A CONTINUING BIBLIOGRAPHY WITH INDEXES

### INTRODUCTION

This issue of Aeronautical Engineering—A Continuing Bibliography (NASA SP-7037) lists 539 reports, journal articles, and other documents originally announced in August 1991 in Scientific and Technical Aerospace Reports (STAR) or in International Aerospace Abstracts (IAA).

Accession numbers cited in this issue are:

STAR (N-10000 Series) N91-23073 — N91-25099 IAA (A-10000 Series) A91-36013 — A91-40566

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the publication consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged by the first nine *STAR* specific categories and the remaining *STAR* major categories. This arrangement offers the user the most advantageous breakdown for individual objectives. The citations include the original accession numbers from the respective announcement journals.

Seven indexes—subject, personal author, corporate source, foreign technology, contract number, report number, and accession number—are included.

A cumulative index for 1991 will be published in early 1992.

Information on availability of documents listed, addresses of organizations, and NTIS price schedules are located at the back of this issue.

SEPTEMBER 1991

#### 01

#### **AERONAUTICS (GENERAL)**

#### A91-36351#

#### WRIGHT LABORATORY

ALAN S. BROWN (USAF, Wright Research and Development Center, Wright-Patterson AFB, OH) Aerospace America (ISSN 0740-722X), vol. 29, May 1991, p. 8-10.

A review is presented of past and present aerospace research conducted at Wright Laboratory. Some of the advanced projects under study include turbines with twice the thrust/weight ratio of today's aircraft engines, flight helmets that reconstitute reality as a computer-enhanced simulation on their darkened inner walls, and hypersonic aircraft that fly from New York to Philadelphia in 90 seconds. The two major research programs being investigated are the National Aerospace Plane and the Integrated High-Performance Turbine Engine Technology effort, whose principal goal is to develop a flow of new technologies that can be integrated into turbine design. Attention is given to the research and development of composite materials and the important role they play in all of these advanced projects.

#### A91-36353#

#### LONG-RANGE AIRCRAFT ARE IN DEMAND

RICHARD DEMEIS Aerospace America (ISSN 0740-722X), vol. 29, May 1991, p. 24-27, 31.

The overriding technological combinations that must be developed to provide for increased payload/long-range efficiency in commercial aircraft are discussed. The many requirements include: lighter structures, fuel efficiency, available engine thrust at optimum cruise altitude, and the relationship of lift, drag, and engine fuel efficiency to produce the greatest range when drag divided by speed is kept to a minimum. Attention is given to the various new ultra-high-bypass turbofans under development that approach the 100,000 lb thrust category with bypass ratios of better than 20/1.

#### A91-36875

#### METAL MATRIX COMPOSITE VERTICAL TAIL FABRICATION

DAVID M. GINBURG (Lockheed Aeronautical Systems Co., Marietta, GA) Society of Manufacturing Engineers, Metal Matrix Clinic Conference, Anaheim, CA, Nov. 13, 14, 1990. 20 p. (SME PAPER EM90-438) Copyright

Four full-scale Metal-Matrix Composite (MMC) vertical tails were built from two types of MMC: 15v/o SiC(w)/2124-T6 Al, and SiC/6061 Al. Fabrication of the detail parts used several unique, cost-effective processes. The greatest labor-saving device was the robotic abrasive waterjet used to cut the flat patterns. Flanged ribs were formed by hot-rubber hydroforming, replacing matched dies with a single male form block. The large laminated SiC(w)Al skins were chemically milled and adhesive-bonded. All fabrication and assembly operations were performed in accordance with production-rate process standards and instructions.

#### A91-36895

#### **AUTOMATIC AIRCRAFT PAINT STRIPPING**

VERNON R. STURDIVANT (Southwest Research Institute, San Antonio, TX) Society of Manufacturing Engineers, Conference on Aerospace Automation and Fastening, Arlington, TX, Oct. 9-11, 1990. 12 p.

(Contract F33615-86-C-5044)

(SME PAPER MS90-280) Copyright

Paint must be removed from aircraft to allow detailed surface inspection, to perform repair operations, and to keep weight at acceptable levels after many coats of paint have been applied. Southwest Research Institute is presently constructing a robotic system for automatically removing paint from fighter aircraft for the United States Air Force. The process removes paint by plastic media bead blasting. The blast nozzles are positioned over the aircraft surface with a robot. The system consists of two, 9 degree-of-freedom (DOF) robots together with two robot controllers, one cell control computer, paint sensors, and bead blasting equipment.

#### A91-36898

# THE INTRODUCTION OF OFF-LINE PROGRAMMING TECHNIQUES FOR THE ROBOTIC ASSEMBLY OF AIRCRAFT STRUCTURES

JOHN R. THOMPSON (British Aerospace /Military Aircraft/, Ltd., Blackburn, England) Society of Manufacturing Engineers, Conference on Aerospace Automation and Fastening, Arlington, TX, Oct. 9-11, 1990. 25 p. refs

(SME PAPER MS90-276) Copyright

A system is described for off-line programming a robot performing assembly operations where interaction and coordination between peripheral devices is essential for correct operation. The complex nature of automated assembly operations requires multidevices to assemble and fasten components together. As part of British Aerospace's on-going commitment to automated assembly development, this paper discusses the introduction of a robotic off-line programming method which uses a CAD database to construct device part programs. A 3-D computer simulation system models and animates all the programmable motions in the physical automated assembly cell. Once tape proved an off-line program is produced incorporating calibration methods.

#### A91-36944

#### AIRCRAFT REPAIR/GENERAL AVIATION QUICK TOOLING

FRED BANKE (Composite Craft, Inc., Orlando, FL) Society of Manufacturing Engineers, Conference on Tooling for Composites '90, Anaheim, CA, June 5-7, 1990. 20 p.

(SME PAPER EM90-178) Copyright

It is often required that a damaged component be returned to its original contours and aerodynamic smoothness on site. Sound, efficient in-field composite repair techniques are necessary to effect such repairs. This paper summarizes some approaches taken to the in-field repair mold concept and the resultant findings.

#### CAPP IMITATIVE SYSTEM OF AIRCRAFT ASSEMBLY

GONGFAN SHE and HUASHOU QIU (Northwestern Polytechnical University, Xian, People's Republic of China) Northwestern

Polytechnical University, Journal (ISSN 1000-2758), vol. 9, April 1991, p. 240-245. In Chinese, with abstract in English.

A rule-based 'imitative' expert system for computer-aided process planning (CAPP) is proposed which can serve as the Chinese aircraft industry's bridge between CAD and CAM processes' implementation. The imitative CAPP employs the Al language TURBO-PROLOG to conduct simple and easily modifiable modular programming; simplicity levels are in fact such as to allow microcomputer CAPP implementation. The modules in question address data inputs, tooling and assembly, operation sequence arrangement, and specifications editing. Attention is presently given to CAPP's description-related data.

### AERONAUTICAL RESEARCH IN THE UNITED STATES - CHALLENGES FOR THE 1990'S

RICHARD H. PETERSEN and BRUCE J. HOLMES (NASA, Langley Research Center, Hampton, VA) DGLR, Annual Meeting, Friedrichshafen, Federal Republic of Germany, Oct. 1-4, 1990, Paper. 12 p. refs

An overview is presented of NASA R&D initiatives in air transportation technologies that will dominate its efforts through the 1990s. These efforts are to be concentrated in (1) advanced subsonic transports with greater fuel economy, passenger capacity, and control effectiveness, whose design will be undertaken with state-of-the-art CFD and CAD/CAM systems; (2) a second-generation SST whose propulsion system will be substantially more fuel-efficient than that of Concorde and have far lower atmospheric emissions; and (3) a hypersonic transport predicated on the results of research into materials, cryogenic fuels, propulsion cycles, and propulsion/airframe aerodynamics integration, which will be undertaken in connection with the X-30 testbed.

#### A91-39392

# THE TECHNICAL CHALLENGES OF THE CREW ESCAPE TECHNOLOGIES PROGRAM

EDWARD O. ROBERTS (USAF, Human Systems Div., Wright-Patterson AFB, OH) IN: Annual SAFE Symposium, 27th, New Orleans, LA, Dec. 5-8, 1989, Proceedings. Newhall, CA, SAFE Association, 1990, p. 170-175. refs

Some of the technical challenges of the Crew Escape Technologies (CREST) program that are inherent in developing a true 700-KEAS open-ejection-seat capability are discussed, and some insight is provided into the complex job of integrating all of the various subsystem components into a workable system. These challenges include the design, construction, and testing of an open ejection seat with a 'safe' ejection up to 700 KEAS; increased performance over the baseline ACES-II, or 'third-generation', seat; the design of a seat system that will tailor its linear and angular acceleration performance to human tolerance criteria that are defined in terms of injury-risk limits; and the development of the appropriate control-system software. Results from a performance comparison of various types of crew-escape technologies (catapult test, axial head lift force, and longitudinal head force) are presented in graphs.

#### A91-39852

#### COMPOSITES FOR A WIDEBODY

FRANK COLUCCI Aerospace Composites and Materials (ISSN 0954-5832), vol. 3, May-June 1991, p. 22-24.

A review is presented of the composite material technology

that has been applied to the development and construction of the wide-bodied MD-11 commercial transport aircraft. It is shown that composites promise fatigue lives two to three times greater than metal, and DC-10 aileron access doors, trailing edge panels, and floor beams and struts all demonstrated the fatigue and corrosion resistance inherent in the new materials. Safety-of-flight structures are developed to handle ultimate loads with undetectable damage and limit loads with easily detectable damage. Advanced stitched spars and stringers can resist interlaminar tension loads in future primary structure, and high modulus toughened thermosets can open new composite design opportunities.

#### A91-39854

#### MOULDED MUSTANG

FRANK COLUCCI Aerospace Composites and Materials (ISSN 0954-5832), vol. 3, May-June 1991, p. 40, 41, 43. Copyright

A project to market full-scale composite replicas of the P-51 is presented that has already produced large high-temperature composite tools to mould Mustang kits for racing and recreational pilots. The teardrop shape, compound curve design of the fuselage lends itself particularly well to composite moulding. It is expected that the composite aircraft will weigh 3,200 to 3,500 lb empty, compared to the 7,800 to 11,000 lb weight empty of the metal original. Details of the composite moulding technique are described along with tooling and materials involved. Engine selection has not been finalized, however, several liquid-cooled candidates from offshore racing boats are under consideration.

#### A91-40180 TILTROTOR DEVELOPMENTS

ICAO Journal (ISSN 0018-8778), vol. 46, Feb. 1991, p. 6-10. Copyright

The present evaluation of the technology-development requirements and commercial viability of tiltrotor VTOL aircraft of V-22 size and larger gives attention to the technical changes needed by the civilian version of the V-22 and the commuter market anticipated for the movement of passengers from small airports to airline hub airports. It is noted that the elimination of various military structural features from the V-22 will substantially reduce gross takeoff weight or allow a less expensive metallic, rather than all-composite, fuselage to be employed. High developmental priority is given in the present study to noise-reduction technology and design features, such as higher blade-number rotors.

#### A91-40181

#### **MODIFICATION MEETS CHAPTER 3 STANDARDS**

WALTER H. JOHNSON (Valsan, Purchase, NY) ICAO Journal (ISSN 0018-8778), vol. 46, Feb. 1991, p. 16, 17. Copyright

Airport vicinity noise-reduction legislation, in conjunction with higher fuel prices and slower growth in global air traffic, have enhanced the economic viability of reenginings for such older airliners as the B 727s presently discussed. A 1990 certification for the reengined 727-100s discussed established noise levels 9 dB lower than ICAO chapter 3 levels, while reducing operating costs and increasing flight performance. The reengining replaces the port and starboard engines with JT8D-217Cs, and acoustically treats the existing central engine.

#### A91-40563#

### SAFETY OF AGING AIRCRAFT - BOEING PROGRAMS FOR THE 1990'S

P. J. HARRADINE and M. MILLER (Boeing Commercial Airplanes, Seattle, WA) AIAA, ASME, ASCE, AHS, and ASC, Structures, Structural Dynamics and Materials Conference, 32nd, Baltimore, MD, Apr. 8-10, 1991. 11 p.

(AIAA PAPER 91-0909) Copyright

An overview is presented of historical and current aging aircraft activities, efforts anticipated for aircraft models in production, and how the knowledge gained and lessons learned will be incorporated into future designs. It is shown how industry and airworthiness

authorities have collaborated to develop and implement major new programs involving structural modifications, corrosion prevention and control, and the damage tolerance of structural repairs. Consideration is also given to awareness and training programs, including a course to acquaint key airline maintenance and FAA personnel with the requirements and the procedures of the newly mandated Corrosion Prevention and Control Program. THE COSTS AND BENEFITS OF AIRCRAFT AVAILABILITY
Final Report, Jan. - Sep. 1990

MATTHEW S. GOLDBERG and KAREN W. TYSON Mar. 1991

(AD-A232660; AD-E501359; IDA-P-2462; IDA/HQ-90-35834) Avail: NTIS HC/MF A03 | CSCL 01/2

This paper contains estimates of the effects of research and development costs (through initial operational capability) and unit procurement costs on the mission-capable (MC) rates of eleven tactical aircraft models. These estimates are transformed into estimates of the marginal cost of increasing MC rates through, respectively, increased development or increased procurement expenditures. The benefits of higher MC rates are also computed. One benefit is that, with more reliable aircraft, the procurement quantity may be reduced. A second benefit is that more reliable aircraft have lower operations and maintenance (O and M) costs in the field. The magnitudes of these effects are also estimated. Finally, the costs and benefits are combined to compute optimal levels of investment in reliability, both for hypothetical aircraft models and for the eleven aircraft models used in the statistical analysis.

N91-23077# Institute for Defense Analyses, Alexandria, VA.
ESTIMATING FIXED AND VARIABLE COSTS OF AIRFRAME
MANUFACTURERS Final Report, Dec. 1988 - Dec. 1990
STEPHEN J. BALUT, THOMAS P. FRAZIER, and JAMES BUI
Mar. 1991 42 p

(AD-A232661; AD-E501360; IDA-P-2401; IDA/HQ-90-35536) Avail: NTIS HC/MF A03 CSCL 05/3

This report presents a model for separating annual costs at airframe manufacturing plants into fixed and variable components. The use of the model is to aid defense analysts in estimating the cost to manufacture aircraft systems when the manufacturer has not yet been determined or when proprietary models for the specific firms are not available. The material is unclassified and non-proprietary.

#### KANSAS AVIATION REVIEW

FLOYD PRICE, ed. 1991 45 p The 5th Annual Kansas State Aviation Conference was held in Liberal, KS, 14-16 Sep. 1990 (NIAR-91-3) Avail: NTIS HC/MF A03

The purpose of the Review is to provide a multi-disciplinary aviation publication opportunity. Topics addressed include: automated inspection of aging aircraft; secondary certification in aerospace education; cognitive performance in cockpits; information resources in aviation; demand for college aviation programs.

# N91-24088# Wichita State Univ., KS. EVALUATION OF AUTOMATION FOR INSPECTION OF AGING AIRCRAFT

BEHNAM BAHR In its Kansas Aviation Review p 1-8 1991 Avail: NTIS HC/MF A03

A new automated/robotics system or a potential system for aircraft inspection is described. In order to develop a semi-automated or robotics system for the inspection of an aircraft, several facts need to be considered. Therefore, a set of criteria are prepared that will enable any interested party to make an appropriate response as to what type of system should be supported or bought. These issues may involve not only the selection of what mechanism is the best system but also if

additional training will be required to implement the automated inspection.

# SOME ANALYSIS OF DECISION-MAKING IN THE TEST MANUFACTURE OF MILITARY AIRCRAFT

RUOSONG WANG 29 Nov. 1990 14 p Transl. into ENGLISH from Guoji Hangkong (Peoples Rep. of China), no. 319, Sep. 1989 p. 23-24

(AD-A233111; FTD-ID(RS)T-0716-90) Avail: NTIS HC/MF A03 CSCL 01/2

Modern military aircraft are complex engineering systems. They include target or object systems, operating systems, as well as related structural systems. They form a large, complicated engineering system made up from natural systems and social systems. As far as the goodness or badness, the success of failure of this type of engineering is concerned, it is not simply a matter of one industry; one cannot even stop with a consideration of the aviation industry of one nation; it extends even to the nation as a whole. All these things are important factors. This type of engineering requires long periods of time. The technology is complicated and new. It has enormous consequences. In addition to this, the whole world is paying careful attention to it. As a result of this, its influence involves economic effects, military effects, and political consequences.

# N91-24160# Wichita State Univ., KS. BONDED/FUSION REPAIR OF AIRCRAFT STRUCTURES WAYNE BECKER and JAMES HO In its Program Plans for Aviation Safety Research 6 p Dec. 1990

Avail: NTIS HC/MF A04

The objective is to quantify a procedure for assessment and repair of aircraft metallic and composite structures which will provide reliable, consistent results with minimal downtime. The technical approach and project management and coordination are briefly discussed.

Author

# N91-24163# Wichita State Univ., KS. MECHANICAL PAINT REMOVAL TECHNIQUES FOR COMPOSITE AIRCRAFT

JORGE E. TALIA, BEHNAM BAHR, WAYNE BECKER, and HAMID M. LANKARANI *In its* Program Plans for Aviation Safety Research 6 p Dec. 1990

Avail: NTIS HC/MF A04

The use of conventional paint removal on composite material can lead to a fast deterioration or weakening of the material due to the absorption and chemical attack of the solvent which may result in a catastrophic failure of the structure. Moreover, recent EPA regulations ban the use of solvents for paint removal and and sea military bases. The objective is to investigate the possibilities of paint removal by mechanical techniques, specifically by the impingement of solid particles, a technique that would not leave structural damage on the treated material and would not effect the environment.

#### 02

#### **AERODYNAMICS**

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

# A91-36359 UNSTEADY, FREQUENCY-DOMAIN ANALYSIS OF HELICOPTER NON-ROTATING LIFTING SURFACES OLYMPIO A. F. MELLO and OMRI RAND (Maryland, University, College Park) American Helicopter Society, Journal (ISSN 0002-8711), vol. 36, April 1991, p. 70-81. refs Copyright

A model for predicting the unsteady periodic loads acting on non-rotating helicopter lifting surfaces is derived. Lifting surfaces and their wakes are represented by bound, trailing, and shed vortices that account for the involved unsteady effects. Rotor blades are represented by bound vortices having prescribed spanwise and azimuthal strength distributions. Rotor wake is modeled by helical tip vortices of varying strength. Assuming periodic behavior, the overall governing equations are formulated in terms of Fourier coefficients. Consequently, no time discretization is used, thus permitting a single step numerical procedure while all the unsteady effects are consistently included. The method is shown to give an insight to the problem and to be an appropriate tool for predicting unsteady characteristics of the lifting surfaces and the related vibratory loads, along with their sensitivity to helicopter design parameters. Correlations with existing experimental results are presented.

