Parimal Kopardekar

Three mega-drivers have emerged that are shaping the future of aviation

Traditional measures of global demand for mobility—economic development, urbanization—are growing rapidly

Severe energy and climate issues create enormous affordability and sustainability challenges

Revolutions in automation, information and communication technologies enable opportunity for safety critical autonomous systems

NASA Aeronautics Research Six Strategic Thrusts

Safe, Efficient Growth in Global Operations

- Enable full NextGen and develop technologies to substantially reduce aircraft safety risks

Innovation in Commercial Supersonic Aircraft

- Achieve a low-boom standard

Ultra-Efficient Commercial Vehicles

- Pioneer technologies for big leaps in efficiency and environmental performance

Transition to Low-Carbon Propulsion

- Characterize drop-in alternative fuels and pioneer low-carbon propulsion technology

Real-Time System-Wide Safety Assurance

- Develop an integrated prototype of a real-time safety monitoring and assurance system

Assured Autonomy for Aviation Transformation

- Develop high impact aviation autonomy applications

What is the Airspace Operations and Safety Program?

This program integrates the Airspace Systems Program and Aviation System-Safety work.

Mission Program

Airspace
Operations
and Safety
Program

Develops and explores fundamental concepts, algorithms, and technologies to increase throughput and efficiency of the National Airspace System safely.

Provides knowledge, concepts, and methods to the aviation community to manage increasing complexity in the design and operation of vehicles and the air transportation system.

Continues Airspace Systems Program research, and the aircraft state awareness research and system wide safety research that was previously conducted within the Aviation Safety Program.

