# Outline

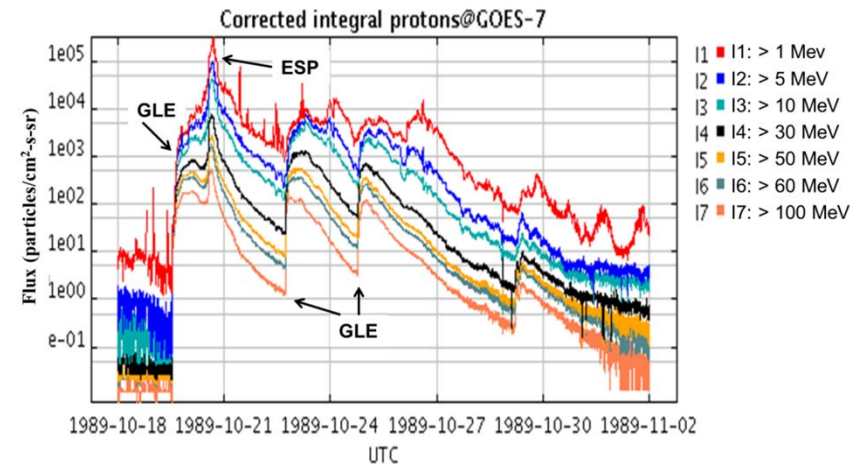

- Introduction
- Previous Work
- Hydrogen-loaded GCR Investigation
- Methane-loaded (GCR & SPE) Investigation

# Introduction

- Fuel cell research focused on hydrogen loading of materials in which the hydrogen can be easily released for use as fuel
  - Space radiation research focused on low-Z materials
  - Can we use a similar concept of loading materials with low-Z substances to increase the radiation mitigation properties of the material?
- 3 classes of materials
  - Metal organic frameworks (MOFs)
  - Metal hydrides (MHs)
  - Nano-porous carbon composites (CNTs)
- Method: HZETRN transport code
  - Tissue detector
  - Output: Dose (cGy)

# Previous Work

- Investigated 64 H-loaded materials
- HZETRN 2005 transport code
  - No restrictions on the energy grid for the SPE
- Focused on 19-24, October 1989 Solar Particle Event (SPE)
  - Particularly hard event
- Compared with typical spacecraft material (aluminum) and “gold standard” materials (HDPE)

	MOFs	CNTs	MHs	Total
<b>Dose &lt; HDPE</b>	1	7	1	9
<b>HDPE &lt; Dose &lt; Al</b>	9	7	14	30
<b>Al &lt; Dose</b>	0	0	25	25

# Hydrogen-Loaded

---

Galactic Cosmic Ray Investigation

# Methods

- 64 materials (same as previous study)
  - 40 metal hydrides (interstitial:26, non-interstitial:7, solution:7)
  - 10 metal organic framework (non-loaded:5, H-loaded:5)
  - 14 carbon composites (non-loaded:7, H-loaded:7)
- Compare with HDPE and Al
- 1977 solar min GCR
- HZETRN 2010