THE STABILITY TO TWO-DIMENSIONAL WAKES AND SHEAR
LAYERS AT HIGH MACH NUMBERS

DEMETRIOS T. PAPAGEORGIOU (New Jersey Institute of Technology, Newark) Physics of Fluids A (ISSN 0899-8213), vol. 3, pt. 1, May 1991, p. 793-802. refs

(Contract NAS1-18605)

Copyright

This study is concerned with the stability properties of laminar free-shear-layer flows, and in particular symmetric two-dimensional wakes, for the supersonic through the hypersonic regimes. Emphasis is given to the use of proper wake profiles that satisfy the equations of motion at high Reynolds numbers. In particular the inviscid stability of a developing two-dimensional wake is studied as it accelerates at the trailing edge of a splitter plate. The nonparallelism of the flow is a leading-order effect in the calculation of the basic state, which is obtained numerically. Neutral stability characteristics are computed and the hypersonic stability is obtained by increasing the Mach number. It is found that the stability characteristics are altered significantly as the wake develops. Multiple modes (secondary modes) are found in the near wake that are closely related to the corresponding Blasius ones, but as the wake develops mode multiplicity is delayed to higher and higher Mach numbers. At a distance of about one plate length from the trailing edge, there is only one mode in a Mach number range of 0-20. The dominant mode emerging at all wake stations, and for high enough Mach numbers, is the so-called vorticity mode that is centered around the generalized inflection point layer. The structure of the dominant mode is also obtained analytically for all streamwise wake locations and it is shown how the far-wake limit is approached. Asymptotic results for the hypersonic mixing layer given by a tanh and a Lock distribution are also given. Author

# A91-36453\* High Technology Corp., Hampton, VA. REAL GAS EFFECTS ON HYPERSONIC BOUNDARY-LAYER STABILITY

M. R. MALIK (High Technology Corp., Hampton, VA) and E. C. ANDERSON (NASA, Langley Research Center, Hampton, VA) Physics of Fluids A (ISSN 0899-8213), vol. 3, pt. 1, May 1991, p. 803-821. refs

Copyright

High-temperature effects alter the physical and transport properties of a gas, air in particular, due to vibrational excitation and gas dissociation, and thus the chemical reactions have to be considered in order to compute the flow field. Linear stability of high-temperature boundary layers is investigated under the assumption of chemical equilibrium and this gas model is labeled here as real gas model. In this model, the system of stability equations remains of the same order as for the perfect gas and the effect of chemical reactions is introduced only through mean flow and gas property variations. Calculations are performed for Mach 10 and 15 boundary layers and the results indicate that real gas effects cause the first mode instability to stabilize while the second mode is made more unstable. It is also found that the

second mode instability shifts to lower frequencies. There is a slight destabilizing influence of real gas on the Goertler instability as compared to the perfect gas results.

### ON THE IMPROVEMENT OF THE SUPERSONIC LIFTING LINE THEORY

I. JADIC (Institutul National pentru Creatie Stiintifica si Tehnica, Bucharest, Rumania) Revue Roumaine des Sciences Techniques, Serie de Mecanique Appliquee (ISSN 0035-4074), vol. 35, Mar.-Apr. 1990, p. 75-88. refs

Two errors associated with the lifting line theory for supersonic linearized flows are pointed out. The first error results from the assumption of the constant chord distribution of vortices and can be corrected by correlating the control point position with the aspect ratio. The second error is related to the possibility of information transfer beyond the inverse Mach cone limit. This error is dealt with by using simple conical flow solutions whenever possible. The improved lifting line theory is validated by comparisons with the available theoretical and experimental data.

V.L.

#### A91-36699#

### NEW METHODS IN THE THEORY OF SUBSONIC FLOWS PAST THIN AIRFOIL CONFIGURATIONS

L. DRAGOS (Bucharest, University, Rumania) Revue Roumaine des Sciences Techniques, Serie de Mecanique Appliquee (ISSN 0035-4074), vol. 35, May-June 1990, p. 179-196. refs

The fundamental solution method is used to obtain integral equations of subsonic flow past various airfoil configurations, including identical or symmetrical airfoils in parallel, cascades, and different airfoils in tandem. By using Gaussian quadrature formulas, the integral equations are reduced to algebraic systems that can be readily programmed on a computer. Numerical results are presented for flat plates.

#### A91-36700#

#### WING CALCULATION IN SUPERSONIC FLOW BY MEANS OF THE SUPERSONIC LIFTING LINE THEORY

I. JADIC (Institutul National pentru Creatie Stiintifica si Tehnica, Bucharest, Rumania) Revue Roumaine des Sciences Techniques, Serie de Mecanique Appliquee (ISSN 0035-4074), vol. 35, May-June 1990, p. 197-208. refs

An improved version of the supersonic lifting line theory, SLLT + C, is assessed by way of comparison with the available theoretical and experimental data. The cases considered include straight, triangular, and swept wings. The predictions of the theory correlate well with test data for conventional planforms. It is concluded that the improved supersonic lifting line theory provides useful approximations of the aerodynamic characteristics of wings without excessive errors even for Mach numbers close to 1. V.L.

#### A91-36724#

# AERODYNAMIC CALCULATION OF TANDEM WINGS IN SUPERSONIC FLOW BY MEANS OF SLLT

I. JADIC (Institutul National pentru Creatie Stiintifica si Tehnica, Bucharest, Rumania) Revue Roumaine des Sciences Techniques, Serie de Mecanique Appliquee (ISSN 0035-4074), vol. 35, July-Aug. 1990, p. 309-324. refs

An improved supersonic lifting line theory (SLLT) is used to calculate wing-tail interference for trandem wings. In contrast to previous, approaches, the loading on the wing is calculated by the lifting line procedure itself. The results obtained show that the accuracy of the proposed method is consistent with the linearized theory, making it possible to calculate the downwash with a moderate computational effort.

DISCONTINUOUS SOLUTIONS FOR A THREE-DIMENSIONAL HYPERSONIC BOUNDARY LAYER WITH INTERACTION [O RAZRYVNYKH RESHENIIAKH PROSTRANSTVENNOGO GIPERZVUKOVOGO POGRANICHNOGO SLOIA SO VZAIMODEISTVIEM]

V. V. MAKHAN'KOV Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza (ISSN 0568-5281), Mar.-Apr. 1991, p. 19-26. In Russian. refs

Copyright

Three-dimensional flow of a viscous gas in a hypersonic boundary layer on a flat wing with a steplike leading edge is analyzed in the case where the boundary layer interacts with a slightly deflected flap on the wing. A linear solution to the problem is obtained assuming that the flap deflection angle is small and the difference of the plate lengths is of the order of one. It is shown that the formation of flow near the flap is determined to a large degree by pressure changes along the wing span due to the stepped shape of the leading edge. Although the displacement pressure and thickness are continuous functions of the transverse coordinates, the longitudinal and transverse components of the friction force become discontinuous.

ENTROPY EFFECTS OF HYPERSONIC FLOW PAST BLUNT DELTA WINGS [ENTROPIINYE EFFEKTY GIPERZVUKOVOGO OBTEKANIJA ZATUPLENNYKH TREUGOL'NYKH KRYL'EV]

S. A. GOROKHOV, V. V. EREMIN, and A. M. POLIAKOV Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza (ISSN 0568-5281), Mar.-Apr. 1991, p. 178-181. In Russian. refs Copyright

Hypersonic flow past blunt delta wings is investigated analytically. It is shown that, for large wing spans, extreme flow regimes with essentially nonuniform gasdynamic parameters may realize in the shock layer at the windward wing surface. Flow patterns on the wing surface are determined for a wing with an angle of sweep of 75 degrees. For the same wing, the ranges of Mach numbers and angles of attack are determined which correspond to extreme flow conditions.

# AERODYNAMIC CHARACTERISTICS OF SLENDER WING-GAP-BODY COMBINATIONS

YUZO YAMAMOTO (Gifu National College of Technology, Japan), SHIGENORI ANDO (Nagoya University, Japan), and KAZUO MIKI (Toyota Central Research and Development Laboratories, Inc., Aichi, Japan) Japan Society for Aeronautical and Space Sciences, Transactions (ISSN 0549-3811), vol. 33, Feb. 1991, p. 154-175.

The aerodynamic characteristics of the slender wing-gap-body combinations are studied exactly within the frame of the slender body aerodynamic theory. Solutions are presented for slender configurations, in which the wings and the body have different incidences with respect to the free stream and arbitrary width chordwise gaps exist between the wings and the body. The expressions of the aerodynamic forces derived originally by Ward

#### 02 AERODYNAMICS

(1949) and the relations between the complex velocity and a downwash on the body are extended to the case of multiply-connected cross sections. The most practical cases encountered by missile aerodynamicists may be covered, and the basic lift results agree with those obtained by Dugan and Hikido (1954).

#### A COMPARISON BETWEEN COMPUTATION AND EXPERIMENT FOR FLOWS AROUND AIRFOIL WITH SLAT AND FLAP

MICHIRU YASUHARA, YOSHIAKI NAKAMURA, and WEI JIA (Nagoya University, Japan) Japan Society for Aeronautical and Space Sciences, Transactions (ISSN 0549-3811), vol. 33, Feb. 1991, p. 218-233. refs

The flows about an airfoil with a slat and a flap are investigated experimentally and numerically. The experiment measures aerodynamic coefficients and velocity distributions in the neighborhood of the slat slot exit and visualizes the flow field for various attack angles and flap angles, which include two cases: open and closed slat slot. The Reynolds number of the experiments is 160,000. A numerical simulation is conducted under the same conditions as the experiment, and comparison between experiment and calculation shows good agreement for aerodynamic coefficients, flow patterns, and velocity distributions, especially in the region influenced by the slat slot jet. Control of a flow separation by the jet is significant for improving the flow situation around an airfoil at large attack angles.

### VARIABLE-PROPERTY EFFECTS IN SUPERSONIC WEDGE

A. POZZI (Napoli, Universita, Naples, Italy) and M. LUPO AIAA Journal (ISSN 0001-1452), vol. 29, May 1991, p. 686, 687. Abridged. Copyright

A study is presented on the variable-property effects on supersonic flow along a wedge, taking into account wall thermal resistance. The axis of the wedge is maintained either at a constant temperature or under adiabatic conditions. Viscosity and thermal conductivity coefficients are assumed to depend on temperature in a polynomial form. The problem governed by the isothermal condition on the axis does not admit similarity solutions and is solved by using two expansions, an initial one and an asymptotic one. The solution of the second problem can be obtained in similarity form. A discussion of the variable-property effects and the influence of thermal resistance of the wall on the Nusselt number friction coefficient, and temperature at the wall, for several values of the Mach number, ends the paper. #### NUMERICAL STUDY OF HYPERSONIC DISSOCIATED AIR **PAST BLUNT BODIES**

ESWAR JOSYULA and JOSEPH S. SHANGE (USAF, Wright Research and Development Center, Wright-Patterson AFB, OH) AIAA Journal (ISSN 0001-1452), vol. 29, May 1991, p. 704-711, refs

Nonequilibrium hypersonic flows past axisymmetric blunt bodies at zero incidence have been numerically simulated by the Navier-Stokes equations with finite-rate dissociation for both noncatalytic and fully catalytic surfaces. The high-temperature air mixture was described by the nonequilibrium Lighthill's dissociation gas model including the equilibrium vibrational excitation of diatomic gas molecules. The numerical results reproduced the detailed physics and the rate of heat transfer in the stagnation region, which agreed very well with the classic theories and experimental measurements. The limiting form of the governing equations used at the axis of symmetry alleviated the numerical bulge error that was frequently encountered for the axisymmetric blunt-body problem. Author

Fluctuating wall-pressure measurements have been made under the unsteady separation shock and the separated shear layer in a Mach 5 compression ramp-induced turbulent interaction. The freestream unit Reynolds number was 49.6 million/m and the turbulent boundary layer developed on the tunnel floor under approximately adiabatic wall-temperature conditions. Conditional sampling and 'variable-window' ensemble-averaging techniques have been used to determine ensemble-averaged pressure distributions for different separation shock-wave positions. The results show that (1) the region in which the separation shock foot translates is characterized by a compression system whose strength is a function of the separation shock position; (2) ensemble-averaged wall-pressure distributions for 'shock-upstream' and 'shock-downstream' conditions are characteristic of large- and small-scale separated flows, respectively, indicative of an expanding and contracting bubble; and (3) ensemble-averaged wall-pressure histories under the separated shear layer rise and fall as the separation shock translates downstream and upstream. respectively. The asymmetric vortex systems generated by aircraft and missile forebodies at high angles of attack create powerful yaw moments that can overwhelm control surfaces. Attention is presently given to the unsteady base bleed technique for Karman vortex street formation control without the use of external appendages; it is shown that this technique can be used to change the asymmetrix flow around a cone-cylinder model at high angles of attack to a symmetric state. Flow visualization verifications of this symmetrization effect are presented and analyzed.

#### DYNAMIC STALL OF AN OSCILLATING CIRCULATION **CONTROL AIRFOIL**

G. D. SHREWSBURY and L. N. SANKAR (Georgia Institute of Technology, Atlanta) IN: International Symposium on Nonsteady Fluid Dynamics, Toronto, Canada, June 4-7, 1990, Proceedings. New York, American Society of Mechanical Engineers, 1990, p. 15-22. refs

Copyright

A two-dimensional, time-accurate Navier-Stokes analysis method has been used to evaluate the dynamic airloads of a circulation control airfoil. Numerical data were acquired for a mean angle of attack of 4.0 degrees and pitching amplitudes of 2.0 and 4.0 degrees. Reduced frequencies of 0.100 and 0.300 were evaluated. For higher values of reduced frequency, dynamic stall produces a complex bimodal characteristic for the aerodynamic load coefficient histories at both values of pitching amplitude. At the lower values of pitching amplitude and reduced frequency, a multiple stall characteristic is observed. At the lower value of reduced frequency and a pitching amplitude of 4.0 degrees, the pitching cycle produces a single loop characteristic, similar to that observed for conventional airfoils, except that the dynamic stall is not nearly as abrupt, and occurs over a much greater portion of Author the cycle.

#### A91-38679 UNSTEADY FLOW PAST AN AIRFOIL PITCHED AT **CONSTANT RATE**

SHIH, L. LOURENCO, L. VAN DOMMELEN, and A. KROTHAPALLI (Florida Agricultural and Mechanical University; Florida State University, Tallahassee) IN: International Symposium on Nonsteady Fluid Dynamics, Toronto, Canada, June 4-7, 1990, Proceedings. New York, American Society of Mechanical Engineers, 1990, p. 41-50. USAF-supported research. Copyright

The particle image displacement velocimetry technique is used to investigate in a water towing tank the unsteady flow plast a NACA 0012 airfoil that is undergoing a constant-rate pitching up motion. The original technique is capable of providing, with great detail and accuracy, the instantaneous two-dimensional velocity and associated vorticity fields. Noticeable leading edge flow separation develops when alpha is greater than 20 deg, as a result of the local imbalance between vorticity generation and convection. The development of the leading edge vortex dominates the later flow behavior. Complete stall occurs after this vortex detaches from the airfoil and triggers the shedding of a counterrotating vortex near the trailing edge. A parallel computer simulation of the Navier-Stokes equations using a discrete vortex, random walk scheme is conducted, the global flow features predicted by the computation comparing well with the experiment.

H. ASHLEY, T. VANECK (Stanford University, CA), M. A. M. JARRAH (Jordan University of Science and Technology, Irbid), and J. KATZ (San Diego Sate University, CA) IN: International Symposium on Nonsteady Fluid Dynamics, Toronto, Canada, June 4-7, 1990, Proceedings. New York, American Society of Mechanical Engineers, 1990, p. 61-78, refs

(Contract NCC2-596; NCA2-287; AF-AFOSR-84-0099)

Experimental and theoretical investigations dealing with unsteady flow phenomena are surveyed, with the emphasis on the pattern of vortices which originate from flow separation at sharp leading edges. It is concluded that these vortices exhibit quasi-steady behavior when the alpha-vibrations are such that bursting instability does not occur above the wing surface. A selection of test results from Jarrah (1988) is presented and discussed. For sharp-edged delta models at low speeds, the aerodynamic loads which are plotted quantify the role of parameters AR and K for three ranges of alpha-variation. An extremely

approximate and empirical 'theory' is offered, with data on crossflow drag and burst location, to reproduce the behavior of these airloads up to 90 deg. Recent attempts to apply the more sophisticated tools of computational fluid dynamics to the combination of unsteadiness and very high alpha are shown to be deficient.

# A91-38681 COMPUTATION OF AXISYMMETRIC SLENDER BODIES ENCLOSING A JET EFFLUX IN PITCHING OSCILLATORY MOTION

M. H. LIN and M. J. SHEU (National Tsing Hua University, Hsinchu, Republic of China) IN: International Symposium on Nonsteady Fluid Dynamics, Toronto, Canada, June 4-7, 1990, Proceedings. New York, American Society of Mechanical Engineers, 1990, p. 79-86. refs

Copyright

A numerical method based on vortex lattice technique is developed to analyze the flow around an axisymmetric ogive-cylinder or ellipsoid-cylinder body, enclosing a jet efflux from the nozzle exit, undergoing harmonic pitching motion. When the body oscillates, the unsteady component of the circulation around the body changes with time. According to the Kelvin's circulation theorem, the total circulation around the oscillatory body must show up as shed vorticity in the wake. It is assumed that this shed vorticity is convected downstream along the body surface to infinity with the local velocity. Results of unsteady pressure distributions, lift and pitching moment for slender body undergoing a simple harmonic pitching oscillation are presented for a range of frequency parameters and several jet mass flow rates in order to study the influence of the frequency parameter, mean angle of incidence and jet mass flow rate on the aerodynamic properties.

The unsteady, compressible, thin-layer, Navier-Stokes equations are solved to simulate steady and unsteady, asymmetric, vortical laminar flow around cones at high incidences and supersonic Mach numbers. The equations are solved by using an implicit, upwind, flux-difference splitting, finite-volume scheme. Locally conical flows are assumed and the solutions are obtained by forcing the conserved components of the flowfield vector to be equal at two axial stations located at 0.95 and 1.0. Computational examples cover steady and unsteady asymmetric flows around a circular cone and its control using side strakes. Unsteady asymmetric flows are also presented for elliptic- and diamond-section cones, which model asymmetric vortex shedding around round and sharp-edged delta wing flows.

