**GAS-GRAIN SIMULATION FACILITY (GGSF)**

Presented by Ken Greenwald  
Space Science Division, Solar Systems Exploration Branch  
NASA Ames Research Center

**ABSTRACT**

The goal of the Gas-Grain Simulation Facility project is to provide a microgravity laboratory to facilitate research relevant to exobiology (the study of the origin and evolution of life in the universe). Such a facility will also be useful in other areas of study important to NASA including planetary science, biology, atmospheric science, astrophysics, chemistry, and physics. To achieve this goal, the project will develop and support the GGSF, a modular facility-class payload planned for inclusion on Space Station Freedom. The GGSF will consist of an experiment chamber(s) supported by subsystems that provide chamber environment regulation and monitoring capabilities; sample generation, injection, positioning, and retrieval capabilities; and computer control, data acquisition and housekeeping capabilities. The facility will also provide analytical tools such as light-scattering measurement systems, aerosol size-spectrum measurement devices, and optical imaging systems.

As much as possible, facility components will be designed to be modular, allowing evolutionary growth of the facility capabilities. A modular design will also allow flexibility in facility configuration; provide for on-orbit integration of experiment unique equipment into the facility; and allow GGSF subsystems to be added, removed or exchanged with minimal crew interaction. To further minimize crew interaction requirements, the GGSF and each experiment to be performed on the GGSF are expected to make use of automation, telepresence and artificial intelligence, allowing nearly autonomous operation.

Laboratory research enabled by the GGSF involves simulating and studying fundamental chemical and physical processes such as formation, growth, nucleation, condensation, evaporation, aggregation, coagulation, collision and mutual interaction of small (sub-micron to millimeter size) particles (e.g., crystals, powders, liquid droplets and dust grains). Twenty-two potential GGSF experiments involving such processes have been defined to date. Benefits of microgravity and specific potential experiments representative of the various disciplines will be discussed.

Currently, TRW is conducting a Phase A engineering reference design study for the GGSF. This design will be outlined and sketches of the concept shown. The GGSF science community met to discuss science requirements and this reference design at the third GGSF science workshop held in May of 1992 at the Desert Research Institute in Las Vegas, Nevada. The project is currently working toward launch of the GGSF to Space Station Freedom in 1998. GGSF science and hardware concept validation tests both ground and space-based are being planned with precursor experiments scheduled for launch on Shuttle in 1996.

Other work related to GGSF development includes four experiment concept studies for the Aerosol Physics Module, a precursor to the GGSF. These explore potential GGSF experiments dealing with smoke agglomerates, fractal particles, Titan atmosphere aerosols, and organic compound synthesis on growing particles. Another related study involves numerical modeling of coagulation and diffusion effects in the GGSF as a tool for experiment design and data analysis. Also related to GGSF development is an experiment just successfully completed in July on the Space Shuttle mission USML- 1, which studied a method of dispersing solid particles in a microgravity environment.

# Gas-Grain Simulation Facility (GGSF)

Space Station Freedom Utilization Conference

Huntsville, Alabama

August 3 - 6, 1992

## Project Goals

- Support exobiology's goal to understand how cosmic, solar system, and planetary evolution have influenced the origin, evolution, and distribution of life and life-related molecules in the universe
- Provide a microgravity laboratory to facilitate research relevant to exobiology, biology, planetary science, astrophysics, atmospheric science, chemistry, and physics

## Project History

- 1984-85: Workshops propose and develop concept
- 1987: Physics feasibility study by Martin Marietta  
Workshop identifies science community, establishes experiment concept data base
- 1991: Science Working Group convenes  
Phase A concept analysis/definition study begins for GGSF and precursor experiment  
4 Aerosol Physics Module/GGSF concept studies funded
- 1992: Science Workshop - GGSF community examines Phase A design concept  
USML-1 Glovebox Expt. tests particle dispersion method

