Universidad Complutense. E-28040 Madrid. Spain

Abstract:

CARRASCO, M. A. 1994. *Cerinthe gymnandra* Gasparr. on the Iberian Peninsula. *Bot. Complutensis*, 19: 75-82.

We studied *Cerinthe gymnandra* Gasparr. in the Iberian Peninsula, and present a comparative table of the four varieties of the species. We also comment on two taxa described from Spain: *Cerinthe gymnandra* Gasparr. var. *iberica* Caballero and *C. major* L. var. *valentina* Pau, now included in *C. gymnandra* Gasparr. var. *gymnandra*.

Keywords: Cerinthe, Iberian Peninsula.

Resumen:

CARRASCO, M. A. 1994. *Cerinthe gymnandra* Gasparr. on the Iberian Peninsula. *Bot. Complutensis*, 19: 75-82.

Estudiamos *Cerinthe gymnandra* Gasparr. en la Península Ibérica, presentando en una tabla comparativa las características de las cuatro variedades de la especie. Comentamos además dos taxones descritos sobre materiales españoles: *C. gymnandra* Gasparr. var. *iberica* Caballero y *C. major* L. var. *valentina* Pau, incluidos actualmente en *C. gymnandra* Gasparr. var. *gymnandra*.

Palabras Clave: Cerinthe, Península Ibérica.

INTRODUCTION

The genus *Cerinthe* L., of the Mediterranean region and Central Europe , is represented on the Iberian Peninsula by two species: *C. major* L. and *C. gymnandra* Gasparr., both belonging to Section *Cerinthe* Reichenbach and closely related to each other.

Frequently, *C. gymnandra* has been regarded as a subspecies of *C. major*. The specific level of both taxa was clearly established by VALDÉS (1981), who studied this group on the Iberian Peninsula.

Considered thus, *C. major* L. is a very homogeneous species, but *C. gymnandra* Gasparr. shows great variability in its distribution. Thus, MURBECK (1898) described three varieties: *C. gymnandra* var. *gymnandra*, *C. gymnandra* var. *oranensis* and *C. gymnandra* var. *macrosiphonia*. In order to include the populations growing on the border of the Spanish provinces of Albacete and Ciudad Real, it has been necessary to describe another variety: *C. gymnandra* var. *quichiotis* (CARRASCO, 1993). To this new variety belong some herbarium materiales collected in the Southeast of the Castillian Plateau.

Kariological studies of Iberian samples of the two species have been made by GADELLA & al. (1966), FERNANDES & LEITAO (1972), LOVE & KJELLQVIST (1974), and more recently by LUQUE (1990). These authors coincide in reporting $x=8$ for both species.

MATERIALS AND METHODS

In order to establish the real variability of the *C. gymnandra* Gasparr., we made observations from living plants supplemented by herbarium studies. We took measures of 118 sheets from the herbaria MA, MAF and MACB (for abbreviations see HOLMGREM & al., 1990). From each sheet we measured 5 features:

1. Corolla length.
2. Point of stamen insertion.
3. Anther length.
4. Exertion of the anthers from the corolla tube.
5. Size of the mature nutlets.

These are the features considered of greatest diagnostic value for this group.

DISCUSSION AND RESULTS

The great diversity of *C. gymnandra* Gasparr. has resulted in the description of two taxa from Spanish plants: *C. major* var. *valentina* Pau and *C. gymnandra* var. *iberica* Caballero, opportunely included by VALDÉS (1981: 102) in *C. gymnandra* Gasparr. var. *gymnandra*. This notwithstanding, certain observations can be made abouth these taxa.

C. major L. var. *valentina* Pau, was described based on plants collected by Pau in Valencia: Sierra de Chiva, barranco de La Ládiga, 8-11-VI-1897.

Several errors concerning this taxon have accumulated, perhaps as a result of the irregular taxonomic treatment given by its author. It was published (PAU, 1897: 195) as *C. major*? L. var. *valentina*, but on the hand-written labels found with the original collections on deposit in MA, Pau respects neither the name nor the taxonomic category, referring to them as *C. valentina* Pau (MA96860) and *C. gymnandra* Gasparr. (*C. major* Willk.! loco) (MA 96833).

