Summary

This report is a compilation of thermodynamic functions of 50 elements in their standard reference state. The functions are C_p^o , $\{H^o(T) - H^o(0)\}$, $S^o(T)$, and $-\{G^o(T) - H^o(0)\}$ for the elements Ag, Al, Ar, B, Ba, Be, Br₂, C, Ca, Cd, Cl₂, Co, Cr, Cs, Cu, F₂, Fe, Ge, H₂, He, Hg, I₂, K, Kr, Li, Mg, Mn, Mo, N₂, Na, Nb, Ne, Ni, O₂, P, Pb, Rb, S, Si, Sn, Sr, Ta, Th, Ti, U, V, W, Xe, Zn, and Zr. Deuterium D₂ and electron gas e⁻ are also included. The data are tabulated as functions of temperature as well as given in the form of least-squares coefficients for two functional forms for C_p^o with integration constants for enthalpy and entropy. One functional form for C_p^o is a fourth-order polynomial and the other has two additional terms, one with T^{-1} and the other with T^{-2} . The gases Ar, D₂, e⁻, H₂, He, Kr, N₂, Ne, O₂, and Xe are tabulated for temperatures from 100 to 20 000 K. The remaining gases Cl₂ and F₂ are tabulated from 100 to 6000 K. The polynomial functional form for C_p^o for all these gases is split into the two temperature intervals of 200 to 1000 K and 1000 to 6000 K. The second functional form for C_p^o has an additional interval from 6000 to 20 000 K for the gases tabulated to 20 000 K. The fits are constrained so that the properties match at the common temperature endpoints. The temperature ranges for the condensed species vary with range of the data, phase changes, and shapes of the C_p^o curves.

Introduction

This report contains thermodynamic functions for 50 chemical elements plus electron gas and deuterium in their standard state. The functions presented are C_p^o , $\{H^o(T) - H^o(0)\}$, $S^o(T)$, and $-\{G^o(T) - H^o(0)\}$. This report is being published primarily to document part of the data currently being used in several NASA Lewis computer programs: PAC91 (ref. 1), CET89 (refs. 2 and 3), GCKP84 (ref. 4), CEA, and LSENS. CEA and LSENS are the newest Lewis codes for chemical equilibrium and kinetics, respectively, and are currently being documented. Selection of thermodynamic data for the elements is important inasmuch as these elements serve as a reference set from which all other species are formed. The reactions of formation and their corresponding equilibrium constants can then be specified unambiguously.

Several earlier references exist which contain

thermodynamic data for the elements (e.g., refs. 5 and 6). Some of the data in these references are obsolete and in other cases the data do not extend to sufficiently high temperatures. Most of the data for this report were selected from nine recent references. Data for the monatomic gases and electron gas were calculated by means of the PAC91 computer program. Data for all species were processed by the PAC91 program to obtain several tables for each species. Tables are given for (1) the selected thermodynamic functions, (2) coefficients for two functional forms for C_p^o which were generated by PAC91 (usually the result of a least-squares fit), (3) thermodynamic functions generated from these coefficients, (4) enthalpies and Gibbs energies (EF data) used by PAC91 to calculate heats of formation and log₁₀K values for other compounds, and (5) maximum and average differences between the selected data and the fitted data. Plots are also given for C_p^o versus temperature for the selected data as well as for the fitted data calculated from one of the functional forms.

In general, the data are given without additional discussion inasmuch as the details of the selection, smoothing, averaging, interpolating, extrapolating, and other processing of the source data are covered adequately in the source references. In a few cases some additional discussion is given.

Symbols

a_i	polynomial coefficients used in eqs. (1) to (3)
b_1	integration constant defined by eq. (2)
b_2	integration constant defined by eq. (3)
C_p^o	heat capacity at constant pressure for standard state
c_2	second radiation constant
$G^o(T)$	either $\{G^o(T) - H^o(0)\} + H^o(0)$ or $\{G^o(T) - H^o(298.15)\} + H^o(298.15)$
$G^o(T) - H^o(0)$	Gibbs energy at temperature T relative to enthalpy at 0 K for standard state
$G^o(T) - H^o(298.15)$	Gibbs energy at temperature T relative to enthalpy at 298.15 K for standard state

