

“Intelligent Ensemble” Projections of Precipitation and Surface Radiation in support of Agricultural Climate Change Adaptation

Patrick C. Taylor and Noel C. Baker
NASA Langley Research Center
Climate Science Branch
4 May 2015

Special Acknowledgement: Noel Baker, NASA Postdoctoral Researcher
This presentation is heavily drawn from her research.

Motivation: Climate influences Society

A location climate influences

- Agriculture
- Energy needs
- Water availability
- Infrastructure
- Building codes

Earth's climate is changing.

Data source: NASA's Goddard Institute for Space Studies (GISS). Credit: NASA/GISS

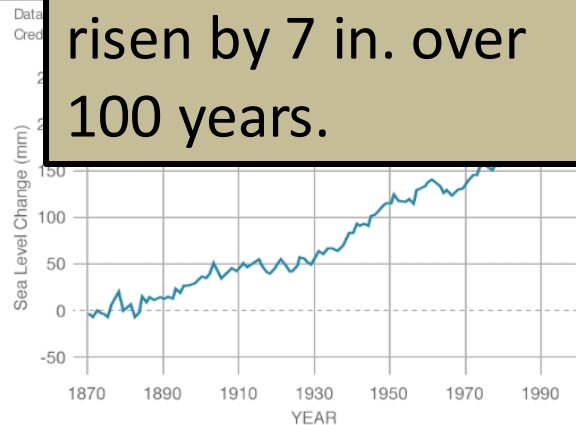

Global mean surface temperature has risen 1.4°F since 1880.