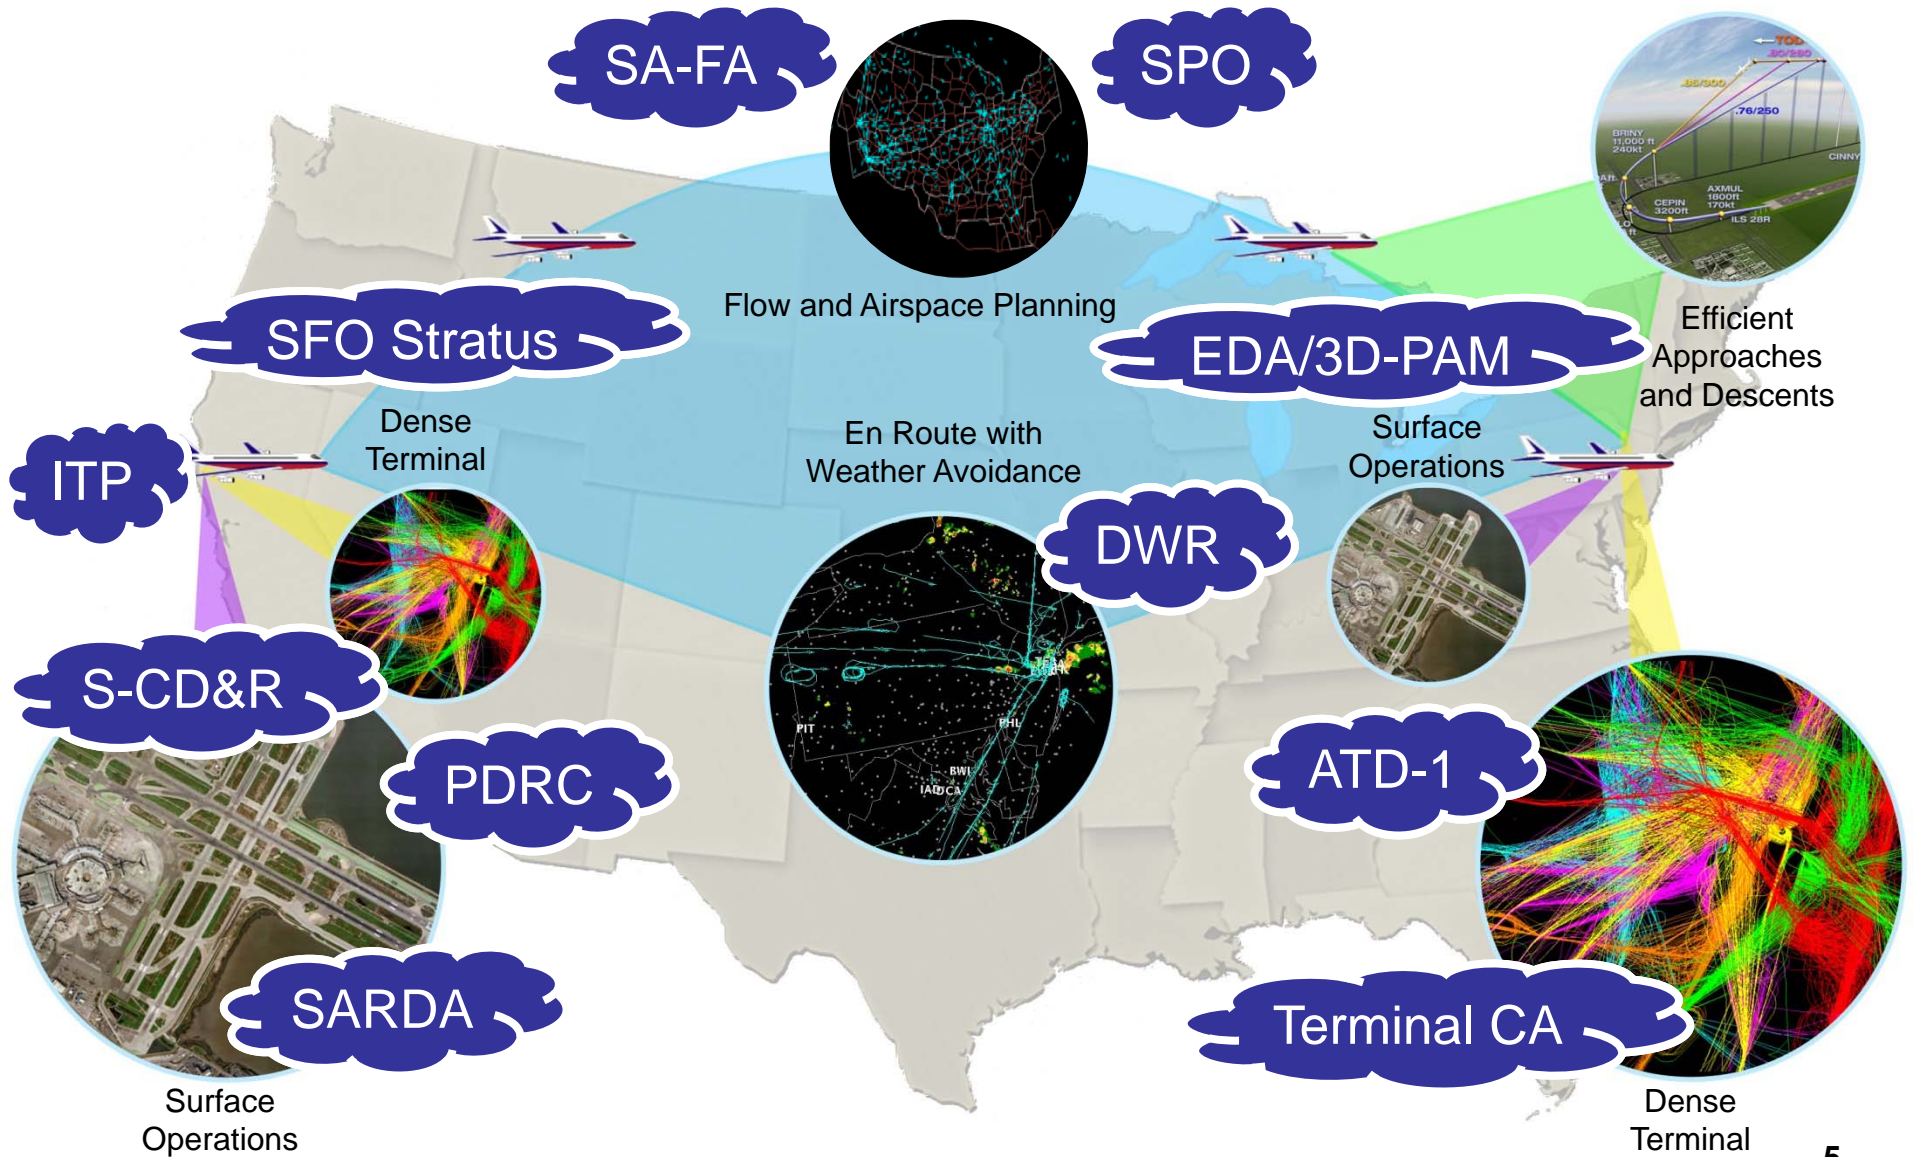

Projects

- Airspace Technology Demonstrations
- SMART NAS - Testbed for Safe Trajectory-Based Operations
- Safe Autonomous System Operations

LIFT

Gate-to-Gate Concepts and Technology

Integrated System Capability ATM Generations

ATM +1

Domain-Focused Enhanced System

Improved individual domains (e.g., surface traffic flow) with some initial integration between domains

Provides improved efficiency in each domain at the earliest possible date, supporting airline cost savings and reduction of environmental impact

Majority of current ASP research is supporting ATM +1

ATM +2

Integrated Airspace System

Integration of terminal and en route, integrated surface and arrivals/departures, and system modeling enable predictive capabilities

Provides system efficiency, predictability and reliability gains to further improve airline and ATM network operations and support traffic growth, including UAS

Some current research supports ATM +2

ATM +3

System-wide Autonomous Optimized Airspace

Dynamic, fully autonomous trajectory services enabling rapid adaption to meet user demand or respond to system perturbations (e.g., weather)