$\Delta_f G^o(T)$	Gibbs energy of formation of a substance at temperature T from its reference elements in their standard state
$H^o(0)$	chemical energy at 0 K for standard state
$H^o(298.15)$	assigned enthalpy at 298.15 K for standard state (equal to $\Delta_f H^o(298.15)$)
$H^o(T)$	either $\{H^o(T) - H^o(0)\} + H^o(0)$ or $\{H^o(T) - H^o(298.15)\} + H^o(298.15)$
$H^o(T) - H^o(298.15)$	sensible enthalpy at temperature T relative to 298.15 K for standard state
$\Delta_f H^o(T)$	enthalpy of formation (heat of formation) of a substance at temperature T from its reference elements in their standard state
h	Planck's constant
K	equilibrium constant
k	Boltzmann constant
m_e	electron mass
N	principal quantum number for atomic species
q_i	temperature exponents in eq. (1)
R	universal gas constant
r	number of coefficients a_i in eq. (1)
S_o/R	Sackur-Tetrode constant
$S^o(T)$	entropy at temperature T for standard state
T	temperature, K
u	atomic mass unit used for the calculation of molar masses, $u = 1/12 \text{ mass } ^{12}\text{C}$

Standard States, Reference States, and Fundamental Constants

The symbols and definitions follow the recommendations of reference 7. All data in this report are for elements in their standard state. For gases, this is ideal gas at standard pressure of 10^5 Pa (1 bar). For condensed species, the standard state is the pure crystalline or liquid substance at the same standard pressure. All thermodynamic properties are standard molar quantities.

The reference states of the elements are indicated in table I. Generally they are taken to be the thermodynamically stable state at 298.15 K. For those elements which are gases at 298.15 K and a pressure of 1 bar, the entire temperature range

is taken to be gaseous. For species that are condensed at 298.15 K, the entire range is taken to be condensed with transitions between various phases such as between solid and liquid phases.

Most of the properties are given in the International System of Units (SI); that is, the temperatures are in Kelvin (K), energies in joules (J), and pressures in pascals (Pa). Sometimes the values are made dimensionless by dividing them either by the gas constant R or RT . The fundamental constants were taken from reference 8 and are as follows:

Quantity	Symbol	Value	Units
Molar gas constant	R	8.314510(70)	J/(mol-K)
Sackur-Tetrode constant:			
For $p_0=100\ 000$ Pa=1 bar	S_o/R	-1.151693(21)	
For $p_0=101\ 325$ Pa=1 atm	S_o/R	-1.64856(21)	
Second radiation constant, hc/k	c_2	.01438769(12)	mK
Electron mass	m_e	0.000548579903(13)	u

These constants were used in PAC91 (ref. 1) in calculating the thermodynamic functions for the monatomic gases. The atomic weights were taken from reference 9. These weights are given in atomic mass units (u) based on $^{12}\text{C} = 12$ u. Some of the thermodynamic functions taken from the literature were calculated with values of R and Sackur-Tetrode constants different from those selected for this report. In this event, corrections were made to these thermodynamic functions to adjust for the differences in these values. In the case of the Sackur-Tetrode constant, corrections were made to entropy and Gibbs energy values for calculations that were made using 1 atm for the standard state pressure rather than 1 bar.

Sources For Thermodynamic Functions

Except for the monatomic gases and electron gas, the thermodynamic functions C_p^o , $\{H^o(T) - H^o(0)\}$, and $S^o(T)$ were taken from nine recent compilations of data (refs. 10 to 18). The specific references for each element are given in table I where the elements are listed alphabetically by chemical symbol. PAC91 (ref. 1) was used to calculate the functions for monatomic gases.

Generally the data for the diatomic gases were taken from references 13 to 16, group IIA metals from reference 18, a few metals from references 15 and 16, the remaining metals from references 10 to 12, and graphite from reference 17. Some of the details are given in the notes at the end of table I.

