1. Introduction and notations

The limiting behavior of fuzzy states in dynamic fuzzy systems has been studied by Kurano et al. [4] and Yoshida et al. [7]. Under a contractive condition for the fuzzy relation, [4] showed that the limiting fuzzy state is a unique solution of a fuzzy relational equation. Also, [7] discussed the limit theorem in a monotone case. In this paper, we consider the limit theorem when fuzzy relations satisfy the transitive property. We show that, in this case, the limiting fuzzy state is a solution of the fuzzy relational equation. But the equation does not necessarily have a unique solution similarly to the monotone case, therefore we need to investigate the space of the solutions of the equation.

The existence and the uniqueness of the solutions of the fuzzy relational equation has been studied by Kurano et al. [5] under some assumptions. In the transitive case, this paper makes clear the structure of the space of the solutions of the fuzzy relational equation, and we give a simple characterization of the limiting fuzzy state by the fundamental solutions for the numerical calculation of the limiting fuzzy state.

We use some notations in [5]. Let $E$ be a compact metric space. Let $C(E)$ be the collection of all non-empty closed subsets of $E$, and let $\rho$ be the Hausdorff metric on $C(E)$. Then it is well-known ([3]) that $(C(E), \rho)$ is a compact metric space. Let $\mathcal{F}(E)$ be the set of all fuzzy sets $\tilde{s} : E \to [0,1]$ which are upper semi-continuous and satisfy $\sup_{x \in E} \tilde{s}(x) = 1$. For $\tilde{s} \in \mathcal{F}(E)$, the $\alpha$-cut $\tilde{s}_\alpha$, $\alpha \in [0,1]$, is defined by

$$\tilde{s}_\alpha := \{x \in E \mid \tilde{s}(x) \geq \alpha\} \quad (\alpha \neq 0) \quad \text{and} \quad \tilde{s}_0 := \text{cl}\{x \in E \mid \tilde{s}(x) > 0\},$$

where cl means the closure of a set. Let $\tilde{q} : E \times E \to [0,1]$ be a fuzzy relation on $E$ satisfying $\tilde{q}(x, \cdot) \in \mathcal{F}(E)$ for $x \in E$. A fuzzy relation $\tilde{q}$ is called "transitive" (see Klir and Yuan [2]) if it satisfies

$$\tilde{q}(x, y) \geq \sup_{z \in E} \{\tilde{q}(x, z) \wedge \tilde{q}(z, y)\}, \quad x, y \in E.$$

Throughout this paper, we assume $\tilde{q}$ is transitive. In Sections 1 and 2, we consider the space of solutions $\tilde{p} \in \mathcal{F}(E)$ of the following fuzzy relational equation (see [5]):

$$\tilde{p}(y) = \sup_{x \in E} \{\tilde{p}(x) \wedge \tilde{q}(x, y)\}, \quad y \in E,$$

(1)

where $a \wedge b := \min\{a, b\}$ for real numbers $a$ and $b$. By the solutions of (1) (see [4, 7] for contractive/monotone fuzzy relations), in Section 3 we discuss the limiting behavior of the sequence of fuzzy states $\{\tilde{s}_n\}_{n=0}^{\infty} \subset \mathcal{F}(E)$ with an initial fuzzy state $\tilde{s} \in \mathcal{F}(E)$ which is defined by

$$\tilde{s}_0 := \tilde{s}, \quad \text{and} \quad \tilde{s}_{n+1}(y) := \sup_{x \in E} \{\tilde{s}_n(x) \wedge \tilde{q}(x, y)\}, \quad y \in E \quad \text{for} \quad n = 0, 1, 2, \ldots.$$  

(2)
Crisp sets $\tilde{q}_\alpha(x)$ ($x \in E$, $\alpha \in [0,1]$) are defined by

$$\tilde{q}_\alpha(x) := \left\{ \begin{array}{ll} \{y \in E \mid \tilde{q}(x,y) \geq \alpha\} & \text{for } \alpha \neq 0 \\ \text{cl}\{y \in E \mid \tilde{q}(x,y) > 0\} & \text{for } \alpha = 0. \end{array} \right.$$ 

