National Future Extreme Heat Scenarios for Assessment of Climate Impacts on Public Health

Project Objective: To provide historical and future measures of climate-driven heat events to enable assessments of heat impacts on public health over the coterminous U.S.

- The project's emphasis is on providing assessments of the magnitude, frequency and geographic distribution of EHEs to facilitate public health studies.
- We focus on the daily to weekly time scales on which EHEs occur, not on decadal-scale climate changes.
- There is, however, a very strong connection between air temperature patterns at the two time scales and long-term climatic changes will certainly alter the frequency of EHEs.

US Average Maximum Daily Air Temperature - 2000-2011

Metrics of Excessive Heat

1. Daily Maximum Air Temperature

➤ Daily maximum air temperature, the highest temperature recorded at an observation site between midnight and midnight local standard time, is a traditional measure of heat, and one with which everyone is familiar.

We used NLDAS data to calculate daily maximum air temperature.

T (°F)

July 15, 2000

Metrics of Excessive Heat

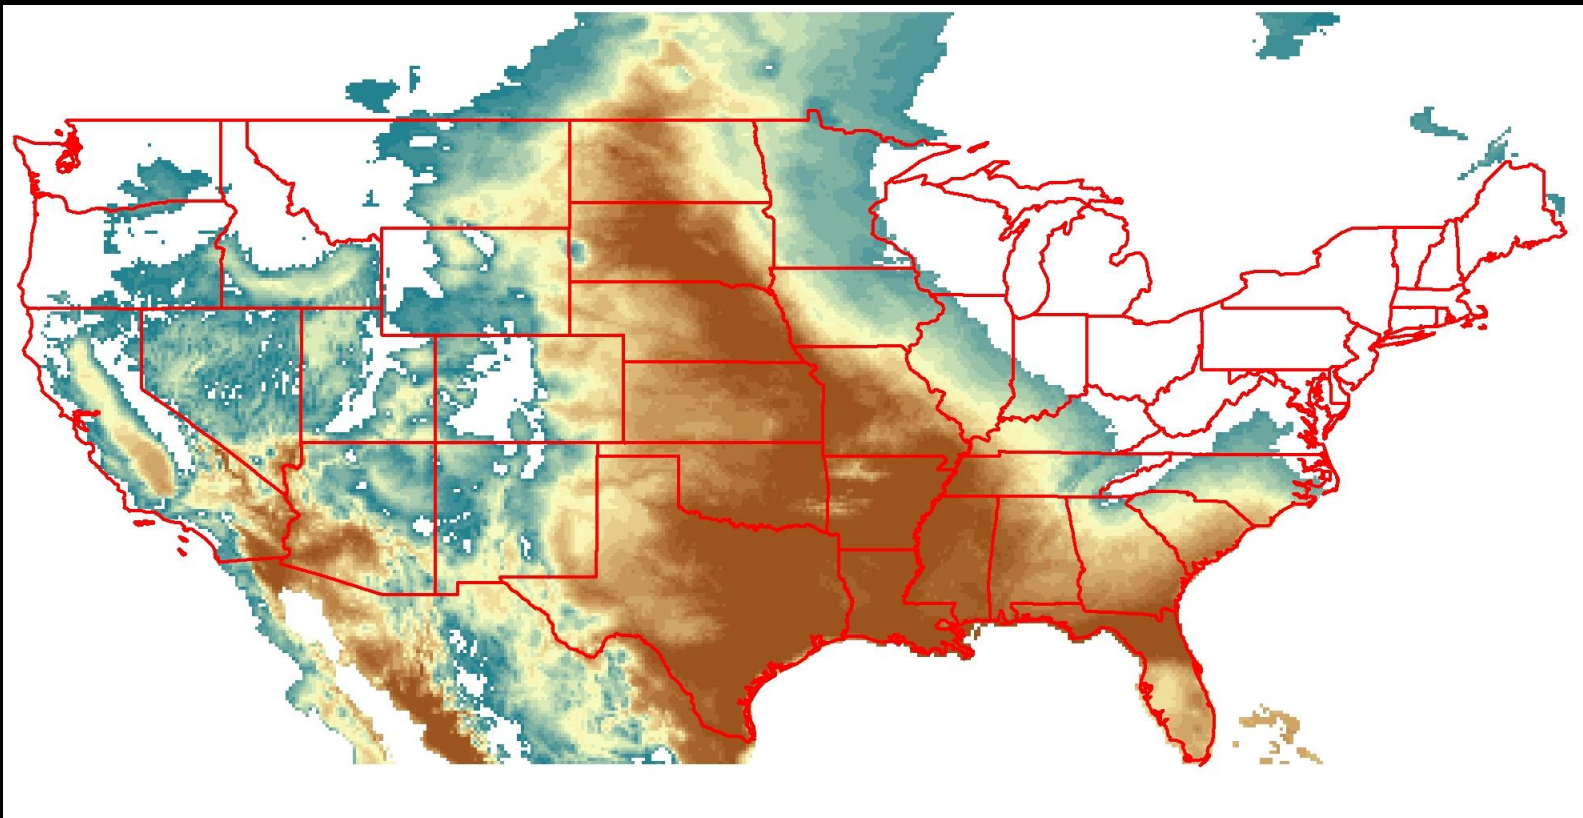

2. Heat Index (HI)