The electronic levels given in references 19 to 21 were used by the PAC91 program to calculate thermodynamic functions for the noble gases He, Ne, Ar, Kr, and Xe to 20 000 K. For the first four of these gases, some of these levels were eliminated by the temperature cutoff method (TEMPER in ref.1) and some levels were added by the FILL option in reference 1. These four gases have a nearly constant C_p^o to at least 6000 K. For Xe, however, only those levels for principal quantum number 5 were used including levels supplied by the

FILL technique. The reason for treating Xe differently from the other noble gases pertains to results obtained from the least-squares fit. As discussed in the section, **Least-Squares Fit** only one temperature interval is used to fit data for gases from 6000 to 20 000 K. For the first four noble gases, errors resulting from the least-squares fit of data calculated with temperature cutoff method are acceptably small. However, this was not true for Xe. Several alternate methods of restricting the number of electronic levels were examined with the selection of $n = 5$ being the most satisfactory for acceptably small least-squares errors to 10 000 K. (See C_p^o plots in fig. 1 and least-squares fitting errors in table X.)

Empirical Equations for Fitting the Thermodynamic Functions

A convenient way to store the thermodynamic data for many individual species for use with computer programs is in the form of coefficients associated with equations that fit the data. The following dimensionless form was chosen for this report:

$$\frac{C_p^o}{R} = \sum_{i=1}^r a_i T^{q_i} \quad (1)$$

Two sets of q_i values were used in this report. One set is used by references 2 and 3 where $r = 5$ and the q_i values are 0, 1, 2, 3, and 4. The second set has two additional terms ($r = 7$), one with $q_i = -1$ and one with $q_i = -2$. (See the section **Least-Squares Fit** for an additional discussion of these equations.)

Enthalpy and entropy are related thermodynamically to C_p^o/R as follows:

$$\frac{H^o(T)}{RT} = \frac{b_1}{T} + \frac{\int C_p^o dT}{RT} \quad (2)$$

$$\frac{S^o(T)}{R} = b_2 + \left(\frac{C_p^o}{RT} \right) dT \quad (3)$$

where b_1 and b_2 are integration constants. These are two additional constants (or coefficients) to the five or seven coefficients in equation (1). The form used in references 2 and 3 will be referred to as the seven-coefficient set ($r = 5 + b_1 + b_2$) and the equations given in table V will be referred to as the nine-coefficient set.

Assigned Enthalpy Values

For some applications, such as discussed in reference 2, it is convenient to combine sensible enthalpy and energies of chemical and physical changes into one numerical value. An arbitrary base may be adopted for assigning absolute values to the enthalpy of various substances inasmuch as only differences in enthalpies are measurable. For this report, as well as references 1 to 4, the arbitrary base selected was a value of zero at 298.15 K for the reference elements. Thus, for the assigned reference elements:

$$\Delta_f H^o(298.15) = H^o(298.15) = 0 \quad (4)$$

And, in general, for all species:

$$H^o(298.15) = \Delta_f H^o(298.15) \quad (5)$$

$$H^o(T) = H^o(298.15) + \{H^o(T) - H^o(298.15)\} \quad (6)$$

Heats of Formation and Equilibrium Constants

Heats of formation and $\log_{10} K$ for a species are calculated as a function of temperature for the formation of the species from the elements in their assigned reference state. The following is an example of how these properties can be calculated for CO(g) at 1000 K:

$$\begin{aligned} \Delta_f H^o(1000) &= H^o(1000)\text{CO(g)} - H^o(1000)\text{C(gr)} \\ &\quad - \frac{1}{2} H^o(1000)\text{O}_2(\text{g}) \end{aligned} \quad (7)$$

$$\begin{aligned} \Delta_f G^o(1000) &= G^o(1000)\text{CO(g)} - G^o(1000)\text{C(gr)} \\ &\quad - \frac{1}{2} G^o(1000)\text{O}_2(\text{g}) \end{aligned} \quad (8)$$

By definition,

$$\log_{10} K = \frac{-\Delta_f G^o(T)}{2.3025851 RT} \quad (9)$$

Least-Squares Fit

For most of the elements in this report, the coefficients in equations (1) to (3) were obtained by means of a least-squares fit. PAC91 (ref. 1) was used to obtain the coefficients. For the gases the temperature intervals for both functional forms are fixed. These intervals are 200 to 1000 K and 1000 to 6000 K for the seven-constant form (i.e., the fourth-order polynomial for C_p^o used in the past). The nine-constant form given in table V uses these same intervals plus an additional interval from 6000 to 20 000 K for all gaseous elements except F_2 and Cl_2 . For the condensed species, each phase has its own set of coefficients. The seven-constant form uses either one or two intervals for each phase with endpoint limits according to the transition points. Two intervals are used when the temperature range for a phase includes the 1000 K breakpoint. The nine-constant functional form has a flexible number of breakpoints in order to fit the selected data more accurately.