An experimental program of unsteady aerodynamic measurements has been carried out in one of the 7 ft by 10 ft low-speed wind tunnels at NASA Ames Research Center. Flow-visualization measurements on a delta wing model of AR =

1.0 with sharp leading edges were carried out by means of a thin planar sheet of laser light fixed in the test section at a convenient angle to the flow direction. Smoke images of the fluid motion and vortex structure above the model were recorded photographically and later analyzed to determine such information as the positions of the cores and occurrence of bursting. Large amplitude transient motion involving post stall angle of attack excursions produced significant hysteresis in the vortex burst location and was reflected in the measured aerodynamic loads.

J. C. WILLIAMS, III and C.-G. CHEN (Auburn University, AL) IN: International Symposium on Nonsteady Fluid Dynamics, Toronto, Canada, June 4-7, 1990, Proceedings. New York, American Society of Mechanical Engineers, 1990, p. 291-301. Cray Research, Inc.-supported research.

Copyrigh

The effects of both body thickness and trailing edge radius on the development of unsteady separation on bodies impulsively set into motion are determined. The boundary layer development is calculated on a series of Carafoli airfoils with varying body thickness ratio and trailing edge radius. Computations show that as time progresses, the skin friction passes through zero and becomes negative on the rear portion of the airfoil while the displacement thickness and displacement velocity each have strong local maxima away from the trailing edge. These characteristics indicate that separation will occur spontaneously away from the rear stagnation point. The main effect of making the body thinner and/or reducing the trailing edge radius is movement of the local maximum in the displacement thickness, the local maximum in the displacement velocity, and the region of reverse flow toward the rear stagnation point. It is concluded that reducing the body thickness or trailing edge radius moves the separation point toward the rear stagnation P.D. point.

This paper describes the development of a new laser-Doppler anemometry technique, suited for unsteady boundary-layer measurements around a moving model. The measurement principle is based on an LDA optical fiber option using an optical head embedded inside the moving model. Instantaneous velocity profiles and boundary-layer characteristics are obtained in a reference frame linked with the motion of the model. The acquisition procedure and data reduction techniques are described and applied to the flow around a flat plate either at rest in the steady flow or

oscillating in fore-and-aft motion. Details of the steady and unsteady boundary-layer measurements are presented at different longitudinal distances along the plate. Unsteady boundary-layer measurements on the oscillating plate are also compared to existing experimental and calculated results obtained on a fixed model positioned in oscillatory flow. Author

A two-dimensional frequency domain source-doublet based potential paneling formulation is used to simulate the unsteady velocity and pressure fluctuation on a high loading turbine stator blade row due to blade-wake interaction. The wake profile developed by Lakshminarayana is employed here as the upstream wake which moves relative to the blades. The results show that a high fluctuating pressure occurred near the trailing edge with an amplitude many times of the inlet velocity head. In addition, the unsteady torsional moment is high. In this paper, the method of frequency domain computation and the cause of high dynamic pressure near the trailing edge of a high loading turbine stator vane are discussed.

#### A91-38710 HIGH SUBSONIC FLOW ABOUT A MOVING SPOILER IDENTIFYING A NOVEL PROBLEM OF WIND TUNNEL

S. AHMED and G. J. HANCOCK (Queen Mary College and Westfield IN: International Symposium on College, London, England) Nonsteady Fluid Dynamics, Toronto, Canada, June 4-7, 1990, Proceedings. New York, American Society of Mechanical Engineers, 1990, p. 477-486. refs

Copyright

A two-dimensional spoiler on a transonic tunnel floor is rotated from 0 deg to 45 deg in the order of 0.005 s over a range of subsonic Mach numbers. Transient pressures are measured on the tunnel floor in front of, and behind of, the spoiler. Physical explanations are given for this transient pressure behavior. In these experiments, initial transient flow responses about the spoiler settle down to an asymptotic steady state before the overall flow in the tunnel has time to respond. A novel problem is encountered at high Mach number. During the initial transient response, although static pressures far upstream of the spoiler change due to forward propagation of compression waves, the static pressures far downstream of the spoiler remain constant. Reasons for this phenomenon are still being sought. Author

#### A91-38736\* Illinois Univ., Urbana. NUMERICAL STUDY OF TWIN-JET IMPINGEMENT UPWASH **FLOW**

W. J. PEGUES and S. P. VANKA (Illinois, University, Urbana) IN: Forum on Turbulent Flows - 1990; Joint CSME/ASME Spring Meeting, Toronto, Canada, June 4-7, 1990, Proceedings. New York, American Society of Mechanical Engineers, 1990, p. 97-103. NASA-supported research. refs

Two horizontally spaced jets impinging normally on a flat surface create a fountain upwash flow due to the collision of the radially flowing wall jets. This fountain flow is of importance to the dynamics and propulsion of STOVL aircraft. The fountain flow influences the lift forces on the aircraft and the ingestion of hot gases and debris by the engine inlet. In this paper, a multigrid based finite-difference numerical procedure has been applied to solve the equations governing this three-dimensional flow. The standard k-epsilon turbulence model has been used. Comparisons with experimental data reveal that while the mean velocities are predicted with reasonable accuracy, the turbulent kinetic energies are seriously in error. The reasons for this discrepancy could be the intense unsteadiness and large-scale structures of the flow in the near-wall region, which cannot be captured well by any Reynolds-averaged turbulence model. Author

#### STEADY FLOW IN A THREE-DIMENSIONAL RECTANGULAR CAVITY YAWED FROM THE FREESTREAM TURBULENT **BOUNDARY LAYER**

R. G. DIMICCO and P. J. DISIMILE (Cincinnati, University, OH) IN: Forum on Turbulent Flows - 1990; Joint CSME/ASME Spring Meeting, Toronto, Canada, June 4-7, 1990, Proceedings. New York, American Society of Mechanical Engineers, 1990, p. 169-174.

The nature of the flow phenomena produced within a three-dimensional rectangular cavity immersed in and yawed from the approaching low-speed turbulent boundary layer is examined. The steady pressure distributions in both the streamwise and spanwise directions are explored. The experiment was conducted in air at a nominal freestream velocity of 2.4 m/s with a corresponding Reynolds number, based on the cavity width, of 9951. The centerline and spanwise pressure distributions on the cavity floor compare well with past investigations. The spanwise 'cell' structure within the cavity is severely affected by the cavity rotation and leads to the growth of the upstream cell and compression of its downsteam counterpart. P.D.

#### A SIMPLIFIED AEROTHERMAL HEATING METHOD FOR **AXISYMMETRIC BLUNT BODIES**

J. B. KOUROUPIS (Johns Hopkins University, Laurel, MD) Heat transfer in space systems; Proceedings of the Symposium, AIAA/ASME Thermophysics and Heat Transfer Conference, Seattle, WA, June 18-20, 1990. New York, American Society of Mechanical Engineers, 1990, p. 49-53. refs

A simple procedure has been developed for use on a personal computer to calculate aerothermal heating of axisymmetric blunt bodies at angle of attack (AOA). Heating rates are correlated from boundary layer edge conditions, thermodynamically defined along the body using entropy and surface pressure. Surface pressure is calculated using a unique variation of the tangent cone method. Variable entropy at the boundary layer edge (due to curvature of the bow shock) is accounted for using a mass-balancing procedure. Streamline spreading for angle of attack cases is determined with a simplified axisymmetric analog technique. The present method is simpler than other hypersonic convective heating codes because it does not require a computational fluid dynamics flow field solution (either viscous or inviscid). The method predicts laminar and turbulent heating rates within 20 percent (usually within 10 percent) of experimental data, except for the leeward ray, in flows with freestream Mach 2-15 and incidence angles up to 30 deg.

Fluid dynamics of turbomachines are complicated due to aerodynamic interactions between rotors and stators. It is necessary to understand the aerodynamics associated with these interactions in order to design turbomachines that are both light and compact as well as reliable and efficient. The current study uses an unsteady, thin-layer Navier-Stokes zonal approach to investigate the unsteady aerodyamics of a multistage compressor. Relative motion between rotors and stators is made possible by use of systems of patched and overlaid grids. Results have been computed for a 2 1/2-stage compressor configuration. The numerical data compares well with experimental data for surface pressures and wake data. In addition, the effect of grid refinement on the solution is studied.

The application of the integral equation method to the study of steady transonic flow of inviscid fluid past an aerofoil is discussed. For the three-dimensional nonplanar aerofoil, the problem is reduced to that of solving a system of two singular nonlinear integral equations. In the plane case an integral equation is obtained whose kernel is expressed in terms of elementary functions only.

#### ROTARY OSCILLATION CONTROL OF A CYLINDER WAKE

P. T. TOKUMARU and P. E. DIMOTAKIS (California Institute of Technology, Pasadena) Journal of Fluid Mechanics (ISSN 0022-1120), vol. 224, March 1991, p. 77-90. refs (Contract F49620-86-C-0134)

Exploratory experiments have been performed on circular cylinders executing forced rotary oscillations in a steady uniform flow. Flow visualization and wake profile measurements at moderate

Reynolds numbers have shown that a considerable amount of control can be exerted over the structure of the wake by such means. In particular, a large increase, or decrease, in the resulting displacement thickness, estimated cylinder drag, and associated mixing with the free stream can be achieved, depending on the frequency and amplitude of oscillation.

#### SECONDARY FREQUENCIES IN THE WAKE OF A CIRCULAR CYLINDER WITH VORTEX SHEDDING

SAUL S. ABARBANEL (Tel Aviv University, Israel), WAI SUN DON, DAVID GOTTLIEB (Brown University, Providence, RI), DAVID H. RUDY, and JAMES C. TOWNSEND (NASA, Langley Research Center, Hampton, VA) Journal of Fluid Mechanics (ISSN 0022-1120), vol. 225, April 1991, p. 557-574. DARPA-supported research. Previously announced in STAR as N90-22540. (Contract NAS1-18107; NAS1-18605; N00014-86-K-0754; AF-ARFOSR-90-0093; NSF DMS-88-10150)

A detailed numerical study of two-dimensional flow past a circular cylinder at moderately low Reynolds numbers was conducted using three different numerical algorithms for solving the time-dependent compressible Navier-Stokes equations. It was found that if the algorithm and associated boundary conditions were consistent and stable, then the major features of the unsteady wake were well-predicted. However, it was also found that even stable and consistent boundary conditions could introduce additional periodic phenomena reminiscent of the type seen in previous wind-tunnel experiments. However, these additional frequencies were eliminated by formulating the boundary conditions in terms of the characteristic variables. An analysis based on a simplified model provides an explanation for this behavior.

#### **FURTHER EXPERIMENTS ON VORTEX FORMATION AROUND** AN OSCILLATING AND TRANSLATING AIRFOIL AT LARGE INCIDENCES

KAZUO OHMI (Osaka University, Japan), MADELEINE COUTANCEAU (Poitiers, Universite, France), OLIVIER DAUBE, and TA P. LOC (CNRS, Laboratoire d'Informatique pour la Mecanique et les Sciences de l'Ingenieur, Orsay, France) Journal of Fluid Mechanics (ISSN 0022-1120), vol. 225, April 1991, p. 607-630. DRET-supported research. refs

The starting flows past a two-dimensional NACA 0012 airfoil translating and oscillating at large incidences are investigated by visualization experiments and numerical calculations. The airfoil model is set in motion impulsively and subjected simultaneously to a constant translation and harmonic oscillation in pitch. The evolution of the vortex wake is followed in a sequence of streamline visualizations and the wake pattern generated is analyzed. The parameters varied in the visualization experiment are the Reynolds number ranging from 1500 to 10,000, the reduced frequency from 0.1 to 1.0, the mean incidence 30 deg or 15 deg and the angular amplitude 15 deg or 7 deg. There are also two additional parameters of special interest: the airfoil cross section and the pitching axis. The effects of these parameters are discussed in relation to the resultant wake patterns. Some comparison is made with the results of earlier experiments. Author

#### FLOW AROUND AN UNSTEADY THIN WING CLOSE TO **CURVED GROUND**

QIAN-XI WANG (University of Science and Technology of China, Hefei, People's Republic of China) Journal of Fluid Mechanics (ISSN 0022-1120), vol. 226, May 1991, p. 175-187. refs

The method of matched asymptotic expansions is applied to the flow analysis of a three-dimensional thin wing, moving uniformly in very close proximity to a curved ground surface. Four flow regions, i.e., exterior, bow, gap, and wake, are analyzed and matched in an appropriate sequence. The solutions in expansions

up to third order are given both in nonlinear and linear cases. It is shown that the flow above the wing is reduced to a direct problem, and the flow beneath it appears to be a two-dimensional channel flow. The wake assumes a vortex-sheet structure close to the curved ground, undulating with the amplitude of the ground curvature, and the flow beneath it is also two-dimensional channel flow. As a consequence, an equivalence is found between the extreme curved-ground effect and the corresponding flat-ground effect, which can be treated by the image method.

#### **AERODYNAMICS AT THE SPEED OF SOUND**

R. M. DENNING Aeronautical Journal (ISSN 0001-9240), vol. 95, April 1991, p. 132-137. refs Copyright

The existence of any examples of steady-state conditions in any free-flight or idealized infinite flow fields at Mach 1.0 is challenged. The steady-state theoretical fields often quoted as proof of the existence of such fields are examined, and their intrinsic anomalies and paradoxes are discussed. In view of the perspective thus developed, the accepted interpretation of the nonlinear transonic similarity rule at Mach 1.0 is also challenged. An alternative hypothesis is proposed in which free-flight Mach 1 flow fields must always be unsteady, and cannot be represented in a steady-flow wind tunnel; a method of calculating the forces on a body in such unsteady conditions is presented.

### INVESTIGATIONS ON FLOW INSTABILITIES ON AIRFOILS BY MEANS OF PIEZOFOIL-ARRAYS

W. NITSCHE, P. MIROW, and T. DOERFLER (Berlin, Technische Universitaet, Federal Republic of Germany) IN: Laminar-turbulent transition; Proceedings of the IUTAM Symposium, Toulouse, France, Sept. 11-15, 1989. Berlin and New York, Springer-Verlag, 1990, p. 129-135. Research supported by BMFT and MBB GmbH.

Copyright

Pressure sensitive piezofoil-arrays were applied in order to investigate the dynamic process of transition on airfoils in wind tunnel as well as in flight tests. First emphasis was on a dependable identification of laminar, transitional and turbulent flow regions on the basis of measured wall pressure fluctuations. Apart from this mainly practical application, more detailed analyzing methods were employed in order to examine more closely dynamic processes during transition. This includes, for example, the detection of TS-waves, investigations on the structure of turbulent spots, amplification rates of flow instabilities as well as probability density distributions of wall pressure fluctuations in transitional flows.

### ON THE INSTABILITY OF HYPERSONIC FLOW PAST A WEDGE

STEPHEN COWLEY (Imperial College of Science, Technology, and Medicine, London, England) and PHILIP HALL (Exeter, University, England) IN: Laminar-turbulent transition; Proceedings of the IUTAM Symposium, Toulouse, France, Sept. 11-15, 1989. Berlin and New York, Springer-Verlag, 1990, p. 261-270. refs Copyright

The instability of a compressible flow past a wedge is investigated in the hypersonic limit. Particular attention is given to Tollmien-Schlichting waves governed by triple-deck theory though some discussion of inviscid modes is given. It is shown that the attached shock has a significant effect on the growth rates of Tollmien-Schlichting waves. Moreover, the presence of the shock allows for more than one unstable Tollmien-Schlichting wave. The shock is shown to have little effect on inviscid hypersonic modes for both Chapman and Sutherland Law fluids.

### EXPERIMENTAL AND THEORETICAL ANALYSIS OF NATURAL TRANSITION ON 'INFINITE' SWEPT WING

D. ARNAL, G. CASALIS, and J. C. JUILLEN (ONERA, Centre d'Etudes et de Recherches de Toulouse, France) IN: Laminar-turbulent transition; Proceedings of the IUTAM Symposium, Toulouse, France, Sept. 11-15, 1989. Berlin and New York, Springer-Verlag, 1990, p. 311-325. refs Copyright

The first part of this paper is concerned with a survey of the methods which can be used for predicting transition on swept wings in incompressible flow; simple transition criteria are presented, and possible extensions of the well known e exp n method to three-dimensional situations are discussed. Applications of these various techniques are given in the second part of the paper; comparisons between measured and predicted transition locations indicate that the key problem lies in the evolution of the stability characteristics from the crossflow direction to the streamwise direction.

#### CROSS-FLOW INSTABILITY OF 3-D BOUNDARY LAYERS ON A FLAT PLATE

NOBUTAKE ITOH (National Aerospace Laboratory, Chofu, Japan) IN: Laminar-turbulent transition; Proceedings of the IUTAM Symposium, Toulouse, France, Sept. 11-15, 1989. Berlin and New York, Springer-Verlag, 1990, p. 359-368. refs

Copyright

The earlier instability of three-dimensional boundary layers on a swept-back wing is primarily due to the existence of cross-flows perpendicular to outer potential flows. When a flat plate is placed in a uniform flow under a pressure gradient in the direction parallel to the leading edge, the boundary layer has a similar cross-flow, even if there is no sweep angle. Linear stability characteristics of such a class of flows are investigated on the basis of the Orr-Sommerfeld equation, and compared with those of the usual three-dimensional boundary layers where the cross-flow is induced by the pressure gradient in the direction normal to the leading Author edge in cooperation with the sweep angle of a wing.

Three-dimensional boundary-layer experiments are currently being conducted on a 45-deg swept wing in the Arizona State University Unsteady Wind Tunnel. Crossflow-dominated transition is produced via a model with contoured end liners to simulate infinite swept-wing flow. Fixed-wavelength stationary and traveling crossflow vortices are observed. The stationary vortex wavelengths vary with Reynolds number as predicted by linear-stability theory, but with observed wavelengths which are about 25 percent smaller than theoretically predicted. The frequencies of the most amplified moving waves are in agreement with linear stability theory; however, traveling waves at higher frequencies than predicted are also observed. These higher-frequency waves may be harmonics of the primary crossflow waves generated by a parametric resonance phenomena. Boundary-layer profiles measured at several spanwise locations show streamwise disturbance profiles characteristic of Author the crossflow instability.

#### ON THE STABILITY OF SWEPT WING LAMINAR BOUNDARY LAYERS INCLUDING CURVATURE EFFECTS

J. VIKEN (Analytical Services and Materials, Inc., Hampton, VA), F. S. COLLIER, JR. (High Technology Corp., Hampton, VA), R. D. WAGNER, and D. W. BARTLETT (NASA, Langley Research Center, IN: Laminar-turbulent transition; Proceedings of Hampton, VA) the IUTAM Symposium, Toulouse, France, Sept. 11-15, 1989. Berlin and New York, Springer-Verlag, 1990, p. 381-388. refs

A linear stability analysis that encompasses curvature effects has been conducted in wind tunnel experiments on a swept NACA 64(2)-A015 wing, and published transition-onset results have been correlated with computed N-factor values. A strong stabilizing influence is noted upon the growth of the crossflow disturbance, when the flow is accelerated in regions of high body curvature. The maximum amplified crossflow disturbances were in all cases travelling waves; when TS waves reached their maximum, the N-factors at transition lay in the 9.9-13.8 range. Stabilization due to curvature effects was less pronounced in cases where acceleration occurred over a large portion of chord.