We used NLDAS data to calculate daily maximum Heat Index (HI).

HI (°F)

- 78.2 - 80
- 80.1 - 81.3
- 81.4 - 82.6
- 82.7 - 83.9
- 84 - 85.3
- 85.4 - 86.7
- 86.8 - 88.1
- 88.2 - 89.4
- 89.5 - 90.8
- 90.9 - 92.2
- 92.3 - 93.6
- 93.7 - 95
- 95.1 - 96.4
- 96.5 - 97.7
- 97.8 - 99
- 99.1 - 100.3
- 100.4 - 101.6
- 101.7 - 102.9
- 103 - 104.3
- 104.4 - 107.3

July 15, 2000

Metrics of Excessive Heat

3. Net Daily Heat Stress (NDHS)

Net Daily Heat Stress is a new heat variable that gives an integrated measure of heat stress (and relief) over the course of a day, defined as:

$$\text{NDHS} = \sum(\text{HI}_i - \text{HI}_{\text{hot}}) - \sum(\text{T}_{\text{cool}} - \text{T}_i)$$

where the summations are over the hours in a day, but only positive terms are included. In other words, the first sum, the 'heat stress', is only calculated when $\text{HI}_i > \text{HI}_{\text{hot}}$, where HI_{hot} is a threshold above which HI is considered a stressor, set to 90° F.

The second term, 'heat relief', is only computed when $\text{T}_i < \text{T}_{\text{cool}}$, a temperature below which relief from heat occurs, set to 75° F. This term is based on air temperature since HI is only defined when $T > 80^\circ \text{ F}$.