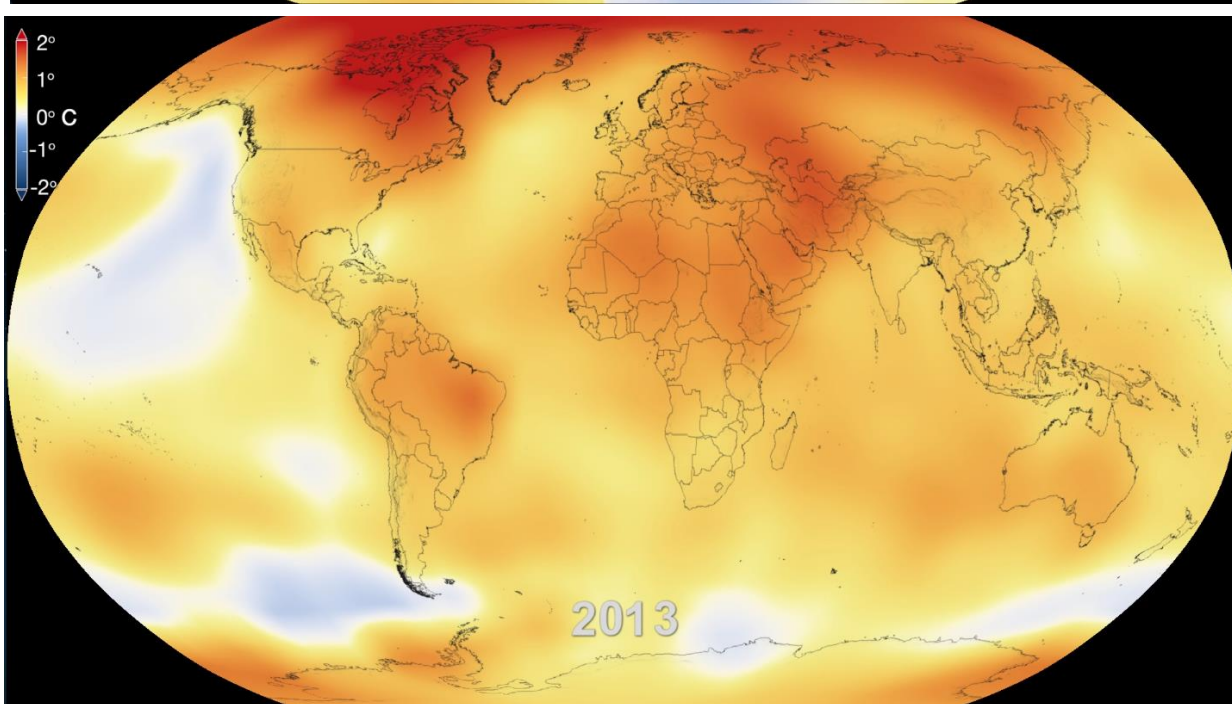

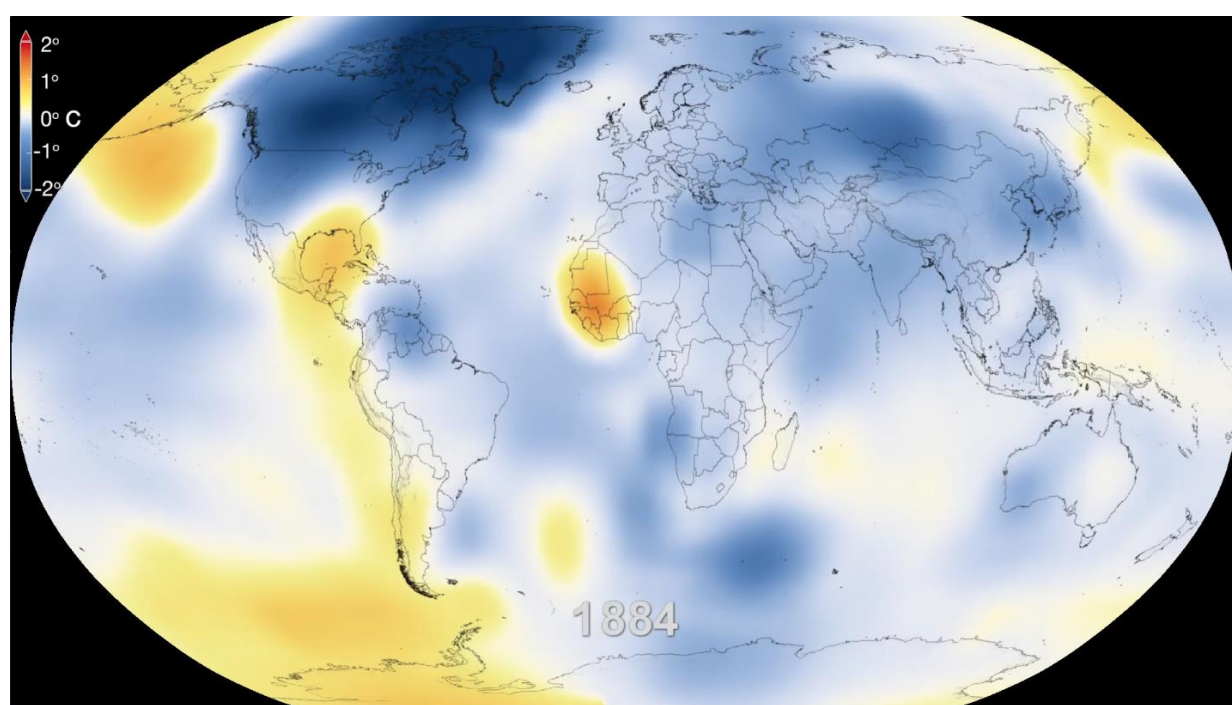

September Arctic sea ice decline at 13% per year.

Global sea level has risen by 7 in. over 100 years.

Record Extremes

Climate change is global but with a regional character.

