Power Control and Rain Fade Software Test Plan

Version 1.0, January 1993

1.0 INTRODUCTION

1.1 Identification of Document

This is the Power Control and Rain Fade Software Test Plan document for the NASA Advanced Communications Technology Satellite (ACTS) High Burst Rate Link Evaluation Terminal (HBR-LET). This document complies with the NASA Software Management and Assurance Program (SMAP) guidelines in the Information System Life-Cycle and Documentation Standards, Release 4.3. This manual is one component of the Control and Performance Monitor (C&PM) Subsystem document series.

1.2 Scope of Document

Users must have a working knowledge of the rain fade prediction algorithms and their implementation with the Power Control Software. General knowledge of the Control and Performance Monitoring software is beneficial for interacting with the C&PM menu system.

This document assumes the reader is familiar with the operation of the Power Control Software. Refer to the *Power Control and Rain Fade Software User's Guide* for additional information on the Power Control Software functions and capabilities.

1.3 Purpose and Objectives of Document

The document provides a test procedure to verify the operation of the Power Control Software and rain fade prediction algorithms. A complete step-by-step procedure tests the operation of both the power control and rain fade programs, their interaction, and intertask communication between the programs.

Refer to the *Power Control and Rain Fade Software User's Guide* for detailed information on the Power Control or Rain Fade Software. Information on individual rain fade prediction algorithms is also available in referenced documents.

Section 1 - Introduction

1.4 Document Status and Schedule

Version 1.0 is the first publication of the Power Control and Rain Fade Software Test Plan. As the development of new rain fade algorithms continues, any modifications to the Power Control and Rain Fade Software Test Plan will be documented in subsequent versions.

Appendix B contains expected test results for past simulations. Additional data will be included as new algorithms are developed and implemented.

1.5 Document Organization

This document contains nine sections. Sections 1 and 2 introduce this document, and describe other documents related to it. Section 3 identifies the tests described in this document. Section 4 contains the test procedures used to verify the operation of the Rain Fade and Power Control software. Expected and actual test results are discussed in Sections 5 and 6. Sections 7 and 8 include a list of abbreviations and acronyms contained in this document and a glossary of special terms. Section 9 contains several appendices that contain the simulation data used in the test procedure and expected test results of existing algorithms.

Section 2 - Related Documentation

2.0 Related Documentation

2.1 Parent Document

The following document is parent to this document:

1. *HBR-LET Power Control and Rain Fade Software User's Guide*, NASA Lewis Research Center, Reinhart, R. and Manning, R, to be published.

2.2 Applicable Documents

The following documents are referenced within this test plan and are directly applicable to its content.

1. *HBR-LET Power Control and Rain Fade Software Maintenance Manual*, NASA Lewis Research Center, Reinhart, R. and Manning, R, to be published.
2. *HBR-LET Experiment Control and Monitor Software User's Guide*, NASA Lewis Research Center, Reinhart R., May 1991.

2.3 Information Documents

The following document provides additional information about the rain fade algorithm model discussed in this document. The second document details the specifications of the Power Control Software.

1. *A Statistical Rain Attenuation Prediction Model With Application to the Advanced Communication Technology Satellite Project*, NASA Technical Memorandum 100243, NASA Lewis Research Center, Manning, R., May 1991.
2. *Fade Data Interface Specification ACTS-DOC-89-034*, COMSAT Laboratories, 1989.

Section 3 - Test Identification

3.0 TEST IDENTIFICATION

The Rain Fade Software and rain fade prediction algorithm monitors the observed link attenuation to predict when the rain fade level will surpass the specified threshold attenuation. The rain fade prediction algorithm calculates the optimal link attenuation, independent of the link noise, from fade depth samples received from COMSAT's Beacon Measurement Subsystem (BMS). The Power Control Software adjusts the output power of the LET to compensate for signal degradation based on the rain fade algorithm. The Power Control Software controls the output power of the LET by varying the bias voltage across a PIN diode, thus varying the attenuation at the input of the traveling wave tube amplifier (TWTA). A low input attenuation results in a high input power, and thus a high output power. A high input attenuation results in a low input power, and thus a low output power.

Test 1 and Test 2 use a single rain fade simulation data set. The simulation data set contains low and high values of fade depth levels illustrated by Figure A-1 in Appendix A. Test 1 begins with low fade depth levels of less than 5 dB to demonstrate the ability of the rain fade algorithm to track and predict future up fade depth levels. At low fade depths, depending on the threshold attenuation, the Power Control Software remains inactive while the rain fade algorithm monitors and predicts future fade depth levels. The Rain Fade Software will invoke the Power Control Software when it predicts that the fade depth level will exceed the threshold attenuation value.

At higher fade levels, the Rain Fade Software tracks the current link attenuation while the Power Control Software adjusts the output power of the LET to compensate for signal degradation. Test 2 contains fade levels between 5 and 10 dB. During Test 2, the Power Control Software dynamically sets the PIN diode power supply based on the link attenuation calculated by the rain fade algorithm.