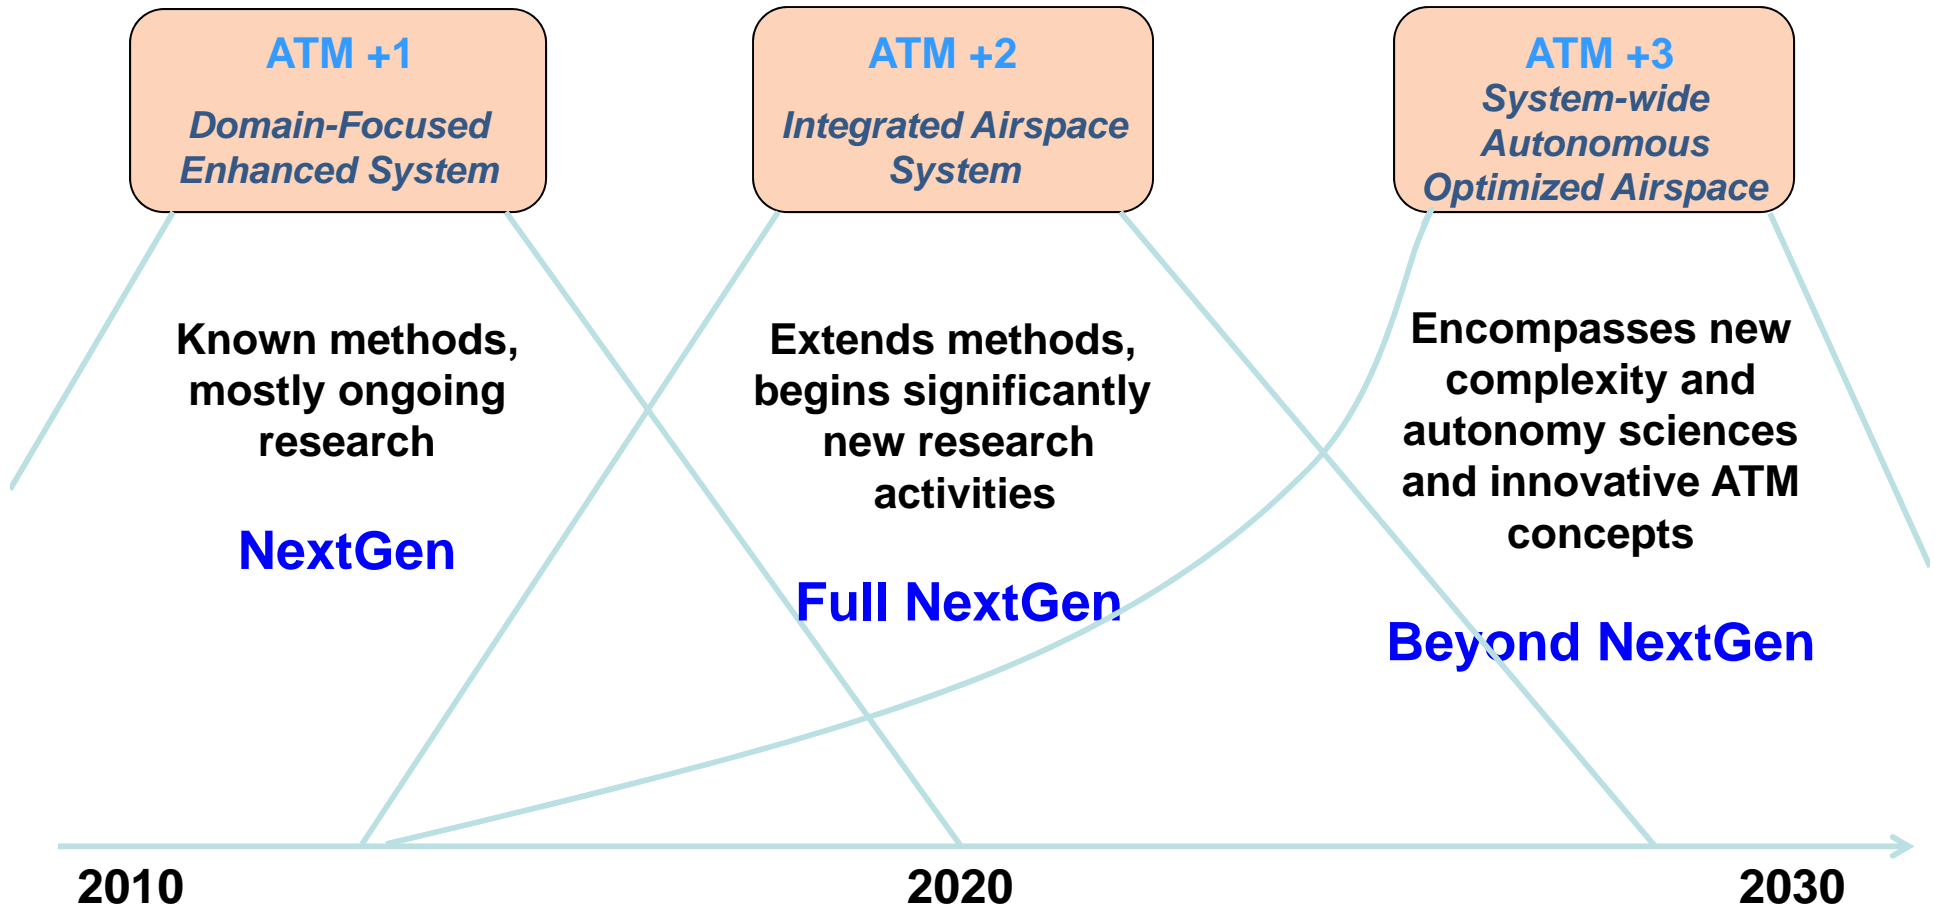

Provides a flexible, scalable, and resilient system to meet significant traffic growth and support changing operators' business-network models

This is beyond NextGen capabilities and requires the development of new concepts

Required to achieve projected 3X+ growth in traffic demand, including UAS*

* Demand based on JPDO IPSA analysis of FAA Terminal Area Forecast and RTCA SC-203 OSED for UAS

ATM Generations Timeline

- ***Airspace Technology Demonstrations***
- ***SMART-NAS Test Bed for Safe, Trajectory-Based Operations***
- ***Safe, Autonomous Systems Operations***

