Introduction and Overview

Mission

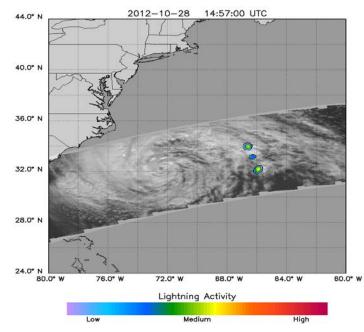

- Fly a space-qualified, flight-spare LIS on ISS to take advantage of unique capabilities provided by the ISS (e.g., high inclination, real time data).
- Integrate LIS as hosted payload on DoD Space Test Program Houston 5 (STP-H5) mission and launch on Space X rocket in January 2016 for a minimum 2 year mission.

Flight Spare LIS

Measurement

- > NASA, the University of Alabama in Huntsville (UAH) and their partners developed and demonstrated effectiveness and value of space-based lightning observations as a remote sensing tool.
- > LIS measures total lightning (*amount, rate, radiant energy*) during both day and night, with storm scale resolution, millisecond timing, and high, uniform detection efficiency.
- LIS daytime detection is especially unique and scientifically important (>70% occurs during day).
- Also, LIS globally detects TOTAL (*both cloud and ground*) lightning with no land-ocean bias.

LIS Lightning and Background Images (Super Storm Sandy October 28, 2012)

Need and Benefit

- Lightning is quantitatively coupled to both thunderstorm and related geophysical processes, and therefore provides important science inputs across a wide range of disciplines (e.g., weather, climate, atmospheric chemistry, lightning physics).
- ISS LIS (or i LIS as Hugh Christian prefers) will extend TRMM time series observations, expand latitudinal coverage, provide real time data to operational users, and enable cross-sensor calibration.

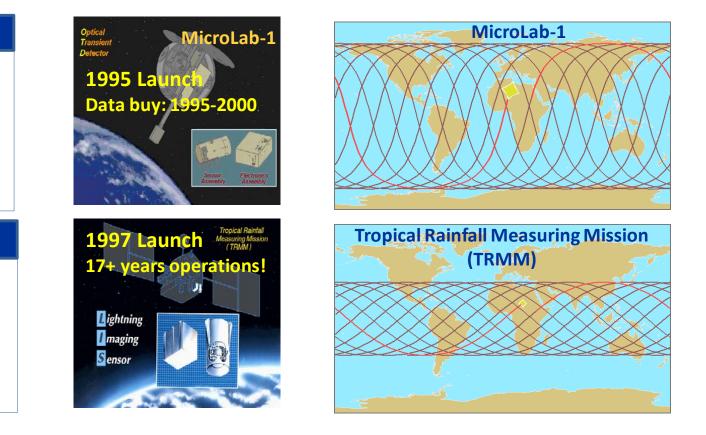

Optical Transient Detector

Launched: April 1995 Data: May 1995 - April 2000 Orbit: 70° inclin., 735 km (detects to ~75°) Field of view: 1250 x 1250 km Diurnal cycle: sampled in 55 days