The following tests demonstrate the capability of the Power Control Software to implement the required TWTA input attenuation to compensate for signal loss due to rain fade attenuation. The Rain Fade Software calculates the optimal link attenuation and passes the attenuation value to the Power Control Software. The Power Control Software transforms the link attenuation to the TWTA input attenuation and properly adjusts the Hewlett Packard (HP) DC Power Supply controlling the PIN diode.

The status of the Power Control and Rain Fade Software parameters illustrate the handshaking that occurs between the two programs. The RAIN FADE ALGOR displays ACTIVE when the Rain Fade Software

Section 3 - Test Identification

receives new data from the BMS, otherwise it displays INACTIVE. The Rain Fade Software executes the Power Control Software (ACTIVE) once the rain fade algorithm predicts that the link attenuation will exceed the threshold attenuation. After the fade has passed and the link attenuation falls below the threshold value, the Power Control Software will reset the TWTA input attenuation to a default value and return to an inactive state (INACTIVE). Monitor the handshaking of the two programs by observing the PIN DIODE CONTROL toggle between ACTIVE and INACTIVE.

The Power Control Software is written to support numerous rain fade prediction algorithms. Refer to the *Power Control and Rain Fade Software User's Guide* for the Rain Fade Software requirements. The Rain Fade Software can have any name, provided the name meets the conditions specified in the *Power Control and Rain Fade Software User's Guide*.

Section 4 - Test Procedures

4.0 TEST PROCEDURES

4.1 Initial Conditions

The Power Control and Rain Fade Software Test Plan simulates the up link beacon level and down link beacon level data received from COMSAT's BMS. The simulation program simulates the BMS by transmitting data to the Power Control Software.

Two ports on the Concurrent 3205 connected together enables communication between the simulation program and the power control receive program. CRT6: is the transmit port of the rain fade simulation software. The rain fade simulation program transmits data to the Power Control Software without alteration. The Power Control Software receives the simulation data at CRTF: and decodes the simulation data according to the format specified in the Fade Data Interface Specification.

- 1) Using a standard communication cable with lines 2 and 3 crossed (to transmit and receive properly), connect ports CRT6: and CRTF: together.
- 2) Record the statistical parameters used for the rain fade prediction algorithm. Include the name of the data file containing the parameters in addition to the parameter values.

Section 4 - Test Procedures

- 2) The statistical parameters used in the rain fade algorithm define the rain fade process as described by the ACTS Rain Attenuation Model. Refer to the *Power Control and Rain Fade Software User's Guide* for additional information on the operation of the rain fade algorithm and statistical parameters. Note additional parameters not listed in Table 4-1.

File Name:		
Variable	Parameter	Value
AM	Mean Attenuation @ 30 Ghz link (dB)	
SDA	Standard Deviation of Attn @ 30 Ghz link	
TFF	Temporal Fade Factor (sec)	
ATTN_TH	Threshold Attenuation (dB)	
ATPRED	Sample prediction time (sec)	
SDN	Standard Deviation of Attn Measurement	
DT	Sample Time Interval	

Table 4-1 Rain Fade Algorithm Statistical Parameters

Section 4 - Test Procedures

- 3) A data file named M1:RAININST.FAD/111 contains information about the instruments used by the Power Control Software. Specify the address and IEEE 488 bus extension number of both the HP DC Power Supply and the Wavetek Peak Power Meter. Also indicate the channel(s) and mode of the Wavetek Peak Power Meter for the Power Control Software to monitor. Table 4-2 lists the available modes and channels of the Wavetek Peak Power Meter with the corresponding option number.

Option Number	Channel	Mode
1	A+B	CW
2	A	CW
3	A+B	PEAK
4	B	CW
6	A	PEAK
8	B	PEAK

Table 4-2 Wavetek Peak Power Meter Channel/Mode Definitions

- 4) In the RAININST.FAD file, specify the default up fade attenuation for clear sky condition. This value is used when there is no fade and power control is not needed. Do not confuse this value with the DC voltage of the power supply.
Up fade default value: _____

Section 4 - Test Procedures

Figure 4-1 illustrates the monitor menu of the Power Control Software. Note the location of the various parameters before beginning the simulation. The Power Control Software will receive the simulation data at the rate specified by the algorithm developer in the DT variable. The monitor menu will update different parameters depending on the PIN DIODE CONTROL status. A status of DISABLE indicates that the Power Control Software is temporarily not needed and is therefore INACTIVE. Once the up fade link attenuation surpasses the attenuation threshold, the Rain Fade Software will execute the Power Control Software and ENABLE the PIN DIODE CONTROL parameter.

Rain Fade Prediction Algorithm Monitor			
PIN DIODE CONTROL			ENABLE
UP FADE DEPTH	-5.55	DOWN FADE DEPTH	-3.68
UP FADE OPT	-5.498	ATTN PREDICTED	-5.2017
POWER CHANNEL A	-16.35	POWER CHANNEL B	-4.17
ATTN PIN	-14.8015	PIN VOLTAGE	1.8409
POWER CONTROL	ACTIVE	RAIN FADE ALGOR	ACTIVE
CURRENT TIME 12:34:56			

Figure 4-1 Power Control Software Monitor Menu

Become familiar with all steps within each test before beginning. The monitor menu parameter values change quickly depending on the variable DT. It is important to note the status of the Power Control and Rain Fade software throughout the simulation.