Additionally, the detailed locality «ad fontem El Enebro» cited in the publication appears only on the label of sample MA 96833 in which the epithet *valentina* is not given.

This may be the cause of the confusion of VALDÉS (1981) who attributes the name *C. major* var. *valentina* to specimen MA 96833 (VALDÉS, *loc. cit.*: 102) and *Cerinthe gymnandra* to specimen MA 96860 (VALDÉS, *loc. cit.*: 99).

The difficulty in interpreting Pau's handwriting has resulted in the locality of the specimen MA 96860 being transcribed by VALDÉS (*loc. cit.*: 99) as Sierra Elvira, which places in Granada materials which are actually Valencian.

Cerinthe gymnandra Gasparr. var. *iberica* Caballero was described from samples collected in Cáceres: Baños de Montemayor, 20-V-1944, Caballero, and conserved in two collections: MA 96832 and MA 96832(2).

The icon which accompanies the original description (CABALLERO, 1945: 517), permits us to recognize the holotype as the sample to the left of the three which comprise the sheet MA 96832(2), the one chosen by the author for the drawing. The other two samples which accompany it and the two other specimens which are included in MA 96832 are therefore isotypes.

Taxonomic, chorological and ecological observations

The diversity of *C. gymnandra* Gasparr. is apparent in table 1.

C. gymnandra Gasparr. var. *gymnandra*

C. major L. subsp. *gymnandra* var. *typica* (Murbeck) Sauvage & Vindt

C. gymnandra Gasparr. var. *typica* Murbeck

C. gymnandra Gasparr. var. *iberica* Caballero

C. major? L. var. *valentina* Pau

C. valentina Pau (in scheed.)

	Corolla length (in mm)	Point of stamen insertion in corolla tube	Anther length (in mm)	Exertion of anthers from the corolla tube	Nutlet size (in mm)
<i>C. gymnandra</i> var. <i>gymnandra</i>	16-21-(30)	1/2-1/3 superior	(5,5)-6-7,5-(7,8)	0-1-(1,6) (1/3 of its length)	4-4,5 x 3,2
<i>C. gymnandra</i> var. <i>quichiotis</i>	19-22	1/3 superior	7,5-8,5	4,5-6,4 (2/3 of its length)	4-4,5 x 3,1-3,2
<i>C. gymnandra</i> var. <i>oranensis</i>	12-14-(17)	1/2-1/3 superior	5-7,5	3-5 (more than 1/2 of its length)	3,5-4 x 3
<i>C. gymnandra</i> var. <i>macrosiphonia</i>	23-25-(30)	1/3 superior	6-8	3-4,5 (more than 1/2 of its length)	4,5-6 x 3,3-3,8

Table 1. Differences in the diagnostic values of the varieties of *C. gymnandra* Gasparr.

This taxon prefers acid soils, and on the Iberian Peninsula it occurs frequently along the coastal strip from Western Andalucia to Portugal and Galicia. In the interior of the Peninsula, according to RICO (1983), it is known from the provinces of Avila, Salamanca and Cáceres.

The materials distributed with no. 196 of the Exsiccata of the Grupo Botánico Gallego, third fascicle sub *Cerinthe major* L. should be included in this variety.

Cerinthe gymnandra Gasparri, var. *quichiotis* Carrasco

To the present this taxon is known only from the provinces of Ciudad Real and Albacete, where it prefers basic soils.

The specimens published as *C. major* L. (VELAYOS, 1983), belong to this variety.

MATERIAL STUDIED

Spain. Albacete: Alcaraz, La Molata [«La Mulata»], 24-V-1928, *Cuatrecasas*, MAF 1603; ibidem, 20-VI-1935, *González Albo*, MA 96778; ibidem, WH4677, en herbazales con gran humedad, 11-VI-1983, *J.