Airspace Technology Demonstration (ATD) Project

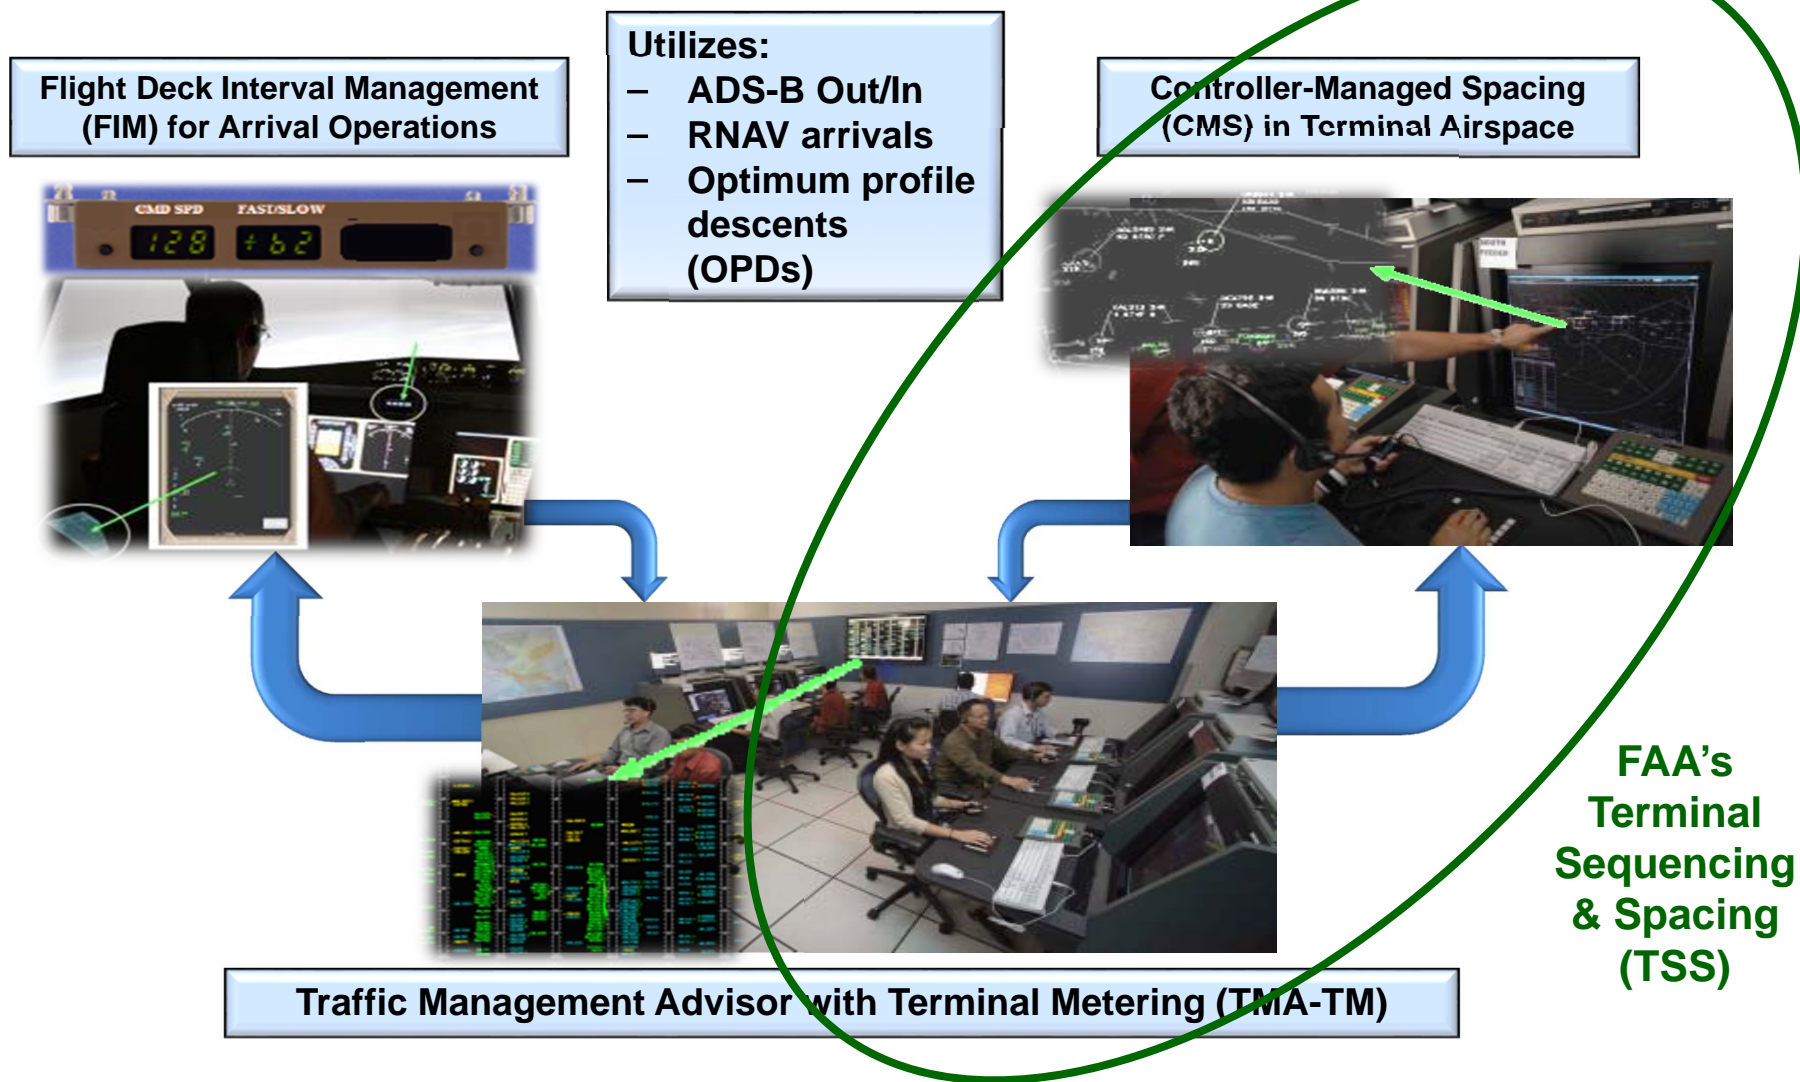

NEXTGEN

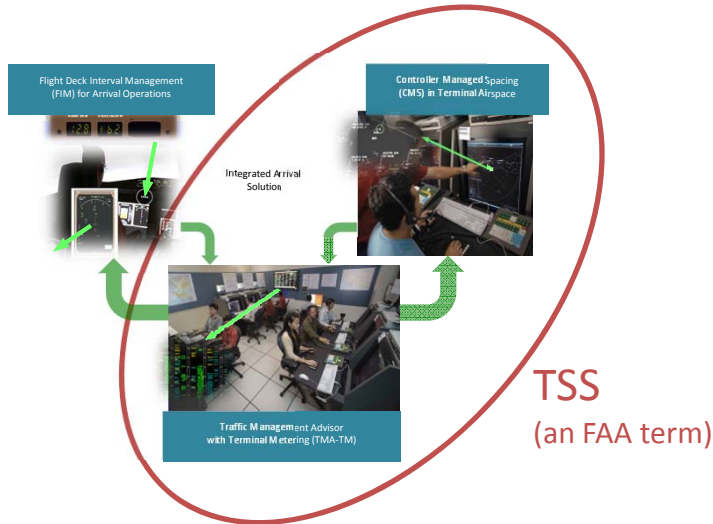

ATM Technology Demonstration-1

ATD-1: Improve arrival operations efficiency while increasing arrival throughput using integrated aircraft-based and ground-based automation technologies

ATD-1 Delivers to NextGen

- ATD-1 transferred Terminal Sequencing and Spacing (TSS) technologies to the FAA in 2013
- TSS enables use of underutilized modern avionics and Performance-Based Navigation or PBN procedures