The Power Control Software will generate data files for both the Power Control and Rain Fade programs. The Rain Fade data file will have the same name as the rain fade algorithm but with the filename extension DAT. This file contains the simulation data received by the Power Control Software, the calculated and predicted attenuation values, the PIN diode flag status, and the time between successive samples. The Power Control data file has the name M1:RAINFADe.DAT/111. RAINFADE.DAT contains the attenuation values calculated by the rain fade algorithm, the Wavetek Peak Power Meter measurements, and the HP Power Supply voltage settings. Use the data in these files to evaluate the simulation.

Section 4 - Test Procedures

4.2 Test 1 - Data Reception

____ Execute the desired rain fade prediction algorithm. Refer to the *Power Control and Rain Fade Software User's Guide* for specific instructions to execute the algorithm.

____ Verify that the following messages appear at the user's terminal, indicating that the Rain Fade Software correctly loaded and started.

"FILENAME VERIFIED, OPENING REQUIRED FILES"

"PLACING POWER METER AND POWER SUPPLY IN REMOTE"

"LOADING RAIN FADE PREDICTION ALGORITHM"

____ Visually verify that both the HP DC Power Supply and the Wavetek Peak Power Meter are in remote mode. Remote mode places an instrument under computer control.

____ Select the Rain Fade Simulation option from the C&PM Main Menu. Verify that the following messages appear at the user's terminal, indicating that the Rain Fade Simulation Software correctly loaded and started.

"Simulation Program Opening Required Files"

"Simulation will begin after two minute delay"

Note: The simulation software will transmit data to the Power Control Software simulating the BMS. A delay built into the software will suspend the execution of the simulation for approximately two minutes, providing the user time to start the rain fade monitor. Appendix A contains a copy of the simulation data and a plot of its up fade depth level versus time.

Section 4 - Test Procedures

Select the Rain Fade Monitor option from the C&PM Main Menu to monitor the status of the Power Control and Rain Fade software. Note the CURRENT TIME when the monitor menu appears to estimate when the data transfer will begin and end. TIME _____.

Verify that both the POWER CONTROL and RAIN FADE ALGOR parameters display INACTIVE (dormant), indicating that no data is currently being received. At this time, the simulation data program should be in the two minute delay and not transmitting data. The UP FADE DEPTH parameter should be zero.

After the two minute delay, verify that the UP FADE DEPTH variable randomly changes indicating that the Power Control Software is receiving the simulation data. The DOWN FADE DEPTH variable will remain constant during this test.

Verify that the RAIN FADE ALGOR parameter changes from INACTIVE to ACTIVE. An ACTIVE status indicates that the Rain Fade Software engages once the Power Control Software receives new data. The POWER CONTROL parameter should initially remain INACTIVE.

Note the status of the PIN DIODE CONTROL and current UP FADE DEPTH parameters. If the UP FADE DEPTH is greater than the threshold value, PIN DIODE CONTROL should be ENABLED. If the UP FADE DEPTH is less than the threshold value, PIN DIODE CONTROL should be DISABLED.

Threshold Value _____
UP FADE DEPTH _____
PIN DIODE CONTROL _____

Verify that one of the following occurs, depending on the state of the PIN DIODE CONTROL parameter:

- The ATTN PREDICTED parameter updates with new values when PIN DIODE CONTROL is DISABLED.
- The UP FADE OPT parameter updates with new values when PIN DIODE CONTROL is ENABLED.

Section 4 - Test Procedures

4.3 Test 2 - Power Control and Intertask Communication

After approximately one minute and forty seconds the simulation Up Fade Depth level will increase above 5 dB attenuation. The following test will verify that the Power Control Software can dynamically control the HP DC Power Supply and Wavetek Peak Power Meter.

Verify that once the Up Fade Depth exceeds the threshold attenuation, the PIN DIODE CONTROL is ENABLED, and the POWER CONTROL status is ACTIVE. The RAIN FADE ALGOR parameter will remain ACTIVE.

Verify the following once PIN DIODE CONTROL is ENABLED.

The Rain Fade Software updates the UP FADE OPT parameter as the Power Control Software receives new data.

The rain fade algorithm stops predicting the observed attenuation. Note that the ATTN PREDICTED parameter does not change as the Power Control Software receives new data.

The Power Control Software updates the PIN VOLTAGE, appropriate POWER CHANNEL's, and ATTN PIN parameters. These parameters correspond to the HP DC Power Supply voltage, TWTA output power (appropriate channel), and TWTA input attenuation, respectively.

Visually verify that the PIN Diode HP DC Power Supply voltage parameter is changing values corresponding to the values on the user terminal. The current parameter on the instrument will remain unchanged.