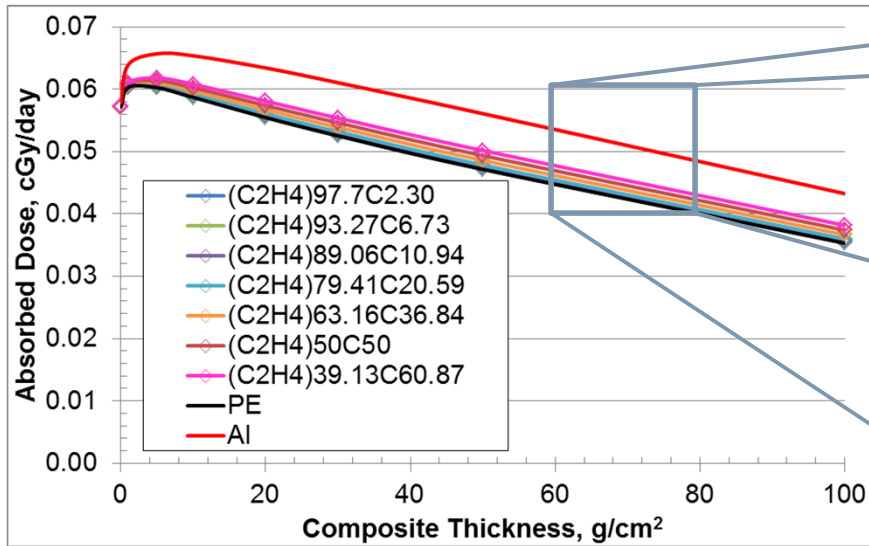

# Results: Metal Organic Framework (MOFs)

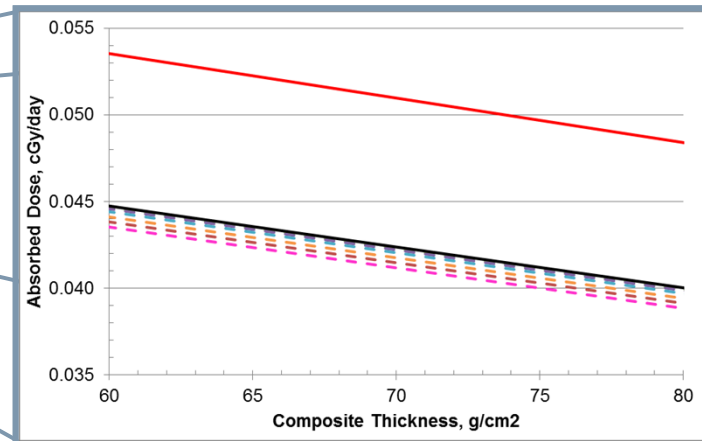

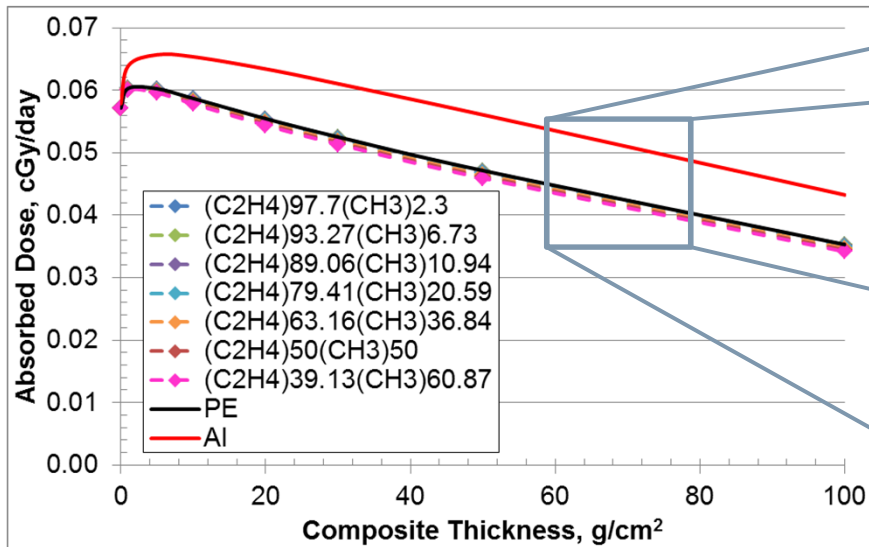

**All 10 MOFs performed better than Aluminum**

# Results: Carbon Composites (CNTs)

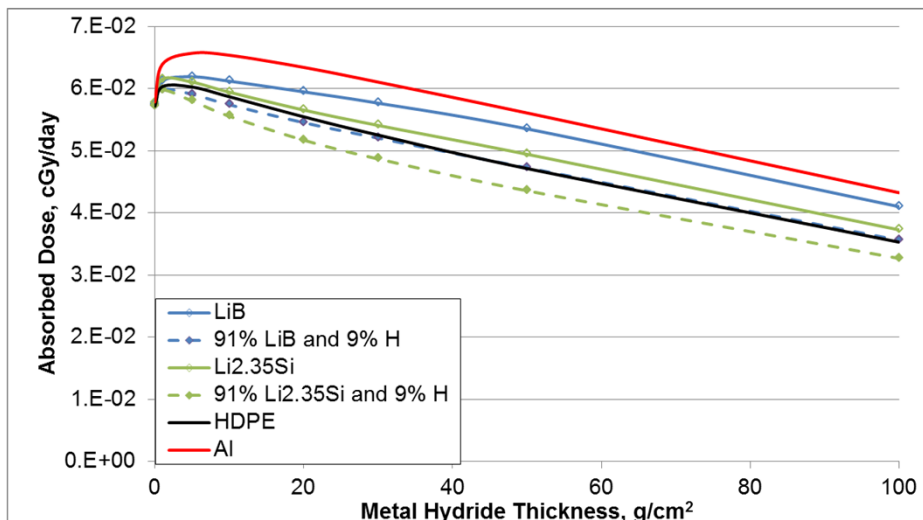

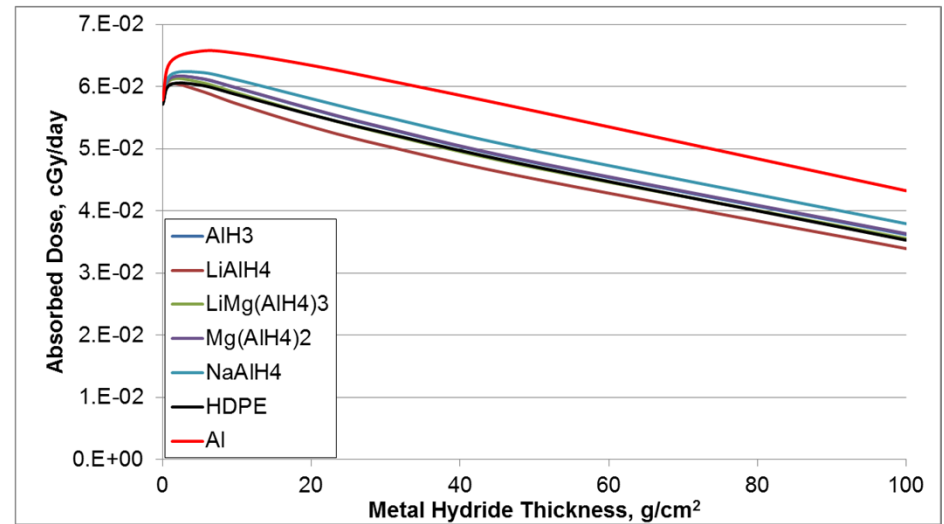

**7 non-H loaded CNTs performed better than Aluminum**

**7 H loaded CNTs performed better than Polyethylene**

# Results: Metal Hydrides

- 9 materials performed better than polyethylene
- 6 materials performed better than aluminum
- 25 materials performed worse than aluminum (not shown in the graphs)

# Summary and Recommendations

	MOFs	CNTs	MHs	Total
<b>Dose &lt; HDPE</b>	<b>0</b>	<b>7</b>	<b>9</b>	<b>16</b>
<b>HDPE &lt; Dose &lt; Al</b>	<b>10</b>	<b>7</b>	<b>6</b>	<b>16</b>
<b>Al &lt; Dose</b>	<b>0</b>	<b>0</b>	<b>25</b>	<b>25</b>