Generally the functions C_p^o/R , $H^o(T)/R$, and $S^o(T)/R$ were fit simultaneously. The fit was constrained to match the functions exactly at 298.15 K. Thus, the least-squares coefficients reproduce heats of formation at 298.15 K exactly. For temperature intervals that do not contain $T=298.15$ K, the fit was constrained to give the same functional values at the common temperature point for any contiguous intervals. When phase transitions occur, the fit was constrained so that the difference in Gibbs energy is zero between the phases.

For some elements and some temperature intervals, however, coefficients were not obtained by means of the PAC91 least-squares fit. These exceptions were as follows:

(1) The inert gases and electron gas—Ar, He, Kr, Ne, Xe, and e^- . C_p^o for electron gas is constant for the entire temperature range and is constant to some high temperature for the inerts. For Ar, He, and Ne data, the least-squares fit was done only for the interval above 6000 K. For Kr and Xe data, the fit was done for the two intervals above 1000 K.

(2) Some species where the C_p^o equations are given in the original reference—Ba, Be, Mg, Ca, Sr, Pb, S, and Sn. Except for Be(ℓ), for which C_p^o was taken to be a constant from reference 12, group IIA elements data (Be, Mg, Ca, Sr, and Ba) were generated from the equations in reference 18. Only the data for the alpha phases were refit because of the discontinuities at 298.15 K in reference 18. Equations for the liquid phases of Pb, S, and Sn were taken directly from references 15 and 16.

(3) For 29 elements in the liquid state. C_p^o is given as a constant in the references from which the data are taken.

The temperature intervals for the coefficients, whether they were obtained from a PAC91 least-squares fit or other sources, are given in table I. The format and coefficients for the nine-constant functional form are given in tables V and VI, respectively, and for the seven-constant functional form in tables VII and VIII, respectively. Table X gives information

for the PAC91 fits only. It lists the maximum and average errors for the nine-constant fit. The two additional terms in the nine-constant functional form generally give approximately an order of magnitude improvement in the error of the fit. See the **Tables** section for definitions and a discussion of this information. Plots of C_p^o for the selected data as well as the data calculated using the the nine-constant functional form are given in figure 1.

Tables

There are nine tables of data. The order of the elements in each table is alphabetical by chemical symbol. Two of these tables are each subdivided into 52 subtables of thermodynamic functions for the 52 species (50 elements plus deuterium and electron gas) for a schedule of temperatures. These two tables are table III, which contains thermodynamic functions selected from the cited references, and table IX, which contains thermodynamic functions generated from fitting these functions. Data from table III will be referred to as *selected* tables or data and data from table IX will be referred to as *coefficients* tables or data.

Table I summarizes some information concerning each of the 52 species. This information consists of the name, chemical symbol, state, reference code, atomic or molecular weight, temperature ranges covered by the coefficients, references from which the thermodynamic data were taken, and letters indicating additional comments at the end of the table. Most of the data given in the selected tables start at temperatures lower than the low end of the temperature range of the fitted data. Since the elements constitute the reference set of species from which all other species are formed, their heats of formation are all zero and are not tabulated. The reference code is a six-character code associated with each set of coefficients to indicate the major source of the data. The numbers indicate the date of the reference and the letters indicate the source as follows: CODA (CODATA, refs. 11 and 12); L (NASA Lewis Research Center, ref. 1); J (JANAF, ref. 10); TPIS (Thermodynamic Properties of Individual Substances, refs. 13 to 16); SRD (Standard Reference Data, ref. 18); and X (TeXas, ref.17). For J and X, the date is associated with the individual species as given in the selected reference: for example, J 6/83 indicates JANAF data dated June 1983.

Table II tabulates the molecular weights and summarizes values of the thermodynamic functions at $T = 298.15$ K. These functions include $\{H^o(298.15) - H^o(0)\}$, C_p^o , and $S^o(298.15)$. Most of the least-squares fitting was constrained to fit these values at 298.15 K. In this event, these values are the same for both the selected and coefficients data.