Visually verify that the Power Control Software is taking measurements from the Wavetek Peak Power Meter by noting the blinking front panel display. The channels read will depend on those specified by the user in Section 4.

Note that the DOWN FADE DEPTH level is equal to the UP FADE DEPTH level. The DOWN FADE DEPTH parameter will remain equal to the UP FADE DEPTH level for the remainder of the simulation data set.

Section 4 - Test Procedures

The simulation data will end after approximately five and a half minutes. Refer to the TIME recorded in Test 1. The last UP FADE DEPTH parameter (a value of -4.2 dB) will remain constant at the end of the simulation. Verify that both the RAIN FADE ALGOR and POWER CONTROL parameters return to an INACTIVE state indicating there is no new data, and the current Up Fade Depth is below the threshold value. The status of the POWER CONTROL parameter is dependent upon the threshold attenuation value specified in Section 4.

Return to the C&PM Main Menu and terminate the Power Control and Rain Fade Algorithm software. This concludes the interactive portion of the Power Control and Rain Fade Software Test Plan. Analyze the test data in subsequent sections.

Manually place the HP DC Power Supply and Wavetek Peak Power Meter in local mode. Local mode returns control of the instrument to its front panel keys.

Section 5 - Expected Test Results

5.0 EXPECTED TEST RESULTS

Appendix B contains a copy of the Power Control and Rain Fade Software data files of past simulation tests. Compare the expected values of the appropriate simulation with the actual results obtained. Verify the following in Test 3:

- The Rain Fade Software received the simulation data at the rate of DT seconds. Note that the time between successive samples has not changed significantly, relative to DT.
- The Rain Fade Algorithm performance has not changed. This will depend on the respective rain fade algorithm.
- Compare the UP_FADE parameter of the Power Control Software with the predicted (ATTNPRED) and optimal attenuation (ATTN_OPT) calculated by the rain fade algorithm. Note the PIN_FLAG parameter value, and verify that the Power Control Software received the proper variable.
- The Wavetek Power Meter power readings have remained constant. Channels read will depend on those specified in Section 4. Verify that the Power Control Software read the proper channel(s).

Section 6 - Expected Test Results

6.0 ACTUAL TEST RESULTS

This section is to verify proper operation of the Power Control Software and the intertask communication with the Rain Fade Software. The developer of the rain fade algorithm must interpret the results of the simulation to determine the effectiveness of the rain fade algorithm. The details for evaluating the rain fade algorithm are not discussed in this document.

Note the revision date of the Power Control and Rain Fade programs and record the name and date of the rain fade algorithm used in this test. Sign-on to a private account on the computer system following the procedure outlined in the MTM Primer or the HBR-LET EC&M Software User's Guide. At the system propmt, type the following command to view the file details of the power control software.

D F,M1:DIODESET.TSK/111

Record the latest date that the file was written. Use a similar command to view the file details of the rain fade algorithm program. The user should know the account where the file resides. Contact the system administrator for details on obtaining a private account.

Power Control Software program name M1:DIODESET.TSK/111

Power Control Software date _____

Rain Fade Software program name _____

Rain Fade Software date _____

6.1 Data abnormalities

The Power Control and Rain Fade software are separate programs concurrently executing on the computer. The performance and execution status of the individual programs depends upon the rain fade samples received and the time between the samples. The Power Control Software receives data from the simulation software every DT seconds. Although the samples are transmitted every DT seconds from the simulation software, the actual program execution time, input/output functions, and the number of programs concurrently executing affects the actual time it takes to transmit and receive a sample. For example, if DT is set to one second, a sample time of two seconds may occur due to program execution time and hardware limitations (seconds is the smallest time resolution available).

Section 6 - Actual Test Results

Also, as described in the *Power Control and Rain Fade Software User's Guide*, the same memory location is updated with each new sample received. The Rain Fade Software may on occasion be unable to receive a sample due to processing at the time a sample is available. Another sample could be received and overwrite the previous sample. These abnormalities have been identified and are deemed as normal occurrences for the power control and rain fade process.

Two terms defined here are used in the Post Processing and Data Analysis section. The terms acceptable and acceptable range are defined as 'within a reasonable amount' determined by the algorithm developer. Also, if the Rain Fade Software does not receive a sample, the data may appear shifted compared to the expected data in Appendix B. Take these perversions into account when reviewing the actual simulation results.

6.2 Test 3 - Post Processing and Data Analysis

Print the data files corresponding to the respective programs using the Experiment Control and Monitor (EC&M) Post Processing Software. Refer to the *EC&M Post Processing Software User's Guide* for information on the EC&M Post Processing Software. The name of the Power Control Software data file is M1:RAINFADe.DAT/111. The name of the Rain Fade Software data file is the same as the algorithm name, but with the filename extension DAT.

— Note that the Rain Fade Software received the correct data from the simulation file. Compare the UP_FADE and DWN_FADE variables with the data in Table A-1. Verify that the Rain Fade program received an acceptable amount of data.