Adaptation Planning is required

GOVERNOR'S COMMISSION ON CLIMATE CHANGE

Final Report: A Climate Change Action Plan

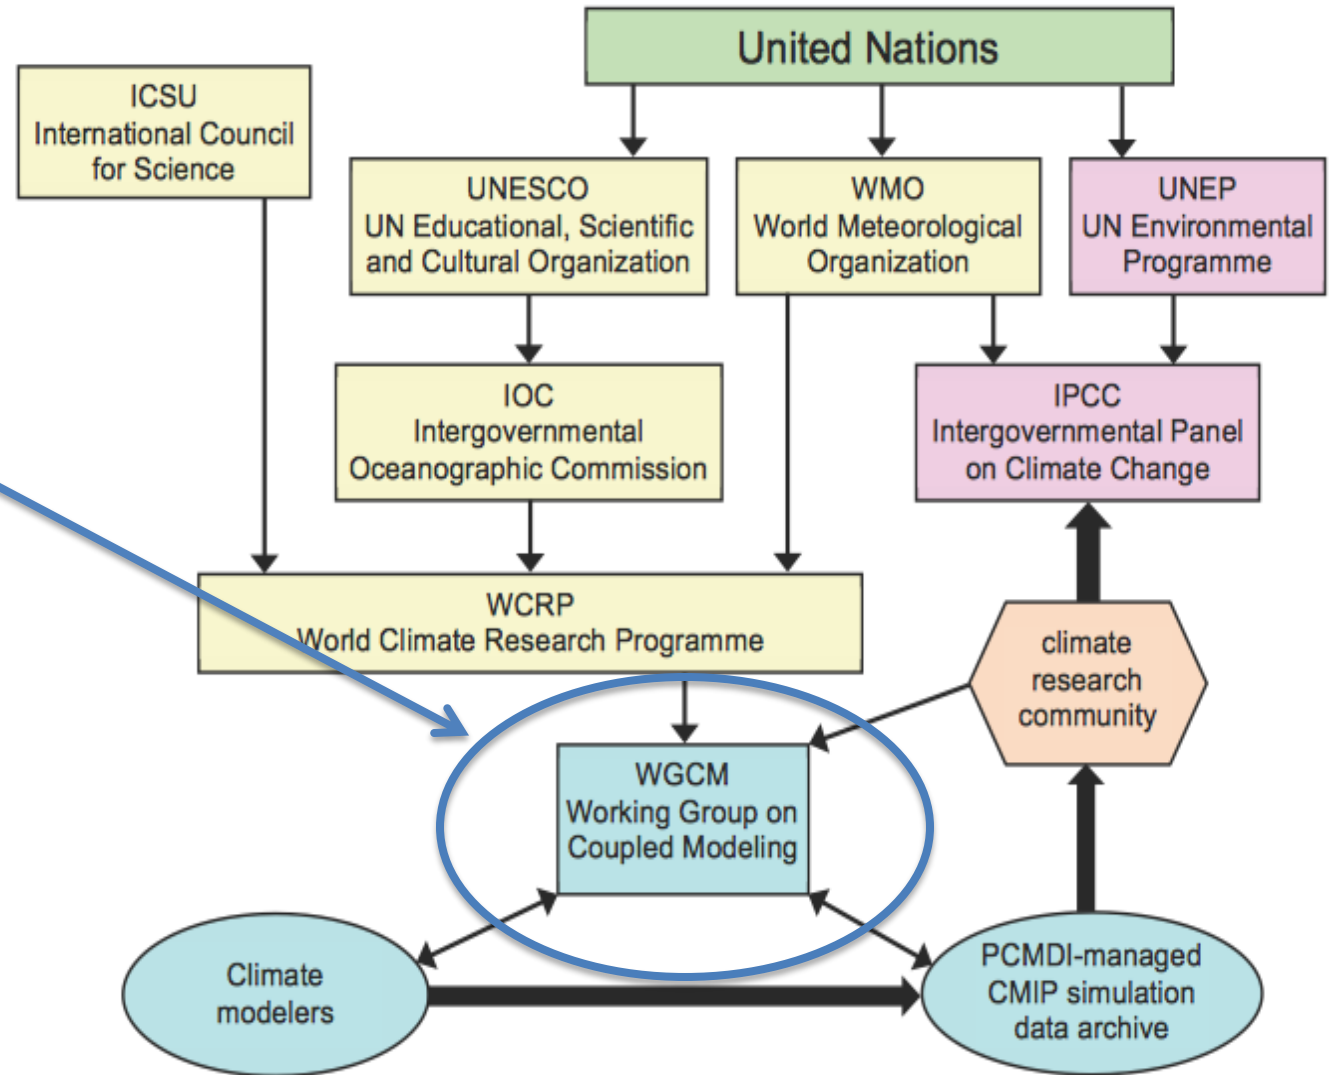

December 15, 2008

The Honorable L. Preston Bryant, Jr.
Secretary of Natural Resources
Chair, Governor's Commission on Climate Change

Climate projections are necessary.

Coupled Model Intercomparison Project 5 (CMIP5)

Taylor et al. (2012; BAMS)

FIG. 1. The relationship of CMIP5 to organizations established to coordinate climate research activities internationally and to the IPCC, the modeling centers, and the climate research community.

Expected Changes: Constructing climate projections

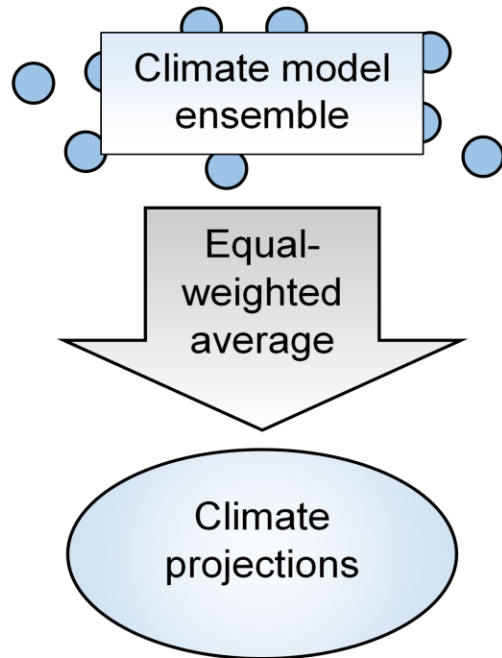

Projected
Temperature
Change:
2-6°C (4-10°F)
by 2100

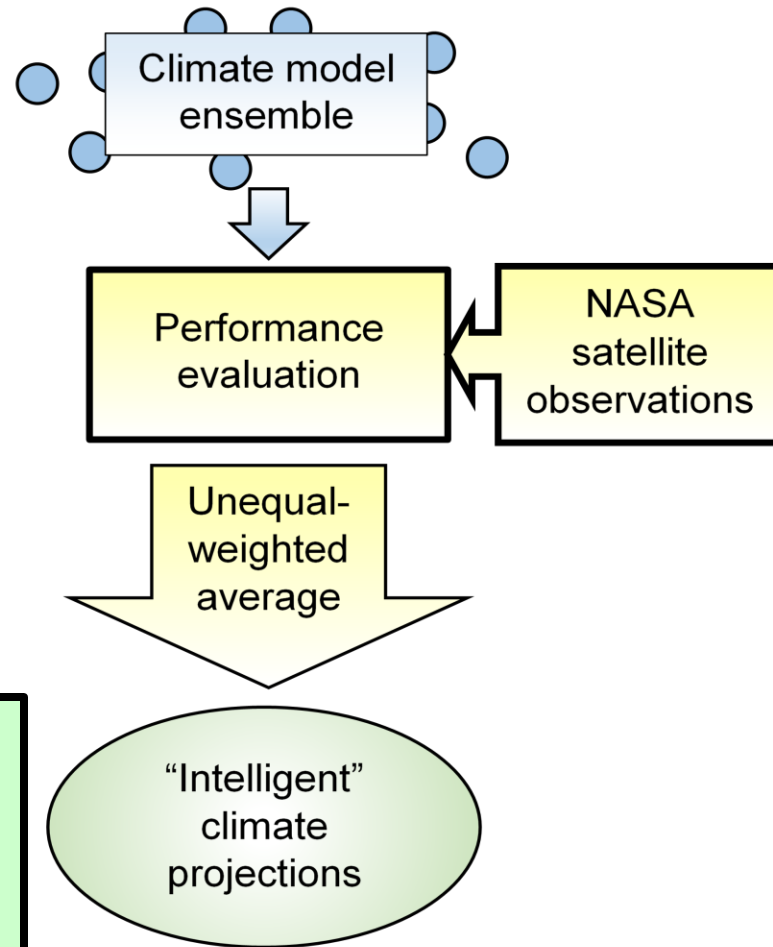

Conventional Ensemble Projection Approach:
One model, one vote

Conventional vs. “Intelligent” Ensemble Method

Conventional method

Proposed “intelligent” method

New methodology synergistically uses NASA observations and model strengths and weaknesses to improve climate projections.