In this paper, we assume the map $\tilde{q}_\alpha(\cdot) : E \mapsto C(E)$ is continuous for all $\alpha \in [0,1]$. We also define $\tilde{q}_\alpha(D) := \bigcup_{x \in D} \tilde{q}_\alpha(x)$ for $D \in C(E)$, and then we note that $\tilde{q}_\alpha : C(E) \mapsto C(E)$. For $x \in E$ and $\alpha \in [0,1]$, a sequence $\{\tilde{q}_\alpha^n(x)\}_{n=0}^\infty \subset C(E)$ is defined iteratively by

$$\tilde{q}_\alpha^0(x) := \{x\}, \quad \text{and} \quad \tilde{q}_\alpha^{n+1}(x) := \tilde{q}_\alpha(\tilde{q}_\alpha^n(x)), \quad n = 0, 1, 2, \cdots.$$ 

Then we have the following lemma for a sequence of fuzzy relations $\{\tilde{q}^n\}_{n=1}^\infty$ defined by

$$\tilde{q}^{n+1}(x,y) := \sup_{z \in E} \{\tilde{q}^n(x,z) \wedge \tilde{q}(z,y)\}, \quad x, y \in E \quad \text{for } n = 1, 2, \cdots.$$ 

(3)

**Lemma 1.1.** The following (i) and (ii) hold:

(i) For all $n = 1, 2, \cdots$,

$$\tilde{q}^n(x,y) \geq \tilde{q}^{n+1}(x,y), \quad x, y \in E,$$ 

and

$$\tilde{q}_\alpha^{n+1}(x) \subset \tilde{q}_\alpha^n(x), \quad x \in E, \ \alpha \in [0,1].$$ 

(ii) $\tilde{q}^n(x,x) = \tilde{q}(x,x)$ for all $x \in E$ and $n = 1, 2, \cdots$.

Let

$$R_\alpha := \left\{ x \in E \mid x \in \bigcup_{n=1}^\infty \tilde{q}_\alpha^n(x) \right\}, \quad \alpha \in [0,1].$$ 

Each state of $R_\alpha$ is called "$\alpha$-recurrent" (see [8]). From Lemma 1.1(i), we have

$$R_\alpha = \{ x \in E \mid \tilde{q}(x,x) \geq \alpha \}, \quad \alpha \in (0,1].$$ 

Let $x \in E$. The following crisp sets are used in [5] to analyze the solutions of (1):

$$F_\alpha(x) := \bigcup_{n=0}^\infty \tilde{q}_\alpha^n(x),$$ 

and

$$\hat{F}_\alpha(x) := \bigcap_{\alpha' < \alpha} \text{cl}\{F_{\alpha'}(x)\} (\alpha \neq 0) \quad \text{and} \quad \hat{F}_0(x) := \text{cl}\{F_0(x)\}.$$ 

In the transitive case, by Lemma 1.1(i) they are reduced to the following (7):

$$\hat{F}_\alpha(x) = \{x\} \cup \tilde{q}_\alpha(x), \quad x \in E, \ \alpha \in [0,1].$$ 

(7)

Especially we have

$$\hat{F}_\alpha(z) = \tilde{q}_\alpha(z), \quad z \in R_1, \ \alpha \in [0,1].$$ 

(8)

Therefore, we obtain the following lemma.