- Focus on hydrogenated CNTs
- Focus on lithium metal hydrides

# Methane-Loaded

---

Solar Particle Events

Galactic Cosmic Rays

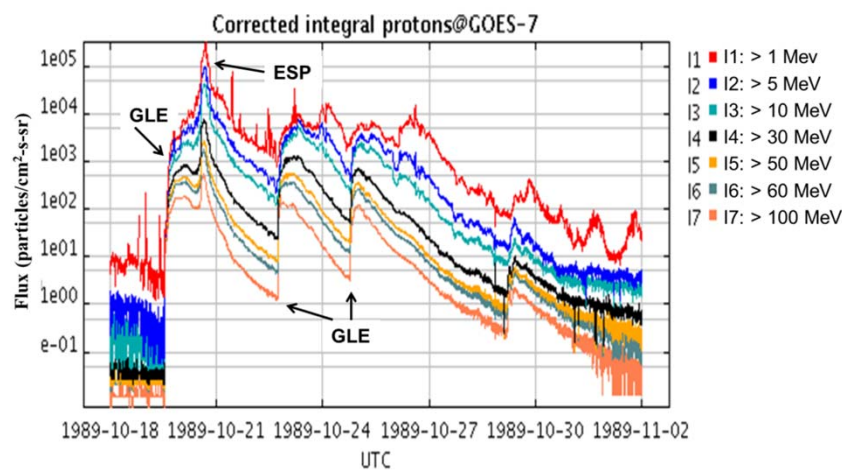

# Why Methane?

- Problems with hydrogen
  - Stability in changing environmental conditions
  - Safety implications for fires and explosions
- Methane is a slightly better mitigator than HDPE

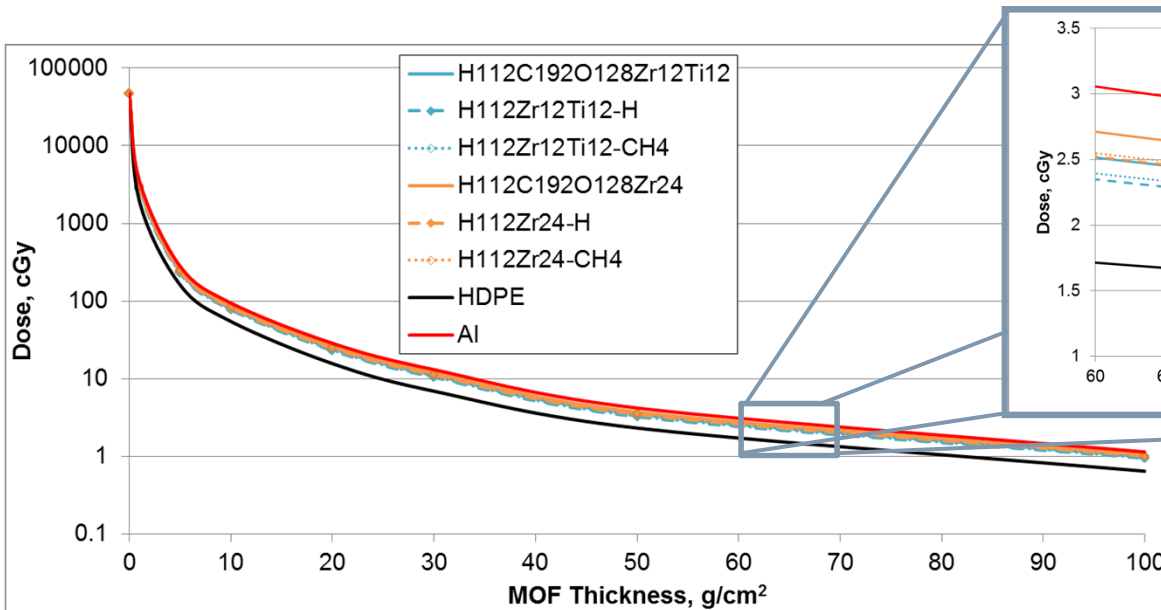

# Methods

- 36 materials
  - 15 metal organic framework (non-loaded:5, H-loaded: 5, CH<sub>4</sub>-loaded:5)
  - 21 carbon composites (non-loaded:7, H-loaded: 7, CH<sub>4</sub>-loaded:7)
- Compare with H-loaded versions, HDPE, and Al
- 1977 solar min GCR
- 19-24 October 1989 SPE
- HZETRN 2010