— Verify that the time between samples (SAMPL_DT) is in an acceptable range. The value of SAMPL DT should be equal to DT, specified by the user in Section 4.

— Verify that the PIN FLAG variable is zero (0.0) when the UP_FADE value is below threshold and one (1.0) when above threshold. This flag determines when the rain fade program activated the Power Control Software.

Section 6 - Expected Test Results

Compare the ATTN_PIN variable of the Power Control Software data file with the Rain Fade Software data. Using the PIN_FLAG variable, verify that the ATTN_PIN variable corresponds to the ATTNPRED variable when PIN_FLAG is first set to one and then equal to ATTN_OPT for each successive sample until PIN_FLAG is reset to zero.

Plot the PIN diode voltage and TWTA output power versus time as shown in Figure B-3 using the EC&M Post Processing Software.

Compare the PIN diode voltage and corresponding TWTA output power with the appropriate simulation graph with the same variables. Verify that the performance of the TWTA has remained consistent.

Note the time the Power Control implements the proper attenuation as discussed in the previous step. Verify that the power control is implemented in a reasonable amount of time, relative to DT.

Verify that the Power Control Software resets the TWTA input attenuation (ATTN_PIN) when the PIN_FLAG resets to zero. The TWTA input attenuation corresponds to the initial Up Fade Depth value specified in Section 4.

Comments:

Section 7 - Abbreviations and Acronyms

7.0 ABBREVIATIONS AND ACRONYMS

Refer to the list of abbreviations and acronyms and their definition for reference when using this manual.

ABBREVIATION	DEFINITION
ACTS	Advanced Communication Technology Satellite
ALGOR	Algorithm
ATPRED/ATTNPRED	Predicted Attenuation
ATTN	Attenuation
ATTN_OPT	Optimal Attenuation
ATTN_PIN	TWTA input attenuation
ATTN_TH	Threshold Attenuation
C&PM	Control and Performance Monitoring Subsystem
COMSAT	Communications Satellite Corporation
DWN_FADE	Down Fade Depth sample
EC&M	Experiment Control and Monitor
ELAP_TIM	Elapse time in seconds since midnight
HBR-LET	High Burst Rate Link Evaluation Terminal
HP	Hewlett Packard
LeRC	Lewis Research Center
NASA	National Aeronautics and Space Administration
PIN_FLAG	PIN diode software flag

Section 7 - Abbreviations and Acronyms

PIN_VOLT	PIN diode, HP DC Power Supply voltage setting
SAMPL_DT	Time between successive rain fade samples
TWTA	Traveling Wave Tube Amplifier
UP_FADE	Up Fade Depth sample
WAV_CH_A	Wavetek Peak Power Meter reading channel A
WAV_CH_B	Wavetek Peak Power Meter reading channel B

Section 8 - Glossary

8.0 GLOSSARY

down fade depth - the beacon fade level of the down link signal from the satellite to the ground station.

optimal link attenuation - link attenuation measured independent of system noise, scintillation, and other imprecisions.

predicted link attenuation - the optimal link attenuation measured some time t , into the future. The rain fade algorithm predicts when the link attenuation will surpass the threshold attenuation thus requiring power augmentation.

rain fade prediction algorithm - determines the amount of signal degradation on a communication link. Also capable of predicting future rain fade levels providing time to compensate for the fade.

sample time - time in seconds between two successive fade level measurements. The sample time is user defined for each application.

threshold value - attenuation value in dB that determines when power control is necessary to compensate for signal degradation. Power control is activated when the fade level exceeds the threshold value.

up fade depth - the beacon fade level of the up link signal from the ground station to the satellite.

Appendix A - Up Fade and Down Fade Depth Simulation Samples

9.0 APPENDICES

Appendix A

Up Fade and Down Fade Depth Simulation Samples

Figure A-1 is a plot of the up fade beacon level versus time for the rain fade simulation data corresponding to Table A-1. Table A-1 lists the values for the rain fade simulation data in file M1:SIMDATA1.FAD/111, described in this document. The simulation consists of 316 samples representing a rain fade event. Use the data in Table A-1 to verify that the Power Control Software receives the data and passes it to the Rain Fade Software.

Table A-1 Up Fade and Down Fade Simulation data

Appendix B - Rain Fade Simulation Expected Test Results

Appendix B

Rain Fade Simulation Expected Test Results

Use this appendix to compare the actual simulation results with past simulations to evaluate the performance of the Power Control and Rain Fade software. Simulation data is algorithm dependent. The data in this section is that which was available at time of publication. Additional data will be added as new algorithms are developed.

Use the EC&M Post Processing Software to reproduce the tables and graphs of the expected data. Each file contains the file name and date the data was sampled. Update this data as needed. Templates are available to reproduce Figures B-1, B-2 and B-3 using the Post Processing Software. Refer to the *EC&M Post Processing Software User's Guide* for additional information.

