Abstract

This report documents the Electromagnetic Interference EMI evaluation performed on the Electrodynamic Dust Shield (EDS) which is part of the MISSE-X System under the Electrostatics and Surface Physics Laboratory at Kennedy Space Center.

Measurements are performed to document the emissions environment associated with the EDS units.

1 Introduction

The following tests methods (See Table 1) were requested for the Electrodynamic Dust Shield Unit 1 (DC power supply). A radiated emissions evaluation was also performed on Unit 2 (AC power supply). The testing was performed using the test methods in SSP 30238.

Table 1: Electrodynamic Dust Shield EMI Requirements

Test Method	Test Description	Frequency Range
CE01	Conducted Emissions, Power Leads	30 Hz to 15 kHz
CE03	Conducted Emissions, Power Leads	15 kHz to 50 MHz
CE07	Conducted Emissions, Spikes, DC Power Leads	N/A
RE02*	Radiated Emissions, Electric Field, Air Force Limit Specified	14 kHz to 18 GHz

*Note: This test method was performed on both EDS units 1 and 2.

The general test setup for the Electrodynamic Dust Shield units is shown in Figures 1-1 and 1-2. The EDS units were connected to the 10 μ F capacitors using the customer supplied cables.

Figure 1-1: Electrodynamic Dust Shield DC Unit (Unit 1) Test Setup

Figure 1-2: Electrodynamic Dust Shield AC Unit (Unit 2) Test Setup

2 Purpose

The purpose of this report is to collect all information needed to reproduce the testing performed on the Electrodynamic Dust Shield units, document data gathered during testing, and present the results.

3 Scope

This document presents information unique to the measurements performed on the Bioculture Express Rack payload; using test methods prepared to meet SSP 30238 requirements. It includes the information necessary to satisfy the needs of the customer per work order number 1037104. The information presented herein should only be used to meet the requirements for which it was prepared.

4 Test Method

Current test requirements are detailed in the SSP 30237 and test methods are specified in SSP 30238 (that meets the requirements of MIL-STD-461).

5 Results

5.1 Testing Results

The results of the EMI evaluation contained within this report were obtained over 21 April 2014 through 28 April 2014. Detailed results are presented in Appendix A through Appendix D.

A.2 Applicability

The test method for CE01 shall be applicable for measuring narrowband conducted emissions in the frequency range between 30Hz and 15kHz on the following types of leads: dc leads which obtain power from, or provide power to other equipment, distribution panels or subsystems.

Note: The equipment is also catalogued in the Maximo System.

C.2 Applicability

CE07 applies to DC input power leads, spikes, and time domain transients. CE07 is applicable for all 28V input power leads.

C.3 CE07 Data

C.3.1 Measurements

The Electrodynamic Dust Shield was powered on remotely. The following modes or events were tested:

1. Initial Power On.
2. Power Off.
3. Steady state.

Oscilloscope screenshots for the above CE07 events are shown in Figures C.3-1 to C.3-4.

Transients are plotted against the SSP 52000 IDD envelope. Only data values with a time greater than zero are plotted (See Figures J.4-1 to J.4.5). Pretrigger information is available in the raw tabular data file. The oscilloscope produced comma separated variable files of the transients are available to the customer or customer's designee. The file sizes prevent including the amplitude time pairs in this appendix. During testing of the initial Power On mode, transients from the power switch were captured. During testing of the steady state, no transients or spikes were observed. Photographs are shown in Figures J.4-6 and J.4-7.

Note: The equipment is also catalogued in the Maximo System.

D.2 Applicability

RE02 is applicable for radiated emissions from equipment and subsystems, cables (including control, pulse, Interface (I/F), power and antenna transmission lines) and interconnecting wiring of the EUT; for narrowband emissions, it applies at the fundamental frequencies and all spurious emissions including harmonics, but does not apply for radiation from antennas. This requirement is applicable for narrowband emissions from 14kHz to 108GHz.
