Space Administration

**SLAVE FINITE ELEMENT FOR**

**NON-LINEAR ANALYSIS OF ENGINE STRUCTURES**

**PROGRAMMER'S MANUAL**

## 1.0 INTRODUCTION

The programming aspects of SFENES are described in the User's Manual. The information presented here is provided for the installation programmer. It is sufficient to fully describe the general program logic and required peripheral storage. All element generated data is stored externally to reduce required memory allocation. A separate section is devoted to the description of these files thereby permitting the optimization of I/O time through efficient buffer description. Individual subroutine descriptions are presented along with the complete Fortran source listings. A short description of the major control, computation, and I/O phases is included to aid in obtaining an overall familiarity with the program's components. Finally, a discussion of the suggested overlay structure which allows the program to execute with a reasonable amount of memory allocation is presented.

## 2.0 GENERAL PROGRAM LOGIC

The general organization of the SFENES program is illustrated in Figures 1 thru 6. The element routines consists of a control program and four principal computation phases; namely,

1. Input interpretation phase
2. Spatial integrations and computations
3. Matrix computations and time assembly
4. Stress recovery and element output phase

### 2.1 Control Program (Figure 1)

Routine "INTRFC" controls the element computation flow. Initially, the "Input Phase" and "Spatial Computational Phase" are executed. These two phases are outside of the iterative phases and need only be executed once. Routine "INTRFC" then executes the "Matrix Computation and Temporal Assembly Phases". Control is referred to the "MAIN" program for all spatial assembly and displacement computations, $[K_F]\{u\}=\{F_D\}$. The "INTRFC" portion is re-entered for convergence checking and the stress recovery phase is then executed. The iterative process is repeated until convergence or the maximum number of iterations is achieved. The Control program is the interface between the element routines and the MAIN program unit.

### 2.2 Input Interpretation Phase (Figure 2)

The purpose of this phase is to read the formatted element input data and control data from the input file "IOIN". The data, in some cases (element loads and local grid coordinates), is used in additional computations and is finally output to binary files "IOEL", "IOLD", and "IOUS" for use by the remaining phases. This phase is only entered prior to the first iteration of the problem. Routine "INPUT" reads the formatted data, provides an echo print for the user and outputs all data to the output files. "GRIDG" computes all of the remaining grid point coordinates from local grid points 13-16 and the corner thicknesses. Routine "LOADIN" reads the input element load data and computes the resulting grid point forces at the user input time increments.

## 2.3 Spatial Integrations and Computations (Figure 3 & 3A)

The "Spatial Computation Phase" is executed once prior to the first iteration. The function of this phase is to perform all spatial computations and any other "one" time computations which required spatial integrations. The primary tasks of this phase are outlined briefly below.

a) The volume, area, and surface definite integrals are computed for the polynomial terms $x^n y^m z^l$ and $\rho^k x^i y^j z^l$; $0 \leq n \leq 9$, $0 \leq m \leq 9$, $0 \leq l \leq 7$, $0 \leq k \leq 3$, $0 \leq i \leq 7$, $0 \leq j \leq 7$. These integrals are computed by routines VOLCOF, COLXYZ, CEAXYZ, CNLXYZ, CURCOF, CURPSI, CNRPSI, CURXYZ, CNRXYZ, TRLCOF, VOL-, VL-, REA-, RA-, SUR-, and SUP-.

b) Routine LOADD computes the element force vector {F} by combining the input element loads as a function of time, (file IOLD) the appropriate spatial integrals from (a) above, the Hermitian time functions, and integrations over the local time ranges. The resulting combination of element body force, pressure and traction forces are output to file "IOFO" for intersolution of $[K_F]\{u\}=\{F\}$ equation.

c) The final function of this phase is to compute and store the spatial matrix partitions of [M], [K], [X], [A], [B], $[C_e]$, $[B_{28}]$, $[P_{28}]$, [C], $[N_x']$, and $[P_{28}]\cdot[B_{28}]^{-1}$. These matrices are stored on file "IOCF", "ICPR", and "IOTP" for use by the third phase. The matrices computed in this task are reused in subsequent iterations since the shape functions are constant.

## 2.4 Matrix Computation and Time Assembly Phase (Figure 4)

The function of this phase is to compute the element stiffness and stress matrices for each local time range. This involves the computation of the $[E_6]$

matrices as a function of time, (routine EPQP19) and integrating over the local time intervals. The result of the time integrations is multiplied by the spatial matrices as computed in the spatial computation phase and assembled into the element $[K_e]$, $[S_e]$, $[A_e]$ and $[B_e]$ matrices for each local time interval. These computations may be made for either the linear elastic quad plate or the non-linear elastic-plastic quad plate elements (routines LEQP and EPQPB respectively). Spatial matrices are input from files "IOPR" and "IOTP" and prior iterative values of {w} and {$\sigma$} are input from file "IOUS". The "IOAO" and "IOA1" are used alternately to read the previous and store the current coefficients of polynomials in (t) used to compute the $[E_7]$ matrices. File "IOKE", "IOAE", "IOBE", and "IOLD" are output files for storing element $[K_e]$ $[A_e]$, $[B_e]$ and $[S_e]$ matrices respectively.

Routines "TBASEM" and "TABSEM" perform the temporal assembly of the element $[K_e]$ matrices for the "LEQP" anbd "EPQP" elements respectively. Files "IOKE", "IOCE", "IOBE", "IOAE" control the input to these routines and the final element $[K_f]$ matrices are output to file "IOKF". For the "EPQP" element the computation $[B_e]\cdot[C_e]^{-1}$ is stored on file "IOLD" for element stress computations.

## 2.5 Stress Recovery and Element Output (Figure 5)

The "CNVRG" routine checks for convergence of all displacement/velocity values and stores the latest value of {u} on file "IOUL" for the next iteration. Element stress is recovered in routines "CSIGO" or "CSIGL" for element types "EPQP" and "LEQP" respectively. The input to these routines is contained in files "IOTF", the current displacement/velocity values {u}, and "IOLD", the stress matrices [S] or $[C_e]^{-1}$ $[B_e]$. The displacement/velocity {u} and stress {$\sigma$} vectors are output to file "IOUS" to be used in the computation of $[E_7]$ for the next estimate of $[K_e]$. Printed output of selected grids displacement and/or stress values for each iteration is provided for by routine "WRITO". This output is at the major time intervals only. Convergence of the problem initiates the extrapolation and output of displacement/velocity values at user specified time intervals within the major time increments.

## 2.6 Displacement Computation (Figure 6)

Control is returned to the "MAIN" program after the stiffness $[K_F]$ and stress [S] or $[C_e^{-1}]\cdot[B_e]$ matrices have been time assembled in the matrix computation phase. The "MAIN" program calls routine "COMPU" which performs the following functions:

a) Read the partitions of the $[K_f]$ matrix (see Figure 7 to Figure 9 for description of $[K_f]$ matrix)

b) Applies the user input boundary conditions to the individual partition (eliminates rows and columns) and forms the reduced $[K_F]$ matrix.

c) Eliminates all rows containing displacement related data at times T=0 and $T=t_N$ (rows 1-84 and rows 1N*168+1 to N*168+84 of the $[K_F]$ matrix).

d) Reads the $\{F_F\}$ vector partitions and time assembles the local partitions (see Figure 14 for a description of the assembled {F} vector).

e) Applies user input boundary conditions as in step b) and c) above to the $\{F_F\}$ vector rows.

f) Computes $\{u\} = [K_F^{-1}]\ \{F\}$ and stores data or file "IOTP" for stress recovery and output phase.

The newly computed displacement vector {u} is then read by the stress recovery phase and the next iteration is entered if required.

## 3.0 MATRIX DESCRIPTION AND LABELING

The basic matrices generated by the element computations consists of the $[K_F]$, $[S]$, and $\{F_F\}$ matrices. The matrices are stored on files "IOKF", "IOLD", and "IOFO" respectively. The basic matrices are illustrated in Figures 7 to 14 and are described as follows.