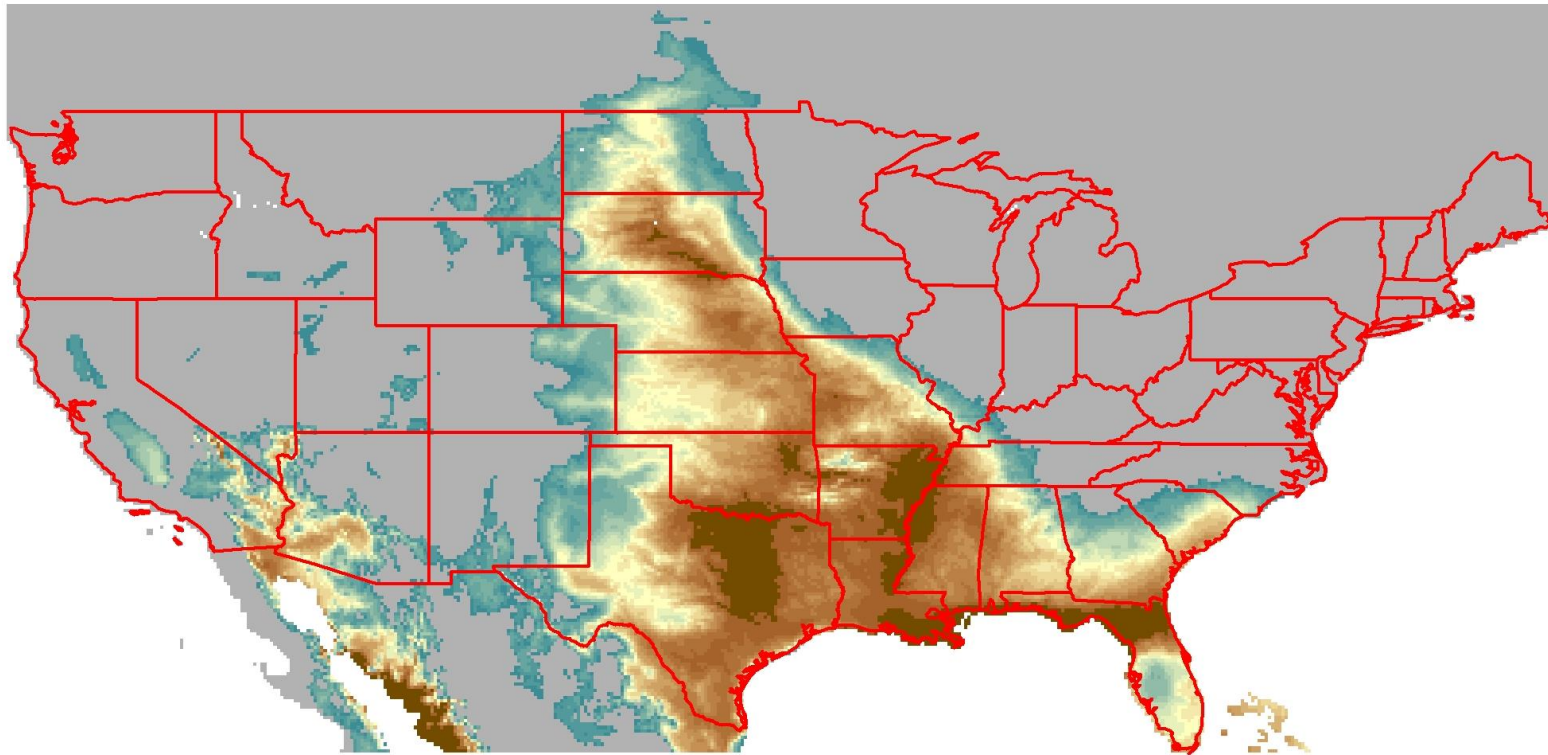

If heat relief is greater than heat stress, NDHS is set to 0.

Metrics of Excessive Heat

3. Net Daily Heat Stress (NDHS)

NDHS (degree-hours)

July 15, 2000

We obtained GCM output of monthly mean minimum and maximum daily temperatures and monthly mean specific humidity.

Source: Coupled Model Intercomparison Project (CMIP3) Multi-Model Dataset Archive at Program for Climate Model Diagnosis and Intercomparison (PCMDI). This activity was in support of the 4th Assessment Report (AR4).

Scenarios:

20th Century Climate for 1980 -1999

SRES A2 for 2030-2049 (2040) and 2080-2099 (2090)