Table III contains the selected data for the 52 species. Generally the temperature schedules are every 100 K with some inserted temperatures for 298.15 K, transition points,

and, in some cases, lower temperatures. The thermodynamic functions are in SI units and include C_p^o , $\{H^o(T) - H^o(0)\}$, $S^o(T)$, $-\{G^o(T) - H^o(0)\}/T$, $H^o(T)$, and $-G^o(T)/T$. Heats of formation and $\log_{10}K$ values were not included in the table since these values are zero for reference elements by definition. Plots of the C_p^o data are given in figure 1.

Table IV gives the enthalpy and Gibbs energy data in dimensionless form and in the format required by the PAC91 computer program described in reference 1. These data are referred to as EFdata in that reference and are used to calculate heats of formation and $\log_{10}K$ of species formed from the elements. In table IV, data for each reference element are preceded by a header record containing some relevant information about that element. For example, the header for the first element in table IV (Ag) contains the following information:

Code	Meaning
EFDA	EFdata record
AG1S	element name, Ag ₁ (s)
CODA89	code for data reference
H0/R	$H^o(0)/R$
-690.9607	value for above
MP	melting point
1235.0800	value for the melting point, K
NT	number of temperatures for this element
63	value for above

In each data record following the header card, the six values given are for a temperature, followed by its value of $H^o(T)/RT$ and $-G^o(T)/RT$, and the next temperature, followed by its value of $H^o(T)/RT$ and $-G^o(T)/RT$.

Table V gives the format for the coefficients in the nine-constant functional form (eqs. (1) to (3) with $r = 7$).

Table VI lists the set of coefficients having the format of table V. In this report gaseous species have a temperature interval break point at 1000 K. For gaseous species with data given to 20 000 K, there is an additional break point at 6000 K. For condensed species, in addition to break points at phase transitions, additional interval break points have been selected to reduce differences between the fitted and *selected* data. Plots of C_p^o values from this table are given in figure 1.

Table VII gives the format for the coefficients in the seven-constant functional form (eqs.(1) to (3) with $r = 5$).

Table VIII lists the set of coefficients having the format of table VII. The seven constants include five constants for a fourth-order polynomial for C_p^o and two integration constants. This is the form used for many years in several NASA Lewis computer programs (refs. 2 to 4). These data are in the "old" format required by these programs and described in reference 2.

When the temperature range embraces 1000 K, there is always a break point at 1000 K and there are always two intervals for this format. Most older data were constrained to match the *selected* data at the 1000 K break point. However, for this report the data are constrained to fit the *selected* data at 298.15 K and to match at the break points.

Table IX is similar to table III in that it contains tables of thermodynamic functions for the 52 species. The data for table IX, however, were calculated from the coefficients listed in table VI, the nine-constant functional form given in table V. The temperature schedule is always from 200 K in 100 K intervals to the maximum temperature of the equations. There are temperatures inserted for 0, 298.15, and transition points. The thermodynamic functions are in SI units and include C_p^o , $\{H^o(T) - H^o(0)\}$, $S^o(T)$, $-\{G^o(T) - H^o(0)\}/T$, $H^o(T)$, and $-G^o(T)/T$.

Table X summarizes the maximum, average, and least-squares errors between the fitted and the selected data for each temperature interval. Only data where the coefficients were obtained from a PAC91 least-squares fit are listed. There are two sets of errors: (1) the *selected* value minus the calculated value and (2) a relative error, which is this value divided by the *selected* value. The least-squares error is the root mean square of errors. Errors are labeled MAX ERR, AVER ERR, and LST SQ ERR. The relative errors are labeled MAX REL ERR, AVER REL ERR, and REL LST SQ ERR. Both sets are given for C_p^o/R , $\{H^o(T) - H^o(0)\}/RT$, $S^o(T)/R$, and $-\{G^o(T) - H^o(0)\}/RT$. See the section **Least-Squares Fit** for a discussion of the constraints. The maximum relative error for C_p^o/R is labeled MAX REL ERR CP/R. Note that most errors are less than 1 percent. The exceptions are the alpha phase of iron Fe(α) above the lambda transition and the noble gases Ar, Kr, and Xe above 10 000 K.