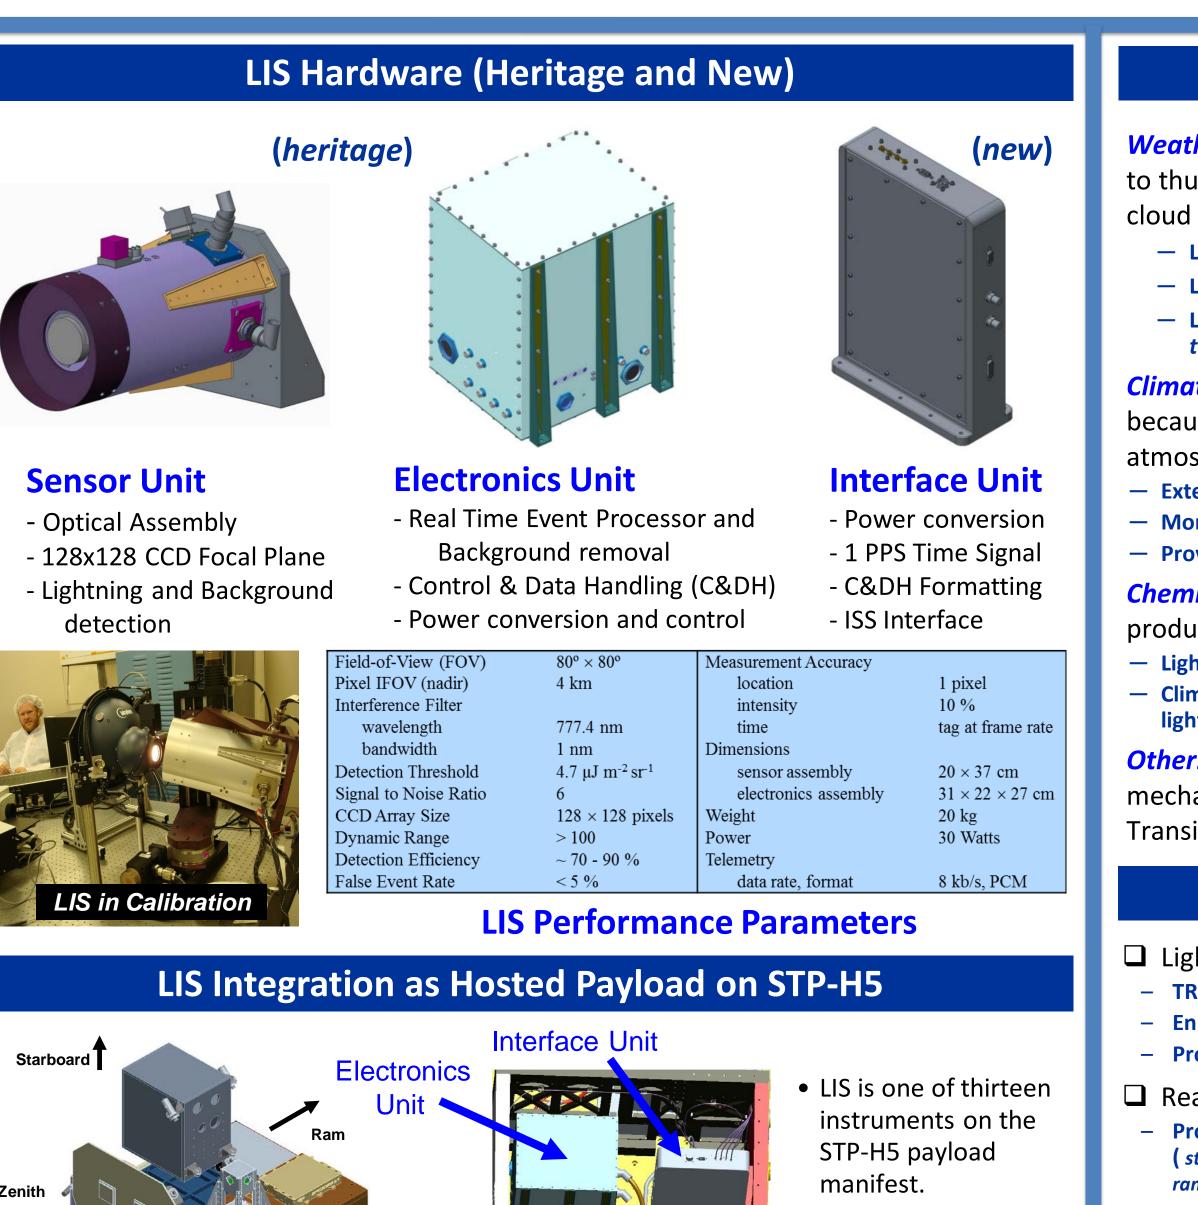

Lightning Imaging Sensor

Launched: November 1997 Data: January 1998 - April 2015 Orbit: 35^o inclin., 350 km (boosted to 400 km in 2001) Field of view: 600 x 600 km Diurnal cycle: sampled in 49 days

LIS Flight Heritage

- > ISS LIS builds upon a solid foundation of previous on-orbit observations, extending 20 years.
- > Key LIS scientists, engineers, and facilities are still in place to support this mission.
- > Well established processing, archival, and distribution systems assures ISS LIS data will be quickly placed into the hands of the science user community.

- LIS will be installed on ISS in an Earth viewing (nadir) position.
- Payload built to allow robotic installation on ISS.

LIS Launch, Installation and Operation on ISS

- Launch on a Space X rocket with Dragon cargo vehicle in January 2016.
- Robotically installed on an external truss (ELC-1) in position shown.
- Operated for 2 years, but will seek mission extension from NASA.

Operation (m

Science and Applications from LIS Lightning

- *Weather:* Total lightning is strongly coupled in a quantitative way to thunderstorm processes and responds to updraft velocity and cloud particles (concentration, phase, type, and flux).
- LIS acts like a radar in space: it reveals the heart of the cloud.
- Lightning can improve convective precipitation estimates.
- Lightning is strongly coupled to severe weather hazards (winds, floods) tornadoes, hail, wild fires) and can improve forecast models.
- *Climate:* Lightning is an excellent variable for climate monitoring because it is sensitive to small changes in temperature and atmospheric forcing. ISS LIS will:
- Extend 16 year time series of TRMM LIS, expand to higher latitudes. Monitor the occurrence and changes in extreme storms.
- Provide much desired cross-sensor calibrations between platforms.
- **Chemistry:** ISS LIS will help improve estimates of lightning produced NO_x for climate and air quality studies.
- Lightning NO, also impacts ozone, an important green house gas. - Climate most sensitive to ozone in upper troposphere, exactly where lightning is the most important source of NO_x.

illustrate strong lightningstorm coupling

Other: Complementary ISS LIS observations will help unravel the mechanisms leading to terrestrial gamma-ray flashes (TGFs) and Transient Luminous Events (TLEs).

Unique Science Contributions from ISS Platform

Lightning coverage at higher latitude missed by TRMM - TRMM LIS missed up to 30% lightning in N. Hemisphere summer - Enhance regional and global weather, climate, and chemistry studies - **Provide CONUS coverage (**needed for National Climate Assessment).

□ Real time lightning using ISS for operational applications Provide real time lightning in data sparse regions, especially oceans (storm warnings, nowcasts, oceanic aviation and international SIGMETs, longrange lightning system validation, hurricane rapid intensification evaluations) **Desired by NASA and strongly endorsed by NOAA partners** (partners include: NWS Pacific Region, Joint Typhoon Warning Center, Ocean Prediction Center, Aviation Weather Center, and National Hurricane Center).

• Enable simultaneous / complementary observations with other ISS payloads

- Provide critical daytime lightning to better understand mechanisms leading to TGFs and TLEs (strongly endorsed by ESA ASIM and JAXA GLIMS).

□ Support cross-sensor calibration and validation activities - Inter-calibrate ISS LIS, TRMM LIS, GOES-R GLM and MTG LI for improved science and applications (strongly endorsed by NOAA and ESA).

Summary

There exist several core science applications of LIS lightning observations, that range from weather and climate to atmospheric chemistry and lightning physics due to strong quantitative connections that can be made between lightning and other geophysical processes of interest.

The space-base vantage point, such as provided by ISS LIS, still remains an ideal location to obtain total lightning observations on a global basis.