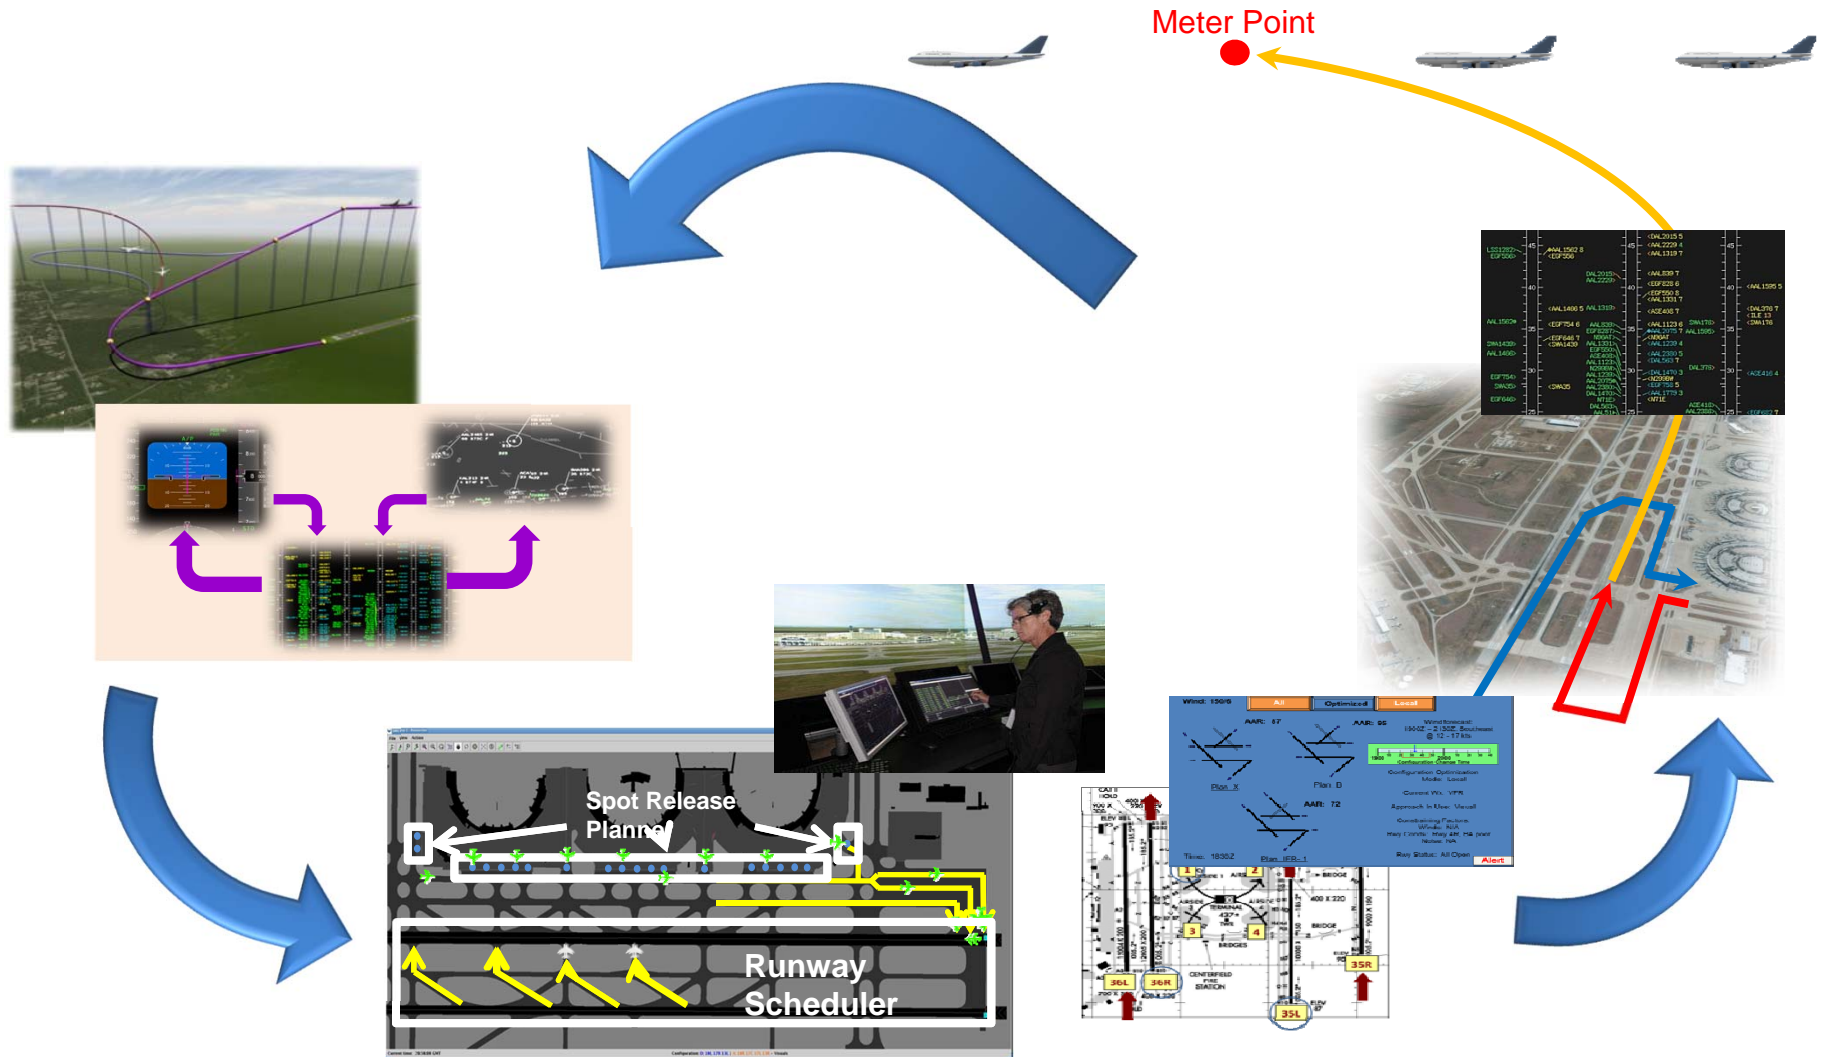

- Estimated benefit to airlines operating at 35 benchmark airports ranges from \$100-200M/year
- FAA is planning for Initial Operating Capability in 2018