Concluding Remarks

Tables of thermodynamic functions are presented for 50 elements plus electron gas and deuterium in their standard reference state. Selection of these data for the elements is important inasmuch as the elements serve as a reference set from which all other species are formed. The tables are given for (1) the selected thermodynamic functions, (2) coefficients for two functional forms for C_p^o and (3) thermodynamic functions generated from coefficients for one of the functional forms. Plots are also given for C_p^o versus temperature for (1) and (3). This report should prove useful as a compilation of thermodynamic data of the elements as well as providing documentation for some of the data currently used in a number of NASA Lewis computer programs.

^aValues of the functions at temperatures where there are phase transitions or enthalpies of transition were adjusted so functions at the transition temperature and higher round to match the original reference.

^b C_p^o is constant in this interval.

^cPAC91 computer program (ref. 1) was used to calculate the functions using method TEMPER to cut off higher electronic levels and the FILL option to fill in predicted but as yet unobserved electronic levels.

^dSix-character code is associated with each set of coefficients to indicate the major source of the data. Letters indicate the reference while the numbers indicate the date of the reference. The letter codes are as follows: CODA (CODATA, refs. 11 and 12); L (Lewis, ref. 1), J (JANAF, ref. 10); SRD (Standard Reference Data, ref. 18); TPIS (Thermodynamic Properties of Individual Substances, refs. 13 to 16); and X (TeXas, ref. 17). Thus, CODA89 refers to CODATA, 1989 (ref. 12). For J and X, the date is associated with the individual species as given with the data. For L the date refers to the date of the calculation.

^eSome data at intermediate temperatures were obtained from Malcolm Chase by private communication.

^fFor this species thermodynamic functions in the selected data of table III as well as the EF data in table IV are given to temperatures lower than the fitted temperature range.

^gSelected data are interpolated to obtain data at intermediate temperatures in order to obtain an improved least-squares fit.

^hAn attempt was made to adjust some of the values so the data would round to values that match the original reference. However a few values are still off in the last figure.

ⁱLeast-squares fit was started at 100 K rather than 200 K because the fit was just about as good.

^jPAC91 computer program (ref. 1) was used to calculate the functions assuming ground state only and a statistical weight of 2. The electron mass was taken to be 0.00054858 from reference 8.

^kData for $T = 50$ K and $T = 150$ K were taken from reference 17, June 20, 1986. Data for 250 and 350 K were taken from reference 10, March 1977.

^l C_p^o values are the same in a newer reference (ref. 15) but the enthalpies and entropies are more consistent with the C_p^o values at high temperatures in the older reference.

^mEquations for C_p^o were taken from the reference.

ⁿValues at 150 K was obtained by interpolation and adjustment. Values of 250 and 350 K were taken from reference 10. The $H^o(T) - H^o(0)$ values at very high temperatures were adjusted to be more consistent with C_p^o and $S^o(T)$ values.

^oHeat of transition used differs slightly from the one given in the reference probably because of rounding when converting from calories to joules.

^pReference data were calculated with a value for gas constant R different from the value $R = 8.31451$ J/mol K used in this report. Adjustment to $R = 8.31451$ results in some of the tabulated data differing in the last figure from the reference data.

^q C_p^o value at 300 K was incorrect in the original reference. It was corrected for this report.

^r C_p^o value at 250 K was taken from reference 10. $H^o(250) - H^o(0)$ and $S^o(250)$ were obtained by numerical integration.

^sFunctions calculated from equations given in the original reference with possibly some adjustments in the integration constants, either for consistency between phases or to match property values given.

^tPAC91 computer program (ref. 1) was used to calculate the thermodynamic functions using the electronic levels given for the principal quantum numbers 4 and 5 with FILL to include missing electronic levels for principal quantum number 5.

^uSlight inconsistency exists in the data at the melting point of Br_2 in the table given in reference 15. This is reflected in tables III and IX in this report.