#### **BLUNT-NOSED SWEPT SUPERCRITICAL LFC WINGS** WITHOUT NOSE FLAPS

W. PFENNINGER, C. S. VEMURU (Analytical Services and Materials, Inc., Hampton, VA), and F. COLLIER (High Technology Corp., Hampton, VA) IN: Laminar-turbulent transition; Proceedings of the IUTAM Symposium, Toulouse, France, Sept. 11-15, 1989. Berlin and New York, Springer-Verlag, 1990, p. 401-415. refs (Contract NAS1-18599)

Copyright

To simplify the design of swept supercritical (SC) Laminar Flow Control (LFC) wings and maintain satisfactory low speed characteristics, blunt-nosed swept SC LFC wings without nose flaps and lower wing loadings were studied. Their boundary layer crossflow in the leading edge area is optimally controlled (1) by compensating the boundary layer crossflow of the front acceleration zone by an opposite crossflow in a downstream pressure rise area, (2) by maintaining a neutrally stable boundary layer crossflow by suction within a narrow spanwise suction strip located close to the wing attachment line in the front acceleration zone. The required suction massflow and power are then very small, especially considering the strongly stabilizing effect of surface and streamline curvature on crossflow stability.

#### INSTABILITY FEATURES APPEARING ON SWEPT WING CONFIGURATIONS

H. BIPPES (DLR, Institut fuer experimentelle Stroemungsmechanik, Goettingen, Federal Republic of Germany) IN: Laminar-turbulent transition; Proceedings of the IUTAM Symposium, Toulouse, France, Sept. 11-15, 1989. Berlin and New York, Springer-Verlag, 1990, p. 419-430. refs

Copyright

In order to provide a more detailed physical understanding of transition on swept wing configurations, possible instability mechanisms are studied in basic experiments. The models are chosen such that the individual mechanisms can be investigated separately as far as practicable. Most emphasis is placed on the identification of the sources of streamwise vortices which in many experiments on swept wings have been observed as dominant instability. In the stagnation region, streamwise vortices only develop if a spanwise periodicity or a specific type of velocity fluctuations are superimposed upon the oncoming flow. In the unstable three-dimensional boundary layer, however, at turbulence levels less than 0.15 percent, the streamwise vortices have proved to be the most amplified disturbance mode, contrary to the prediction of linear stability theory. In the three-dimensional boundary layer on a concave surface nonstationary waves are Author found as dominant instability.

#### DEVELOPMENT AND INTERACTION OF INSTABILITIES IN THE CROSSFLOW FIELD

Y. KOHAMA, F. OHTA, and K. SEGAWA (Tohoku University, Sendai, Japan) IN: Laminar-turbulent transition; Proceedings of the IUTAM Symposium, Toulouse, France, Sept. 11-15, 1989. Berlin and New York, Springer-Verlag, 1990, p. 431-440. refs

Systematic investigation has been performed to make clear the three-dimensional boundary-layer transition mechanism on a swept cylinder which gives fundamenntal transition informations for swept main wing of Airbus-class aircraft. Combined use of hot wire anemometer, smoke and liquid crystal film visualizations made it possible to clarify the quantitative spatial view of the transition process where two instabilities are interacting with each other, and the relation between the velocity field and the heat transfer field. The result shows that the crossflow vortex (stationary primary instability) is important to the turbulent transition process only secondarily in the sense that they deform the three-dimensional boundary-layer velocity field into inflectional one locally in streamwise direction. This condition directly produces the inflectional instability (traveling secondary instability) which is important primarily to the turbulent transition process.

# A91-39940\* Exeter Univ. (England). ON THE GOERTLER VORTEX INSTABILITY MECHANISM AT HYPERSONIC SPEEDS

P. HALL and Y. B. FU (Exeter, University, England) IN: Laminar-turbulent transition; Proceedings of the IUTAM Symposium, Toulouse, France, Sept. 11-15, 1989. Berlin and New York, Springer-Verlag, 1990, p. 453-463. refs (Contract NAS1-18107; AF-AFOSR-89-0042) Copyright

The linear instability of the hypersonic boundary layer on a curved wall is considered. As a starting point real-gas effects are ignored and the viscosity of the fluid is taken to be related to the temperature either by Chapman's Law or by Sutherland's Law. It is shown that the flow is susceptible to Goertler vortices. If Chapman's Law is used the vortices are trapped in the logarithmically thin adjustment layer in which the temperature of the basic flow changes rapidly to its free stream value and the nonuniqueness of the neutral stability curve associated with incompressible Goertler vortices is shown to disappear at high Mach numbers if the appropriate 'fast' streamwise dependence of the instability is built into the disturbance flow structure. If, on the other hand. Sutherland's Law is used, the vortices are found to spread into an O(1) region and the concept of a unique neutral stability curve is not tenable because of the nonparallel effects. For both laws the leading order terms in the expansions of the Goertler number are independent of the wave number and are due to the curvature of the basic state. Author

#### A91-39941 VISUAL STUDY OF BOUNDARY LAYER TRANSITION ON ROTATING FLAT PLATE

S. MASUDA and M. MATSUBARA (Keio University, Yokohama, Japan) IN: Laminar-turbulent transition; Proceedings of the IUTAM Symposium, Toulouse, France, Sept. 11-15, 1989. Berlin and New York, Springer-Verlag, 1990, p. 465-474. refs Copyright

The effect of Coriolis acceleration on transition of a rotating Blasius boundary layer has been visually investigated. A flat plate is installed in the small-size wind tunnel rotating around the axis parallel to the leading edge. The air flow is visualized by introducing paraffin mist from a wall slit. The transition of the low pressure side boundary layer was found to be characterized by the turbulent spot, while the pressure-side boundary layer was associated with the longitudinal vortex instability. The variation of the boundary layer parameters as well as the velocity fluctuation signals during transition can be well explained by the present visualization results.

### THEORETICAL STUDY OF GOERTLER VORTICES - LINEAR STABILITY APPROACH

S. JALLADE, D. ARNAL (ONERA, Centre d'Etudes et de Recherches de Toulouse, France), and H. H. MINH (Ecole Nationale Superieure d'Electrotechnique, d'Electronique, d'Informatique et d'Hydraulique, Toulouse, France) IN: Laminarturbulent transition; Proceedings of the IUTAM Symposium, Toulouse, France, Sept. 11-15, 1989. Berlin and New York, Springer-Verlag, 1990, p. 565-572. refs Copyright

Linear stability theory is presently used to calculate the stability of Goertler vortices. Attention is given to the fact that different values of the amplification rate can appear for the same Goertler number. While the application of theory to this problem yields an analytic dispersion relation, it is established that several assumptions of the linear theory are not valid at low wave numbers. Since the nonlinear effects which can affect the development of Goertler vortices are not yet well known, however, an effort has been made to develop a numerical simulation.

### SECOND MODE INTERACTIONS IN SUPERSONIC BOUNDARY LAYERS

GORDON ERLEBACHER (NASA, Langley Research Center, Hampton, VA) and M. Y. HUSSAINI (NASA, Langley Research Center; ICASE, Hampton, VA) IN: Laminar-turbulent transition; Proceedings of the IUTAM Symposium, Toulouse, France, Sept. 11-15, 1989. Berlin and New York, Springer-Verlag, 1990, p. 631-641. refs
Copyright

The nonlinear evolution of a two-dimensional second mode unstable wave in a Mach 4.5 wall-bounded flow is computed by solving the full time-dependent compressible Navier-Stokes equations. A highly accurate solution is obtained using spectral collocation methods. It is shown that departure from linearity first occurs in the critical layer due to the cubic nonlinearities in the momentum equation. This is a direct result of the large density perturbations in this regime. Time evolution studies of the growth rate as a function of normal distance from the plate suggests that the mode is evolving toward a nonlinear saturated state, and that this problem is possibly amenable to standard weakly nonlinear perturbation methods.

#### **BOUNDARY LAYER TRIPPING IN SUPERSONIC FLOW**

D. ARNAL, F. VIGNAU, and J. C. JUILLEN (ONERA, Centre d'Etudes et de Recherches de Toulouse, France) IN: Laminar-turbulent transition; Proceedings of the IUTAM Symposium, Toulouse, France, Sept. 11-15, 1989. Berlin and New York, Springer-Verlag, 1990, p. 669-679. refs Copyright

This experimental study is concerned with the problem of boundary layer tripping by three-dimensional roughness elements in supersonic flow. Two series of experiments are reported: in the first one, the problem of the 'effective roughness height' is examined, and flat plate results are compared with the predictions deduced from the criterion proposed by Van Driest and Blumer. In the second series of measurements, attention is focused on attachment line problems, which are related with the appearance of leading edge contamination on swept models.

A technique involving the use of liquid crystals which are solely sensitive to shear stress has been employed to visualize the fine detail in the transition process from laminar to turbulent flow in the boundary layer on wind tunnel models of various wing configurations. Examples are given of natural and forced transition in two-dimensional flow at subsonic speeds and the effects of isolated and distributed roughness elements are compared. In regions where the flow is highly three-dimensional, particularly at transonic speeds, the presence of laminar cross flow instabilities is well defined by parallel striations in the surface flow pattern which can lead to the development of tubulence.

# A91-40126# SYNCHRONOUS ITERATIVE METHOD FOR COMPUTATION OF VORTEX FLOWS AT HIGH ANGLES OF ATTACK

ZHANG WU (Beijing University, People's Republic of China) and SHIJUN LUO (Northwestern Polytechnical University, Xian, People's Republic of China) Acta Aeronautica et Astronautica Sinica (ISSN 1000-6893), vol. 12, Jan. 1991, p. A1-A5. In Chinese, with abstract in English. refs

A robust iterative method suitable for the numerical simulation of vortex flows at high angles of attack is established based upon the multiple line-vortex model. Convergent solutions of vortical

the multiple line-vortex model. Convergent solutions of vortical flows over bodies of revolution for angles of attack up to 60 deg are obtained. Calculated values of the aerodynamical loads on a tangent-ogive forebody compare well with experimental data.

### TRANSONIC ANALYSIS AND DESIGN USING AN IMPROVED GRID

XUESONG BAI and ZIQIANG ZHU (Beijing University of Aeronautics and Astronautics, People's Republic of China) Acta Aeronautica et Astronautica Sinica (ISSN 1000-6893), vol. 12, Jan. 1991, p. A75-A79. In Chinese, with abstract in English. refs

CO grid is generated by using an algebraic method. In this grid transonic full potential equation is solved by the finite volume method. The calculated results agree well with experimental data, while the computation time is reduced by a factor of 1/3-1/4 of the one required in CH grid. Transonic analysis and design using this improved grid can be made not only for large aspect ratio wings, but also for small aspect ratio wings without any difficulties.

An infrared imaging system was used to detect the thermal signature of boundary-layer flow regimes on a NACA 0012 airfoil from zero angle of attack up to separation. The boundary-layer transition from laminar to turbulent flow and the onset of separation could be seen on the airfoil thermograms. The findings were compared against the behavior of aluminum foil tufts observable both visually and with the infrared imaging system. This arrangement offers the option of using the infrared imaging system both for flow regime detection through surface thermography and flow visualization by the aluminum foil tufts. Ultimately the surface temperature changes due to variation in the angle of attack of a lifting surface provide a means for interpretation of the boundary-layer flow regimes.

A scissor-wing configuration, consisting of two independently sweeping-wing surfaces, is compared with an equivalent fixed-wing geometry baseline over a wide Mach number range. The scissor-wing configuration is shown to have a higher total lift-to-drag ratio than the baseline in the subsonic region primarily due to the slightly higher aspect ratio of the unswept scissor wing. In the transonic region, the scissor wing is shown to have a higher lift-to-drag ratio than the baseline for values of lift coefficient greater than 0.35. It is also shown that, through the use of wing decalage, the lift of the two independent scissor wings can be equalized. In the supersonic regime, the zero lift wave drag of the scissor-wing at maximum sweep is shown to be 50 and 28 percent less than the zero lift wave drag of the baseline at Mach numbers 1.5 and 3.0, respectively. In addition, a pivot-wing configuration is introduced and compared with the scissor wing. The pivot-wing configuration is shown to have a slightly higher total lift-to-drag ratio than the scissor wing in the supersonic region due to the decreased zero lift wave drag of the pivot-wing configuration.

The ground vortex formed by a jet impinging on the ground in the presence of a crossflow has been studied experimentally. High speed motion pictures and spectral measurements were obtained to study the unsteady features of this flowfield. A very low-frequency pulsation or 'puffing' instability was observed. Since this unsteadiness could not be correlated with any other oscillations in the flowfield, the low-frequency oscillations must come from the gross features of the ground vortex itself. Namely, jet fluid accumulates in the ground vortex until the vortex is so large that

the flowfield breaks up, the ground vortex is swept away, a new smaller vortex forms, and the process repeats itself. Measurements of the frequency of these oscillations are presented for the first time, and data on the vertical extent (height) of the ground vortex are also shown.

JOSEPH KATZ (San Diego State Univerity, CA) and DANIEL LEVIN (NASA, Ames Research Center, Moffett Field, CA) Journal of Aircraft (ISSN 0021-8669), vol. 28, April 1991, p. 282, 283. refs (Contract NCC2-596)

Copyright

Slender delta wing planforms are susceptible to self-induced roll oscillations due to aerodynamic hysteresis during the limit cycle roll oscillation. Test results are presented which clearly establish that the static rolling moment hysteresis has a damping character; hysteresis tends to be greater when, due to either wing roll or side slip, the vortex burst moves back and forth over the wing trailing edge. These data are an indirect indication of the damping role of the vortex burst during limit cycle roll oscillations. O.C.

#### A NEW PSEUDO-POTENTIAL FUNCTION MODEL FOR ROTATIONAL FLOW AND ITS APPLICATION TO TRANSONIC-SUPERSONIC FLOW

GAOLIAN LIU (Shanghai Institute of Mechanical Engineering, People's Republic of China) Journal of Engineering Thermophysics (ISSN 0253-231X), vol. 12, Feb. 1991, p. 20-26. In Chinese, with abstract in English. refs

By means of the term-condensing method, a new general function, the pseudopotential function is introduced, being a simple and consistent generalization of the potential function to general rotational flow. It retains the advantages of the potential function, while removing the restriction of flow potentiality (namely homentropy and homrothalpy). The general formulations of rotational flow along S(1) and S(2) stream sheets in turbomachines are derived, and methods of solution are given with special attention to trans- and supersonic flow, providing a new physically consistent and computationally simple flow-model.

#### ANALYSIS OF CIRCULAR ELASTIC MEMBRANE WINGS

TAKESHI SUGIMOTO Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 39, no. 447, 1991, p. 180-187. In Japanese, with abstract in English. refs

Membrane wings, such as sails of yachts and hang-gliders, have quite complicated aerodynamic characteristics owing to interactions between compliant wings and the flow around them. All the existing methods of solution for three-dimensional membrane wing theories contain iterative procedures to deal with the strong nonlinearity of the problem. The uniform tension is assumed to weaken this nonlinearity, so that the iterative procedures can be eliminated. This method is aplied to the problem of circular elastic membrane wings. Numerical results have been compared with experimental results. The consistency between the analysis and the experiment shows the validity of the method. The existence of two equilibria is also confirmed.

#### MODELING FOR UNSTEADY AERODYNAMICS OF RECTANGULAR WING IN INCOMPRESSIBLE FLOW USING STEP RESPONSES

SHINJI SUZUKI and KOSYU KADOTA Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 39, no. 447, 1991, p. 188-194. In Japanese, with abstract in English. refs

This paper considers approximating unsteady aerodynamic forces acting on a rectangular wing in the time domain. Time responses of the aerodynamic forces caused by a step movement of a rectangular wing in incompressible flow are calculated by using the time domain vortex element method. Transient characteristics in the step responses can be represented by one decreasing function regardless of wing motions. By approximating the decreasing function with a set of exponential functions and by calculating apparent mass coefficients and steady state forces, a mathematical model for the aerodynamic forces in the form of first-order linear time-invariant differential equations (the state equations) is obtained. The results obtained for the example problems show that a good fit to the aerodynamic forces can be achieved with two exponential functions approximating the decreasing function. Author

### ANALYSIS OF NUMERICAL SOLUTIONS FOR THREE-DIMENSIONAL LIFTING WING FLOWS

K. M. WANIE, E. H. HIRSCHEL, and M. A. SCHMATZ (MBB GmbH, Munich, Federal Republic of Germany) Zeitschrift fuer Flugwissenschaften und Weltraumforschung (ISSN 0342-068X), vol. 15, no. 2, 1991, p. 107-118. BMFT-supported research. refs Copyright

Numerical solutions for three-dimensional lifting wing flows are analyzed with regard to their kinematic properties. For this purpose the various levels of modeling real flow and the corresponding governing equations are shortly reviewed. Physical principles and compatibility conditions inherent in these models are discussed. The degree of accordance of the numerical solutions with this physical basis is investigated. Results of this kind of analysis are both a better understanding of physical and numerical properties of the solutions and hints for the development and improvement of numerical solution procedures.