Locate the appropriate algorithm from those available to compare results. After evaluating the data files, fill out Section 6 describing the results. Note any significant differences, other than those previously discussed in Section 6. If problems in the Power Control Software are suspected, submit a copy of the actual and expected test results to the C&PM Software Manager. Describe the discrepancy in detail so that the simulation test can be repeated. This information will assist the software developers to improve the Power Control Software and provide more information in the Power Control and Rain Fade Software Test Plan.

Appendix B - Rain Fade Simulation Expected Test Results

Rain Fade Algorithm M1:BMALGR1.FTN/111

Table B-1 lists the statistical parameters used for the rain fade algorithm BMALGR1.FTN. Verify that the parameters listed are concurrent with those used in the actual test. Also, this test simulation read channel B of the Wavetek Peak Power Meter. Note any changes in the actual simulation in Section 6. The channels read will affect the timing of the Power Control Software.

File Name: M1:CLEVE.FAD/111		
Variable	Parameter	Value
AM	Mean Attenuation @ 30 Ghz link (dB)	2.656
SDA	Standard Deviation of Attn @ 30 Ghz link	1.066
TFF	Temporal Fade Factor (sec)	17.487
ATTN TH	Threshold Attenuation (dB)	5
ATPRED	Sample prediction time (sec)	2
SDN	Standard Deviation of Attn Measurement	.15
DT	Sample Time Interval (sec)	1

Table B-1 Rain Fade Algorithm Actual Statistical Parameters

A copy of both the BMALGR1 algorithm and power control data files and graphs of selected data are provided on the following pages. These tables and graphs were generated using the EC&M Post Processing Software. Compare the actual simulation results with the expected data. Complete Section 6-2, Post Processing and Data Analysis.

Appendix B - Rain Fade Simulation Expected Test Results

Appendix B - Rain Fade Simulation Expected Test Results

Figure B-1 illustrates the Up Fade samples received by the Power Control receive program and passed to the Rain Fade BMALGR1 Software. This figure is similar to Figure A-1. Verify that the actual Up Fade samples received for the current simulation are similar to Figure B-1.

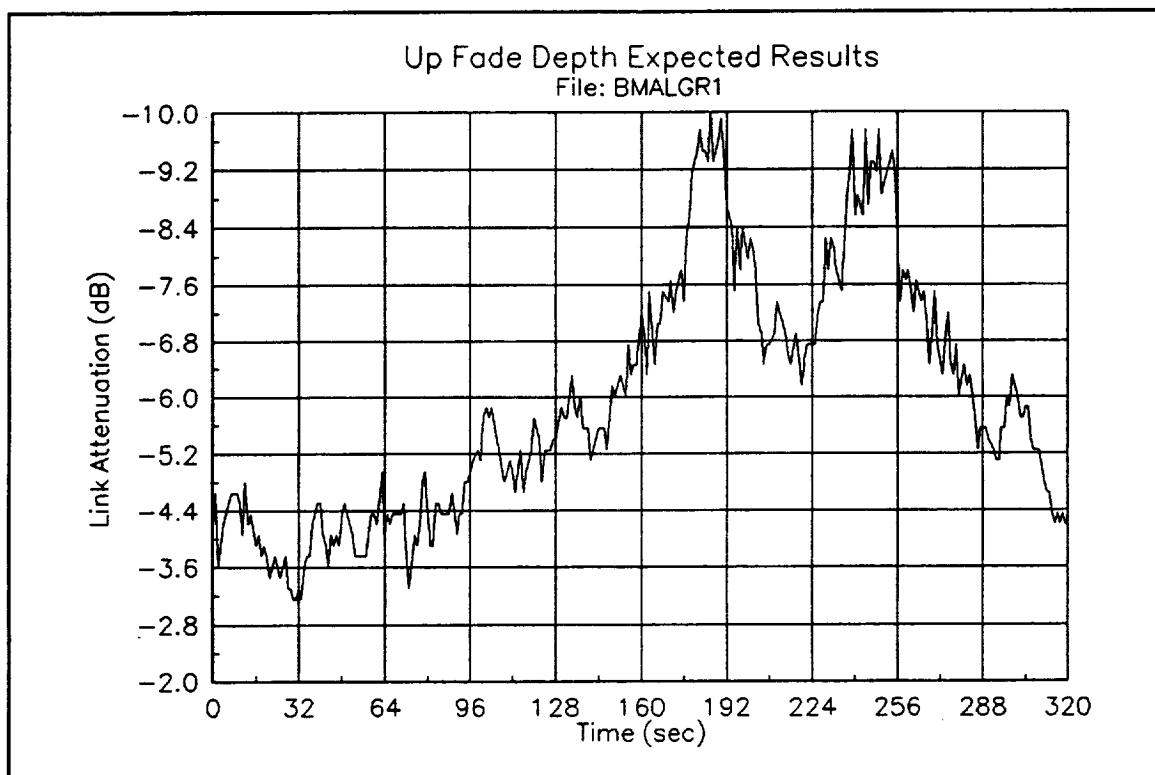

Figure B-1 BMALGR1 Up Fade Depth versus Elapsed Time

Appendix B - Rain Fade Simulation Expected Test Results

Figure B-2 compares the Up Fade samples received to the Optimal Attenuation calculated by the Rain Fade Software. For the given simulation, the Optimal Attenuation tracks the Up Fade samples. In actual rain fade events, the Optimal Attenuation will vary somewhat from the Up Fade samples due to scintillation and other system imperfections. The Optimal Attenuation is a measure of signal fade due to rain only.