TABLE V. - FORMAT FOR THE 9-FUNCTIONAL FORM

General format:

Record	Constants	Format	Columns
1	Species name or formula Comments - data source	A24 A56	1-24 25-80
2	Number of T intervals Optional identification code Chemical formula, symbols and numbers 0 for gas and non-zero for condensed Molecular weight Heat of formation of 298.15 K, J/mol	I2 A6 5(A2,F6.2) I1 F13.5 F15.3	2 4-9 11-50 52 53-65 66-80
3	Temperature range Number of coefficients for C_p^o T exponents in empirical equation for C_p^o { $H^o(298.15)-H^o(0)$ }, J/mol	2F10.3 I1 8F5.1 F15.3	2-21 23 24-63 66-80
4	First 5 coefficients for C_p^o	5D16.8	1-80
5	Last 3 coefficients for C_p^o Integration constants b_1 and b_2	3D16.8 2D16.8	1-48 49-80
---	Repeat 3, 4, and 5 for each interval		

Example:

```

```

Empirical equations for above example (from eqs. (1) to (3)):

$$\text{Heat capacity: } \frac{C_p^o}{R} = a_1 T^{-2} + a_2 T^{-1} + a_3 + a_4 T + a_5 T^2 + a_6 T^3 + a_7 T^4$$

$$\text{Enthalpy: } \frac{H^o(T)}{RT} = -a_1 T^{-2} + a_2 T^{-1} \ln T + a_3 + a_4 \frac{T}{2} + a_5 \frac{T^2}{3} + a_6 \frac{T^3}{4} + a_7 \frac{T^4}{5} + \frac{b_1}{T}$$

$$\text{Entropy: } \frac{S^o(T)}{R} = -a_1 \frac{T^{-2}}{2} - a_2 T^{-1} + a_3 \ln T + a_4 T + a_5 \frac{T^2}{2} + a_6 \frac{T^3}{3} + a_7 \frac{T^4}{4} + b_2$$

```

Empirical equations for above example (from eqs. (1) to (3)):

$$\text{Heat capacity: } \frac{C_p^\circ}{R} = a_1 + a_2 T + a_3 T^2 + a_4 T^3 + a_5 T^4$$

$$\text{Enthalpy: } \frac{H^\circ(T)}{RT} = a_1 + a_2 \frac{T}{2} + a_3 \frac{T^2}{3} + a_4 \frac{T^3}{4} + a_5 \frac{T^4}{5} + \frac{b_1}{T}$$

$$\text{Entropy: } \frac{S^\circ(T)}{R} = a_1 \ln T + a_2 T + a_3 \frac{T^2}{2} + a_4 \frac{T^3}{3} + a_5 \frac{T^4}{4} + b_2$$

13. ABSTRACT (Maximum 200 words) This report is a compilation of thermodynamic functions of 50 elements in their standard reference state. The functions are C_p^o , $\{H^o(T) - H^o(0)\}$, $S^o(T)$, and $-\{G^o(T) - H^o(0)\}$ for the elements Ag, Al, Ar, B, Ba, Be, Br ₂ , C, Ca, Cd, Cl ₂ , Co, Cr, Cs, Cu, F ₂ , Fe, Ge, H ₂ , He, Hg, I ₂ , K, Kr, Li, Mg, Mn, Mo, N ₂ , Na, Nb, Ne, Ni, O ₂ , P, Pb, Rb, S, Si, Sn, Sr, Ta, Th, Ti, U, V, W, Xe, Zn, and Zr. Deuterium D ₂ and electron gas e ⁻ are also included. The data are tabulated as functions of temperature as well as given in the form of least-squares coefficients for two functional forms for C_p^o with integration constants for enthalpy and entropy. One functional form for C_p^o is a fourth-order polynomial and the other has two additional terms, one with T^{-1} and the other with T^{-2} . The gases Ar, D ₂ , e ⁻ , H ₂ , He, Kr, N ₂ , Ne, O ₂ , and Xe are tabulated for temperatures from 100 to 20 000 K. The remaining gases Cl ₂ and F ₂ are tabulated from 100 to 6000 K. The polynomial functional form for C_p^o for all these gases is split into two temperature intervals - 200 to 1000 K and 1000 to 6000 K. The second functional form for C_p^o has an additional interval from 6000 to 20 000 K for the gases tabulated to 20 000 K. The fits are constrained so that the properties match at the common temperature endpoints. The temperature ranges for the condensed species vary with range of the data, phase changes, and shapes of the C_p^o curves.