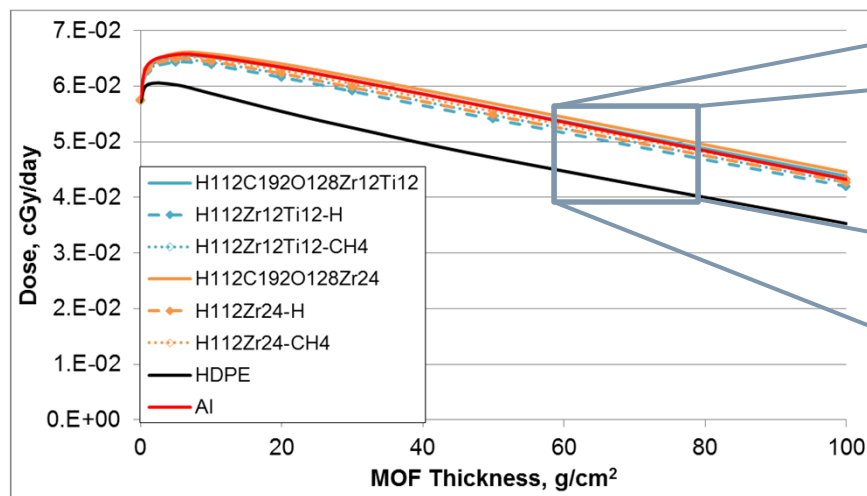

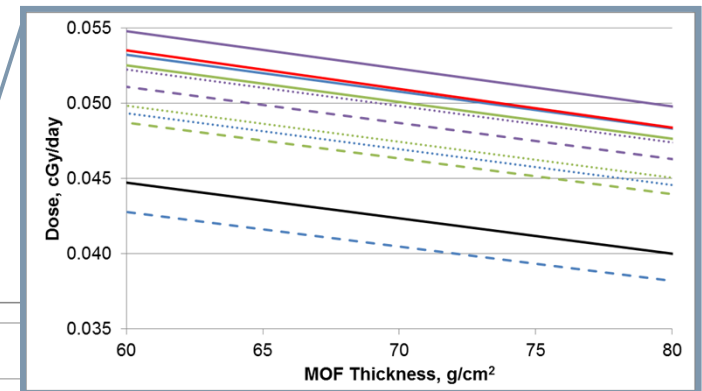

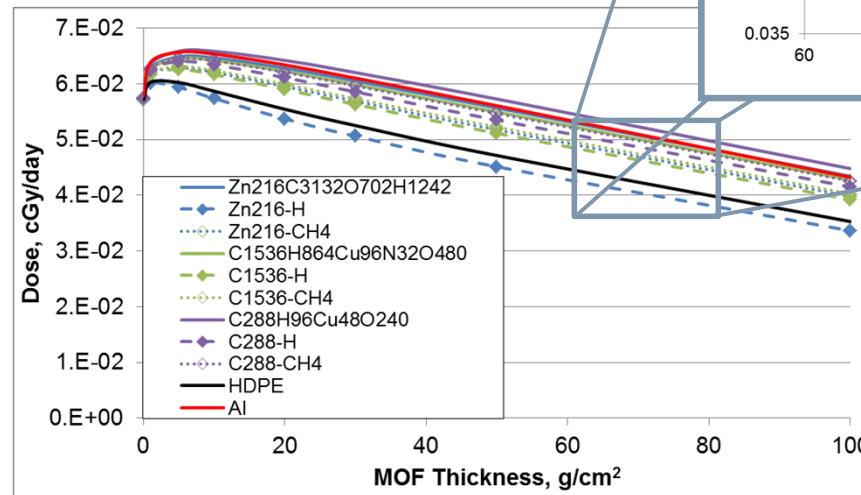

# Results: MOFs - SPE

(C2H4)50	5%
(C2H4)39.13	6%

# Summary and Recommendations

- Not much difference in dose between hydrogen and methane loaded materials
  - Concentrate on methane loading to eliminate concerns with hydrogen
- CNTs most promising candidate material

# Interstitial Metal Hydrides

- New phases after hydrogen loading
- Non-stoichiometric with variable amounts of hydrogen
- Hydrides form via two mechanisms
  - Adsorption of di-hydrogen
  - Electrolytic reduction of ionized hydrogen on the surface, followed by diffusion of protons into the lattice