NASA Earth Science Missions

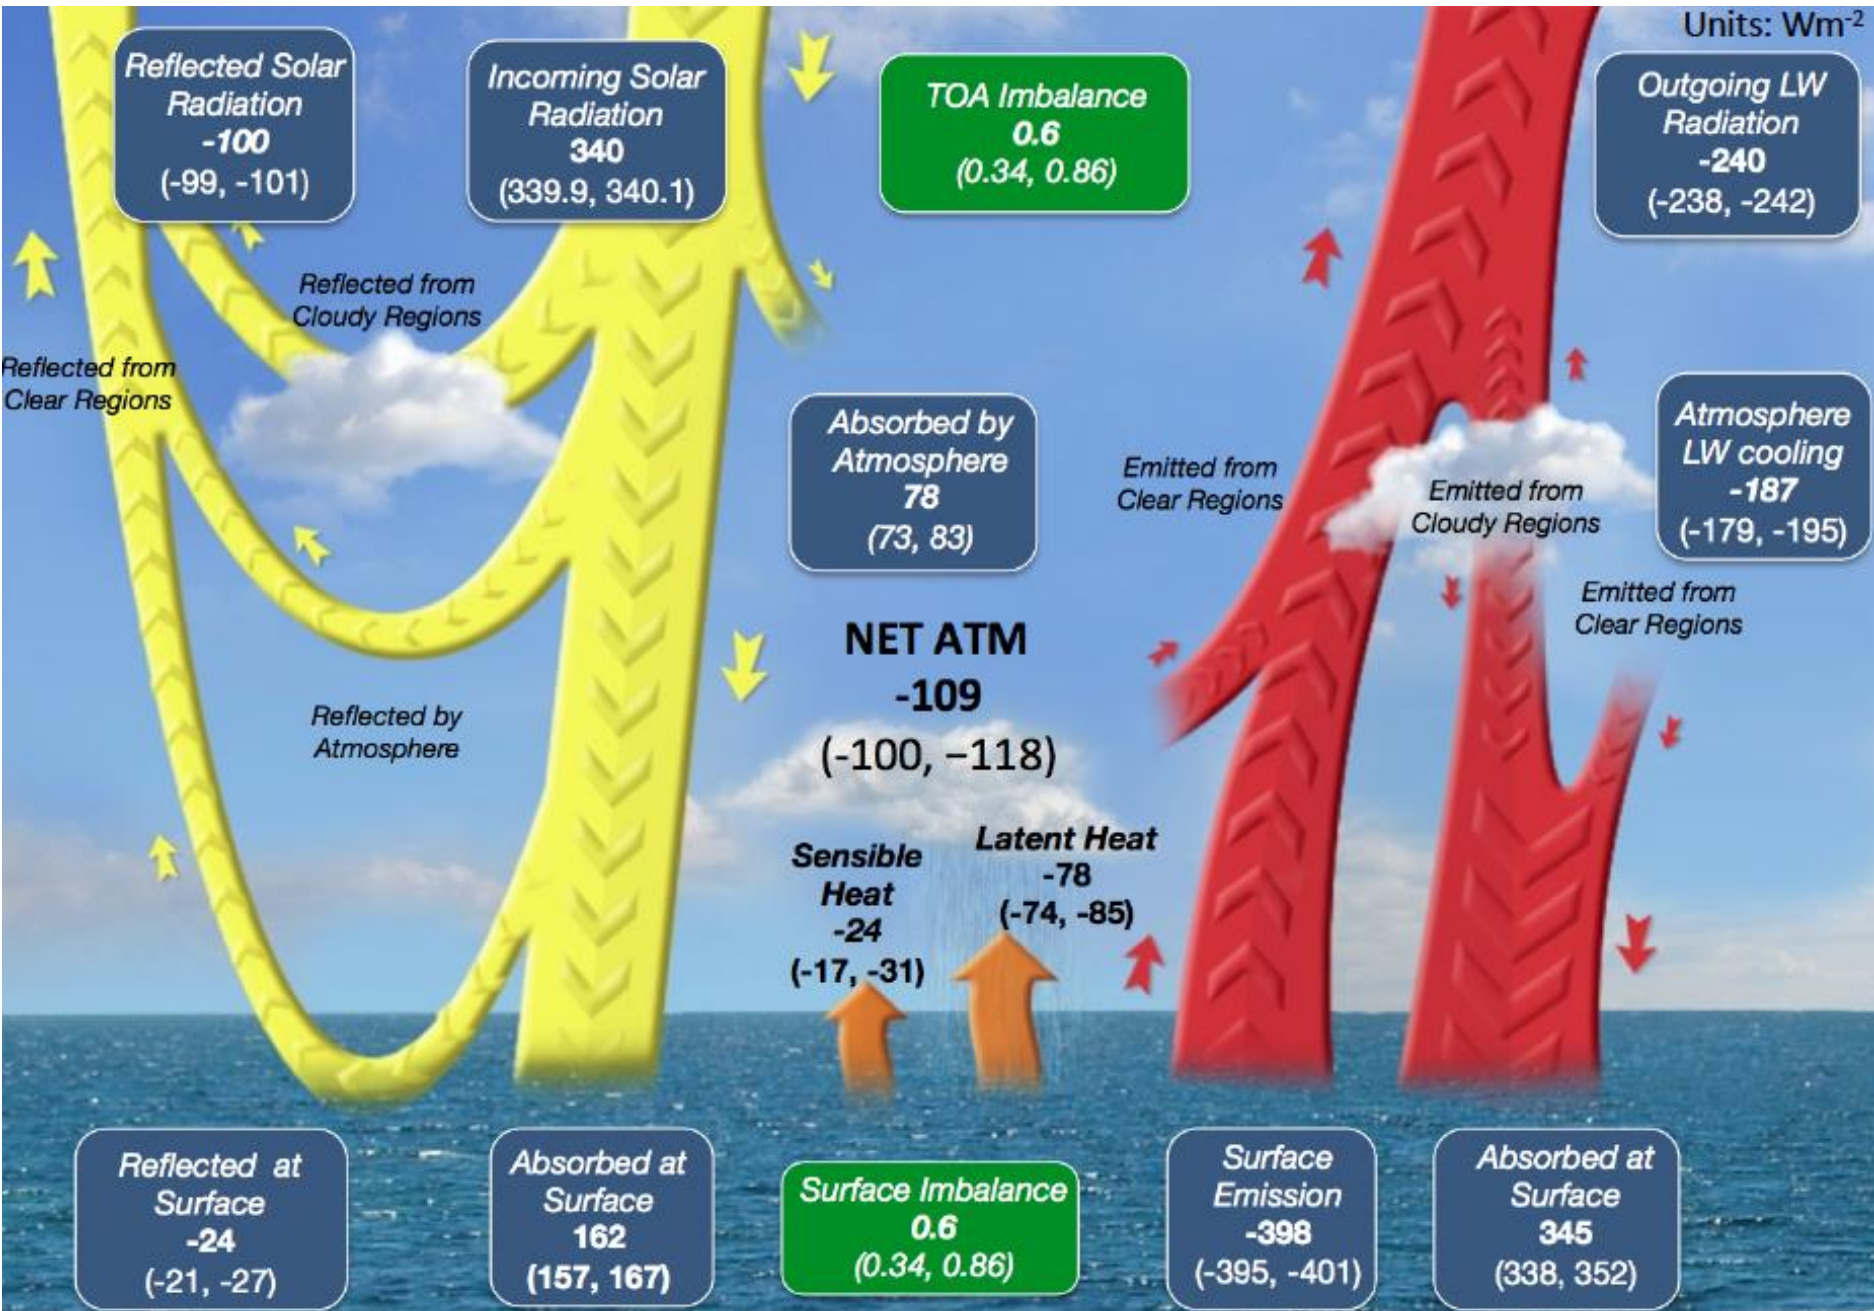

Current & Planned

- Formulation
- Implementation
- Primary Ops
- Extended Ops

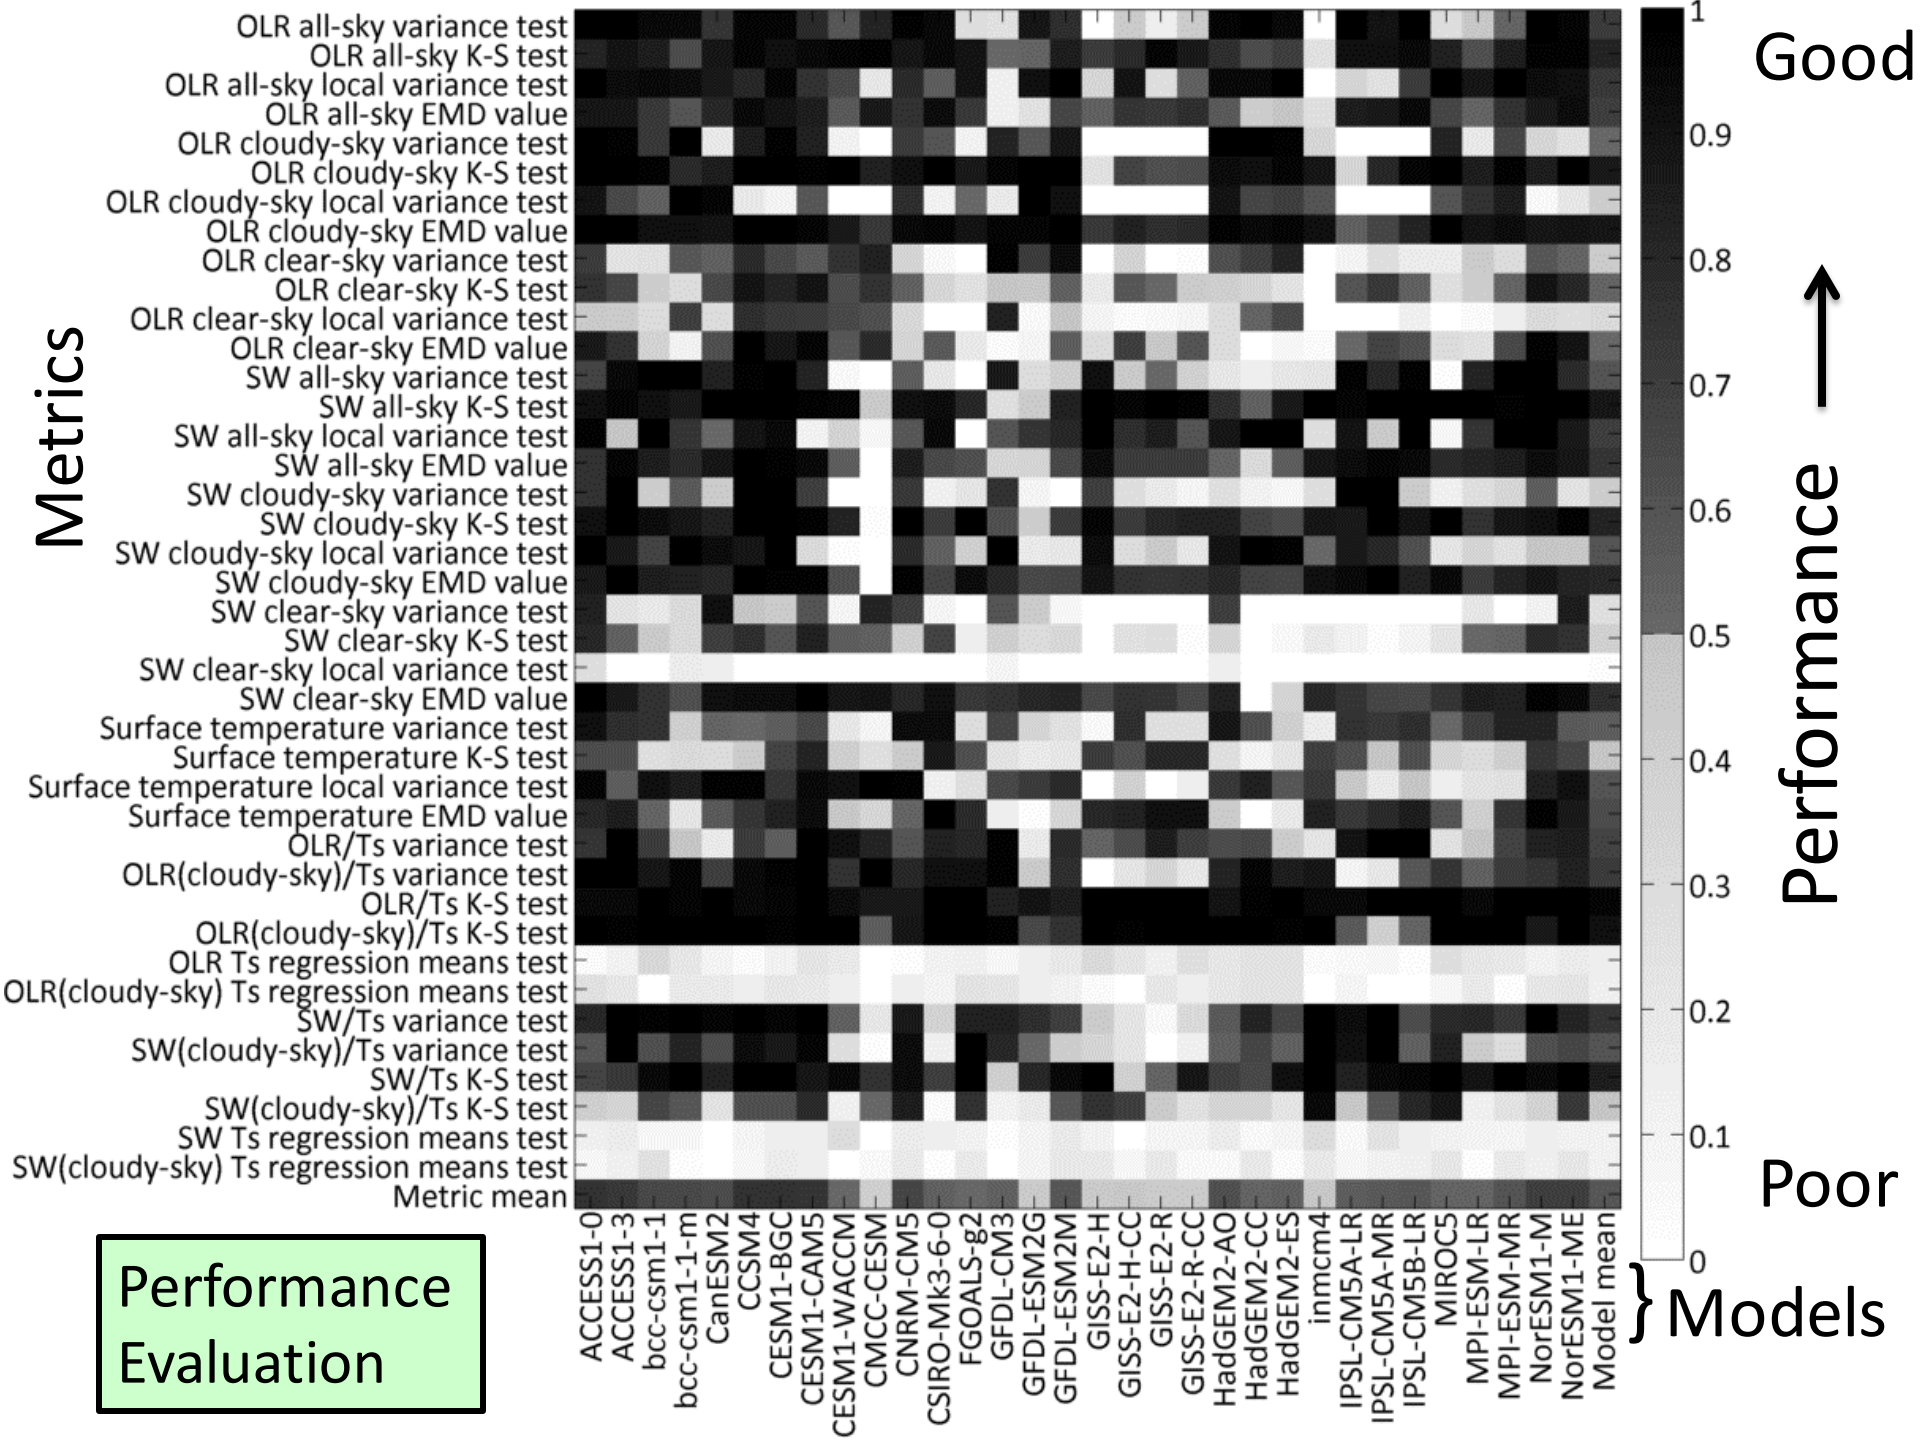