### 3.1 Stiffness $[K_F]$ Matrices

Figure 7 depicts the time assembled $[K_F]$ matrix for the EPQP element. Each numbered box represents a 168 by 168 partition and each partition is labeled from $T_0$ to $T_N$ (global time, were $T_0$=0.0). The numbering of the partitions signifies the order in which they are stored on the sequential file "IOKF". Similarly, Figure 8 depicts the time assembled $[K_F]$ matrix for the LEQP element. It should be noted that rows 1-84 of partition rows $T_0$ and $T_N$ are to be reduced from the matrix before using to solve for $\{u\}$. Finally, Figure 9 illustrates the labeling of each $K_F$ partition.

### 3.1.1 $[K_F]$ MATRIX LABELING

The $[K_F]$ matrix partitions are computed and time assembled ($K_F = K_e + [A_e][C_e^{-1}][B_e]$). The non-zero 168 by 168 $K_F$ partitions are stored on File IOKE. Figure 7 shows the $K_F$ matrix-partition labeling and order of storing on file IOKF for the EPQP element. Similarly, Figure 8 represent the $K_F$ matrix for the LEQP element. Figure 9 is a sketch of the labeling of each partition for both the EPQP and LEQP elements.

FIGURE 7: EPQP $[K_F]$ MATRIX PARTITIONS

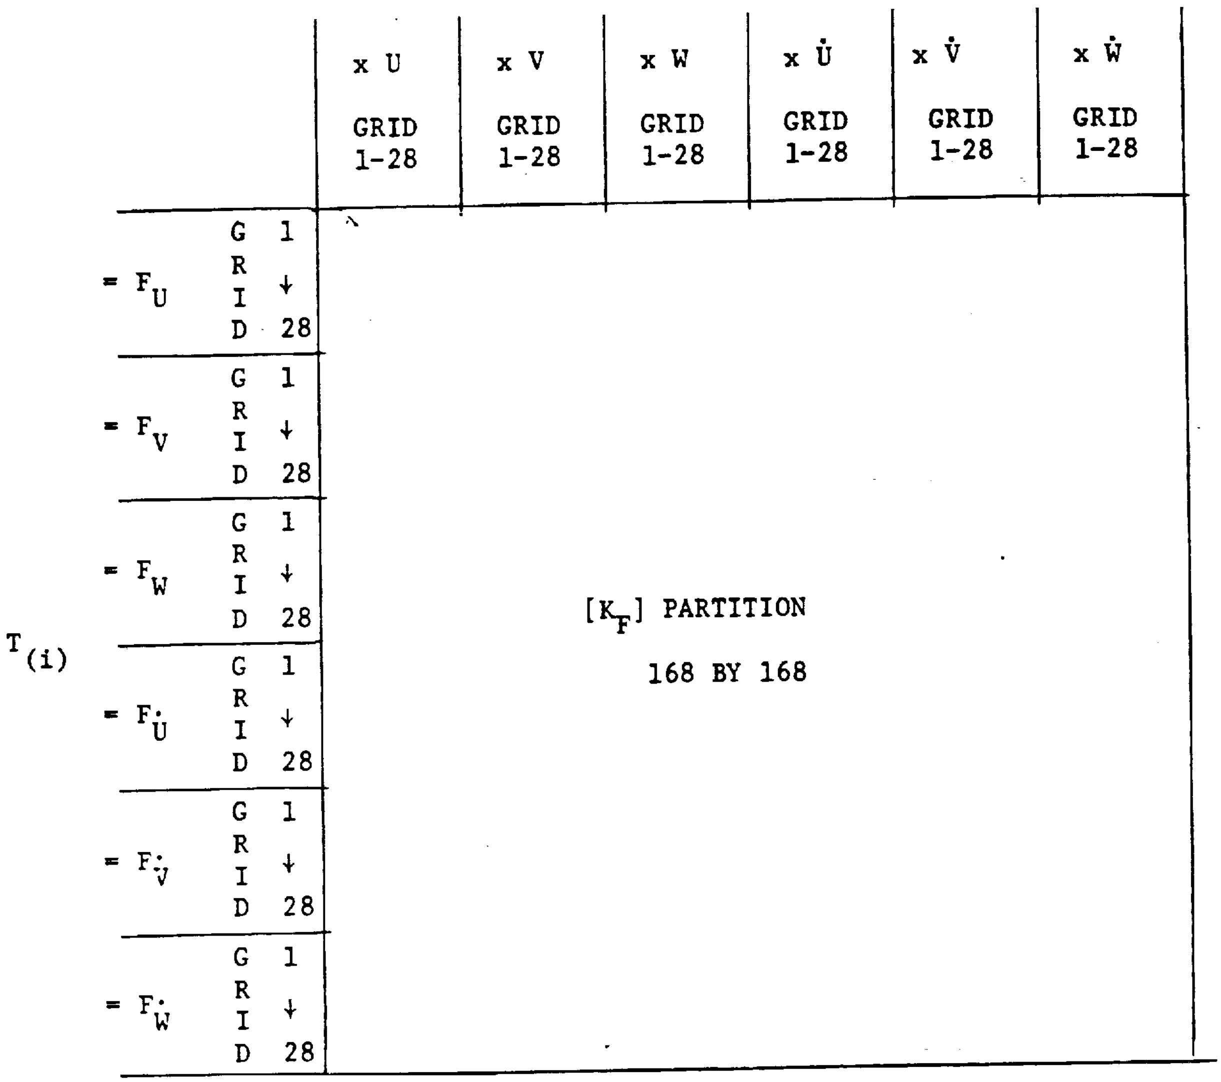
2) Partitions are output to file IOKF in the order they are numbered in diagram above

3) Each partition is a 168 by 168 matrix. See Figure 3 for labeling of partitions.



NOTE: GRID NOD ARE LOCAL

FIGURE 9

### 3.2 Stress [S] Matrices (EPQP Element)

The equation to compute the six (6) stress components at the 28 element grid points for time interval J is:

$$\{\sigma\}_J = [C_\sigma^{-1}][B_o^{\,1}]\{u_o\} + \sum_{I=2}^{J} ([C_\sigma^{-1}]\cdot([B_o^{\,I}] + [B_T^{\,(I-1)}])\cdot\{u_{(I-1)}\}) + [C_\sigma^{-1}][B_T^{\,J}]\{u_{(J)}\} - \sum_{I=1}^{J} ([C_\sigma^{-1}]\{q_{(I)}\}) + \{\sigma_o\} \qquad (1)$$

The time assembled resulting matrix equation, collecting like terms, could be represented as follows:

$$\underbrace{\begin{Bmatrix} \sigma_{(1)} \\ \sigma_{(2)} \\ \cdot \\ \cdot \\ \cdot \\ \sigma_{(N)} \end{Bmatrix}}_{(Nx28x6)} = \underbrace{[S_1]}_{(N\cdot 168)x(N+1)\cdot 168} \cdot \underbrace{\begin{Bmatrix} U_0 \\ U_1 \\ U_2 \\ \cdot \\ \cdot \\ U_N \end{Bmatrix}}_{(N+1)\cdot 168} - \underbrace{[S_2]}_{(N\cdot 168)\,x\,(N\cdot 168)} \cdot \underbrace{\begin{Bmatrix} q\tau_1 \\ q\tau_2 \\ \cdot \\ \cdot \\ \cdot \\ q\tau_N \end{Bmatrix}}_{(n\cdot 168)} + \underbrace{\begin{Bmatrix} \sigma_o \\ \sigma_o \\ \cdot \\ \cdot \\ \cdot \\ \sigma_o \end{Bmatrix}}_{(N\cdot 168)}$$

Figure 10 illustrates the $[S_1]$ matrix which is computed in routine "TASSEM" and stored on file "IOLD" in 168 by 168 partitions. The number of each partition represents its location on the sequential output file "IOLD" as well as the terms of equation (1) above as listed below.

