

Oscillation of Angiogenesis and Vascular Dropout in Progressive Human Vascular Disease

Vascular Pattern as Useful Read-Out of Complex Molecular Signaling

Oscillation of Angiogenesis and Vascular Dropout in Progressive Human Vascular Disease

When analyzed by VESsel GENeration Analysis (VESGEN) software, vascular patterns provide useful integrative read-outs of complex, interacting molecular signaling pathways. Using VESGEN, we recently discovered and published our innovative, surprising findings that angiogenesis oscillated with vascular dropout throughout progression of diabetic retinopathy, a blinding vascular disease. Our findings provide a potential paradigm shift in the current prevailing view on progression and treatment of this disease, and a new early-stage window of regenerative therapeutic opportunities. The findings also suggest that angiogenesis may oscillate with vascular disease in a homeostatic-like manner during early stages of other inflammatory progressive diseases such as cancer and coronary vascular disease.

A photograph of an astronaut in a white spacesuit floating in space. The astronaut is holding a white envelope or document. In the background, the blue and white horizon of the Earth is visible on the left, and a bright sun with a starburst effect is in the upper right. The overall scene is dark, representing the void of space.