Metric Selection: Earth's Climate is determine by energy flows

Units: Wm^{-2}

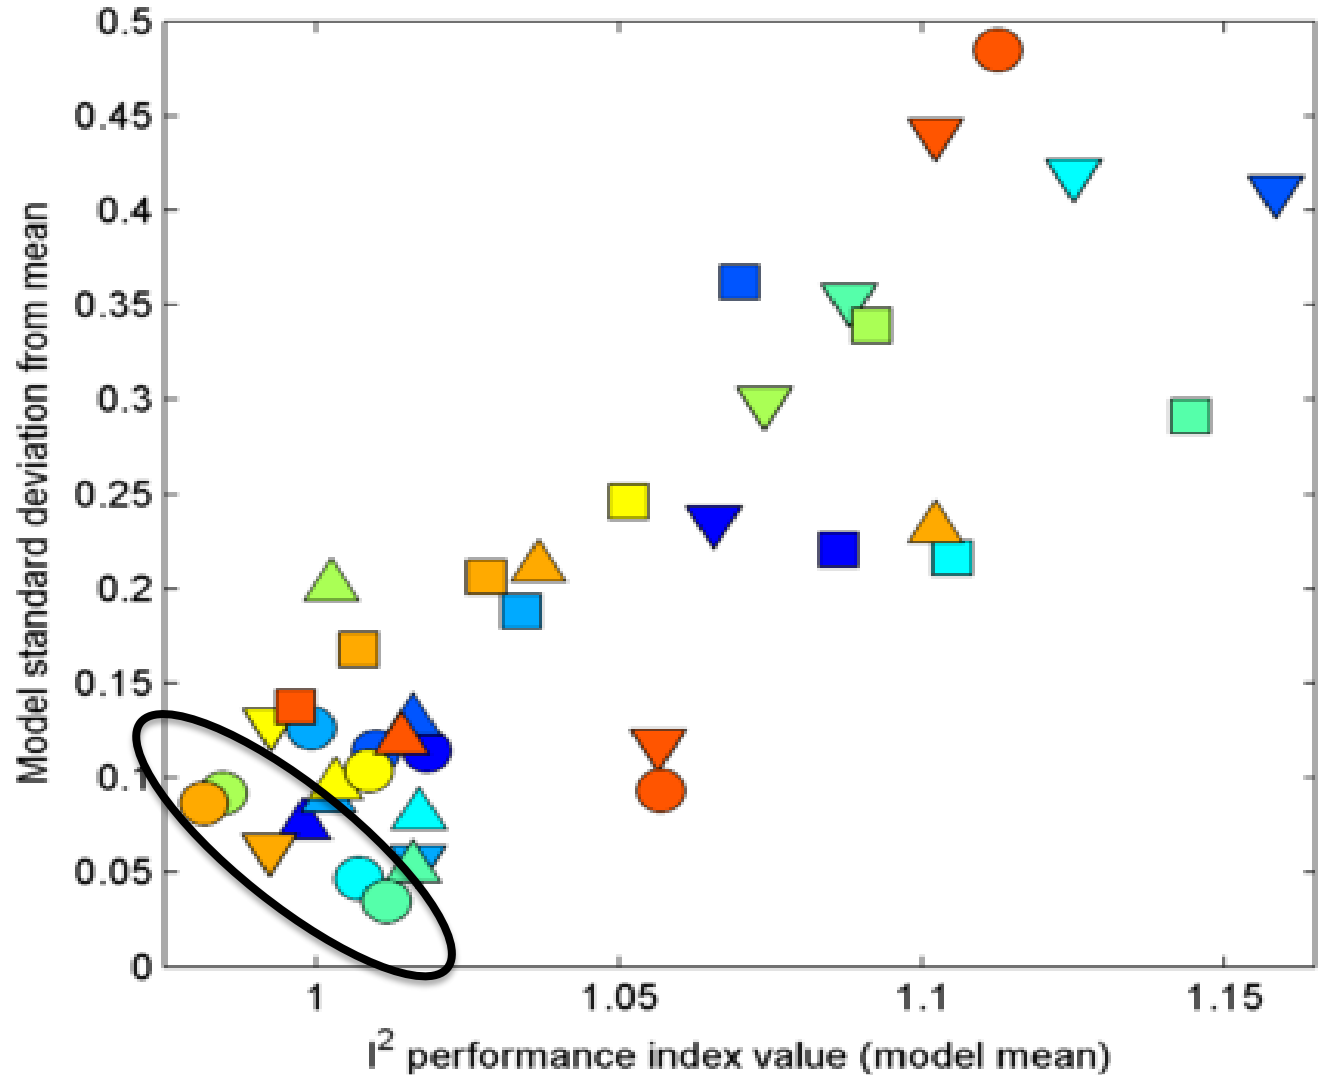

Methodology

- Use perfect model approach to determine the quantities whose performance in an unforced variability simulation robustly relates to climate projections
- Then use NASA observations to produce data-constrained climate projections
- The climate model ensemble is used to understand the relationship between variability in Earth's energy budget and the sensitivity of Earth's climate to a radiative perturbation.

Producing “Intelligent Ensemble Projections: Selecting “Ideal” Metrics:

Best metrics have both a low standard deviation and I^2 value.