| PARTITION TYPE | CONTAINS |
|---|---|
| 1 | $[C_\sigma^{-1}]\cdot[B_o^{\,1}]$ |
| 2, 4, 6, ... (Nx2) | $[C_\sigma^{-1}]\cdot[B_T^{\,IR}]$; IR=1,N |
| 3, 5, 7, ... (Nx2)-1 | $[C_\sigma^{-1}]\cdot([B_o^{\,(IC+1)}]+[B_T^{\,IC}])$; IC=1,(N-1) |

Figure 11 illustrates the $[S_2]$ matrix. Matrix $[S_2]$ is simply the time assembled $-[C^1]^{-1}$ matrix where $[C^1] = {}^-[C_e]$ with the first column removed; i.e.,

$$[C_e] = \begin{bmatrix} -[C_\sigma] & [C_\sigma] & 0 & \cdot & \cdot & \cdot & 0 & 0 \\ 0 & -[C_\sigma] & [C_\sigma] & \cdot & \cdot & \cdot & 0 & 0 \\ \cdot & \cdot & \cdot & \cdot & \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot & \cdot & \cdot & \cdot & \cdot \\ 0 & 0 & 0 & \cdot & \cdot & \cdot & -[C_\sigma] & [C_\sigma] \end{bmatrix} (N \times (N+1))$$

$$[C^1] = \begin{bmatrix} [C_\sigma] & 0 & 0 & 0 & \cdot & \cdot & 0 & 0 \\ -[C_\sigma] & [C_\sigma] & 0 & 0 & \cdot & \cdot & 0 & 0 \\ 0 & -[C_\sigma] & [C_\sigma] & 0 & \cdot & \cdot & 0 & 0 \\ 0 & 0 & -[C_\sigma] & [C_\sigma] & \cdot & \cdot & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & 0 & 0 & 0 & \cdot & \cdot & -[C_\sigma] & [C_\sigma] \end{bmatrix} (N \times N)$$

File "IOCE" contains a 168 x 168 partition, $[C_\sigma^{-1}]$. The remaining variables namely, $\{w\}$, $\{q\}$, and $\{u_o/\sigma_o\}$ are stored on files "IOTP", "IOQT", and "IOUS" respectively.

Figure 12 contains a sketch of the partition labeling for both the $[S_1]$ and $[S_2]$ matrix partitions.

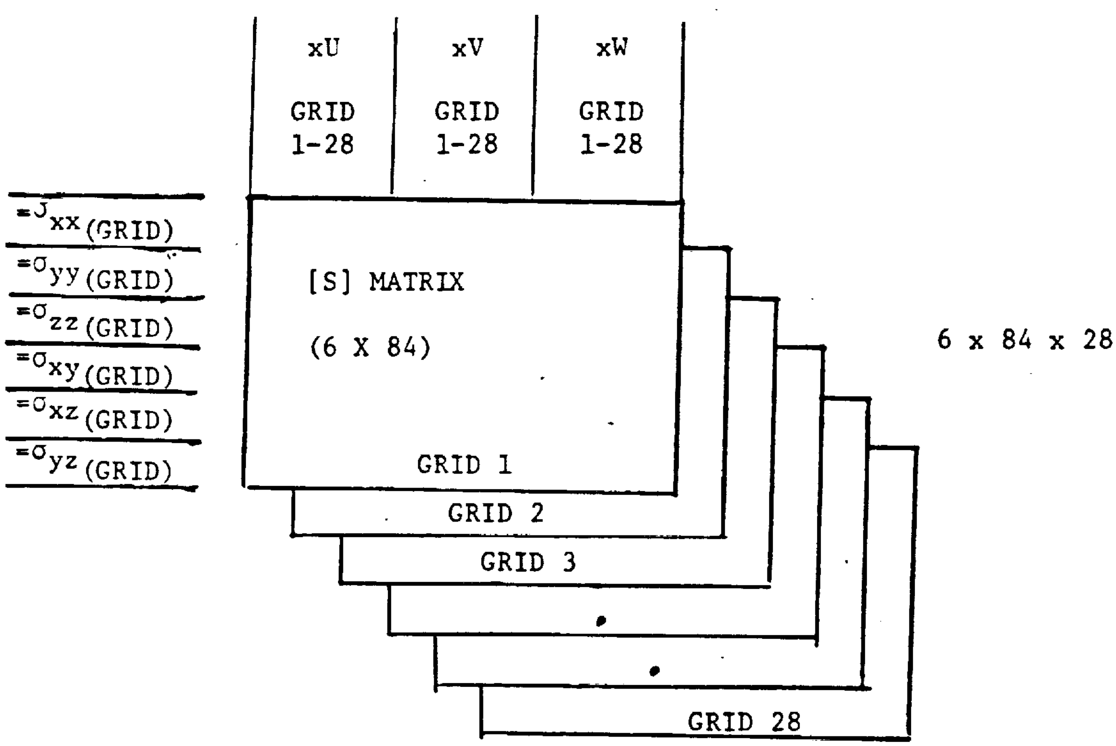
t=1-N  Nx (N+1) Partitions  t=0-N  NxN Partitions  t=1-N

### 3.3 Stress [S] Matrices (LEQP Element)

The 6 x 84 x 28 stress matrices for the LEQP element are generated in routine LEQP and stored on file "IOLD". The equation used to obtain [S] is $[S]=[E_6][N_x^{1}]_{(GRID)}$, where $[N_x^{1}]$ is evaluated at each of the 28 grid points of the quadrilateral plate. Figure 13 illustrates the labeling of [S]. Since [S] for the LEQP element is time independent, the same matrix is used for each time increment in the problem solution and the velocity terms of the {u} vector are not used in this solution.

FIGURE 13. LEQP STRESS MATRIX LABELING

FOR ALL TIME INCREMENTS



$$\sigma(6,\mathrm{GRID})_t = [\,S_{6X84}\,]_{(GRID)} \cdot \begin{Bmatrix} U_t \\ V_t \\ W_t \end{Bmatrix}_{84X1}$$

$$[S] = [E_6][N_x{}'\,]_{(GRID)}$$

### 3.4 Element Force Vector $\{F_F\}$

Figure 14 illustrates the force vector labeling and the time assembly of the element load vectors. The equations to adjust the force vectors for known initial conditions are as follows:

$$\{F_{F(o)}\} = \{F_o^{\,1}\} - [K_{oo}^{\,1}]\ \{u_o\} - [A_o^{\,1}]\ \{\sigma_o\} \tag{1}$$

$$\{F_F(1)\} = \{F_o^{\,2} + F_T^{\,1}\} - ([K_{To}^{\,1}] + [A_o^{\,2}][C_\sigma^{\,-1}][B_o^{\,1}])\ \{u_o\} - \tag{2}$$

$$([A_o^{\,2}] + [A_T^{\,1}])\ \{q_o\} + [A_o^{\,2}][C_\sigma^{\,-1}]\ \{q_1\}$$

If N=1 $\quad \{F_{F(1)}\} = \{F_{F(1)}\} - [A_T^{\,1}]\ [C_\sigma^{\,-1}]\ [B_o^{\,1}]\ \{u_o\}$

$$\{F_{F(J)}\} = \{F_o^{\,(J+1)} + F_T^{\,J}\} - ([A_o^{\,(J+1)}] + [A_T^{\,J}])\ [C_\sigma^{\,-1}]\ [B_o^{\,1}]\ \{u_o\} -$$

J=2,N

$$([A_o^{\,(J+1)}] + [A_T^{\,J}])\ \{\sigma_o\} +$$

$$\sum_{L=1}^{J-1} (([A_o^{\,(J+1)}] + [A_T^{\,(J)}])\ [C_\sigma^{\,-1}]\ \{q_L\} +$$