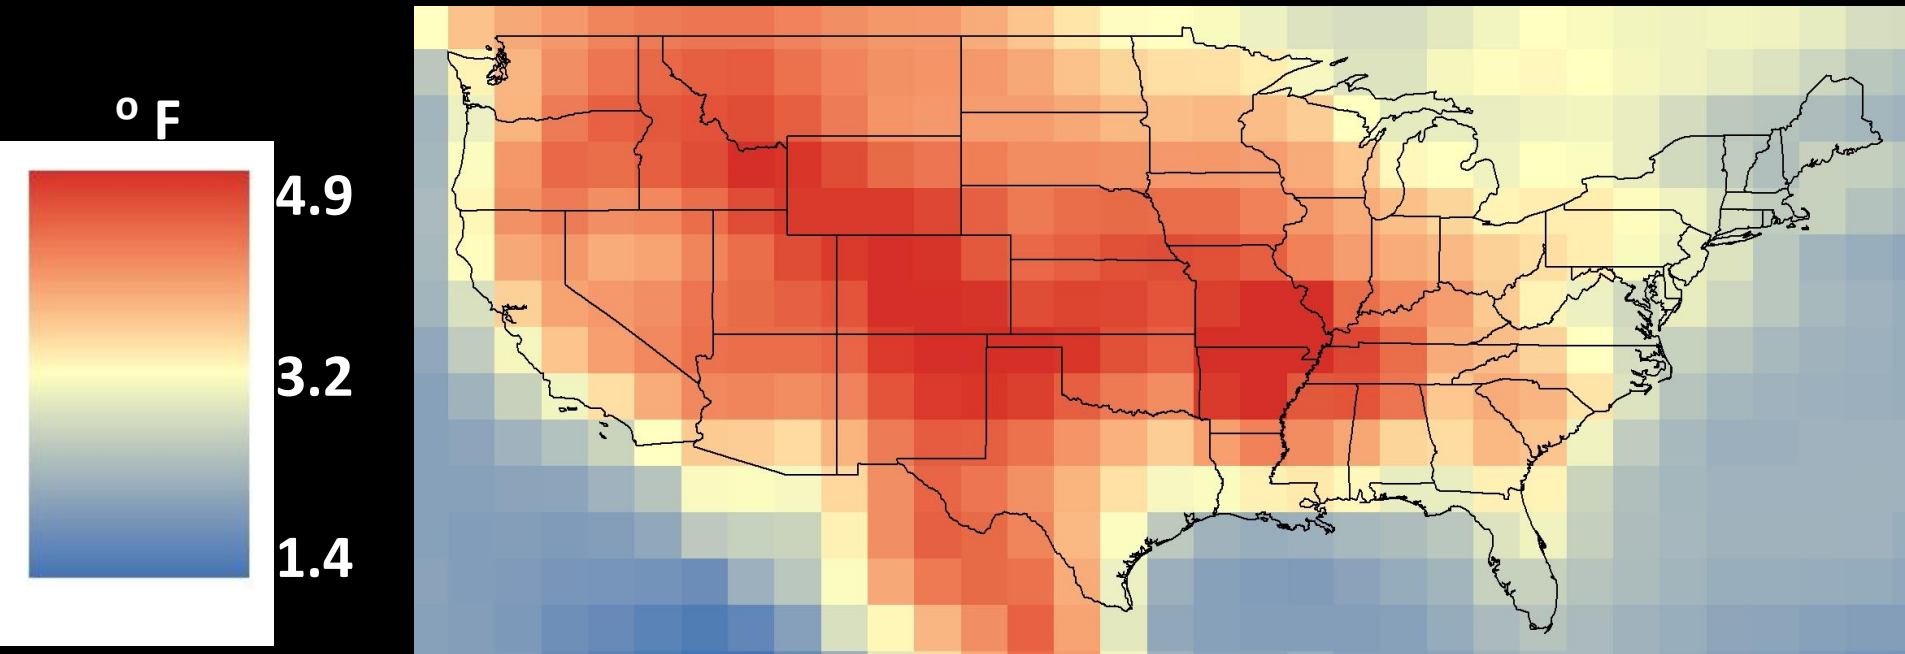

SRES A1B for 2030-2049 (2040) and 2080-2099 (2090)

	<u>Model</u>	<u># Ensemble members used</u>
1.	CCSM3 (NCAR)	2
2.	CSIRO-MK3.0 (Australia)	2
3.	CSIRO-MK3.5 (Australia)	3
4.	BCCR-BCM2.0 (Norway)	1
5.	INM CM3.0 (Russia)	1
6.	MIROC 3.2 Med. Res. (Japan)	3

Means of each variable were computed across ensembles, then across models.

Mean Maximum Temperature Difference - August

Population projections

Combine current gridded population estimates with county-level projections

**2010 Population
NLDAS Grid**

**2050 County Projections
(EPA-ICLUS)**

**2050 Population
NLDAS Grid - A2 Scenario**

- 2010 5 km Gridded Population of the World (GPW-3) aggregated to 12 km NLDAS grid.
- Distribution of population across NLDAS grids within each county determined from 2010 county populations (EPA-ICLUS).
- Projections made using county-level estimates (EPA-ICLUS), keeping in-county distribution constant.

Daily Maximum Heat Index Heat Event Definition

Mean Annual Number of Extreme Heat Event Person-Days
Daily Maximum Temperature Heat Event Definition

Mean Annual Number of Extreme Heat Event Person-Days
Net Daily Heat Stress (NDHS) Heat Event Definition

These graphs show the mean annual number of EHE person-days by decade, based on three EHE definitions.

Bottom left is same as top left except with bars showing the standard error of the means.