SSFUC.krg 8/92 3

## Payload Data

- Readiness
  - Core Facility (MTC): 1998
  - Mature Facility (PMC): 2001
- Lifetime: > 10 years
- Mass (total): 700 Kg
- Size: 80"H x 42"W x 39"D (1 ISPR)
- Volume: ~ 1 m<sup>3</sup>
- Power: < 3 KW peak
- Location: Pressurized Laboratory

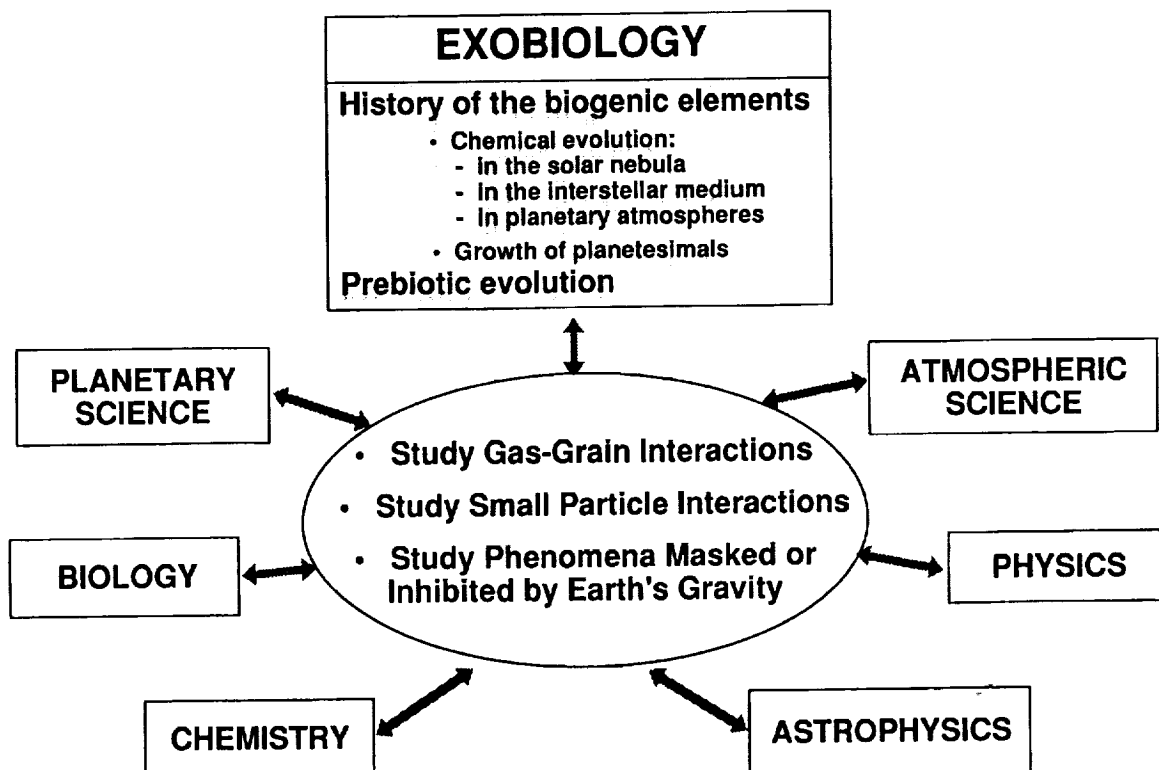

## Science Objectives

To investigate fundamental chemical & physical processes involving suspended particles mainly in the sub-micron to millimeter size range (e.g., dust grains, crystals, combustion products, droplets, ...):

- Nucleation
- Condensation
- Evaporation
- Particle/Droplet Formation
- Particle/Droplet Growth
- Aggregation
- Coagulation
- Collisions
- Mutual Interactions

SSFUC.krg 8/92 5

## GGSF Science

## Exobiology

### Question

What can planetary scale atmospheric chemistry reveal about the conditions on early Earth which led to the origin of life?

### Potential GGSF Experiment

#### Titan's Atmospheric Aerosol Simulation

- Simulate formation and growth of organic haze
- Measure optical properties
- Determine chemical composition

SSFUC.krg 8/92 6

## Biology/Aerobiology

### Question

What is the fate of airborne microbes, and how does microgravity affect aerosol disease spread in a confined space such as Space Station?