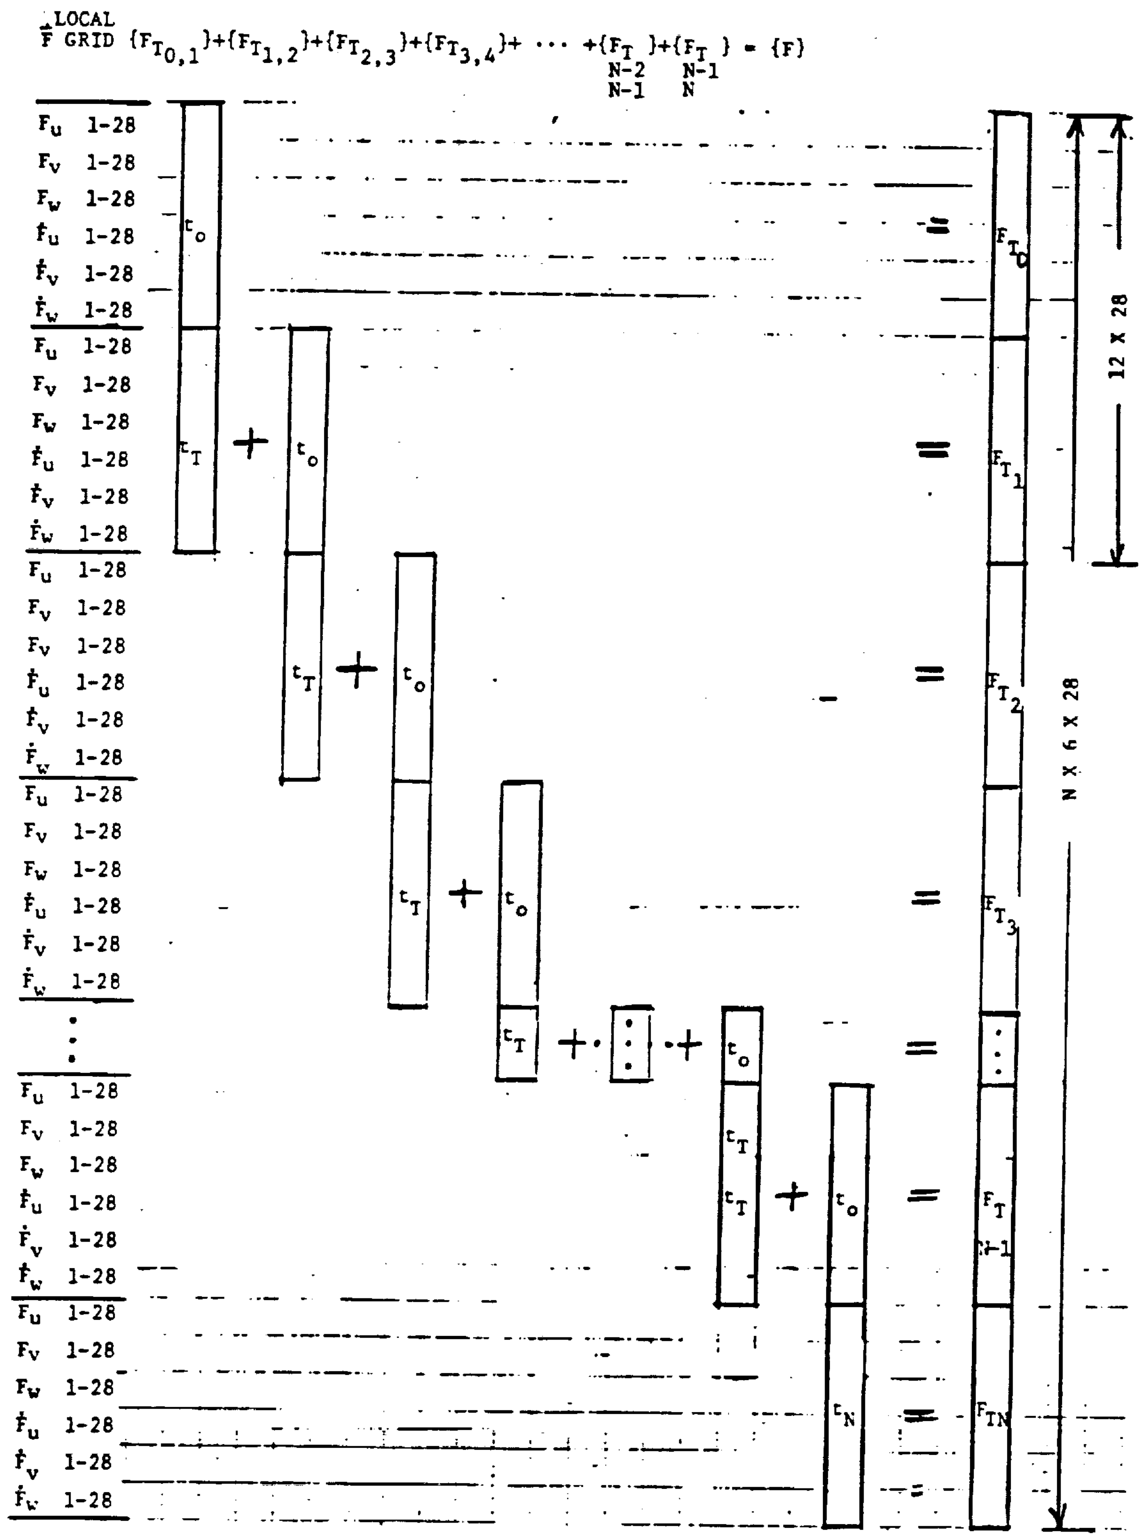
$$[A_o^{\,(J+1)}]\ [C_\sigma^{\,-1}]\{q_J\}$$

The first force vector is written to file IOFF(1) for solution of the problem $[K_F]\ \{u\} = \{F_F\}$.

NOTE:

(1) The above computations are not currently performed in the program. It is assumed that $\{u_o\} = \{\sigma_o\} = \{q\} = \{0\}$ and therefore file "IOFO" contains the $\{F_{OIT}^{\,L}\}$ vectors (unassembled). Routine "COMPU" currently preferring the time assembled.

FIGURE 14. {F} VECTOR TIME ASSEMBLY AND LABELING N=NTIME, $T_O$=0.0



## 4.0 EXTERNAL DATA SET STRUCTURE

The SFENES program uses 18 data sets during execution. The dataset variable unit names are stored in labeled common "IO" and are initialized to the integer unit number in routine "INTRFC". Table 1 contains the dataset names, default unit number, routines using the dataset and a brief description of the contents of each dataset. Table 2 lists the record descriptions and record formats contained in each dataset. All datasets contain binary output except "IOIN" and "I6". The binary datasets in several instances contain variable length records.

TABLE 1

| UNIT NAME | UNIT NO. | ROUTINE USING | IN/OUT | CONTENTS |
|---|---|---|---|---|
| IOLD | 1 (Binary) | INPUT<br>EPQPA<br>RDOTDT | OUT<br>IN<br>IN | Element load codes and the computed or input force tables. This data is destroyed after total element load vectors are computed. |
| | | LEQP<br>CSIGL | OUT<br>IN | Element stress matrix (LEQP element) |
| | | ATEMP | OUT | Element matrix computation $[C_e]^{-1} \cdot [B_e]$ - (EPQP Stress Computation) results |

# SLAVE FINITE ELEMENT FOR

# NONLINEAR ANALYSIS OF ENGINE STRUCTURES

# USER'S MANUAL

## I.0 INTRODUCTION

The purpose of the SFENES program is to provide the user with validation of the basic matrices needed to compute the transient displacements of a group of non-linear elements and to provide for element stress recovery unpon convergence of the problem. In addition, the element matrices routines have been provided to compute resultant displacements, checks for convergence, output displacement and stress and perform element stress recovery. The program is limited by the following factors:

1. The only element currently provided is the quadrilateral plate element with either linear elastic analysis or non-linear elastic-plastic analysis.
2. Only a single structural element may be analyzed (multiple time intervals).
3. All input and output is in terms of the "local" coordinate system.
4. A maximum of 25 time points (solution times) may be requested. Output displacement times are unlimited.