Population on the NLDAS grid

Procedure for projecting population on the NLDAS grid

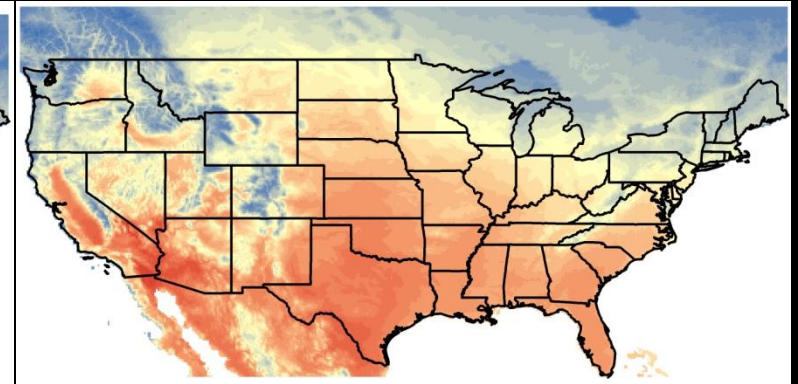

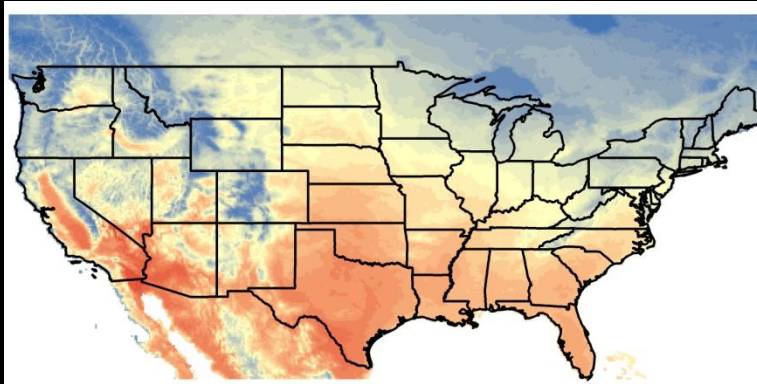

- Population on the NLDAS grid were determined from 2010 U.S. Census populations at the Census Tract level.
- County populations were determined by aggregating the NLDAS grid populations.
- The proportion of the county population within each NLDAS grid cell was computed by dividing the grid cell population by the respective county population.
- Populations in 5-year intervals to 2100 were estimated using projected county populations from EPA-ICLUS (Integrated Climate and Land Use Scenarios), keeping in-county distribution constant. The A2 climate scenario projections were used here.
- The 5-year projections were interpolated to create annual projections.

NDHS
(degree-days)

1981-2010

2031-2060

2081-2110

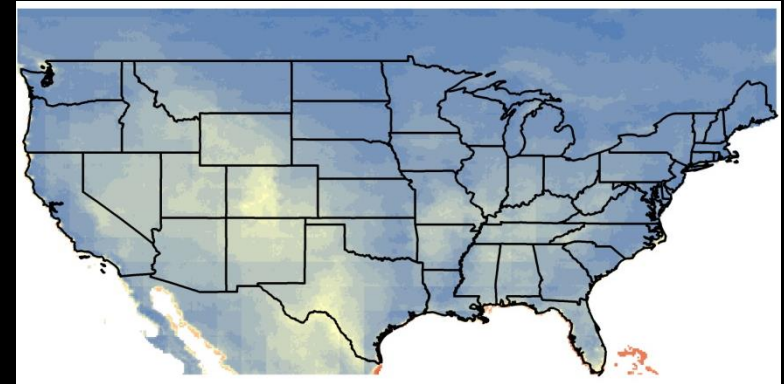

May – September Mean Number of Extreme Heat Event Days Maximum Temperature Definition

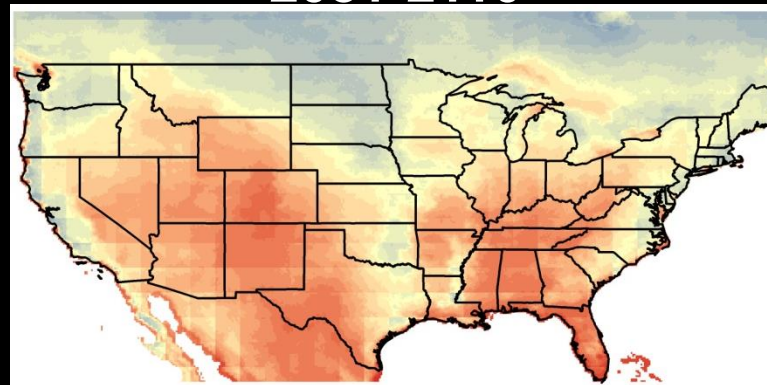

1981-2010

2031-2060

Number of days

2081-2110

Note: Since EHE days are based on days exceeding percentiles for the local climate, the number of EHE days for the baseline period (1981-2010) is nearly uniform across the country, at about 6 days per year.