**Lemma 1.2** (Kurano et al. [5, Lemma 1.2(i) and Theorem 2.1(ii)]).
(i) For $\tilde{p} \in \mathcal{F}(E)$, $\tilde{p}$ satisfies (1) if and only if
\[
\tilde{q}_{\alpha}(\tilde{p}_{\alpha}) = \tilde{p}_{\alpha}, \quad \alpha \in [0,1].
\] (9)

(ii) Let $z \in R_1$. Define a fuzzy state
\[
\tilde{p}^z(x) := \sup_{\alpha \in [0,1]} \{ \alpha \wedge \tilde{q}_{\alpha}(x) \} = \tilde{q}(z,x), \quad x \in E.
\] (10)

Then $\tilde{p}^z \in \mathcal{F}(E)$ satisfies (1).

2. The space of the solutions

We put $\mathcal{P} := \{ \tilde{p} \in \mathcal{F}(E) \mid \tilde{p} \text{ is a solution of (1)} \}$. Then the space $\mathcal{P}$ has the following property:

Lemma 2.1 (Kurano et al. [5, Theorem 2.2(ii)]). Let $\tilde{p}^k \in \mathcal{P}$ ($k = 1, 2, \cdots, l$), and let $\{ \alpha^k \in [0,1] \mid k = 1, 2, \cdots, l \}$ satisfy $\sup_{k=1,2,\cdots,l} \alpha^k = 1$. Put
\[
\tilde{p}(x) := \max_{k=1,2,\cdots,l} \{ \alpha^k \wedge \tilde{p}^k(x) \}, \quad x \in E.
\] (11)

Then $\tilde{p} \in \mathcal{P}$.

The purpose of this section is to prove an inverse of the statement of Lemma 2.1. Namely, we represent general solutions $\tilde{p} \in \mathcal{P}$ of (1) by the fundamental solutions $\tilde{p}^z$ of (10). From now on, we assume $R_1 \neq \emptyset$. We identify the states of $R_1$ with respect to the following equivalent relation $\sim$ on $R_1$ (see [5] and (8)): For $z_1, z_2 \in R_1$,
\[
z_1 \sim z_2 \quad \text{means that} \quad z_1 \in \tilde{q}_1(z_2) \text{ and } z_2 \in \tilde{q}_1(z_1).
\]

Then we put $R_1^\sim := R_1 / \sim$.

Assumption A. Let $\alpha \neq 0$ and $A \in \mathcal{C}(E)$. If $\tilde{q}_\alpha(A) = A$ holds, then
\[
R_\alpha \cap A \subset \bigcup_{z \in R_1^\sim} \tilde{q}_\alpha(z).
\]

From now on, we suppose that Assumption A holds (c.f. [5, Assumption A3]).

Theorem 2.1. Let $\tilde{p}$ be a solution of (1). Then, there exists a family of coefficients $\{ \alpha^z \in [0,1] \mid z \in R_1^\sim \}$ satisfying $\sup_{z \in R_1^\sim} \alpha^z = 1$ and
\[
\tilde{p}(x) = \sup_{z \in R_1^\sim} \{ \alpha^z \wedge \tilde{p}^z(x) \} = \sup_{z \in R_1^\sim} \{ \alpha^z \wedge \tilde{q}(z,x) \}, \quad x \in E.
\] (12)
3. A Limit Theorem

We use the convergency of fuzzy states in the following sense.

**Definition** (see [7]). Let $\tilde{s}_n, \tilde{p} \in \mathcal{F}(E)$. Then

$$\lim_{n \to \infty} \tilde{s}_n = \tilde{p} \text{ means } \rho(\tilde{s}_n, \tilde{p}_\alpha) \to 0 \ (n \to \infty) \text{ for all } \alpha \in [0, 1],$$

where $\tilde{s}_n,\alpha$ are the $\alpha$-cuts of $\tilde{s}_n$ and $\rho$ is the given Hausdorff metric.

Fix an initial fuzzy state $\tilde{s} \in \mathcal{F}(E)$. In this section, first we discuss the convergence of the sequence of fuzzy states $\{\tilde{s}_n\}_{n=0}^\infty$ defined by (2), and we prove the limiting fuzzy state is a solution of the fuzzy relational equation (1). Next, we give a representation of the limiting fuzzy state for the numerical calculation, by using the characterization (12).