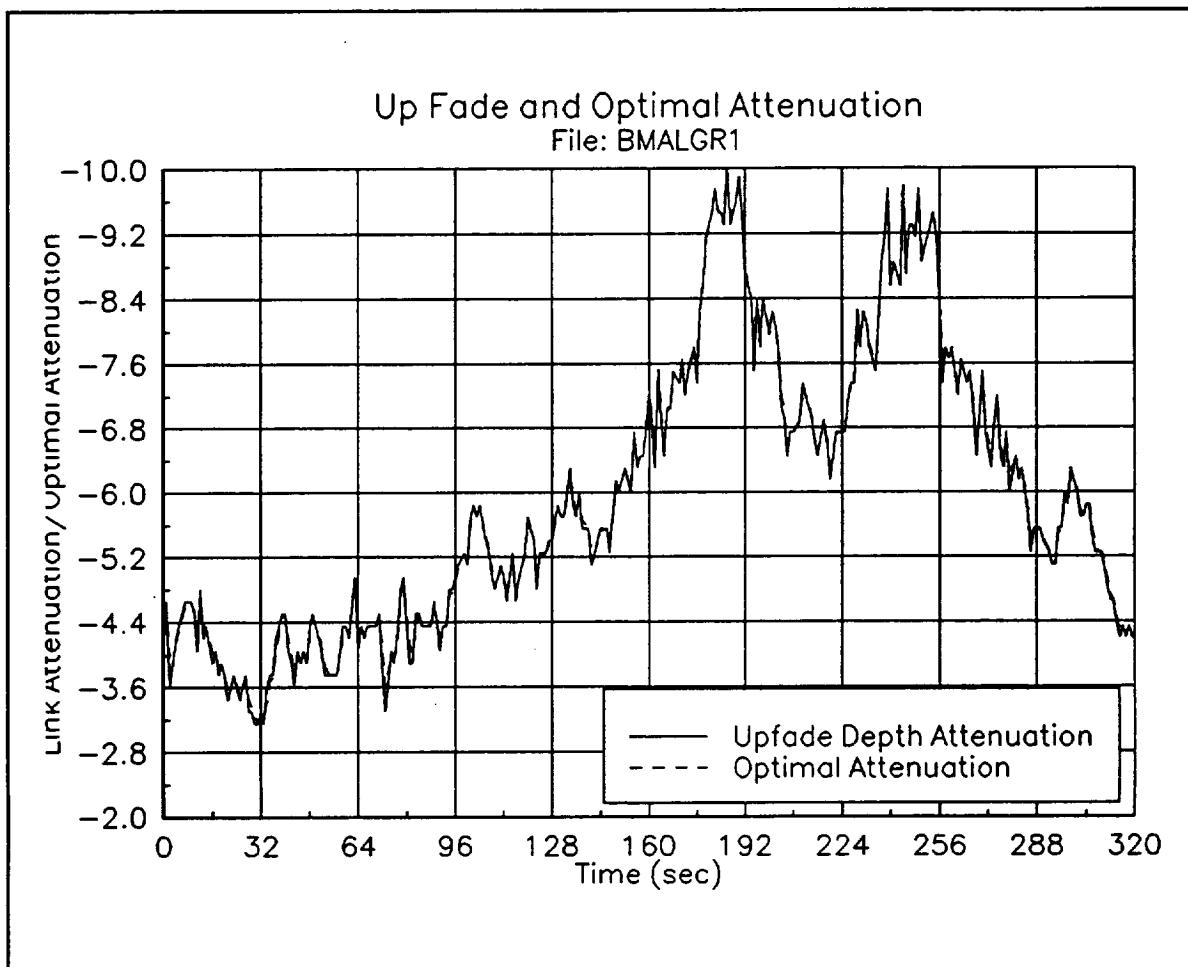

Figure B-2 BMALGR1 Up Fade Depth and Optimal Attenuation versus Elapsed Time

Appendix B - Rain Fade Simulation Expected Test Results

Figure B-3 is a plot of both the PIN Diode voltage and the corresponding TWTA output power as a function of time. As illustrated in the graph and discussed earlier, a low voltage results in a low TWTA input attenuation and thus a high output power. Conversely, a high voltage produces a high TWTA input attenuation and thus a low output power. Plot the appropriate power and voltage data to verify that the actual results obtained are similar to the expected values.