### Potential GGSF Experiment

#### Airborne Bacteria in Microgravity

- Examine metabolism and growth, if any, of aerosolized microbes
- Determine the interrelationship between atmospheric trace gases (e.g., NO<sub>x</sub>) and airborne microbes
- Determine how being airborne affects microbial pathogenicity

## Astrophysics

### Question

What are the properties of fractal materials? Do fractals play an important role in circumstellar and interstellar environments as well as in the early solar nebula?

### Potential GGSF Experiment

#### Study of Fractal Particles

- Measure coagulation coefficients of silicates & metal grains
- Measure scattering & extinction efficiencies of aggregates
- Measure cohesive strength
- Study fractal structure
- Look for signatures to distinguish fractal aggregates from a distribution of particles

SSFUC.krg 8/92 8

## Planetary Science

### Question

How do low energy collisions influence the behavior of ring structures such as those of Jupiter, Saturn, Uranus, and Neptune?

### Potential GGSF Experiment

#### Planetary Ring Dynamics

- Study collision dynamics
- Measure energy loss in low velocity collisions
- Determine coefficients of restitution
- Analyze the transfer of linear to angular momentum

SSFUC.krg 8/92 9

## Atmospheric Science

### Question

What are the properties of cirrus cloud crystals and what role do they play in the the balance of the Earth's atmospheric radiation budget? What is their effect on global warming?

### Potential GGSF Experiment

**Ice Scavenging and Aggregation: Optical and Thermal IR Absorption and Scattering Properties**

- Study crystal growth
- Study aggregation
- Measure optical and thermal IR scattering and absorption properties
- Study scavenging of aerosols by ice crystals

## **GGSF Strawman Investigations**

- 1 Low-Velocity Collisions Between Fragile Aggregates**
- 2 Low-Energy Grain Interaction/Solid Surface Tension**
- 3 Cloud Forming Experiment**
- 4 Planetary Ring Particle Dynamics**
- 5 Aggregation of Fine Geological Particulates in Planetary Atmospheres**
- 6 Optical Properties of Low-Temperature Cloud Crystals**
- 7 Ice Scavenging and Aggregation**
- 8 Synthesis of Tholin and Measurement of its Optical Properties**
- 9 Metallic Behavior of Aggregates**
- 10 Organic Compound Synthesis on Surfaces of Growing Particles**
- 11 Crystallization of Protein Crystal-Growth Inhibitors**
- 12 Dipolar Grain Coagulation and Orientation**
- 13 Titan Atmospheric Aerosol Simulation**
- 14 Surface Condensation and Annealing of Chondritic Dust**
- 15 Studies of Fractal Particles**
- 16 Emission Properties of Particles and Clusters**
- 17 Effect of Convection on Particle Deposition and Coagulation**
- 18 Study of Smoke Agglomerates**
- 19 Airborne Bacteria in Microgravity**
- 20 Infrared Emissivity of Extraterrestrial Particles**
- 21 Radiation-Induced Rotation of Interplanetary Dust**
- 22 Dynamics and Evaporation of Clusters of Drops in Vortical Flows**

## Benefits of Microgravity to GGSF

- **Suspension times increased**
  - **Permits long duration aerosol studies**
  - **Enables low-velocity collision experiments**
- **Buoyancy-driven convection reduced ( $\Delta T_{cr} \propto 1/g$ )**
- **Allows low energy interactions that are masked by gravitational forces on Earth**
- **Fractals and other gravitationally unstable ( at 1 g) objects may be studied**

SSFUC.krg 8/92 11

## Modular Design Concept (Phase A)

- **Interchangeability of subsystems accommodates a broad range of experiments**
- **Allows for new experiments and technology upgrades**
- **Four interchangeable chambers**

Function	Temperature (K)	Pressure (bar)	Volume (Liters)
Core	150 to 400	$10^{-6}$ to 1	67
Low Temp.	40 to 400	$10^{-6}$ to 3	4.2
High Temp	300 to 1200	$10^{-6}$ to 1	8.2
High Vacuum	60 to 300	$10^{-10}$ to 1	4.2