**Lemma 3.1.** Let $\alpha \in [0, 1]$. Then

$$\lim_{n \to \infty} \tilde{s}_{n,\alpha} = \cap_{n \geq 1} \bigcup_{x \in \tilde{s}_\alpha} \tilde{q}_{\alpha}^n(x) = \bigcup_{x \in \tilde{s}_\alpha} \cap_{n \geq 1} \tilde{q}_{\alpha}^n(x). \quad (13)$$

We use the following lemma to construct the limiting fuzzy state.

**Lemma 3.2** ([4, 6]). Let a family of subsets $\{D_\alpha \mid \alpha \in [0, 1]\} \subset C(E)$ satisfies the following conditions (a) and (b):

(a) $D_\alpha \subset D_{\alpha'}$ for $0 \leq \alpha' < \alpha \leq 1$.

(b) $\lim_{\alpha' \uparrow \alpha} D_{\alpha'} = D_\alpha$ for $\alpha \in (0, 1]$.

Then $\tilde{s}(x) := \sup_{\alpha \in [0, 1]} \{\alpha \wedge 1_{D_\alpha}(x)\}$, $x \in E$, satisfies $\tilde{s} \in \mathcal{F}(E)$ and $\tilde{s}_\alpha = D_\alpha$ for all $\alpha \in [0, 1]$, where $1_D$ denotes the characteristic function of a set $D \in C(E)$.

From Lemma 3.1, we define

$$\tilde{p}(x) := \sup_{\alpha \in [0, 1]} \{\alpha \wedge 1_{D_\alpha}(x)\}, \ x \in E,$$

where

$$D_\alpha := \lim_{n \to \infty} \tilde{s}_{n,\alpha} = \cap_{n \geq 1} \bigcup_{x \in \tilde{s}_\alpha} \tilde{q}_{\alpha}^n(x) = \bigcup_{x \in \tilde{s}_\alpha} \cap_{n \geq 1} \tilde{q}_{\alpha}^n(x), \ \alpha \in [0, 1]. \quad (15)$$

**Theorem 3.1.** $\tilde{p}$ has the following property (i) and (ii):

(i) $\tilde{p} = \lim_{n \to \infty} \tilde{s}_n \in \mathcal{F}(E)$.

(ii) $\tilde{p}$ is a solution of (1).

Finally, by using the limit theorem (Theorem 3.1) and the characterization of the solutions of the fuzzy relational equation (Theorem 2.1), we give a simple representation of the limiting fuzzy state $\tilde{p}$ for the numerical calculation (Section 4).
Theorem 3.2. The coefficients in Theorem 2.1 are given by

$$\alpha^z = \hat{q}(\hat{s})(z) = \hat{p}(z), \quad z \in R_1^\sim,$$

where $\hat{q}(\hat{s})(z) = \sup_{x \in E} \{\hat{s}(x) \wedge \hat{q}(x, z)\}$. Namely,

$$\hat{p}(x) = \sup_{z \in R_1^\sim} \{\hat{q}(\hat{s})(z) \wedge \hat{q}(z, x)\} = \sup_{z \in R_1^\sim} \{\hat{p}(z) \wedge \hat{q}(z, x)\}, \quad x \in E.$$

4. A numerical example

We consider a one-dimensional numerical example to illustrate our results in Sections 2 and 3. Let $E = [-2, 2]$. We give the transitive fuzzy relation $\hat{q}$ (see Fig.1) by

$$\hat{q}(x, y) = \begin{cases} 
\left( \frac{f(y) + y - 2x}{y - x} \vee 0 \right) \wedge 1 & \text{if } xy > 0, \ y \neq -1, 1 \\
1 & \text{if } y = 0 \\
1 & \text{if } x \geq 1, \ y = 1 \\
1 & \text{if } x \leq -1, \ y = -1 \\
0 & \text{otherwise},
\end{cases}$$