A 9.2 percent scale STOVL hot gas ingestion model was tested in the NASA Lewis 9 x 15-foot Low-Speed Wind Tunnel. Flow visualization from the Phase 1 test program, which evaluated the hot ingestion phenomena and control techniques, is covered. The Phase 2 test program evaluated the hot gas ingestion phenomena at higher temperatures and used a laser sheet to investigate the flow field. Hot gas ingestion levels were measured for the several forward nozzle splay configurations and with flow control/life improvement devices (LIDs) which reduced the hot gas ingestion. The test was conducted at full scale nozzle pressure ratios and inlet Mach numbers. Results are presented over a range of nozzle pressure ratios at a 10 kn headwind velocity. The Phase 2 program was conducted at exhaust nozzle temperatures up to 1460 R and utilized a sheet laser system for flow visualization of the model flow field in and out of ground effects. The results reported are for nozzle exhaust temperatures up to 1160 R and contain the compressor face pressure and temperature distortions, the total pressure recovery, the inlet temperature rise, and the environmental effects of the hot gas. The environmental effects include the ground plane contours, the model airframe heating, and the location of the ground flow separation. Author

ODDVAR O. BENDIKSEN (California, University, Los Angeles) AIAA, ASME, ASCE, AHS, and ASC, Structures, Structural Dynamics and Materials Conference, 32nd, Baltimore, MD, Apr. 8-10, 1991. 11 p. NSF-supported research. refs (Contract NAS3-25574)

(AIAA PAPER 91-1104) Copyright

In the present paper, Euler calculations of unsteady transonic flow in cascades are presented. A finite volume scheme is used to discretize the equations, which are implemented on a blade-fitted deformable mesh. The space-discretized equations are integrated forward in time using a multistage Runge-Kutta scheme. Adaptive dissipation terms of the type proposed by Jameson and Baker

are added to capture shocks and to suppress nonphysical oscillations. Phase-shifted boundary conditions are used to reduce the computational domain to a single reference passage. No assumptions of small amplitudes or small flow deflections are made. Thus, the present code makes it possible to carry out aeroelastic calculations for cases where the shock strengths and oscillation amplitudes exceed the inherent limitations of potential flow codes. AN EXPERIMENTAL STUDY OF AN AXISYMMETRIC
TURBULENT BOUNDARY LAYER DISTURBED BY A
PERIODIC FREESTREAM Ph.D. Thesis

CHITHRABHANU KOODALATTUPURAM Apr. 1990 212 p Avail: NTIS HC/MF A10

Behavior of an axisymmetric equilibrium turbulent boundary layer disturbed by a propeller wake in the freestream was investigated experimentally. Tests were conducted in a low speed wind tunnel and measurements of turbulence quantities were made using an x wire probe and a constant temperature anemometer. The boundary layer flow on a cylindrical body was characterized by measuring its gross parameters and comparing them with classical values. Propeller speed was measured using an electronic circuit whose output signal was also used to trigger the hot wire probe. Gross boundary layer characteristics of the disturbed boundary layer did not deviate appreciably from the classical two dimensional turbulent boundary layer except immediately behind the propeller. From conditional sampling, it was found that the near wall periodic Reynolds stress approached 30 percent of the conventional time averaged Reynolds stress. Turbulent kinetic energy, kinetic energy of the organized field, and various kinetic energy production terms responsible for exchange of turbulent kinetic energy between different flow fields were calculated from the experimental data. It was found that kinetic energy was being transferred from the organized flow field to the random turbulent flow field, as expected. The variation of both periodic and turbulent kinetic energy were governed by similar equations. A mechanism for the transport of turbulent kinetic energy was suggested.

# N91-23082 California Univ., Berkeley. INTERFEROMETRIC INVESTIGATION OF SUPERSONIC FLOW FIELDS WITH SHOCK-SHOCK INTERACTIONS Ph.D. Thesis MARK PAUL LOOMIS 1990 127 p

Avail: Univ. Microfilms Order No. DA9103798

An experimental investigation of the two-dimensional interaction between an oblique shock wave generated by a wedge and the bow shock upstream of an cylinder placed in cross flow is presented. New interferometric techniques to provide density information on the entire flow field were compared to previous investigations. Results were compared with a concurrent numerical investigation. The data obtained are useful in documenting and understanding such complex flow fields as that occurring when oblique shocks impinge on the cowl inlet of a vehicle such as the National Aerospace Plane. Depending on the position of the impinging shock with respect to the bow shock, type 1, 2, and 3 interactions as defined by Edney were obtained. The experiments were performed in a 14 by 14 cm supersonic wind tunnel with a nominal Mach number of 2.4. The primary experimental emphasis was the development of interferometric techniques and the application of these techniques to provide interferometric data for the different types of interactions. Since the flow field was two dimensional, the global density was deduced from the interferograms. Two types of interferometers were constructed and used, holographic interferometry and dark central ground interferometry. Using holographic interferometry, interferograms were made by storing holographically two images of the test section, one at test conditions and one with no flow in the tunnel. By comparing the two images an interferogram was constructed after the test had taken place. The second interferometer used a relatively new technique called dark central ground interferometry. The method involved placing a spatial filter at the focal point of the system after the beam has passed through the test section. Since the technique produces real time interferograms it was found to have many advantages over holographic interferometry. The current study represents one of the first applications of this technique in routine wind tunnel testing. Dissert. Abstr.

### NASA AEROPROPULSION RESEARCH IN SUPPORT OF PROPULSION SYSTEMS OF THE 21ST CENTURY

JOSEPH A. ZIEMIANSKI and EDWARD A. WILLIS (Sverdrup Technology, Inc., Brook Park, OH.) 1991 26 p Presented at the 36th International Gas Turbine and Aeroengine Congress and Exposition, Orlando, FL, 3-6 Jun. 1991; sponsored by ASME

(NASA-TM-104403; E-6226; NAS 1.15:104403) Avail: NTIS HC/MF A03 CSCL 01/1

A review is given of the NASA's ongoing and planned research and technology programs leading to advanced air breathing propulsion systems of the next century. The primary focus is on efforts being performed or sponsored by NASA-Lewis, with emphasis on civil, subsonic, and supersonic transportation systems which should begin to enter service within 10 to 20 years. Subsonic transport propulsion program elements, including ducted UltraHigh Bypass (UHB) engines and high efficiency cores are discussed in terms of goals, technical issues and problems, approaches and plans. Similarly, The Supersonic Cruise Propulsion Program is reviewed via discussion of near term and far term goals; barrier issues such as NOx and noise reduction and the consequent Phase 1 (near term) research plans are described; and finally, emerging technologies such as the supersonic through-flow fan are considered for their potential long term impact.

# A STUDY OF THE NOISE MECHANISMS OF TRANSONIC BLADE-VORTEX INTERACTIONS Semiannual Technical Report

ANASTASIOS S. LYRINTZIS and Y. XUE 1990 37 p Presented at the AHS 46th Annual Forum, Washington, DC, 21-23 May 1990

(Contract NAG2-588; NAG2-646)

(NASA-CR-188199; NAS 1.26:188199) Avail: NTIS HC/MF A03 CSCL 01/1

Transonic blade-vortex interactions (BVI) are simulated numerically and the noise mechanisms are investigated. The two-dimensional high frequency transonic small disturbance equation is solved numerically (VTRAN2 code). An ADI scheme with monotone switches is used; viscous effects are included on the boundary, and the vortex is simulated by the cloud in cell method. The Kirchhoff method is used for the extension of the numerical two-dimensional near-field aerodynamic results to the linear acoustic three dimensional far field. The viscous effects (shock/boundary layer interactions) on BVI is investigated. The different types of shock motion are identified and compared. Two important disturbances with different directivity exist in the pressure signal and are believed to be related to the fluctuating lift and drag forces. Noise directivity for different cases is shown. The maximum radiation occurs at an angle between 60 and 90 degrees below the horizontal for an airfoil-fixed coordinate system and depends on the details of the airfoil shape. Different airfoil shapes are studied and classified according to the BVI noise produced.

T. L. FULLERTON, J. H. STRICKLAND, and W. D. SUNDBERG 1991 8 p Presented at the 11th AIAA Aerodynamic Decelerator Systems Technology Conference, San Diego, 9-11 Apr. 1991 (Contract DE-AC04-76DP-00789)

(DE91-009764; SAND-90-2178C; CONF-9104171-7) Avail: NTIS HC/MF A02

A discussion is presented of a methodology of the paneled wing method for calculating aircraft induced wake velocities. This discussion includes a description of how an aircraft and its wake are represented by finite length vortex filaments, how the strength and location of these filaments are determined based upon aircraft characteristics and trajectory data, and how the induced velocity values are determined once the location and strength of the vortex filaments are known. Examples are presented showing comparisons between induced velocity values calculated using both the paneled wing method and Strickland's lifting line method. Comparison is also made between calculated results from the paneled wing method and wind tunnel data collected in the wake of a scale model aircraft. Additional examples show the effect of including aircraft downwash calculations in a trajectory analysis for a parachute-retarded store delivered via aircraft. DOF

SIMULATION OF ICED WING AERODYNAMICS

M. G. POTAPCZUK, M. B. BRAGG, O. J. KWON, and L. N. SANKAR (Georgia Inst. of Tech., Atlanta.) 1991 17 p Presented at the 68th Fluid Dynamics Panel Specialists Meeting, Toulouse, France, 29 Apr. 1 May 1991; sponsored by AGARD (NASA-TM-104362; E-6158; NAS 1 15:104362) Avail: NTIS HC/MF A03 CSCL 01/1

The sectional and total aerodynamic load characteristics of moderate aspect ratio wings with and without simulated glaze leading edge ice were studied both computationally, using a three dimensional, compressible Navier-Stokes solver, and experimentally. The wing has an untwisted, untapered planform shape with NACA 0012 airfoil section. The wing has an unswept and swept configuration with aspect ratios of 4.06 and 5.0. Comparisons of computed surface pressures and sectional loads with experimental data for identical configurations are given. The abrupt decrease in stall angle of attack for the wing, as a result of the leading edge ice formation, was demonstrated numerically and experimentally.

#### ICING SIMULATION: A SURVEY OF COMPUTER MODELS AND EXPERIMENTAL FACILITIES

M. G. POTAPCZUK and J. J. REINMANN 1991 29 p Presented at the 68th Fluid Dynamics Panel Specialists Meeting, Toulouse, France, 29 Apr. - 1 May 1991; sponsored by AGARD (NASA-TM-104366, E-6164; NAS 1.15:104366) Avail: NTIS HC/MF A03 CSCL 01/1

A survey of the current methods for simulation of the response of an aircraft or aircraft subsystem to an icing encounter is presented. The topics discussed include a computer code modeling of aircraft icing and performance degradation, an evaluation of experimental facility simulation capabilities, and ice protection system evaluation tests in simulated icing conditions. Current research focussed on upgrading simulation fidelity of both experimental and computational methods is discussed. The need for increased understanding of the physical processes governing ice accretion, ice shedding, and iced airfoil aerodynamics is examined.

PROCEDURE FOR DETERMINATION OF THREE-DIMENSIONAL WIND TUNNEL WALL INTERFERENCES AND WALL ADAPTATION IN COMPRESSIBLE SUBSONIC FLOW USING MEASURED WALL PRESURES Thesis - Technische Univ. HARMUT HOLST 11 Dec. 1990 171 p In GERMAN; ENGLISH

(DLR-FB-90-46; ISSN-0171-1342; ETN-91-99067) Avail: NTIS HC/MF A08; DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Fed. Republic of Germany, HC

Green's Theorem is applied to the problem of wall interferences in wind tunnels. The velocity components at the boundaries of the test section are the data required for the calculation. The computation of the wall adaptation is performed in a single step. Measurements in an adaptive test section show that the method can be used for the determination of wall interferences, wall adaptation, and residual interferences. Computations demonstrate that optimization of slot widths in test sections with longitudinally slotted walls and calculation of residual interferences can be performed using this method. The limitations of the method are discussed.

A STUDY OF THREE DIMENSIONAL TURBULENT BOUNDARY LAYER SEPARATION AND VORTEX FLOW CONTROL USING THE REDUCED NAVIER STOKES EQUATIONS

BERNHARD H. ANDERSON and SAEED FAROKHI (Kansas Univ., Lawrence.) 1991 8 p Presented at the Turbulent Shear Flow Symposium, Munich, Fed. Republic of Germany, 9-11 Sep. 1991 (NASA-TM-104407; E-6233; NAS 1.15:104407) Avail: NTIS HC/MF A02 CSCL 01/1

A reduced Navier Stokes (RNS) initial value space marching solution technique was applied to vortex generator and separated flow problems and demonstrated good predictions of the engine face flow field. This RNS solution technique using FLARE approximations can adequately describe the topological and topographical structure flow separation associated with vortex liftoff, and this conclusion led to the concept of a subclass of separations which can be called vorticity separations: separations dominated by the transport of vorticity. Adequate near wall resolution of vorticity separations appears necessary for good predictions of these flows.

#### THE PERFORMANCE OF 60 DEG DELTA WINGS: THE EFFECTS OF LEADING EDGE RADIUS ON VORTEX FLAPS AND THE WING

B. K. HU and J. L. STOLLERY Mar. 1990 35 p (CRANFIELD-AERO-9004; ISBN-1-871564-05-0; ETN-91-99333) Avail: NTIS HC/MF A03

Low speed wind tunnel tests were conducted on 60 degree delta wings. The wings were tested with well rounded and sharp leading edge vortex flaps to estimate the effects of leading edge radius on the aerodynamic performance. The Reynolds number based on root chord was approx. 800,000. Results indicate that leading edge radius has little effect on the contribution of the vortex flap to lift/drag ratio on the 60 deg delta wing. The 60 deg delta wing with a well rounded leading edge and no vortex flap deflection has a higher lift/drag ratio over almost the entire lift coefficient range tested.

N91-23094# Lehigh Univ., Bethlehem, PA. UNSTEADY FLOW STRUCTURE FROM SWEPT EDGES SUBJECTED TO CONTROLLED MOTION Final Report, 1 May 1986 - 31 Oct. 1990

DONALD ROCKWELL 26 Dec. 1990 89 p (Contract AF-AFOSR-0177-86; AF PROJ. 2307) (AD-A232714; LU-AFOSR-FR-90; AFOSR-91-0139TR) Avail: NTIS HC/MF A05 CSCL 01/1

This program addresses the unsteady flow structure and loading of delta wings subjected to controlled pitching motion. Efforts are focussed on three primary areas: generation of computer-aided techniques for quantitative interpretation of flow structure; development of new types of experimental instrumental and facilities; and characterization of the unsteady flow structure on delta wings. Computer applications for quantitative visualization of the vortex structure involve tracking of hydrogen bubble timelines and particles illuminated by scanning lasers. These techniques are integrated with active control systems that generate prescribed pitching motion of delta wings. Characterization of the unsteady flow structure is concerned with the response of the vortex breakdown to the motion of the wing and with preliminary consideration of the instantaneous cross-sectional structure of the leading edge vortices. The phase lag of these features of the flow structure, relative to the wing motion, is a central consideration.

#### SOME ASPECTS OF SHOCK-WAVE BOUNDARY LAYER INTERACTION RELEVANT TO INTAKE FLOWS

In AGARD, Hypersonic Combined Cycle J. L. STOLLERY Propulsion 14 p Dec. 1990

Copyright Avail: NTIS HC/MF A20; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

Four main topics are discussed: (1) 2-D shock induced separation; (2) 3-D glancing interaction; (3) shock/shock boundary layer interaction; and (4) hypersonic viscous interaction. Wherever possible both laminar and turbulent flows are considered and reference is made to experimental data and to the results of mathematical modeling. Some thoughts on future research topics are presented along with the facilities needed to pursue them.

# REACTING SHOCK WAVES IN HYPERSONIC PROPULSION APPLICATIONS

M. ONOFRI In AGARD, Hypersonic Combined Cycle Propulsion 10 p Dec. 1990

Copyright Avail: NTIS HC/MF A20; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

Problems connected to the occurrence of finite rate chemical processes behind shock waves in hypersonic flow fields are analyzed and a numerical technique is proposed for their solution. The computational difficulties connected with the presence of large gradients of the species concentrations are considered. A method is proposed, based on a shock-fitting technique for the gas dynamic model and a variable step integration along the streamlines for the energy and species conservation equations. This approach provides the needed resolution where it is actually required, without becoming cumbersome elsewhere, and the relaxation layer behind shocks can be computed efficiently and precisely.

A Navier-Stokes computer code was validated using a number of two- and three-dimensional configurations for both laminar and turbulent flows. The validation data covers a range of freestream Mach numbers from 3 to 14, including wall pressures, velocity pressure, and skin friction. Nozzle flow fields computed for a generic scramjet nozzle from Mach 3 to 20, wall pressures, wall skin friction values, heat transfer values, and overall performance are presented. In addition, three-dimensional solutions obtained for two asymmetric, single expansion ramp nozzles at a pressure ratio of 10 consists of the internal expansion region in the converging/diverging sections and the external superonic exhaust in a quiescent ambient environment. The fundamental characteristics that were captured successfully include expansion fans; Mach wave reflections; mixing layers; and nonsymmetrical, multiple inviscid cell, supersonic exhausts. Comparison with experimental data for wall pressure distributions at the center Author planes shows good agreement.

THE NASA LANGLEY LAMINAR-FLOW-CONTROL EXPERIMENT ON A SWEPT, SUPERCRITICAL AIRFOIL: SUCTION COEFFICIENT ANALYSIS

CUYLER W. BROOKS, JR., CHARLES D. HARRIS, and WILLIAM D. HARVEY Jun. 1991 19 p (NASA-TM-4267; L-16774; NAS 1.15:4267) Avail: NTIS HC/MF A03 CSCL 01/1

A swept supercritical wing incorporating laminar flow control at transonic flow conditions was designed and tested. The definition of an experimental suction coefficient and a derivation of the compressible and incompressible formulas for the computation of the coefficient from measurable quantities is presented. The suction flow coefficient in the highest velocity nozzles is shown to be overpredicted by as much as 12 percent through the use of an incompressible formula. However, the overprediction on the computed value of suction drag when some of the suction nozzles were operating in the compressible flow regime is evaluated and found to be at most 6 percent at design conditions.

The three dimensional quasi-analytical sensitivity analysis and the ancillary driver programs are developed needed to carry out the studies and perform comparisons. The code is essentially contained in one unified package which includes the following: (1) a three dimensional transonic wing analysis program (ZEBRA); (2) a quasi-analytical portion which determines the matrix elements the quasi-analytical equations; (3) a method for computing the sensitivity coefficients from the resulting quasi-analytical equations; (4) a package to determine for comparison purposes sensitivity coefficients via the finite difference approach; and (5) a graphics package.

# N91-24103 Georgia Inst. of Tech., Atlanta. AERODYNAMIC INTERACTIONS BETWEEN BODIES IN RELATIVE MOTION Ph.D. Thesis

OLIVIER SCHREIBER 1990 281 p

Avail: Univ. Microfilms Order No. DA9105464

The problem of aerodynamic interactions between bodies in arbitrary relative motion is considered, with emphasis on the aerodynamics of rotor with fuselage interactions. This problem is too complex to be analyzed using the full Navier-Stokes equations, and it has previously been shown that the dominant features of such flow field can be explained using ideal fluid flow concepts. Thus, an ideal fluid flow formulation, allowing complex unsteady interactions between arbitrary shaped bodies, is used. The computational scheme is time dependent and designed to handle several bodies moving with respect to each other, such as a rotor and fuselage. It is not specialized in its treatment of lifting versus nonlifting bodies or their motion characteristics. The wakes of the bodies are modeled by vortex particle. The handling of the Helmholtz equation, which governs vorticity convection and distortion and its interaction with the bodies, is simplified. Stability and convergence of the scheme are made by smearing the discrete point distribution over finite elementary volumes and using a multistep time marching integration method. A mix of boundary element methods is used simultaneously to solve the boundary Dissert. Abstr. value problem.

