2)$ . Thus k and hence k' are computable.

In this way routine computations yield

**Theorem 4.** The non-trivial  $A_2$ -action on

$$H_{*}(\Omega F_{4}; Z_{2}) = Z_{2}[\sigma_{1}, \sigma_{2}, \sigma_{5}', \sigma_{7}, \sigma_{11}']/(\sigma_{11}^{2})$$

is given by:

(1) 
$$(\sigma_2)Sq^2 = \sigma_1$$
.  
(2)  $(\sigma'_5)Sq^2 = \sigma_2^2 \text{ and } (\sigma'_5)Sq^4 = 0$ .  
(3)  $(\sigma_7)Sq^2 = 0, (\sigma_7)Sq^4 = \sigma'_5 \text{ and } (\sigma_7)Sq^6 = 0$ .  
(4)  $(\sigma'_{11})Sq^2 = {\sigma'_5}^2, (\sigma'_{11})Sq^4 = 0, (\sigma'_{11})Sq^6 = {\sigma'_2}, (\sigma'_{11})Sq^8 = {\sigma_7} \text{ and } ({\sigma'_{11}})Sq^{10} = 0$ .

The argument for the case p=3 is similar (we have prepared Proposition 3 in place of Proposition 1) and so we only present the result.

**Theorem 5.** The non-trivial  $A_3$ -action on

$$H_{*}(\Omega F_{4}; Z_{3}) = Z_{3}[\sigma_{1}, \sigma_{3}, \sigma_{5}', \sigma_{7}', \sigma_{11}']/(\sigma_{1}^{3})$$

is given by:

- (1)  $(\sigma_3) \mathcal{P}^1 = \sigma_1$ .
- (2)  $(\sigma'_5) \mathcal{P}^1 = 0$ .

COHOMOLOGY OPERATIONS IN THE LOOP SPACE

- (3)  $(\sigma'_7)\mathcal{O}^1 = \sigma'_5 \text{ and } (\sigma'_7)\mathcal{O}^2 = 0$ .
- (4)  $(\sigma'_{11})\mathcal{P}^1 = \sigma^3_{3}, (\sigma'_{11})\mathcal{P}^2 = 0 \text{ and } (\sigma'_{11})\mathcal{P}^3 = 0.$