The following pages describe the program and its input/output features.

## 2.0 SFENES OVERVIEW

The Slave Finite Element procedure is described here. Reference to Figure 1 will aid in the description of the solution algorithm. The element input data is interpreted and stored for later reference. All of the required spatial definite integrals are computed and stored as is the one time computation of the $[C]^{-1}$ matrix. The input element lead data (if any) is combined and integrated over the time intervals. The force vector {F} is then stored for later use in computation of {u}.

The iterative procedure starts with the computation of the matrices $[K_e]$ and either $[A_e]$, $[B_e]$ for the EPQP case or $[S_e]$ for the LEQP case. For the EPQP case the initial iteration assumes that the structural element is elastic for all time intervals but for each subsequent iteration the elastic and/or plastic regions are computed. The structural matrices are then assembled for global time. For the EPQP case final time assembled $[K_F]$ matrix is computed as $[K_F] = [K_e] = [A_c]\ [C_e]^{-1}\ [B_e]$ and the matrix multiplication $[C_e]^{-1}\ [B_e]$ is stored for later stress computation. The linear LEQP case simply involves the time assembly of each of the $[K_e]$ matrices as computed over the specified local time intervals. The $[K_F]$ matrix and the {F} vectors are then reduced based upon the input boundary conditions as well as the removal of the tows corresponding to displacements at times $T_0$ and $T_N$ (rows 1-84) and rows ((N*168)+1 to (N*168)+84) where N = the number of input time points minus 1 ($1<N<24$). The reduced $[K_F]$ matrix and {F} vector are used to compute the new