AN EFFICIENT HYBRID SCHEME FOR THE SOLUTION OF ROTATIONAL FLOW AROUND ADVANCED PROPELLERS Ph.D. Thesis

RAKESH SRIVASTAVA 1990 154 p Avail: Univ. Microfilms Order No. DA9105466

A free air propeller offers the highest propulsive efficiency. However, as the flight speed increases, the high tip speed of a conventional propeller leads to large compressibility losses. To overcome these losses and extend the flight Mach number to near transonic range, propellers were redesigned to have large tip sweep, twist, and very thin airfoils. The efficiency was further increased by using a counter-rotating row of blades to recover the swirl losses. One problem with these advanced propellers, however, is that some of the propellers have fluttered in wind tunnel tests. In order to be able to predict flutter, an accurate prediction of unsteady airloads is necessary. Also, as the propellers operate in the transonic Mach number range, compressibility effects important. In the present solution procedure, three-dimensional, unsteady, compressible Euler equations are solved. A directionally hybrid scheme is used to make the scheme computationally more efficient. The governing equations are cast in strong conservative form and solved in a body-fitted coordinate system using an approximate factorization scheme. Specifically, the solution procedure is applied to solve Euler equations around single and counter-rotating advanced propeller geometries to obtain airloads and integrated performance quantities. The solution procedure was also coupled with NASTRAN in an open loop fashion, to study the effects of blade flexibility on the performance of the single rotation advanced propeller. An attempt was also made to evaluate the possibility of reducing the number of grid points in the solution domain by using a fourth-order scheme.

NONLINEAR AERODYNAMICS AND THE DESIGN OF WING TIPS Final Report, 1 Apr. 1990 - 31 Mar. 1991

ILAN KROO May 1991 5 p (Contract NCC2-683)

(NASA-CR-188044; NAS 1.26:188044) Avail: NTIS HC/MF A01 CSCL 01/1

The analysis and design of wing tips for fixed wing and rotary wing aircraft still remains part art, part science. Although the design of airfoil sections and basic planform geometry is well developed, the tip regions require more detailed consideration. This is important because of the strong impact of wing tip flow on wing drag; although the tip region constitutes a small portion of the wing, its effect on the drag can be significant. The induced drag of a wing is, for a given lift and speed, inversely proportional to the square of the wing span. Concepts are proposed as a means of reducing drag. Modern computational methods provide a tool for studying these issues in greater detail. The purpose of the current research program is to improve the understanding of the fundamental issues involved in the design of wing tips and to develop the range of computational and experimental tools needed for further study of these ideas.

THE COMPUTATION OF INDUCED DRAG WITH NONPLANAR AND DEFORMED WAKES

ILAN KROO (Stanford Univ., CA.) and STEPHEN SMITH In Stanford Univ., Nonlinear Aerodynanics and the Design of Wing Tips 9 p May 1991

Avail: NTIS HC/MF A01 CSCL 01/1

The classical calculation of inviscid drag, based on far field flow properties, is reexamined with particular attention to the nonlinear effects of wake roll-up. Based on a detailed look at nonlinear, inviscid flow theory, it is concluded that many of the classical, linear results are more general than might have been expected. Departures from the linear theory are identified and design implications are discussed. Results include the following: Wake deformation has little effect on the induced drag of a single element wing, but introduces first order corrections to the induced drag of a multi-element lifting system. Far field Trefftz-plane analysis may be used to estimate the induced drag of lifting systems,

even when wake roll-up is considered, but numerical difficulties arise. The implications of several other approximations made in lifting line theory are evaluated by comparison with more refined analyses.

EULER FLOW PREDICTIONS FOR AN OSCILLATING CASCADE USING A HIGH RESOLUTION WAVE-SPLIT SCHEME

DENNIS L. HUFF, TIMOTHY W. SWAFFORD, and T. S. R. REDDY (Toledo Univ., OH.) 1991 19 p Presented at the 36th International Gas Turbine and Aeroengine Congress and Exposition, Orlando, FL, 3-6 Jun. 1991; sponsored by ASME (NASA-TM-104377; E-5933; NAS 1.15:104377) Avail: NTIS HC/MF A03 CSCL 01/1

A compressible flow code that can predict the nonlinear unsteady aerodynamics associated with transonic flows over oscillating cascades is developed and validated. The code solves the two dimensional, unsteady Euler equations using a time-marching, flux-difference splitting scheme. The unsteady pressures and forces can be determined for arbitrary input motions. although only harmonic pitching and plunging motions are addressed. The code solves the flow equations on a H-grid which is allowed to deform with the airfoil motion. Predictions are presented for both flat plate cascades and loaded airfoil cascades. Results are compared to flat plate theory and experimental data. Predictions are also presented for several oscillating cascades with strong normal shocks where the pitching amplitudes, cascade geometry and interblade phase angles are varied to investigate nonlinear behavior. BREAKING DOWN THE DELTA WING VORTEX: THE ROLE OF VORTICITY IN THE BREAKDOWN PROCESS Ph.D. Thesis Final Report

ROBERT C. NELSON and KENNETH D. VISSER 1990 16 p Presented at AGARD Symposium on Vortex Flow Aerodynamics, Scheveningen, Netherlands, 1-4 Oct. 1990 (Contract NAG1-1156)

(NASA-CR-188235; NAS 1.26:188235) Avail: NTIS HC/MF A03 CSCL 01/1

Experimental x-wire measurements of the flowfield above a 70 and 75 deg flat plate delta wing were performed at a Reynolds number of 250,000. Grids were taken normal to the wing at various chordwise locations for angles of attack of 20 and 30 deg. Axial and azimuthal vorticity distributions were derived from the velocity fields. The dependence of circulation on distance from the vortex core and on chordwise location was also examined. The effects of nondimensionalization in comparison with other experimental data is made. The results indicate that the circulation distribution

scales with the local semispan and grows in a nearly linear fashion in the chordwise direction. The spanwise distribution of axial vorticity is severely altered through the breakdown. The axial vorticity components with a negative sense, such as that found in the secondary vortex, seem to remain unaffected by changes in wind sweep or angle of attack, in direct contrast to the positive components. In addition, the inclusion of the local wing geometry into a previously derived correlation parameter allows the circulation of growing leading edge vortex flows to be reduced into a single

AN EXPERIMENTAL ANALYSIS OF CRITICAL FACTORS INVOLVED IN THE BREAKDOWN PROCESS OF LEADING **EDGE VORTEX FLOWS Ph.D. Thesis** 

KENNETH D. VISSER 30 May 1991 285 p

(Contract NAG1-1156)

(NASA-CR-188231; NAS 1.26:188231) Avail: NTIS HC/MF A13 CSCL 01/1

Experimental crosswire measurements of the flowfield above a 70 and 75 degree flat plate delta wing were performed at a Revnolds number of 250,000. Survey grids were taken normal to the platform at a series of chordwise locations for angles of attack of 20 and 30 degrees. Axial and azimuthal vorticity distributions were derived from the velocity fields. The dependence of circulation on distance from the vortex core as well as on chordwise location was examined. The effects of nondimensionalization in comparison with other experimental data was made. The circulation distribution scales with the local semispan and grows approximately linearly in the chordwise direction. For regions of the flow outside of the vortex subcore, the circulation at any chordwise station was observed to vary logarithmically with distance from the vortex axis. The circulation was also found to increase linearly with angle of incidence at a given chordwise station. A reduction in the local circulation about the vortex axis occurred at breakdown. The spanwise distribution of axial vorticity was severely altered through the breakdown region and the spanwise distribution of axial vorticity present appeared to reach a maximum immediately preceding breakdown. The local concentration of axial vorticity about the vortex axis was reduced while the magnitude of the azimuthal vorticity decreased throughout the breakdown zone. The axial vorticity components with a negative sense, found in the secondary vortex, remained unaffected by changes in wing sweep or angle of attack, in direct contrast to the positive components. The inclusion of the local wing geometry into a previously derived correlation parameter indicated that the circulation of growing leading edge vortex flows were similar at corresponding radii from the vortex axis. It was concluded that the flow over a delta wing, upstream of the breakdown regions and away from the apex and trailing edge regions, is conical. In addition, the dominating factors leading to the onset of breakdown are felt to be the local circulation of the vortex and the accompanying pressure field. Author

A numerical investigation of the flow field about a 76-degree leading edge sweep delta wing at 20.5 degree angle of attack is presented. The computational results are obtained using a Beam-Warming algorithm with a Newton-like subiteration procedure. For M = 0.2 and Re = 900,000 an unsteady flow field is obtained which is shown to be physical in nature. The unsteady behavior is a result of the existence of small-scale vortical structures that are associated with a Kelvin-Helmholtz type instability of the shear layer emanating form the leading edge of the delta wing. The computed results show qualitative agreement with other experimental and numerical findings. GRA

A computational method for lateral-directional aerodynamics of fighter configuration is developed. The leading edge vortices are represented by free vortex filaments which are adjusted iteratively to satisfy the force-free condition. The forebody vortex separation, both symmetrical and asymmetrical, is calculated using slender body theory. Effect of boundary layer separation on lifting surfaces is accounted for using the effective sectional angles of attack. The latter are obtained iteratively by matching the nonlinear sectional lift with the computed resulted based on lifting surface theory. Results for several fighter configurations are employed for comparison with available data. It is shown that the present method produces reasonable results in predicting sideslip derivatives, while role and yaw rate derivatives do not compare very well with forced oscillation test data at high angles of attack. Industrial usage of this has produced mixed results. At this time, the use of these methods in a production manner is not recommended.

C. E. LAN, H. EMDAD, SUEI CHIN, P. SUNDARAM, and S. C. MEHROTRA Apr. 1991 59 p (Contract F33615-87-C-3616) (AD-A233569; WL-TR-91-3033-VOL-3) Avail: NTIS HC/MF A04

A computational method for unsteady aerodynamics of fighter configurations at high angles of attack is developed. The leading-edge vortices are represented by free vortex filaments which are adjusted iteratively to satisfy the force-free condition. The small-disturbance, unsteady potential equation is solved in the frequency domain for motions in pitching, plunging, flapping, side movement, rolling, and yawing oscillation in compressible flow. Computed results in rolling moment coefficients due to side acceleration are compared with data for 60-deg and 80-deg delta wings. Lateral-directional characteristics for an F-106b configuration are also compared with data obtained in forced oscillation tests. It is shown that reasonable results can be obtained by the present unsteady flow method, but not by steady flow theory. Calculation of dynamic stall effects on a rectangular wing of aspect ratio 4 is demonstrated by using experimental section data. Although no data for the wing are available, the results appear plausible. Industrial usage of this has produced mixed results. At this time, the use of these methods in a production manner is recommended.

HC/MF A04 CSCL 01/1

An Euler flow solver was developed for predicting the airframe/propulsion integration effects for an aft-mounted turboprop transport. This solver employs a highly efficient multigrid scheme, with a successive mesh-refinement procedure to accelerate the convergence of the solution. A new dissipation model was also implemented to render solutions that are grid insensitive. The propeller power effects are simulated by the actuator disk concept. An embedded flow solution method was developed for predicting the detailed flow characteristics in the local vicinity of an aft-mounted propfan engine in the presence of a flow field induced by a complete aircraft. Results from test case analysis are presented. A user's guide for execution of computer programs, including format of various input files, sample job decks, and sample input files, is provided in an accompanying volume.

(NASA-CR-181924-VOL-2; NAS 1.26:181924-VOL-2) Avail: NTIS HC/MF A04 CSCL 01/1

This manual explains how to use an Euler based computational

method for predicting the airframe/propulsion integration effects for an aft-mounted turboprop transport. The propeller power effects are simulated by the actuator disk concept. This method consists of global flow field analysis and the embedded flow solution for predicting the detailed flow characteristics in the local vicinity of an aft-mounted propfan engine. The computational procedure includes the use of several computer programs performing four main functions: grid generation, Euler solution, grid embedding, and streamline tracing. This user's guide provides information for these programs, including input data preparations with sample input decks, output descriptions, and sample Unix scripts for program execution in the UNICOS environment.

N91-24120\*# Boeing Commercial Airplane Co., Seattle, WA. A GENERAL MULTIBLOCK EULER CODE FOR PROPULSION INTEGRATION. VOLUME 1: THEORY DOCUMENT Final Report H. C. CHEN, T. Y. SU, and T. J. KAO May 1991 47 p (Contract NAS1-18703)

(NASA-CR-187484-VOL-1; NAS 1.26:187484-VOL-1) Avail: NTIS HC/MF A03 CSCL 01/1

A general multiblock Euler solver was developed for the analysis of flow fields over geometrically complex configurations either in free air or in a wind tunnel. In this approach, the external space around a complex configuration was divided into a number of topologically simple blocks, so that surface-fitted grids and an efficient flow solution algorithm could be easily applied in each block. The computational grid in each block is generated using a combination of algebraic and elliptic methods. A grid generation/flow solver interface program was developed to facilitate the establishment of block-to-block relations and the boundary conditions for each block. The flow solver utilizes a finite volume formulation and an explicit time stepping scheme to solve the Euler equations. A multiblock version of the multigrid method was developed to accelerate the convergence of the calculations. The generality of the method was demonstrated through the analysis of two complex configurations at various flow conditions. Results were compared to available test data. Two accompanying volumes, user manuals for the preparation of multi-block grids (vol. 2) and for the Euler flow solver (vol. 3), provide information on input data format and program execution.

N91-24121\*# Boeing Commercial Airplane Co., Seattle, WA. A GENERAL MULTIBLOCK EULER CODE FOR PROPULSION INTEGRATION. VOLUME 2: USER GUIDE FOR BCON. PRE-PROCESSOR FOR GRID GENERATION AND GMBE Final

T. Y. SU, R. A. APPLEBY, and H. C. CHEN May 1991 71 p. (Contract NAS1-18703)

(NASA-CR-187484-VOL-2; NAS 1.26:187484-VOL-2) Avail: NTIS HC/MF A04 CSCL 01/1

The BCON is a menu-driven graphics interface program whose input consists of strings or arrays of points generated from a computer aided design (CAD) tool or any other surface geometry source. The user needs to design the block topology and prepare the surface geometry definition and surface grids separately. The BCON generates input files that contain the block definitions and the block relationships required for generating a multiblock volume grid with the EAGLE grid generation package. The BCON also generates the block boundary conditions file which is used along with the block relationship file as input for the general multiblock Euler (GMBE) code (GMBE, volumes 1 and 3). Author

This manual explains the procedures for using the general multiblock Euler (GMBE) code developed under NASA contract NAS1-18703. The code was developed for the aerodynamic analysis of geometrically complex configurations in either free air or wind tunnel environments (vol. 1). The complete flow field is divided into a number of topologically simple blocks within each of which surface fitted grids and efficient flow solution algorithms can easily be constructed. The multiblock field grid is generated with the BCON procedure described in volume 2. The GMBE utilizes a finite volume formulation with an explicit time stepping scheme to solve the Euler equations. A multiblock version of the multigrid method was developed to accelerate the convergence of the calculations. This user guide provides information on the GMBE code, including input data preparations with sample input files and a sample Unix script for program execution in the UNICOS environment.

North Carolina State Univ., Raleigh. Dept. of N91-24123\*# Mechanical and Aerospace Engineering THEORETICAL EVALUATION OF ENGINE AUXILIARY INLET

DESIGN FOR SUPERSONIC V/STOL AIRCRAFT Final Report MICHAEL A. BOLES and RICHARD L. HEAVNER Cleveland. OH NASA May 1991 97 p (Contract NAG3-608)

(NASA-CR-187098; NAS 1.26:187098) Avail: NTIS HC/MF A05 CSCL 01/1

A higher order panel method is used to evaluate the potential flow of a 2-D supersonic V/STOL inlet. A nonsymmetric analytical inlet model is developed to closely match a wind tunnel model tested at NASA-Lewis. The analytical inlet used is analyzed for flow characteristics around the lower cowl lip and auxiliary inlets. The results for this analysis are obtained for the output of a computer program produced by the McDonnell Douglas Corp. This program is based on the Hess Panel Method which determines source strengths of panel distributed over a 3-D body. The analytical model was designed for the implementation of a drooped/translated cowl lip and auxiliary inlets as flow improvement concepts. A 40 or 70 deg droop lip can be incorporated on the inlet to determine if these geometry changes result in flow improvements which may reduce the propensity for flow separation on the interior portion of the lip. Auxiliary inlets are used to decrease the mass flow over the inlet lip; thus, the peak flow velocity is reduced at the lip which also lessens the likelihood of flow separation on the interior portion of the lip. A 2, 4, and 6 in. translated lip can be used to also decrease mass flow over the inlet lower lip in the same manner.

IMPLICIT SOLVERS FOR UNSTRUCTURED MESHES Final Report

V. VENKATAKRISHNAN (Computer Sciences Corp., Moffett Field, CA.) and DIMITRI J. MAVRIPLIS May 1991 24 p (Contract NAS1-18605)

(NASA-CR-187564; NAS 1.26:187564; ICASE-91-40) Avail: NTIS HC/MF A03 CSCL 01/1

Implicit methods were developed and tested for unstructured mesh computations. The approximate system which arises from the Newton linearization of the nonlinear evolution operator is solved by using the preconditioned GMRES (Generalized Minimum Residual) technique. Three different preconditioners were studied, namely, the incomplete LU factorization (ILU), block diagonal factorization, and the symmetric successive over relaxation (SSOR). The preconditioners were optimized to have good vectorization properties. SSOR and ILU were also studied as iterative schemes. The various methods are compared over a wide range of problems. Ordering of the unknowns, which affects the convergence of these sparse matrix iterative methods, is also studied. Results are presented for inviscid and turbulent viscous calculations on single and multielement airfoil configurations using globally and adaptively Author generated meshes.