This is an unprecedented contribution of NASA technology to NextGen

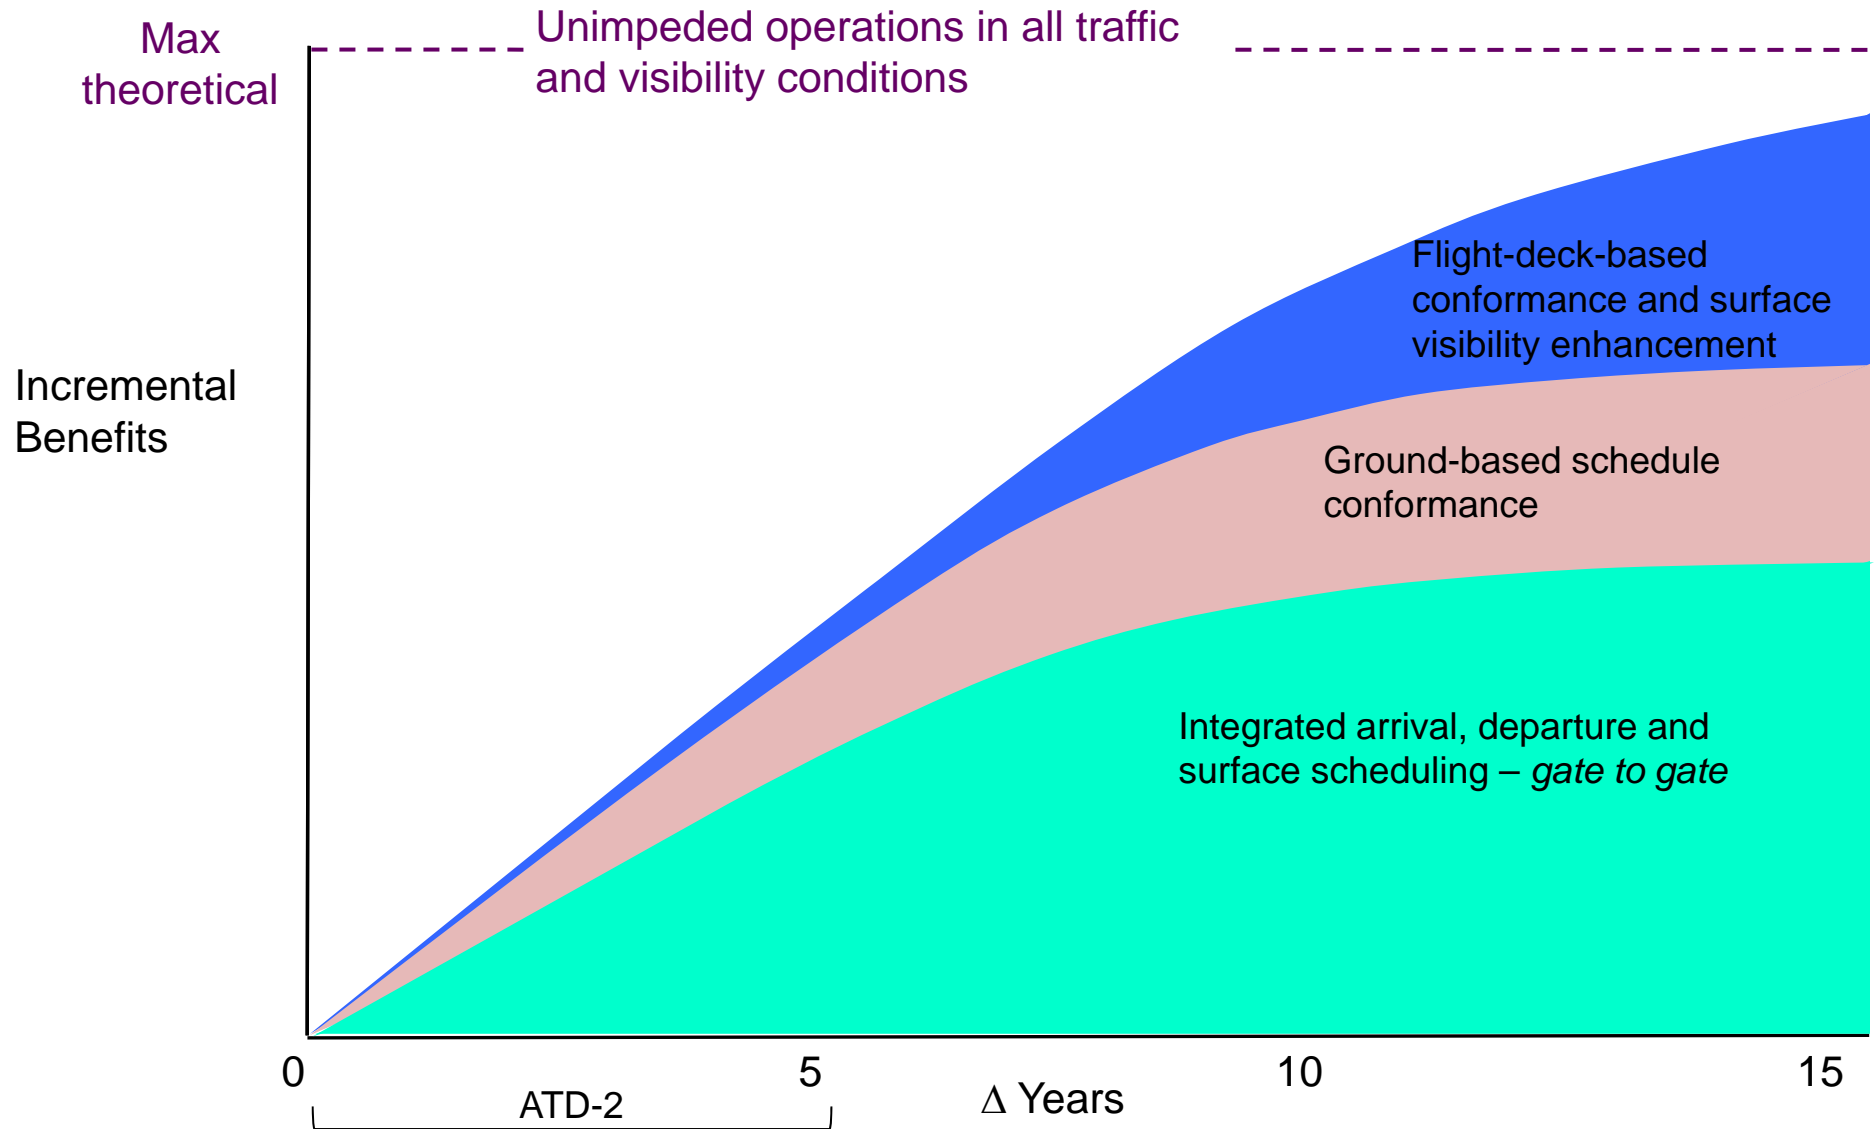

Integrated Arrival/Departure/Surface Operations

Integrated Arrival/Departure/Surface Operations (IADS): Simultaneously increase arrivals, departures, and surface operations efficiency while increasing overall throughput

