INTRODUCTION

The recent awakening to the reality of human-induced changes to the environment has resulted in an organized effort to promote global change research. The goal of this research as outlined by NASA's Earth System Science Committee (Earth System Science: A Closer View, 1988) is to understand the entire Earth system on a global scale by describing how its component parts and their interactions have evolved, how they function, and how they may be expected to evolve on all timescales. The practical result is the capacity to predict that evolution over the next decade to century. Key variables important for the study of global change include external forcing factors (solar radiance, UV flux), radiatively and chemically important trace species (CO₂, CH₄, N₂O, etc.), atmospheric response variables (temperature, pressure, winds), land-surface properties (river run-off, snow cover, albedo, soil moisture, vegetation cover), and oceanic variables (sea surface temperature, sea ice extent, sea level ocean wind stress, currents, chlorophyll, biogeochemical fluxes).

The purpose of this document is to identify existing data sets available (both remotely sensed and in situ data) covering some of these variables. This is not intended to be a complete list of global change data, but merely a highlight of what is available. The information was extracted from the Master Directory (MD), an on-line scientific data information service which may be used by any researcher. This report contains the coverage dates for the data sets, sources (satellites, instruments) of the data and where they are archived.

Much more complete descriptions of these and many more data sets can be found in the MD. The MD, operated by the National Space Science Data Center at Goddard Space Flight Center in Greenbelt, Maryland, has been adopted by the Interagency Working Group on Data Management for Global Change as a centralized directory to facilitate global change research. Interagency Working Group members include NASA, NOAA, USGS, NSF and other U.S. agencies. The MD provides high level information about multidisciplinary data sets, including Earth science (geology, oceanography, atmospheric science), space physics, solar physics, planetary science, and astronomy/astrophysics. A search using selected keywords provides users with a description of relevant data sets, their attributes, spatial and temporal coverage, data center, personnel contacts, and bibliography. More detailed information, browse or ordering capability is available through automated connections to other systems using a simple LINK command. The MD also provides supplementary information data centers, projects and campaigns, and the MD, with new data sets being added to the system regularly. Users may access this system via NSI DECnet, Internet, or by direct dialing. The MD is Option #1 on the menu of the National Space Science Data Center's On-Line Data Information Services (NODIS) account.