National Aeronautics and Space Administration. Hugh L. Dryden Flight Research Facility, Edwards, CA FLOW VISUALIZATION STUDY OF A 1/48-SCALE AFTI/F111 MODEL TO INVESTIGATE HORIZONTAL TAIL FLOW **DISTURBANCES**

HC/MF A03; 24 functional color pages CSCL 01/1
During flight testing of the AFTI/F111 aircraft, horizontal tail buffet was observed. Flutter analysis ruled out any aeroelastic instability, so a water-tunnel flow visualization study was conducted to investigate possible flow disturbances on the horizontal tail which might cause buffet. For this study, a 1/48-scale model was used. Four different wing cambers and one horizontal tail setting were tested between 0 and 20 deg angle of attack. These wing cambers corresponded to the following leading training edge deflections: 0/2, 10/10, 10/2, and 0/10. Flow visualization results in the form of still photographs are presented for each of the four wing cambers between 8 and 12 deg angle of attack. In general, the horizontal tail experiences flow disturbances which become more pronounced with angle of attack or wing trailing-edge deflection. Author

National Aeronautics and Space Administration. N91-24130\*# Lewis Research Center, Cleveland, OH. THE 3-D NAVIER-STOKES ANALYSIS OF CROSSING, GLANCING SHOCKS/TURBULENT BOUNDARY LAYER INTERACTIONS

Presented at the 22nd Fluid D. R. REDDY 1991 14 p Dynamics, Plasma Dynamics and Lasers Conference, Honolulu, HI, 24-26 Jun. 1991; sponsored by AIAA (NASA-TM-104469; E-6318; NAS 1.15:104469; AIAA-91-1758) Avail: NTIS HC/MF A03 CSCL 01/1

Three dimensional viscous flow analysis is performed for a configuration where two crossing and glancing shocks interact with a turbulent boundary layer. A time marching 3-D full Navier-Stokes code, called PARC3D, is used to compute the flow field, and the solution is compared to the experimental data obtained at the NASA Lewis Research Center's 1 x 1 ft supersonic wind tunnel facility. The study is carried out as part of the continuing code assessment program in support of the generic hypersonic research at NASA Lewis. Detailed comparisons of static pressure fields and oil flow patterns are made with the corresponding solution on the wall containing the shock/boundary layer interaction in an effort to validate the code for hypersonic inlet applications

A DESIGN STRATEGY FOR THE USE OF VORTEX GENERATORS TO MANAGE INLET-ENGINE DISTORTION USING COMPUTATIONAL FLUID DYNAMICS

BERNHARD H. ANDERSON and RALPH LEVY (Scientific Research Associates, Inc., Glastonbury, CT.) 1991 36 p Presented at the 27th Joint Propulsion Conference, Sacramento, CA, 24-27 Jun. 1991; sponsored by AIAA, SAE, ASME, and the American Society for Electrical Engineers

(NASA-TM-104436; E-6275; NAS 1.15:104436; AIAA-91-2474) Avail: NTIS HC/MF A03 CSCL 01/1

A reduced Navier-Stokes solution technique was successfully used to design vortex generator installations for the purpose of minimizing engine face distortion by restructuring the development of secondary flow that is induced in typical 3-D curved inlet ducts. The results indicate that there exists an optimum axial location for this installation of corotating vortex generators, and within this configuration, there exists a maximum spacing between generator blades above which the engine face distortion increases rapidly. Installed vortex generator performance, as measured by engine face circumferential distortion descriptors, is sensitive to Reynolds number and thereby the generator scale, i.e., the ratio of generator blade height to local boundary layer thickness. Installations of corotating vortex generators work well in terms of minimizing engine face distortion within a limited range of generator scales. Hence,

#### 02 AERODYNAMICS

the design of vortex generator installations is a point design, and all other conditions are off design. In general, the loss levels associated with a properly designed vortex generator installation are very small; thus, they represent a very good method to manage engine face distortion. This study also showed that the vortex strength, generator scale, and secondary flow field structure have a complicated and interrelated influence over engine face distortion, over and above the influence of the initial arrangement of generators.

# REYNOLDS NUMBER EFFECTS ON THE TRANSONIC AERODYNAMICS OF A SLENDER WING-BODY CONFIGURATION

JAMES M. LUCKRING, CHARLES H. FOX, JR., and JEFFREY S. CUNDIFF (George Washington Univ., Hampton, VA.) In its Transonic Symposium: Theory, Application and Experiment, Volume 2 p 41-58 Apr. 1989

Avail: NTIS HC/MF A11 CSCL 01/1

Aerodynamic forces and moments for a slender wing-body configuration are summarized from an investigation in the Langley National Transonic Facility (NTF). The results include both longitudinal and lateral-directional aerodynamic properties as well as slideslip derivatives. Results were selected to emphasize Reynolds number effects at a transonic speed although some lower speed results are also presented for context. The data indicate nominal Reynolds number effects on the longitudinal aerodynamic coefficients and more pronounced effects for the lateral-directional aerodynamic coefficients. The Reynolds number sensitivities for the lateral-directional coefficients were limited to high angles of attack.

LAMINAR-FLOW WIND TUNNEL EXPERIMENTS

WILLIAM D. HARVEY, CHARLES D. HARRIS, WILLIAM G. SEWALL, and JOHN P. STACK In its Transonic Symposium: Theory, Application and Experiment, Volume 2 p 105-145 Apr. 1989

Avail: NTIS HC/MF A11 CSCL 01/1

Although most of the laminar flow airfoils recently developed at the NASA Langley Research Center were intended for general aviation applications, low-drag airfoils were designed for transonic speeds and wind tunnel performance tested. The objective was to extend the technology of laminar flow to higher Mach and Reynolds numbers and to swept leading edge wings representative of transport aircraft to achieve lower drag and significantly improved operation costs. This research involves stabilizing the laminar boundary layer through geometric shaping (Natural Laminar Flow, NLF) and active control involving the removal of a portion of the laminar boundary layer (Laminar-Flow Control, LFC), either through discrete slots or perforated surface. Results show that extensive regions of laminar flow with large reductions in skin friction drag can be maintained through the application of passive NLF boundary-layer control technologies to unswept transonic wings. At even greater extent of laminar flow and reduction in the total drag level can be obtained on a swept supercritical airfoil with active boundary layer-control.

N91-24139\*# Boeing Commercial Airplane Co., Seattle, WA. VARIABLE SWEEP TRANSITION FLIGHT EXPERIMENT (VSTFE): UNIFIED STABILITY SYSTEM (USS). DESCRIPTION AND USERS' MANUAL Report, Oct. 1985 - May 1990 ROZENDAAL and ROXANNA BEHBEHANI Jun. 1990 124 p (Contract NAS1-15325)

(NASA-CR-181918; NÁS 1.26:181918; D6-54961) Avail: NTIS HC/MF A06 CSCL 01/1

NASA initiated the Variable Sweep Transition Flight Experiment (VSTFE) to establish a boundary layer transition database for laminar flow wing design. For this experiment, full-span upper surface gloves were fitted to a variable sweep F-14 aircraft. The development of an improved laminar boundary layer stability analysis system called the Unified Stability System (USS) is documented and results of its use on the VSTFE flight data are shown. The USS consists of eight computer codes. The theoretical background of the system is described, as is the input, output, and usage hints. The USS is capable of analyzing boundary layer stability over a wide range of disturbance frequencies and orientations, making it possible to use different philosophies in calculating the growth of disturbances on sweptwings.

This paper includes the results of a significant research program for verification of computer trajectory codes used in aircraft icing analysis. Experimental water droplet impingement data have been obtained in the NASA Lewis Research Center Icing Research Tunnel for a wide range of aircraft geometries and test conditions. The body whose impingement characteristics are required is covered at strategic locations by thin strips of moisture absorbing (blotter) paper and then exposed to an airstream containing a dyed-water spray cloud. Water droplet impingement data are extracted from the dyed blotter strips by measuring the optical reflectance of the dye deposit on the strips with an automated reflectometer. Impingement characteristics for all test geometries have also been calculated using two recently developed trajectory computer codes. Good agreement is obtained with experimental data. The experimental and analytical data show that maximum impingement efficiency and impingement limits increase with mean volumetric diameter for all geometries tested. For all inlet geometries tested, as the inlet mass flow is reduced, the maximum impingement efficiency is reduced and the location of the maximum impingement shifts toward the inlet inner cowl.

#### A91-39384 AN UPDATE ON SKAD (SURVIVAL KIT AIR DROPPABLE) SYSTEMS

P. D. JOHNSON (Irvin Industries Canada, Ltd., Fort Erie) Annual SAFE Symposium, 27th, New Orleans, LA, Dec. 5-8, 1989, Proceedings. Newhall, CA, SAFE Association, 1990, p. 89-95. Copyright

The status of current SKAD systems, their requirements, and potential future applications are discussed. Recent recovery-parachute development and feasibility programs are described. The programs include the development of the MINNIPAC II recovery-parachute system and the feasibility of a twin-chute personnel-recovery system. The MINIPAC II was found to provide a rapid and reliable pilot-chute deployment upon seat separation, and no hesitations occurred in pilot-chute opening because the chute is deployed outside of the pilot's wake. Studies showed, that with the novel twin-chute system, injuries could be reduced to 2 percent. The design and development of a solid-state data recorder to acquire parachute drop-test data are also discussed. Photographs are provided of the MINIPAC II seat pan with parachute and survival pouches, a packed 26-foot conical in a deployment bag, a bag with three-ring riser releases, a jumper during deployment (with the pilot chute in the low-speed mode), and a dummy in free-fall at 25,000 ft, (with the pilot chute in the high-speed mode).

#### A91-40558# LOW ALTITUDE HIGH SPEED CARGO PARACHUTE SYSTEM **DEVELOPMENT - A STATUS REPORT**

W. D. SUNDBERG, THOMAS H. ALSBROOKS, KENNETH L. RONQUILLO (Sandia National Laboratories, Albuquerque, NM), JAMES E. SADECK, and CALVIN K. LEE (U.S. Army, Research, Development, and Engineering Center, Natick, MA) Aerodynamic Decelerator Systems Technology Conference, 11th, San Diego, CA, Apr. 9-11, 1991. 16 p. refs (AIAA PAPER 91-0880) Copyright

A Low Altitude High Speed Cargo (LAHSC) parachute is being developed for deployment at velocities up to 250 knots at 300 ft altitude. The LAHSC parachute will decelerate and turnover a load to a 40 to 60 ft/sec vertical velocity at first vertical at approximately 30 ft AGL. The acceleration limit is 5 g's. Main chute cargo extraction will be necessary. A single parachute will be utilized for a 7500 lb load, and clusters will be used for larger loads. The 64-gore, 70-ft-dia parachute has a ring-slot/solid construction with a flare at the skirt to aid the inflation. This paper describes the parachute, the design process and testing to date. Model parachutes have been tested in wind tunnels and in free flight. A single full-scale parachute has been tested at low speeds with conventional load extraction, and with a vertical trajectory at deployment.

#### A91-40559# DEPLOYMENT OPTIMIZATION AND HUMAN FACTORS CONSIDERATIONS FOR LOW-ALTITUDE TROOP **PARACHUTES**

JOHN W. WATKINS (U.S. Army, Research, Development, and Engineering Center, Natick, MA) AlAA, Aerodynamic Decelerator Systems Technology Conference, 11th, San Diego, CA, Apr. 9-11, 1991, 14 p.

(AIAA PAPER 91-0889)

On of the major objectives in the development of troop parachutes is to reduce the jump altitude. This requires faster parachute deployment, inflation, and stabilization. At this time, it has not been possible to make significant reductions in jump altitude through improvements in deployment and stabilization. Faster inflation and a corresponding reduction in altitude loss was achieved through the development of special reefing techniques, but testing showed that opening forces could exceed human factors limits. An investigation was done to verify and more closely define the presently accepted human factors limits. These limits have remained the same. The results from tests of a wide variety of parachutes were then compiled to determine the potential for meeting the jump altitude requirement without exceeding the human factors limits. This investigation showed that while it would be possible, careful optimization of the reefing technique used to speed up inflation is required.

AIRBORNE RESCUE SYSTEM Patent Application LEONARD A. HASLIM, inventor (to NASA) 6 Oct. 1989 17 p (NASA-CASE-ARC-11909-1; NAS 1.71:ARC-11909-1;

US-PATENT-APPL-SN-418320) Avail: NTIS HC/MF A03 CSCL

01/3

The airborne rescue system includes a boom with telescoping members for extending a line and collar to a rescue victim. The boom extends beyond the tip of the helicopter rotor so that the victim may avoid the rotor downwash. The rescue line is played out and reeled in by winch. The line is temporarily retained under the boom. When the boom is extended, the rescue line passes through clips. When the victim dons the collar and the tension in the line reaches a predetermined level, the clips open and release the line from the boom. Then the rescue line can form a straight line between the victim and the winch, and the victim can be lifted to the helicopter. A translator is utilized to push out or pull in the telescoping members. The translator comprises a tape and a rope. Inside the telescoping members the tape is curled around the rope and the tape has a tube-like configuration. The tape and rope are provided from supply spools.

#### N91-23096 California Univ., Berkeley. NEAR MIDAIR COLLISIONS AS AN INDICATOR OF GENERAL AVIATION COLLISION RISK Ph.D. Thesis

H. PAUL SHUCH 1990 225 p

Avail: Univ. Microfilms Order No. DA9103873

Conventional wisdom suggests aircraft midair collisions to be random events, governed by the laws of Brownian Motion, and best analyzed by stochastic methods. An alternative hypothesis, that such accidents are deterministic in nature, and that specific factors leading to midair collisions can be identified and mitigated, is discussed. A predictive model using case control theory is developed for assessing Risk Index, a criterion measure of midair collision likelihood, for any General Aviation flight, actual or hypothetical. Generating the model requires statistical validation of two independent near midair collision data bases, and identifying within them those aircraft, aircrew and airspace characteristics most closely associated with collision risk.

AIRCRAFT COMMAND IN EMERGENCY SITUATIONS (ACES). PHASE 1: CONCEPT DEVELOPMENT Final Report

THOMAS L. REYNOLDS, GREGORY E. GRIMSTAD, and CHARLES D. ANDERSON Apr. 1991 136 p (Contract DTFA03-89-C-00061)

(DOT/FAA/CT-90/21) Avail: NTIS HC/MF A07

Two conceptual approaches for an advanced smoke/fire detection system for commercial passenger jet aircraft are defined that would provide for accurate, timely guidance to the flight crew for their use in responding to possible and/or actual inflight smoke and fire events within the pressurized fuselage. The motivation for this was the computerization of the modern commercial jet aircraft flight deck, the evolution toward the two-man crew, and documented times taken to locate and implement the appropriate emergency procedure. The primary objective of the Aircraft Command in Emergency Situations (ACES) System concepts are to provide the capability to reduce the time required for the flight deck crew to make a decision to land the aircraft.

### ENGINE TECHNOLOGY CHALLENGES FOR A 21ST CENTURY HIGH SPEED CIVIL TRANSPORT

ROBERT J. SHAW 1991 13 p Proposed for presentation at the 10th International Symposium on Air Breathing Engines, Nottingham, England, 1-6 Sep. 1991; sponsored by AIAA (NASA-TM-104363; E-6159; NAS 1.15:104363) Avail: NTIS HC/MF A03 CSCL 01/3

Recent NASA funded studies by Boeing and Douglas suggest an opportunity exists for a 21st Century High Speed Civil Transport (HSCT) to become part of the international air transportation system. However, before this opportunity for high speed travel can be realized, certain environmental and and economic barrier issues must be overcome. These challenges are outlined. Research activities which NASA has planned to address these barrier issues and to provide a technology base to allow U.S. manufacturers to make an informed go/no go decision on developing the HSCT are discussed.

N91-23099\*# National Aeronautics and Space Administration. Ames Research Center, Moffett Field, CA. MICROWAVE LANDING SYSTEM MODELING WITH

MICROWAVE LANDING SYSTEM MODELING WITH APPLICATION TO AIR TRAFFIC CONTROL

M. M. POULOSE Apr. 1991 23 p (NASA-TM-102832; A-90184; NAS 1.15:102832) Avail: NTIS HC/MF A03 CSCL 01/3

Compared to the current instrument landing system, the microwave landing system (MLS), which is in the advanced stage of implementation, can potentially provide significant fuel and time savings as well as more flexibility in approach and landing functions. However, the expanded coverage and increased accuracy requirements of the MLS make it more susceptible to the features of the site in which it is located. An analytical approach is presented for evaluating the multipath effects of scatterers that are commonly found in airport environments. The approach combines a multiplane model with a ray-tracing technique and a formulation for estimating the electromagnetic fields caused by the antenna array in the presence of scatterers. The model is applied to several airport scenarios. The reduced computational burden enables the scattering effects on MLS position information to be evaluated in near real time. Evaluation in near real time would permit the incorporation of the modeling scheme into air traffic control automation; it would adaptively delineate zones of reduced accuracy within the MLS coverage volume, and help establish safe approach and takeoff trajectories in the presence of uneven terrain and other scatterers.

A TEST OF THE AMERICAN SAFETY FLIGHT SYSTEMS, INC. PREBREATHER/PORTABLE OXYGEN SYSTEM Final Report ROBERT L. STEPHENS, FRANCIS S. KNOX, ROBERT A. MITCHELL, and VADANKUMAR M. PATEL Jan. 1991 27 p (Contract DA PROJ. 3E1-62787-A-878) (AD-A232723; USAARL-91-5) Avail: NTIS HC/MF A03 CSCL 14/2

In response to a request from the Aviation Life Support Equipment Product Manager (ALSE-PM) of the Aviation Systems Command (AVSCOM), the U.S. Army Aeromedical Research Laboratory (USAARL) conducted an investigation and evaluation of the Prebreather/Portable Oxygen System (P/POS) manufactured by American Safety Flight Systems, Inc. A test of the P/POS was conducted in the hypobaric chamber at the U.S. Army School of Aviation Medicine. Four crews of four subjects each and one crew of three (the last crew had only three because one subject had a middle ear infection) prebreathed 100 percent chamber oxygen for 30 minutes. Then they switched to the P/POS while the chamber was depressurized to 18,000 feet MSL at a rate of 500 fpm. They remained at this altitude pressure until they reduced the P/POS pressure from 1800 psi to 200 psi. Following this, the chamber was repressurized to sea level at a rate of 4000 fpm. Mission durations, percent oxygen saturation and cognitive performance were measured for each subject. The average mission duration was 2 hr 28 min with a standard deviation of 13.9 min. The study indicated the P/POS will meet the needs of all helicopter missions for the Army that do not require prebreathing.

#### AIRBORNE WIND SHEAR DETECTION AND WARNING SYSTEMS: THIRD COMBINED MANUFACTURERS' AND TECHNOLOGISTS' CONFERENCE, PART 2

DAN D. VICROY, comp., ROLAND L. BOWLES, comp., and HERBERT SCHLICKENMAIER, comp. (Federal Aviation Administration, Washington, DC.) Jan. 1991 464 p Conference held in Hampton, VA, 16-18 Oct. 1990 Prepared in cooperation with Federal Aviation Administration, Washington, DC (NASA-CP-10060-PT-2; NAS 1.55:10060-PT-2;

DOT/FAA/RD-91/2-PT-2) Avail: NTIS HC/MF A20 CSCL 01/3
The Third Combined Manufacturers' and Technologists'
Conference was held in Hampton, Va., on October 16-18, 1990.
The purpose of the meeting was to transfer significant on-going results of the NASA/FAA joint Airborne Wind Shear Program to the technical industry and to pose problems of current concern to the combined group. It also provided a forum for manufacturers to review forward-look technology concepts and for technologists to gain an understanding of the problems encountered by the manufacturers during the development of airborne equipment and the FAA certification requirements.