IADS Benefits Roadmap

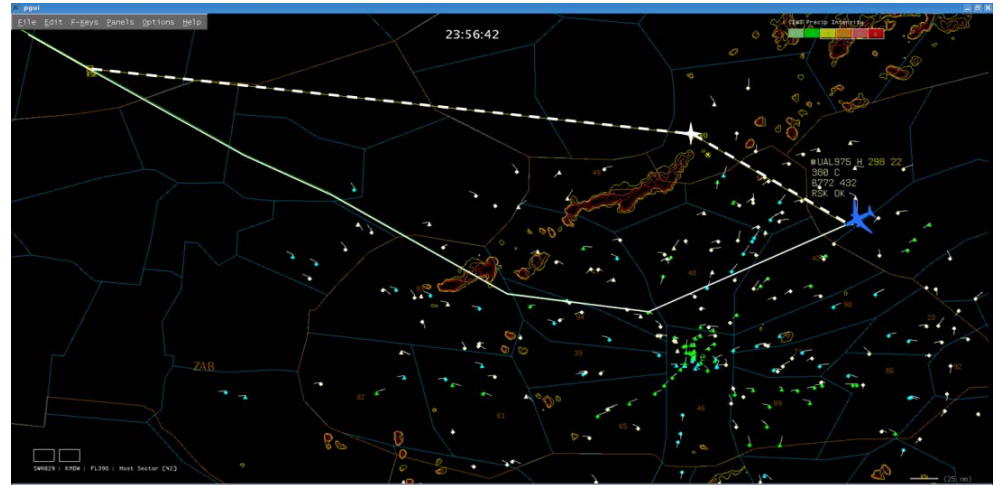

Applied Traffic Flow Management

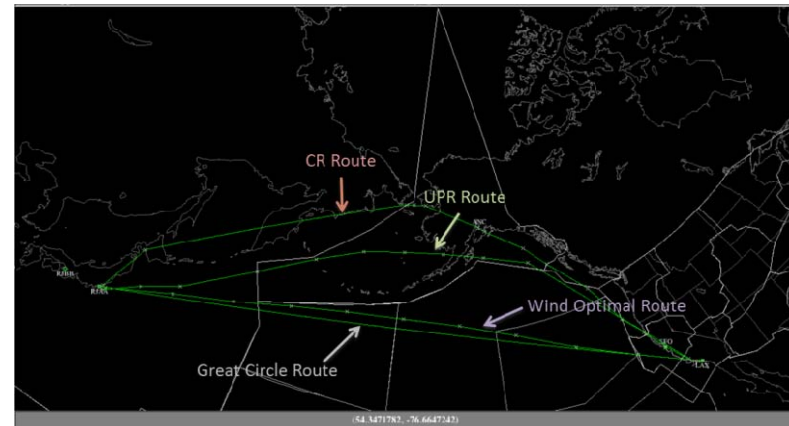

Domestic:

- Integrated solutions are to extend NASA already developed Domestic ground/air capabilities for individual aircraft to overcome these current TFM challenges opportunistically to achieve reduced lengths of conservative re-routes, ground holds and stops, Miles-In-Trail for multiple aircraft, into web based tools
- Estimated \$79M per year nationwide savings to US airspace users

Oceanic:

- Integrated solutions are to extend NASA already developed Oceanic capabilities for aircraft to

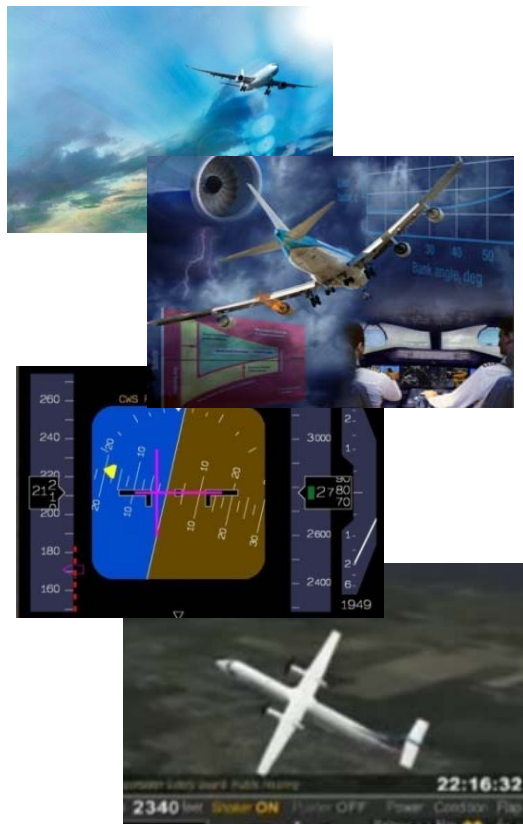

Technologies for Assuring Safe Energy and Attitude State

- CAST's Airplane State Awareness Joint Safety Implementation Team (ASA JSIT) Recommended Research Safety Enhancements (SEs)
- NASA's precursor safety focus to *Increase Pilots' Ability To Avoid, Detect, And Recover From Adverse Events That Could Otherwise Result In Accidents/Incidents*