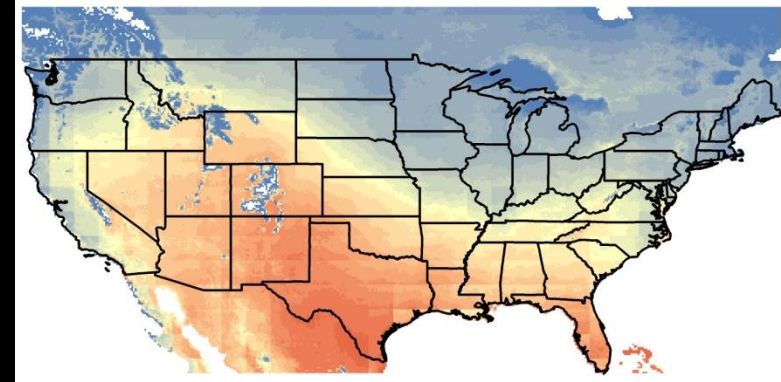

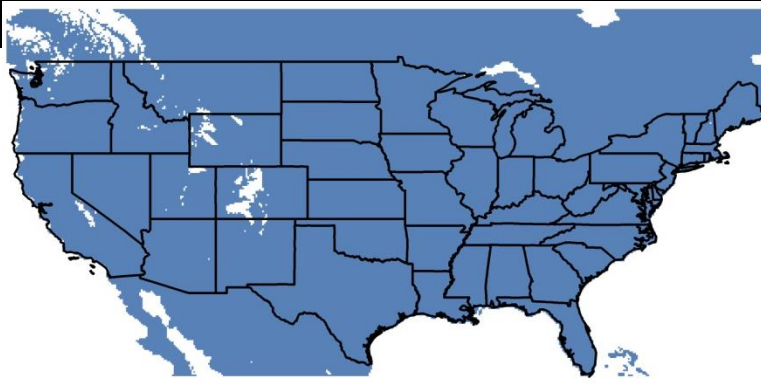

Based on the Maximum Temperature EHE definition, the mean annual number of EHE days rises to 20-40 for much of the country by mid-century , and to 50 – 100+ by the end of the century.

May – September Mean Number of Extreme Heat Event Days Maximum Heat Index Definition

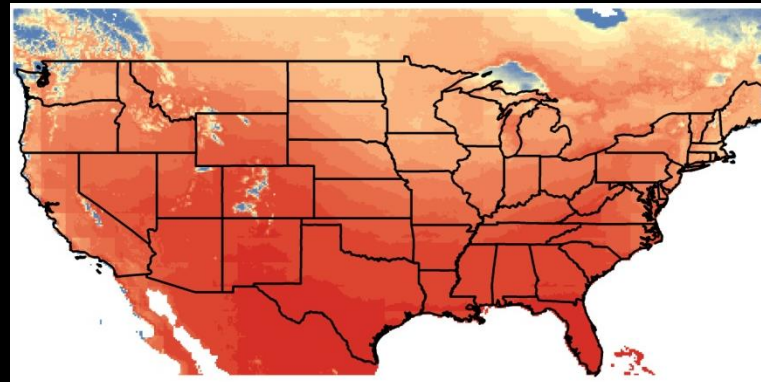

1981-2010

2031-2060

Number of days

2081-2110

Based on the Maximum Heat Index EHE definition, the mean annual number of EHE days rises to 30-60 for much of the country by mid-century, and to 60 – 150 by the end of the century.

Summary

- **GCM-scale monthly climatologies of max/min air temperature and specific humidity for the historical period 1981-2000, and future changes relative to this period.**
- **NLDAS-scale daily max/min temperatures, maximum heat index and Net Daily Heat Stress for historical period.**
- **NLDAS-scale statistics over 20-year past and future periods of heat stress measures.**
- **County-level heat stress measures to enable assessments of heat impacts on public health.**
- **Population-weighted NDHS for coterminous U.S.**