SSFUC.krg 8/92 12

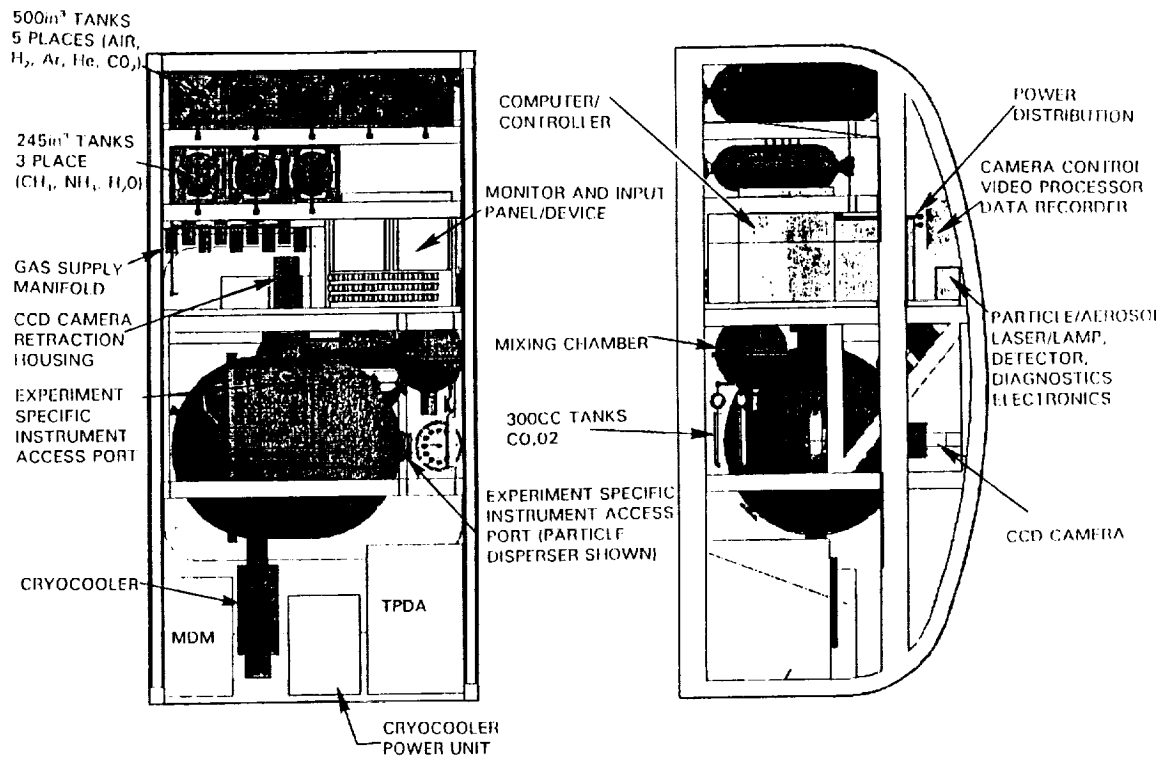

The 4 Chambers Accommodate the Following:

Physical Objectives
Aggregation
Biological
Condensation/Nucleation
Crystal Formation
Particle Dynamics/Collisions
Spectral/Optical Properties
Synthesis of Compounds

Generation Methods
Low Temp. Nuc./Condensation
High Temp. Vapor Formation
Solid Particle Dispersion
• Single/Small Number
Combustion (Smoke/Soot)
Liquid Aerosol Dispersion
• Single/Small # of Drops
Radiation-Induced Synthesis

SSFUC.krg 8/92 13

### Core Chamber

## Future Plans

- **Science and Hardware Concept Validation**
  - **Ground-based KC-135, drop tower; space-based Shuttle middeck and Spacelab opportunities**
  - **Reduces hardware development risks**
  - **Provides early science return**
  
- **GGSF Technology Workshop**
  
- **GGSF Science Workshop**