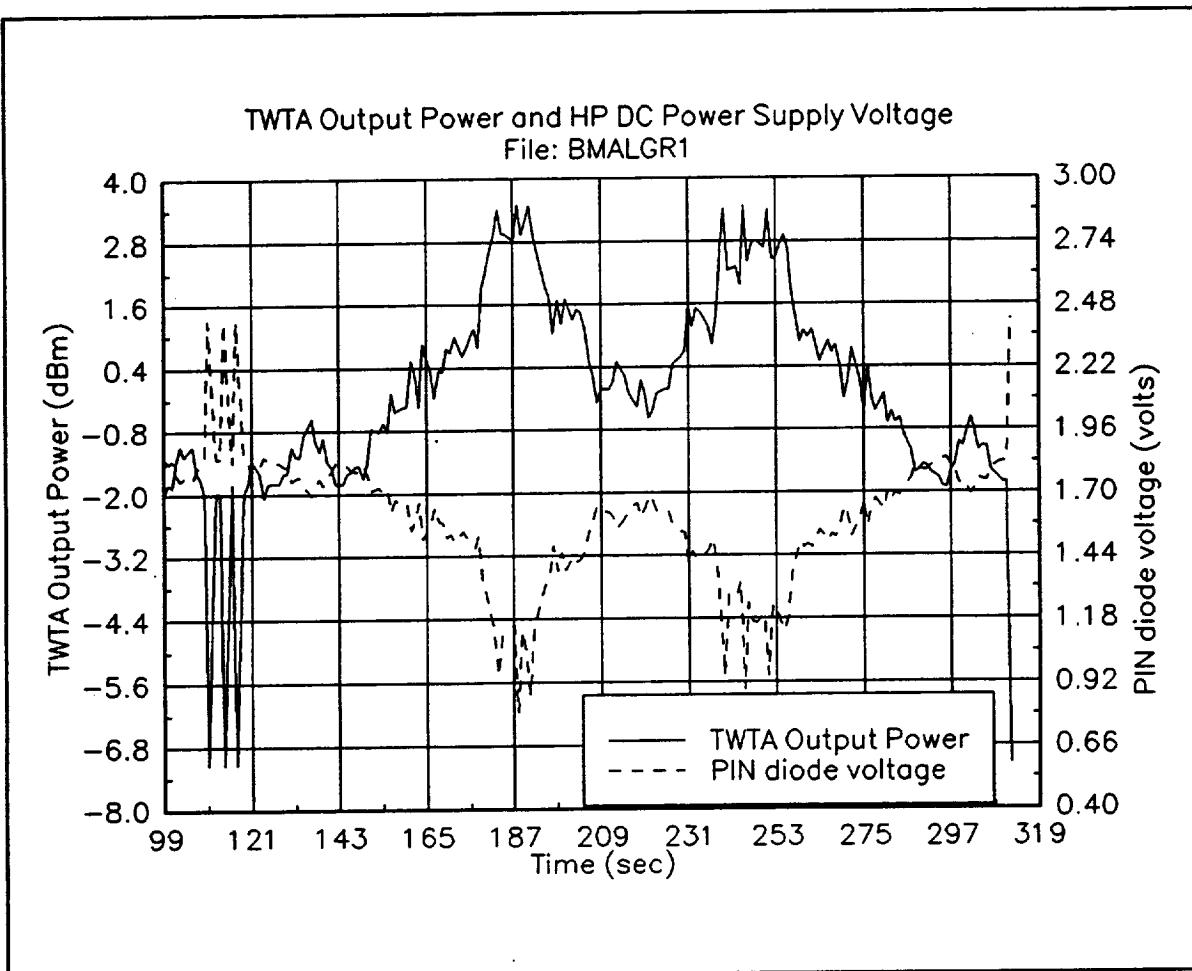

Figure B-3 BMALGR1 TWTA Output Power and PIN Diode Voltage versus Elapsed Time

13. ABSTRACT (Maximum 200 words) The Power Control and Rain Fade Software was developed at the NASA Lewis Research Center to support the Advanced Communications Technology Satellite High Burst Rate Link Evaluation Terminal (ACTS HBR-LET). The HBR-LET is an experimenters terminal to communicate with the ACTS for various experiments by government, university, and industry agencies. The Power Control and Rain Fade Software is one segment of the Control and Performance Monitor (C&PM) Software system of the HBR-LET. The Power Control and Rain Fade Software automatically controls the LET uplink power to compensate for signal fades. Besides power augmentation, the C&PM Software system is also responsible for instrument control during HBR-LET experiments, control of the Intermediate Frequency Switch Matrix on board the ACTS to yield a desired path through the spacecraft payload, and data display. The Power Control and Rain Fade Software User's Guide, Version 1.0 (NASA CR-189165, to be published) outlines the commands and procedures to install and operate the Power Control and Rain Fade Software. The Power Control and Rain Fade Software Maintenance Manual, Version 1.0 (NASA CR-189166, to be published) is a programmer's guide to the Power Control and Rain Fade Software. This manual details the current implementation of the software from a technical perspective. Included is an overview of the Power Control and Rain Fade Software, computer algorithms, format representations, and computer hardware configuration. The Power Control and Rain Fade Test Plan (NASA CR-189167) provides a step-by-step procedure to verify the operation of the software using a predetermined signal fade event. The Test Plan also provides a means to demonstrate the capability of the software.