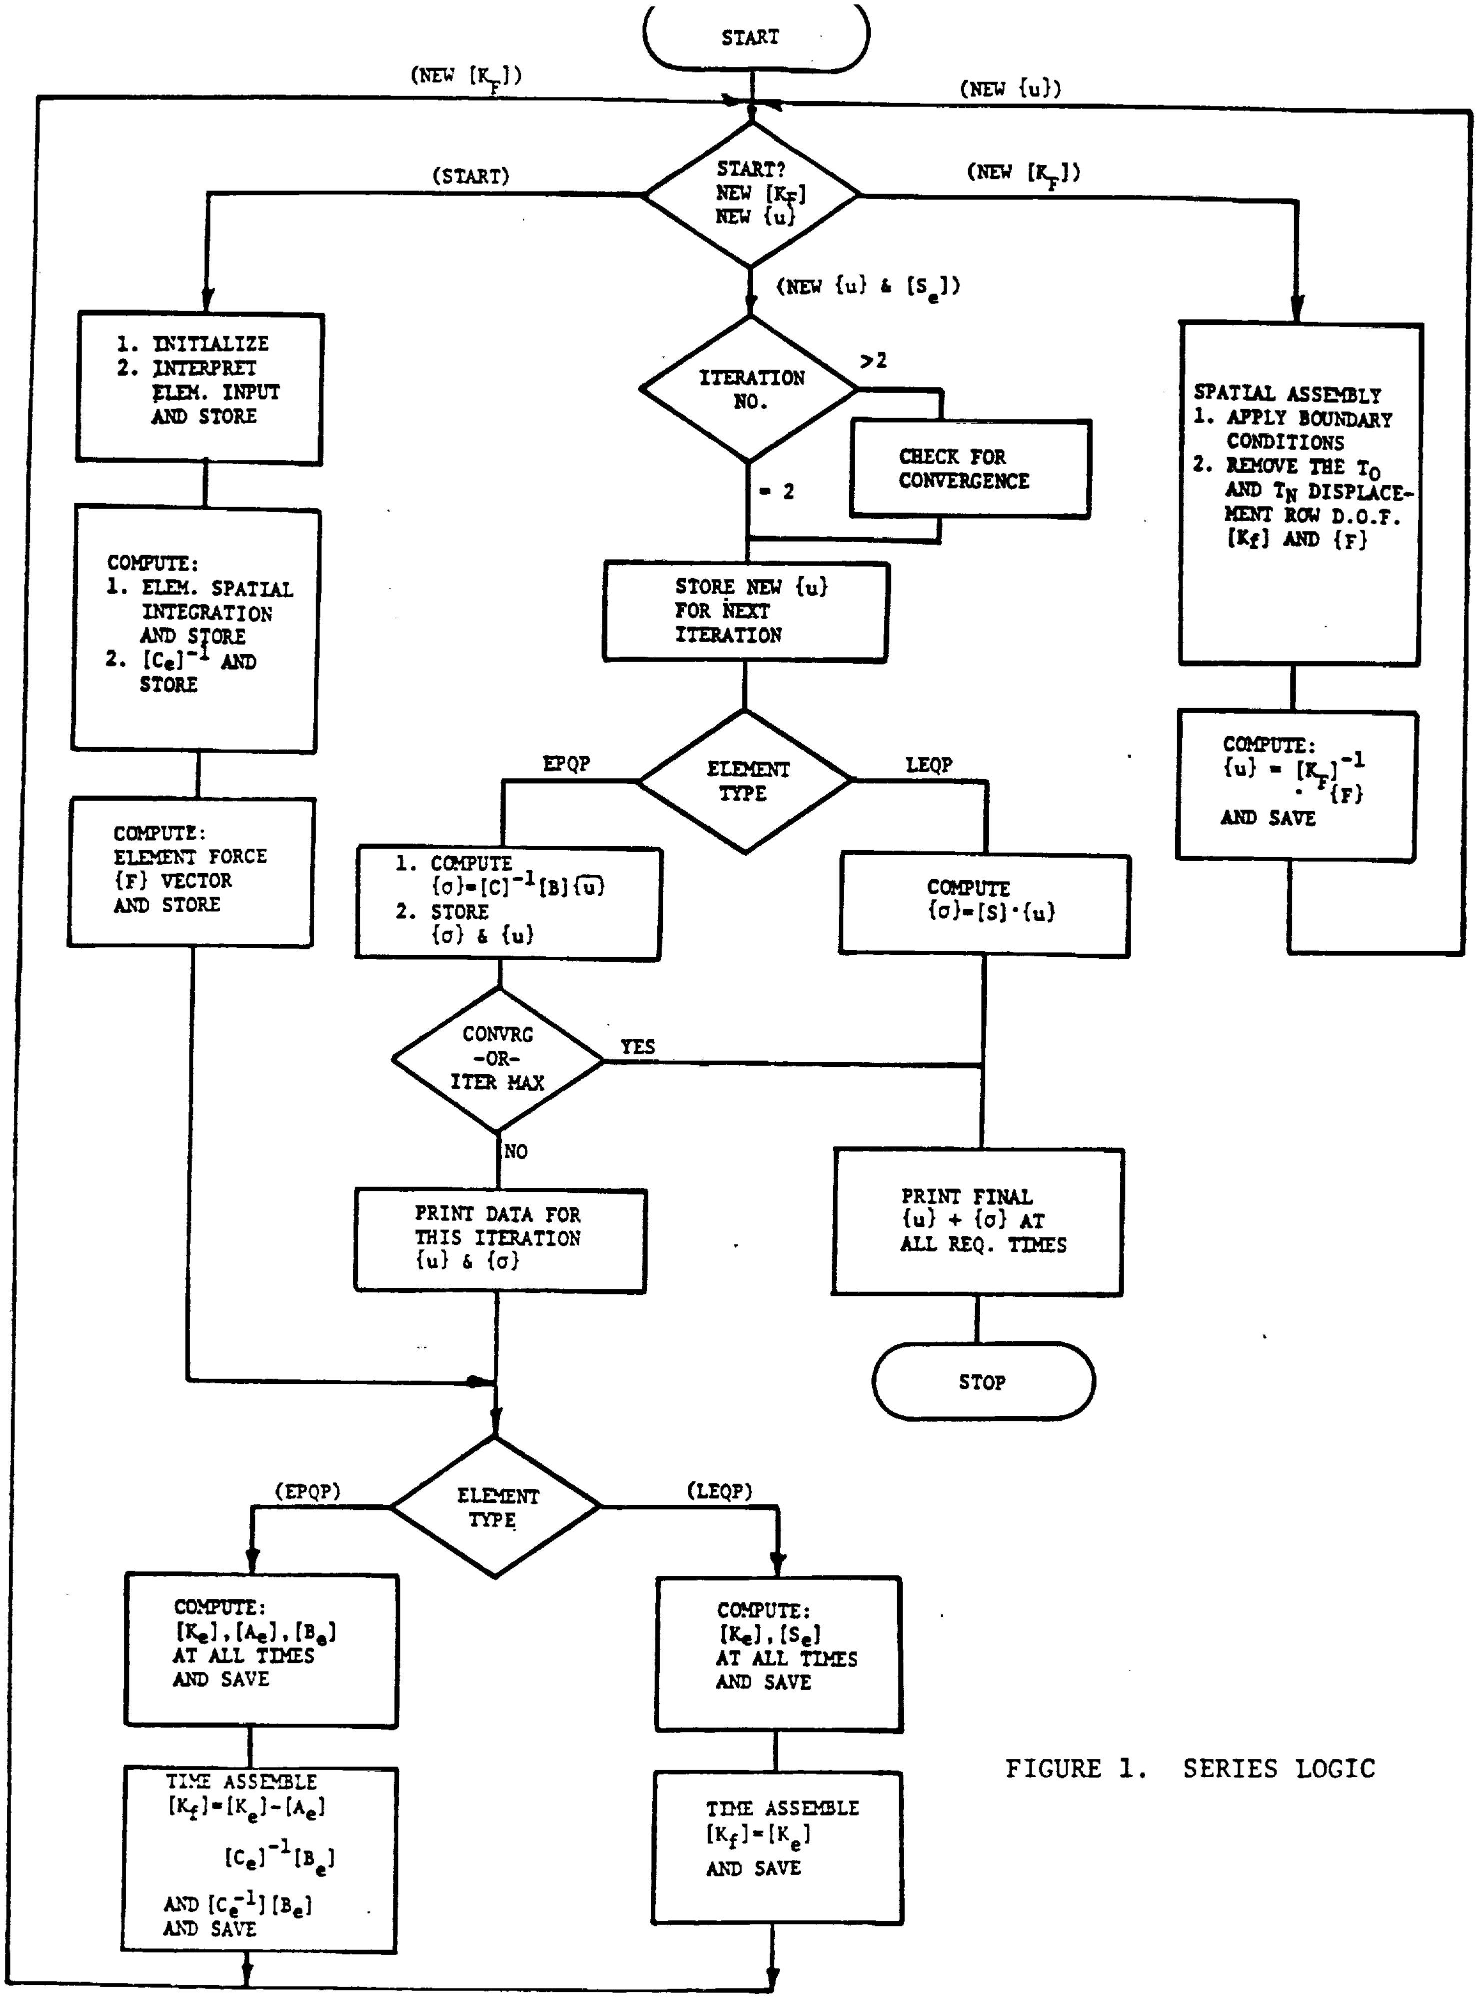

FIGURE 1. SERIES LOGIC

$\{u\}$ vector ($[K_F]\ \{u\} = \{F\}$). The updated value of $\{u\}$ is checked for convergence and then stored for the next iteration.

The vector $\{u\}$ and the stress matrices $[C_e]^{-1}\ [B_e]$ or $[S_e]$ are used to compute the stress vector $\{\sigma\} = [C_e]^{-1}\ [Be_e]\ \{u\}$ or $\{\sigma\}=[S_e]\ \{u\}$. The displacement and stress vectors are then stored for use in computation of the $[E_7]$ matrices for the next iteration. After each iteration the displacement and stresses are printed for the input time intervals only. When the problem converges the displacements are also printed at the requested output interval. The iterative procedure continues until convergence or maximum iteration is achieved.

## 3.0 QUADRILATERAL PLATE DESCRIPTION

One finite element is provided in SFENES and that is the quadrilateral plate element. Figure 2 depicts the local coordinate grid labeling and the orientation requirements. The analysis procedure permits transient analysis of the plate as either a linear elastic element (LEQP) or as a non-linear elastic-plastic element (EPQP).