Results: 21st-century “Intelligent” projections (regional weights)

“Intelligent” ensemble mean precipitation trend (cm/year)

Difference between “Intelligent” and Equal-weight ensemble means (cm/year)

Results: new 21st-century projections

"Intelligent" ensemble mean temperature trend (°C)

US mean temperature increase: 3.9 °C

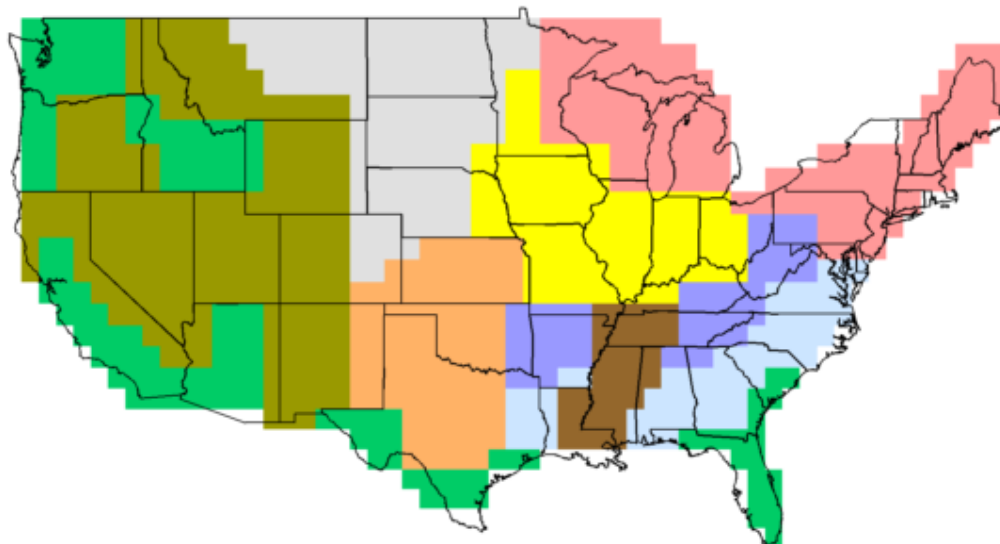

- Basin and Range: 3.9 °C
- Fruitful Rim: 3.4 °C
- Prairie Gateway: 3.8 °C
- Northern Great Plains: 4.1 °C
- Heartland: 4.1 °C
- Northern Crescent: 4.3 °C
- Eastern Uplands: 3.8 °C
- Southern Seaboard: 3.5 °C
- Mississippi Portal: 3.6 °C

Results: new 21st-century projections

"Intelligent" ensemble mean precipitation trend (cm/year)

US mean precipitation increase: 3.4 cm/year

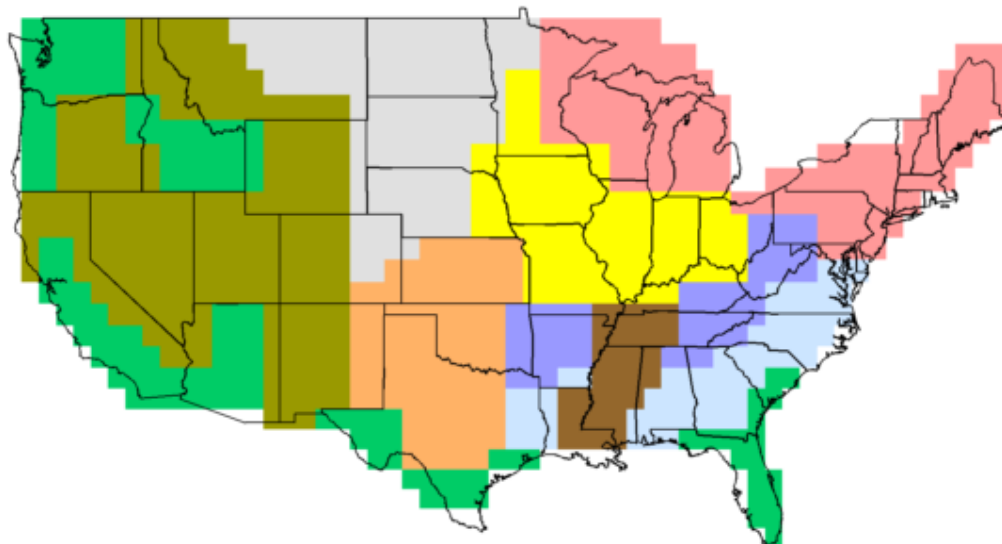

- Basin and Range: 0.6 cm/year
- Fruitful Rim: 0.8 cm/year
- Prairie Gateway: -1.8 cm/year
- Northern Great Plains: 2.7 cm/year
- Heartland: 7.2 cm/year
- Northern Crescent: 9.1 cm/year
- Eastern Uplands: 6.8 cm/year
- Southern Seaboard: 6.8 cm/year
- Mississippi Portal: 5.4 cm/year

Results: new 21st-century projections

"Intelligent" ensemble mean surface shortwave radiation trend (W/m²)

US mean decrease in surface solar radiation: -0.33 Watts/m^2

- Basin and Range: -2.4 Watts/m^2
- Fruitful Rim: -0.5 Watts/m^2
- Prairie Gateway: 0.7 Watts/m^2
- Northern Great Plains: -1.9 Watts/m^2
- Heartland: 0.7 Watts/m^2
- Northern Crescent: -0.1 Watts/m^2
- Eastern Uplands: 2.7 Watts/m^2
- Southern Seaboard: 2.5 Watts/m^2
- Mississippi Portal: 2.6 Watts/m^2

Summary and Conclusions

- Data constrained climate change projections are one way science can address society's need for better climate information.
- The “Intelligent” Ensemble method uses model performance to constrain projections.
- The data-constrained projections differ from the equal weighted projections by as much as 50%.