where $f(y) := y^5 - 2y^3 + 2y$, and we put $a \vee 0 := \max\{a, 0\}$ and $a \wedge 1 := \min\{a, 1\}$ for real numbers $a$. The $\alpha$-cut of fuzzy relation $\hat{q}$ is written as follows (see Fig.2):

$$\hat{q}_\alpha(x) := \begin{cases} 
[0, \hat{q}_\alpha(x)^*] & \text{if } x \geq 0 \\
[\hat{q}_\alpha(x)^*, 0] & \text{if } x < 0,
\end{cases}$$

where

$$\hat{q}_\alpha(x)^* := \begin{cases} 
\max \hat{q}_\alpha(x) & \text{if } x \geq 0 \\
\min \hat{q}_\alpha(x) & \text{if } x < 0.
\end{cases}$$

Figure 1. The transitive fuzzy relation $\hat{q}(x, y)$. 
We can easily check $\tilde{q}$ is transitive (c.f. (5)) since the transitivity is equivalent to
\[ \tilde{q}^2_{\alpha}(x) \subset \tilde{q}_{\alpha}(x), \quad x \in E, \ \alpha \in [0,1]. \] (20)
It is trivial that the map $\tilde{q}_\alpha(\cdot) : E \mapsto C(E)$ is continuous for all $\alpha \in [0,1]$. Then, we have
\[ R_1^\sim = R_1 = \{-1,0,1\} \text{ and } R_\alpha = \{-1,0,1\} \ (\alpha \in [0,1]). \]
If $A \in C(E)$ satisfies $\tilde{q}_\alpha(A) = A$ for some $\alpha \in (0,1]$, then $A = \{0\}$ or $[-1,0]$ or $[0,1]$ or $[-1,1]$. Therefore, we can easily check that $\tilde{q}$ satisfies Assumption A. From Theorem 3.2, we have the coefficients
\[ \alpha^{\tilde{q}}(\tilde{s})(z) = \sup_{x \in E} \{ \tilde{s}(x) \wedge \tilde{q}(x,z) \} = \begin{cases} 1 & \text{if } z = 0 \\ \sup_{x \leq -1} \tilde{s}(x) & \text{if } z = -1 \\ \sup_{x \geq 1} \tilde{s}(x) & \text{if } z = 1 \end{cases} \] (21)
since we get $\tilde{q}(x,0) = 1$, $\tilde{q}(x,-1) = 1_{[-2,-1]}(x)$ and $\tilde{q}(x,1) = 1_{[1,2]}(x)$ from (18). From (18) and (10), we get the fundamental solutions of (1):
\[ p^x(z,x) = \tilde{q}(z,x) = \begin{cases} 1_{(0)}(x) & \text{if } z = 0 \\ 1_{[-1,0]}(x) & \text{if } z = -1 \\ 1_{[0,1]}(x) & \text{if } z = 1. \end{cases} \] (22)
For example, we put an initial fuzzy state $\tilde{s}$ by
\[ \tilde{s}_0(x) = \tilde{s}(x) = \max\{1 - |x - 1/2|, 0\}, \quad x \in E. \]
Then, from (21), we have $\alpha^0 = 1$, $\alpha^{-1} = 0$ and $\alpha^1 = 1/2$. By Theorem 3.1, the sequence of fuzzy states $\{\tilde{s}_n\}_{n=0}^\infty$ converges to the limiting fuzzy state $\tilde{p}$. Therefore, from (21), (22) and Theorem 3.2, we obtain the limiting fuzzy state

$$\tilde{p}(x) = \max_{z=-1,0,1} \{\alpha^z \wedge p^z(x)\} = 1_{\{0\}}(x) \vee \{1/2 \wedge 1_{[0,1]}(x)\} = \begin{cases} 1 & \text{if } x = 0 \\ 1/2 & \text{if } 0 < x \leq 1 \\ 0 & \text{otherwise.} \end{cases}$$