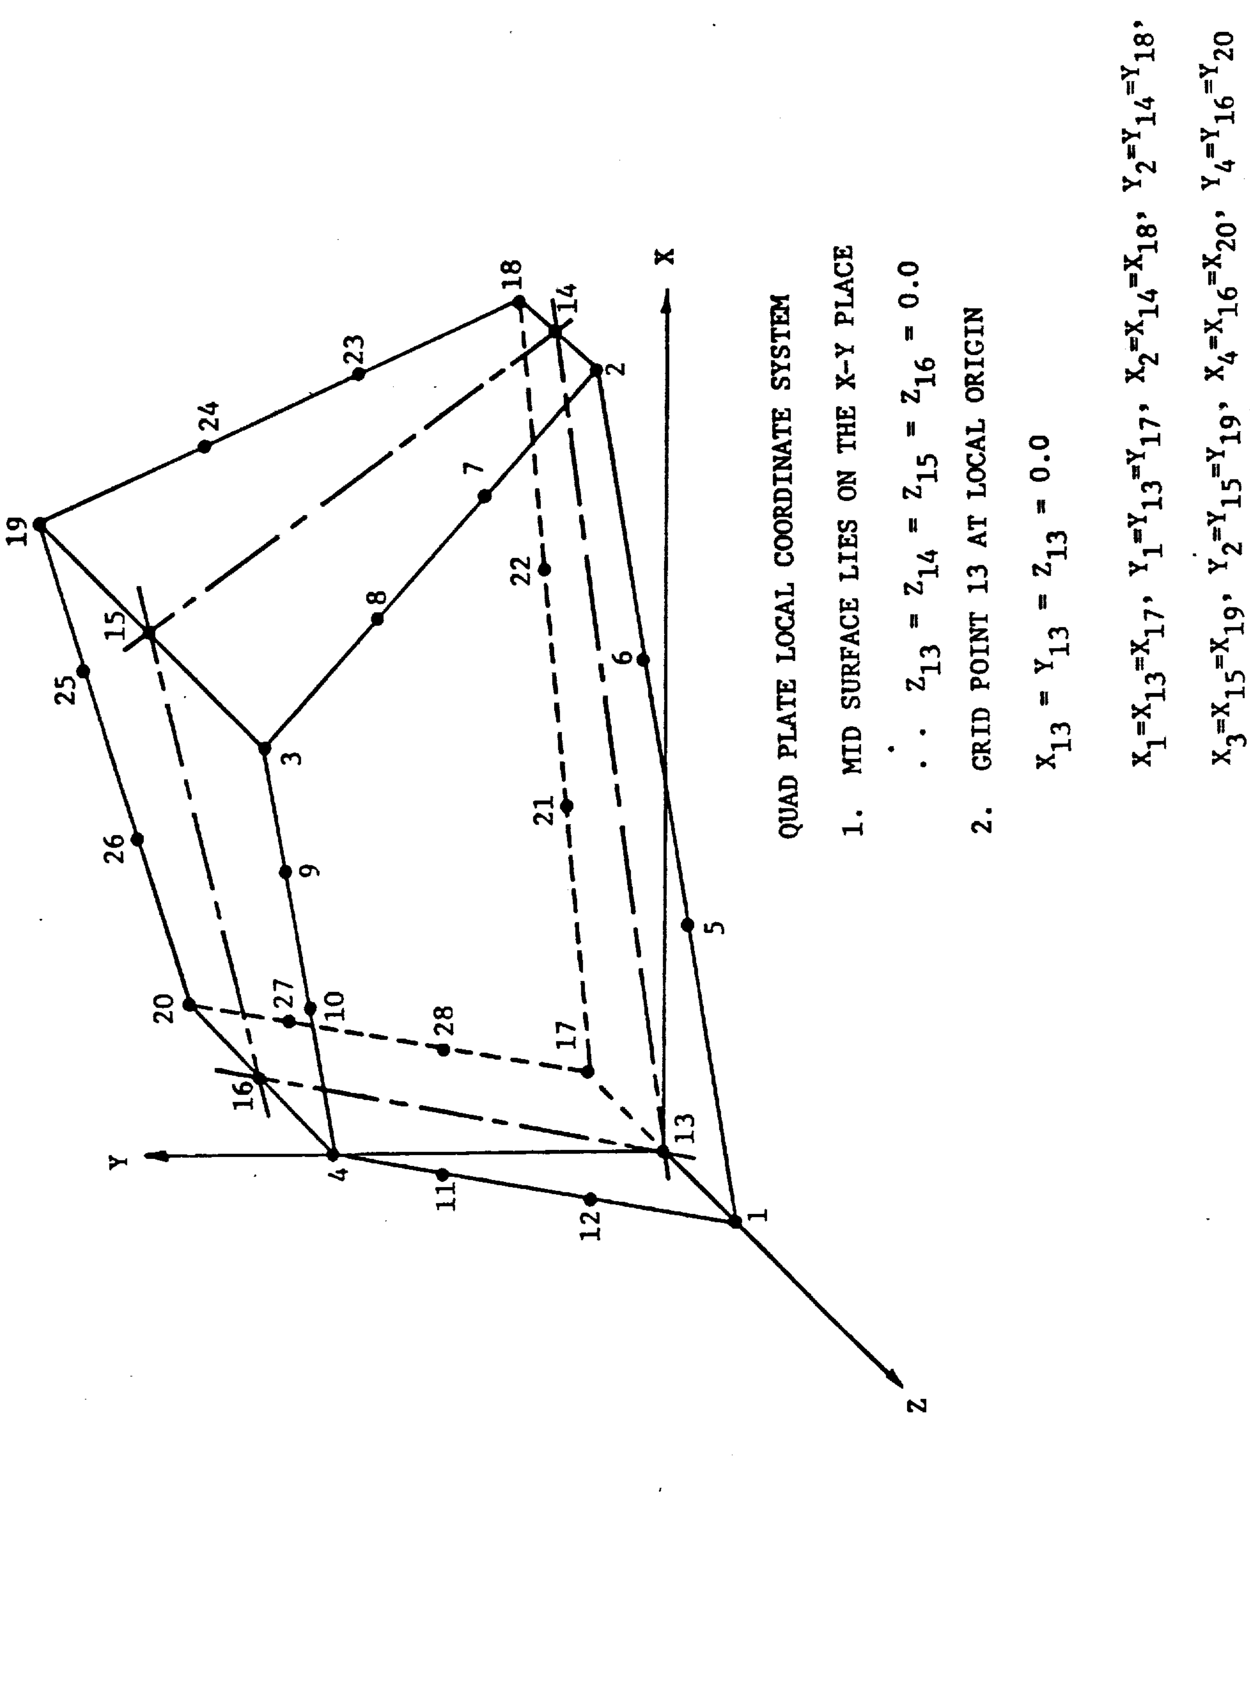

FIGURE 2. QUADRILATERAL PLATE LOCAL GRID IDENTIFICATION

## 4.0 INPUT OVERVIEW

The input requirements and options are described below. The following general rules must be observed.

1. Each input line consists of 8 fields of 10 characters each. In some cases a field is subdivided for integer or alpha input.
2. Integer data and floating point "E" format data must be right justified in their respective input fields.
3. One of the material prop inputs is required.

Listed below is a brief summary of the input options and notes regarding order and required usage.

| | |
|---|---|
| TITLE | Title information |
| TIME | (Required and must preceed and load input) The number of time increments +1 and the values of beginning/end of the time increments. |
| EPQP | Contains material properties and local grid point co-ordinates for the linear plastic quad plate element. |
| LEQP | Contains material properties and local grid point co-ordinates for the linear elastic quad plate element. |
| LOAD | Defines element body force, pressure and traction load (must be preceeded byTIME input option). |
| ISTRES | Defines any initial stress component values (at TIME = 0.0) |
| ISISP | Defines any initial displacement and velocity component values (at TIME = 0.0) |
| PDOF | Displacement and STRESS output print selection (Default = Print All D.O.F.) |

| | |
|---|---|
| PGRD | Local grid number output print control (Default = Print All Grid Points). |
| ICND | Boundary conditions, grid identifications (Default= None Bounded Out) |
| CONT | Execution control parameters - maximum iterations, convergence criteria and output format. |
| END | Require last input for the element. |

## 5.0 INPUT DESCRIPTION

Figure 3 contains an illustrative example of typical user input. A detailed description of each line and field of input, that may be entered for each of the input options summarized in Section 4.0, is contained on the following pages. Input record description contained on these pages includes:

1) Input Code, i.e., "TIME"
2) Record Format, i.e., Field Usage and Mnemonic
3) Record Example, as contained on Figure 3
4) Field Description - verbal explanation of each field in the record along with data type, limits and defaults if any.
5) Qualifying Notes

All input is formatted and is currently read from logical unit 5 "IOIN".

| CORD | 15 | 10.0 | 10.0 | 0.0 | 1.0 | | | |

FIELD DESCRIPTION:

| CARD NO. | FIELD LABEL | FIELD NO. | CONTENTS |
|---|---|---|---|
| 1 | EPQP | 1 | THE ALPHANUMERIC "EPQP" |
| 1 | NL | 1 | CODE TO PERFORM LINEAR OR NONLINEAR (ITERATIVE) COMPUTATIONS; (INTEGER, 00 = LINEAR, 01 = NONLINEAR) |
| 1 | E | 3 | YOUNG'S MODULUS (REAL > 0.0) |
| 1 | G | 4 | SHEAR MODULUS (REAL > 0.0) |
| 1 | AMU | 5 | POISSON'S RATIO (REAL, 0.0<AMU<0.5) |
| 1 | RHO | 6 | MASS DENSITY (REAL) |
| 1 | ALPHA | 7 | MATERIAL PARAMETER IN PLASTICITY LAW (REAL) |
| 1 | AJ | 8 | MATERIAL PARAMETER IN PLASTICITY LAW (REAL) |
| 2 | YSTR | 2 | NOMINAL YIELD STRESS (REAL) |
| 2 | NU | 3 | ALTERNATE POISSON'S RATIO (NOT USED) (REAL) |
| 3 - 6 | CORD | 1 | THE ALPHANUMERIC "CORD" |
| 3 - 6 | IG | 1 | THE LOCAL GRID NUMBER (INTEGER, 13<IG<16) |
| 3 - 6 | XENTER | 2 | THE LOCAL X-COORDINATE OF GRID POINT IG (REAL) |
| 3 - 6 | YENTER | 3 | THE LOCAL Y-COORDINATE OF GRID POINT IG (REAL) |
| 3 - 6 | ZENTER | 4 | THE LOCAL Z-COORDINATE OF GRID POINT IG (REAL) |
| 3 - 6 | H | 5 | THE THICKNESS OF PLATE AT CORNER CONTAINING LOCAL GRID POINT IG (REAL>0.) |

NOTE: 4 CORD CARDS ARE REQUIRED, ONE EACH FOR LOCAL GRID POINTS 13,14,15 AND 16. IN THE LOCAL COORDINATE SYSTEM GRID POINT 13 MUST BE AT THE ORIGIN AND POINTS 13 - 16 MUST ALL LIE IN THE X-Y PLANE.

INPUT - LEQP - LINEAR ELASTIC QUADRILATERAL PLATE ELEMENT

FORMAT:

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| LEQP | | | G | AMU | RHO | | | |
| CORD IG | XENTER | YENTER | ZENTER | H | | | | |

EXAMPLE:

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| LEQP | | | 11538000 | 0.3 | 2.588E-4 | | | |
| CORD 13 | 0.0 | 0.0 | 0.0 | 1.0 | | | | |
| CORD 16 | 0.0 | 10.0 | 0.0 | 1.0 | | | | |
| CORD 14 | 10.0 | 0.0 | 0.0 | 1.0 | | | | |
| CORD 15 | 10.0 | 10.0 | 0.0 | 1.0 | | | | |

FIELD DESCRIPTION:

| CARD NO. | FIELD LABEL | FIELD NO. | CONTENTS |
|---|---|---|---|
| 1 | LEQP | 1 | THE ALPHANUMERICS "LEQP" |
| 1 | G | 4 | SHEAR MODULUS (REAL > 0.0) |
| 1 | AMU | 5 | POISSON'S RATIO (REAL, 0.0<AMU<0.5) |
| 1 | RHO | 6 | MASS DENSITY (REAL > 0.0) |
| 2 - 5 | CORD | 1 | THE ALPHANUMERIC "CORD" |
| 2 - 5 | IG | 1 | THE LOCAL GRID NUMBER (INTEGER, 13<IG<16) |
| 2 - 5 | XENTER | 2 | THE LOCAL X-COORDINATE OF GRID POINT IG (REAL) |
| 2 - 5 | YENTER | 3 | THE LOCAL Y-COORDINATE OF GRID POINT IG (REAL) |
| 2 - 5 | ZENTER | 4 | THE LOCAL Z-COORDINATE OF GRID POINT IG (REAL) |
| 2 - 5 | H | 5 | THE THICKNESS OF PLATE AT CORNER CONTAINING LOCAL GRID POINT IG (REAL>0.) |

NOTE: 4 CORD CARDS ARE REQUIRED, ONE EACH FOR LOCAL GRID POINTS 13,14,15 AND 16. IN THE LOCAL COORDINATE SYSTEM GRID POINT 13 MUST BE AT THE ORIGIN AND POINTS 13 - 16 MUST ALL LIE IN THE X-Y PLANE.

INPUT - LOAD - ELEMENT LOAD DATA

FORMAT: FOR EQUATION TYPE INPUT It=1 OR It=2

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| LOAD I1 | ItIdIpInIs | | | | | | |
| | COEFFu | XuYuZuTu | COEFFv | XvYvWvTv | COEFFw | XwYwZwTw | |

FIELD DESCRIPTION:

| CARD NO. | FIELD LABEL | FIELD NO. | CONTENTS |
|---|---|---|---|
| 1 | ICND | 1 | THE ALPHANUMERICS "ICND" |
| 1 | NB | 1 | THE NUMBER OF BOUNDED GRID POINTS (LOCAL) IDENTIFIED ON LINES 2 OR 2 AND 3 (INTEGER - RIGHT JUSTIFIED; 1<NB<27) |
| 2 | N(1)-N(14) | 2A - 8B | LOCAL GRID POINTS BOUNDED OUT OF PROBLEM (INTEGERS BETWEEN 1 AND 28) |
| 3 | N(15)-N(NB) | 2A - 8B | LOCAL GRID POINTS BOUNDED OUT OF PROBLEM (INTEGERS BETWEEN 1 AND 28) |

INPUT - CONT - PROBLEM EXECUTION CONTROL PARAMETERS (REQUIRED)

FORMAT:

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| CONT | MiPc | CRITR | DELTM | | | | | |

EXAMPLE:

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| CONT | 1002 | .05 | 1.0E-04 | | | | | |

FIELD DESCRIPTION:

| CARD NO. | FIELD LABEL | FIELD NO. | CONTENTS |
|---|---|---|---|
| 1 | CONT | 1 | THE ALPHANUMERICS "CONT" |
| 1 | Mi | 2 | THE MAXIMUM NUMBER OF ITERATIONS TO EXECUTE; DEFAULT TO 3 IF RANGE EXCEEDED. (INTEGER BETWEEN 1 AND 20) |
| 1 | Pc | 2 | PRINTED OUTPUT FORMAT (INTEGER; 1 OR 2) DEFAULT = 1<br>1 = PRINT GRID POINT VALUES AT ALL TIMES<br>2 = PRINT ALL GRID POINT VALUES FOR THIS TIME |
| 1 | CRITR | 3 | THE CONVERGENCE CRITERIA FOR ALL DISPLACEMENT VALUES; RELATIVE CONVERGENCE, DEFAULT TO 0.01 (REAL > 0.) |
| 1 | DELTM | 4 | PRINTED OUTPUT TIME INCREMENT |

INPUT - END (REQUIRED LAST INPUT)

FORMAT AND EXAMPLE:

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| END | | | | | | | |

## 6.0 OUTPUT OVERVIEW

Typical output is illustrated in Section 7, Figure 5. An echo print of the user input is always printed first. The echo print is followed by a group of program controlled output which contains:

1. Computed local coordinates of analysis element
2. Labeled material properties, as input
3. Tables giving element load values in the local coordinate system for each input time slice
4. Table of input initial stress and displacement values.

The third data output grouping is output each iteration and contains the displacement/stress data computed that iteration. This output is only at the input time slices. This data is not present for the LEQP case since only one iteration is performed.

The final output consits of displacement/stress data at the requested print time increments upon convergence of the problem. The printed format is operator controlled for this grouping.

## 7.0 OUTPUT EXAMPLE

A quadrilateral plate of constant thickness is sued to illustrate the input-output format of SFENES. Table 1 provides the required input to solve a linear quad plate problem and Figure 4 shows the geometric layout of the problem plate. Used input data is illustrated in Figure 3 and each input record is described in Section 5 of this report.

Problem output is illustrated in Figure 5. A description of this output is contained in Section 6 of this report.. The output contrived here is only partial (unbounded D.O.F. only) in order to conserve space.

TABLE 1.

QUADRILATERAL PLATE MATERIAL PROPERTIES, COORDINATE INPUT,

LOAD EQUIPMENT AND INITIAL VALUES

(1) Material Properties

$G = 1.1538 \times 10^7$

$\rho = .2588 \times 10^{-3}$

$\mu = .30$

(2) Spatal Coordinates

| Grid No. | X | Y | Z | Thickness |
|---|---|---|---|---|
| 13 | 0 | 0 | 0 | 1.0 |
| 14 | 10.0 | 10.0 | 0 | 1.0 |
| 15 | 10.0 | 10.0 | 0 | 1.0 |
| 16 | 0.0 | 10.0 | 0 | 1.0 |

(3) Time Coordinates

0.0

0.0005

0.0010

(4) Element Load

Pressure Load on Top Surface of

-10,000t or -10,000t in W dir

(5) Initial Values

Stress = 0.0 at all grids

Displacement = 0.0 at all grids

**13. ABSTRACT** ***(Maximum 200 words)***

The programming aspects of SFENES are described in the User's Manual. The information presented here is provided for the installation programmer. It is sufficient to fully describe the general program logic and required peripheral storage. All element generated data is stored externally to reduce required memory allocation. A separate section is devoted to the description of these files thereby permitting the optimization of I/O time through efficient buffer description. Individual subroutine descriptions are presented along with the complete Fortran source listings. A short description of the major control, computation, and I/O phases is included to aid in obtaining an overall familiarity with the program's components. Finally, a discussion of the suggested overlay structure which allows the program to execute with a reasonable amount of memory allocation is presented.

**14. SUBJECT TERMS**
Computer code; Nonlinear analysis displacements stresses time; Shape functions; Nodal representation; Four-dimensional; Solution algorithm