# N91-24141\*# Lockheed Missiles and Space Co., Palo Alto, CA. CLASS: COHERENT LIDAR AIRBORNE SHEAR SENSOR. WINDSHEAR AVOIDANCE

RUSSELL TARG In NASA. Langley Research Center, Airborne Wind Shear Detection and Warning Systems: Third Combined Manufacturers' and Technologists' Conference, Part 2 p 509-526 Jan 1991

(LMSC-F-415048) Avail: NTIS HC/MF A20 CSCL 01/3

The coherent lidar airborne shear sensor (CLASS) is an airborne CO2 lidar system being designed and developed by Lockheed Missiles and Space Company, Inc. (LMSC) under contract to NASA Langley Research Center. The goal of this program is to develop a system with a 2- to 4-kilometer range that will provide a warning time of 20 to 40 seconds, so that the pilot can avoid the hazards of low-altitude wind shear under all weather conditions. It is a

predictive system which will warn the pilot about a hazard that the aircraft will experience at some later time. The ability of the system to provide predictive warnings of clear air turbulence will also be evaluated. A one-year flight evaluation program will measure the line-of-sight wind velocity from a wide variety of wind fields obtained by an airborne radar, an accelerometer-based reactive wind-sensing system, and a ground-based Doppler radar. The success of the airborne lidar system will be determined by its correlation with the windfield as indicated by the onboard reactive system, which indicates the winds actually experienced by the NASA Boeing 737 aircraft.

N91-24142\*# Ophir Corp., Lakewood, CO. CONTINUOUS WAVE LASER FOR WIND SHEAR DETECTION LOREN NELSON In NASA. Langley Research Center, Airborne Wind Shear Detection and Warning Systems: Third Combined Manufacturers' and Technologists' Conference, Part 2 p 527-554 Jan. 1991

Avail: NTIS HC/MF A20 CSCL 01/3

Details of the design and development of a continuous-wave heterodyne carbon dioxide laser which has wind shear detection capabilities are given in viewgraph form. The goal of the development was to investigate the lower cost CW (rather than pulsed) lidar option for look-ahead wind shear detection from aircraft. The device has potential utility for ground based wind shear detection at secondary airports where the high cost of a Terminal Doppler Weather Radar system is not justifiable.

STATUS OF 2 MICRON LASER TECHNOLOGY PROGRAM

MARK STORM In its Airborne Wind Shear Detection and Warning Systems: Third Combined Manufacturers' and Technologists Conference, Part 2 p 555-576 Jan. 1991 Avail: NTIS HC/MF A20 CSCL 01/3

The status of 2 micron lasers for windshear detection is described in viewgraph form Theoretical atmospheric and instrument system studies have demonstrated that the 2.1 micron Ho:YAG lasers can effectively measure wind speeds in both wet and dry conditions with accuracies of 1 m/sec. Two micron laser technology looks very promising in the near future, but several technical questions remain. The Ho:YAG laser would be small, compact, and efficient, requiring little or no maintenance. Since the Ho:YAG laser is laser diode pumped and has no moving part, the lifetime of this laser would be directly related to the diode laser lifetimes which can perform in excess of 10,000 hours. Efficiencies of 3 to 12 percent are expected, but laser demonstrations confirming the ability to Q-switch this laser are required. Coherent laser operation has been demonstrated for both the CW and Q-switched lasers.

In NASA. Langley Research Center, BURNELL MCKISSICK Airborne Wind Shear Detection and Warning Systems: Third Combined Manufacturers' and Technologists' Conference, Part 2 p 589-608 Jan. 1991

Avail: NTIS HC/MF A20 CSCL 01/3

The status of NASA's wind shear detection research is reported in viewgraph form. Information is given on early experience, FLIR detectors, quantities measured by Airborne Warning and Avoidance System 1 (AWAS 1), the time series model for Flight 551, conclusions from NASA 737 flights, conclusions on Orlando 7-7-90, Author and AWAS 3 mnemonics.

N91-24146\*# Turbulence Prediction Systems, Boulder, CO. STATUS OF TURBULENCE PREDICTION SYSTEM'S AWAS 3 PAT ADAMSON In NASA. Langley Research Center, Airborne Wind Shear Detection and Warning Systems: Third Combined Manufacturers' and Technologists' Conference, Part 2 p 609-635 Jan. 1991

Avail: NTIS HC/MF A20 CSCL 01/3

The status of the Airborne Warning and Avoidance System 3 (AWAS 3) is reported in viewgraph form. Information is given on flight tests and FAA certification. Included is a description of the flight test of a passive infrared system that achieved the first ever advanced warning of an in-flight windshear encounter. The infrared system recorded the detection of the windshear with a 35 second advance warning. The data recorded in-flight by the infrared system was later compared to and found to agree with the data recorded by the Terminal Doppler Weather Radar (TDWR) and the in-situ Author air data.

#### N91-24147\*# Colorado State Univ., Fort Collins. AN AIRBORNE FLIR DETECTION AND WARNING SYSTEM FOR LOW ALTITUDE WIND SHEAR

PETER C. SINCLAIR and PETER M. KUHN (Aries Corp., McLean, In NASA. Langley Research Center, Airborne Wind Shear Detection and Warning Systems: Third Combined Manufacturers' and Technologists' Conference, Part 2 p 637-677 Submitted for publication

Avail: NTIS HC/MF A20 CSCL 01/3

It is shown through some preliminary flight measurement research that a forward looking infrared radiometer (FLIR) system can be used to successfully detect the cool downdraft of downbursts (microbusts/macrobursts) and thunderstorm gust front outflows that are responsible for most of the low altitude wind shear (LAWS) events. The FLIR system provides a much greater safety margin for the pilot than that provided by reactive designs such as inertial air speed systems. Preliminary results indicate that an advanced airborne FLIR system could provide the pilot with remote indication of microburst (MB) hazards along the flight path ahead of the aircraft. Results of a flight test of a prototype FLIR system show that a minimum warning time of one to four minutes (5 to 10 km), depending on aircraft speed, is available to the pilot prior to the microburst encounter. CLUTTER MODELING OF THE DENVER AIRPORT AND SURROUNDING AREAS

STEVEN D. HARRAH, VICTOR E. DELMORE, and ROBERT G. ONSTOTT (Environmental Research Inst. of Michigan, Ann Arbor.) In NASA. Langley Research Center, Airborne Wind Shear Detection and Warning Systems: Third Combined Manufacturers' and Technologists' Conference, Part 2 p 783-836 Avail: NTIS HC/MF A20 CSCL 01/3

To accurately simulate and evaluate an airborne Doppler radar as a wind shear detection and avoidance sensor, the ground clutter surrounding a typical airport must be quantified. To do this, an imaging airborne Synthetic Aperture Radar (SAR) was employed to investigate and map the normalized radar cross sections (NRCS) of the ground terrain surrounding the Denver Stapleton Airport during November of 1988. Images of the Stapleton ground clutter scene were obtained at a variety of aspect and elevation angles (extending to near-grazing) at both HH and VV polarizations. Presented here, in viewgraph form with commentary, are the method of data collection, the specific observations obtained of the Denver area, a summary of the quantitative analysis performed on the SAR images to date, and the statistical modeling of several of the more interesting stationary targets in the SAR database. Additionally, the accompanying moving target database, containing NRCS and velocity information, is described. Author

CHARLES L. BRITT In NASA. Langley Research Center, Airborne Wind Shear Detection and Warning Systems: Third Combined Manufacturers' and Technologists' Conference, Part 2 p 839-867

(Contract NAS1-18925)

Avail: NTIS HC/MF A20 CSCL 01/3

The NASA Radar Simulation Program is a comprehensive calculation of the expected output of an airborne coherent pulse Doppler radar system viewing a low level microburst along or near the approach path. Inputs to the program include the radar system parameters and data files that contain the characteristics of the microbursts to be simulated, the ground clutter map, and the discrete target data base which provides a simulation of the moving ground clutter. For each range bin, the simulation calculates the received signal amplitude level by integrating the product of the antenna gain pattern and the scattering source amplitude and phase of a spherical shell volume segment defined by the pulse width, radar range, and ground plane intersection. A series of in-phase and quadrature pulses are generated and stored for further processing if desired. In addition, various signal processing techniques are used to derive the simulated velocity and hazard measurements, and store them for use in plotting and display programs.

Avail: NTIS HC/MF A20 CSCL 01/3

Presented here is a description of a coherent radar scattermeter and its associated signal processing hardware, which have been specifically designed to detect microbursts and record their radar characteristics. Radar parameters, signal processing techniques and detection algorithms, all under computer control, combine to sense and process reflectivity, clutter, and microburst data. Also presented is the system's high density, high data rate recording system. This digital system is capable of recording many minutes of the in-phase and quadrature components and corresponding receiver gains of the scattered returns for selected spatial regions, as well as other aircraft and hardware related parameters of interest for post-flight analysis. Information is given in viewgraph form.

Theoretical studies and experimental results obtained at Coulommiers airport showed the capability of Proust radar to detect wind shears, in clear air condition as well as in presence of clouds or rain. Several examples are presented: in a blocking highs situation an atmospheric wave system at the Brunt-Vaisala frequency can be clearly distinguished; in a situation of clouds without rain the limit between clear air and clouds can be easily seen; and a windshear associated with a gust front in rainy conditions is shown. A comparison of 30 cm clear air radar Proust and 5 cm weather Doppler radar Ronsard will allow to select the best candidate for wind shear detection, taking into account the low sensibility to ground clutter of Ronsard radar. INTEGRATION OF WEATHER SENSING DEVICES

JIM DAILY In NASA. Langley Research Center, Airborne Wind Shear Detection and Warning Systems: Third Combined Manufacturers' and Technologists' Conference, Part 1 p 177-199

Avail: NTIS HC/MF A21 CSCL 01/3

The state of airborne atmospheric sensing is continually evolving as devices are developed which further enhance the detection of meteorological phenomena. Assuming that these technologies prove to be feasible, the greatest long-term benefit would be attained by effective integration of the various sensors. A system which could accomplish this goal would conceivably provide enhanced atmospheric analysis, coherent display capability, and would allow for the development of expert system to predict weather conditions. The existing and developing weather detection technologies are presented, followed by an overview of what issues must be dealt with in the creation of an integrated system. A framework of a basic system is also presented which identifies some of the potential applications that exist.

#### NATIONAL AIRSPACE SYSTEM. COMMUNICATIONS **OPERATIONAL CONCEPT NAS-SR-136**

WILLIAM TRENT, THOMAS PICKERELL, and HAROLD NELSON May 1991 68 p

(Contract DTFA01-91-Y-01004)

(DOT/FAA/SE-91/1) Avail: NTIS HC/MF A04

A requirement of the National Airspace System (NAS) is to provide for communications, as identified in the NAS Requirement Specification, NAS-SR-1000 (NASSRS). A concept of operation for air-ground, ground-ground communications connectivity and capability, and national emergency communications is presented. This concept describes the capabilities and shows the relationships between subsystems, facilities, information, and operators/users. It is intended to provide a common perspective for personnel involved in communication activities, assist in determining whether communications meet formal requirements, and support coordination among the organizations involved. This concept is one of eight operational concepts. The remaining yet to be written concepts will complete the description of the system requirements as detailed in the NASSRS.

Royal Aerospace Establishment, Farnborough N91-24186# (England).

LIGHTNING PROTECTION REQUIREMENTS FOR AIRCRAFT: A PROPOSED SPECIFICATION

G. A. M. ODAM, A. W. HANSON, and R. H. EVANS (Halarose Ltd., England ) 25 Oct. 1990 147 p Revised (RAE-TM-FS(F)-632-ISSUE-1-REV; BR116373; ETN-91-99331; AD-A233712) Copyright Avail: NTIS HC/MF A07

A Royal Aerospace recommendation for a specification to define the United Kingdom Ministry of Defense (UK MOD) requirements for the lightning protection of aircraft is presented. It is an appendix to a JAC paper proposing changes to the lightning content of DEF STAN 00-970. This issue covers background and advisory material, certification, design, and testing requirements. It applies to all fixed and rotary wing aircraft.

THE AIRBAG AS A SUPPLEMENT TO STANDARD RESTRAINT SYSTEMS IN THE AH-1 AND AH-64 ATTACK HELICOPTERS AND ITS ROLE IN REDUCING HEAD STRIKES OF THE COPILOT/GUNNER, VOLUME 2 Final Report

NABIH M. ALEM, DENNIS F. SHANAHAN, and JOHN V. BARSON Jan. 1991 162 p

(AD-A232907; USAARL-91-6-VOL-2) Avail: NTIS HC/MF A08 CSCL 01/3

Accident investigation records of U.S. Army helicopter crashes show injuries of pilots due to striking a structure inside the cockpit outnumber those due to excessive accelerations by a five-to-one ratio. This two-volume report presents the results of a study of the effectiveness of airbags in reducing the severity of contact injury to the gunner when striking the gunsight. Airbag systems were installed on the gunsights in simulated Cobra and Apache cockpits, then sled tested at 7 and 25 g. The tests indicated airbags reduced head accelerations by 65 percent, head injury criteria by 77 percent, and head angular acceleration by 76 percent in the Cobra tests. In the Apache tests, the airbags reduced those same indicators by 68, 52, and 83 percent. An airbag system, the report concludes, is likely to prevent severe or fatal head and chest injuries in an Apache or Cobra crash. Volume 1 of the report describes the tests and discusses the results. Volume 2 consists of Appendixes A, B, and C of the report and contains processed signal graphs of all sled tests.

#### AIRCRAFT COMMUNICATIONS AND NAVIGATION

Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

#### A91-37094 RELATIVE EFFECTIVENESS OF 2-D VS. 1-D HIGH RESOLUTION MICROWAVE IMAGEING

BERNARD D. STEINBERG and BONGSOON KANG (Pennsylvania, University, Philadelphia) IN: Noise and clutter rejection in radars and imaging sensors; Proceedings of the 2nd International Symposium, Kyoto, Japan, Nov. 14-16, 1989. Amsterdam, Elsevier Science Publishers, 1990, p. 142-147. Research supported by USAF and U.S. Army. refs Copyright

The relative effectiveness of two-dimensional and one-dimensional high-resolution microwave imaging is evaluated, with preliminary comparison results presented for the Boeing 727 and the widebodied L-1011. Data were obtained at X-band as the aircraft were flying into Philadelphia International Airport. The data-acquisition radar was a low-power 1250-W-peak short-pulse fully coherent radar. The results indicate that it is as yet unwarranted to conclude that one-dimensional imaging is relatively useless for target identification.

#### A91-37101 **EVOLUTION OF CLUTTER SUPPRESSION TECHNIQUES FOR** AIR TRAFFIC CONTROL AND SURVEILLANCE RADAR

GASPARE GALATI (Roma II, Universita, Rome, Italy) IN: Noise and clutter rejection in radars and imaging sensors; Proceedings of the 2nd International Symposium, Kyoto, Japan, Nov. 14-16, 1989. Amsterdam, Elsevier Science Publishers, 1990, p. 257-262. refs

Copyright

The problem of suppressing clutter while maintaining the detection capability of aircraft targets is of paramount importance for air traffic control radars. This paper deals with the most popular suppression method, i.e., discriminating clutter from moving targets by Doppler filtering. The development of valuable clutter filtering techniques and of the pertinent processing schemes is reviewed. Some pitfalls related to incorrect use of intuition (instead of the well-established theory corroborated by field experience) are also described. The overall evolution of the ATC radar is also reviewed, including future trends.

#### A91-37107 ALL SOLID-STATE ASR WITH ADAPTIVE PULSE DOPPLER PROCESSING

HIROSHI NAKAMURA, and TOSHIHIKO EliCHI KIUCHI, HAGISAWA (NEC Corp., Radio Application Div., Fuchu, Japan) IN: Noise and clutter rejection in radars and imaging sensors; Proceedings of the 2nd International Symposium, Kyoto, Japan, Nov. 14-16, 1989. Amsterdam, Elsevier Science Publishers, 1990, p. 293-298.

Copyright

An all solid-state ASR employing a pulse Doppler processor

#### 04 AIRCRAFT COMMUNICATIONS AND NAVIGATION

adaptable to each clutter area and capable of supplying analog video with smoothed blips has been developed. The high subclutter visibility provided by pulse Doppler processing is combined with the azimuth accuracy of a conventional MTI. The new ASR promises better target detectability for small aircraft in a clutter environment, with better reliability and maintainability than conventional radars.

#### SSR SIGNAL DISCRIMINATION FROM GARBLED REPLIES

KAKUICHI SHIOMI and TORAO ISHIBASHI (Ministry of Transport, Electronic Navigation Research Institute, Mitaka, Japan) IN: Noise and clutter rejection in radars and imaging sensors; Proceedings of the 2nd International Symposium, Kyoto, Japan, Nov. 14-16, 1989. Amsterdam, Elsevier Science Publishers, 1990, p. 397-402. Copyright

A new method for discriminating garbled SSR (Secondary Surveillance Radar) replies is described. By using two SSR receiving stations and analyzing received signals from aircraft, the SSR identification of aircraft is made for the garbled replies. The results of the simulation show that aircraft has been identified about 90 percent of cases by this method when two replies are garbled.

#### ADAPTIVE AIRBORNE TRACK WHILE SCAN

DAVID CALUGI and ALDO RICCOBONO (Segnalamento Marittimo ed Aereo S.p.A., Florence, Italy) IN: Noise and clutter rejection in radars and imaging sensors; Proceedings of the 2nd International Symposium, Kyoto, Japan, Nov. 14-16, 1989. Amsterdam, Elsevier Science Publishers, 1990, p. 596-601.

This paper presents the track while scan (TWS) systems adopted on airborne radar for tracking of naval targets. The filter adopted is an adaptive Kalman, which permits it to support the tracking of targets that are either in a steady state or maneuvering. This TWS technique gives accurate estimations of both the start and termination of target maneuvers as it can select the proper bandwidth of the estimator filter according to the relation between the maneuver and noise intensity. To evaluate both the filtering efficiency and the plot extractor, the geometric operative environment and the radar processing chain are simulated on VAX computers.

## EVALUATION OF THE PERFORMANCE OF A RISC BASED REAL TIME DATA PROCESSOR IN AIR TRAFFIC CONTROL RADAR APPLICATIONS

PIERCARLO GIUSTINIANI (Selenia S.p.A., Rome, Italy) IN: Noise and clutter rejection in radars and imaging sensors; Proceedings of the 2nd International Symposium, Kyoto, Japan, Nov. 14-16, 1989. Amsterdam, Elsevier Science Publishers, 1990, p. 638-643. Copyright

A RISC based architecture developed to perform radar management, parameter extraction, adaptivity control, and clutter/interference rejection in ATC systems is described. Relevant parameters, design criteria, HW/SW allocation of the implemented functions and the SW algorithms are analyzed. This architecture is optimized to process the detections created by a thresholding system applied to a filtered video, but it can be readily utilized in different processing models. The utilization of processor resources in terms of data and program memory occupations and computing power for the different radar functions is shown.

(Kharkov) (ISSN 0485-8972), no. 91, 1989, p. 100-106. In Russian. refs

Copyright

A theoretical model is developed for characterizing the reception by the antennas of a descending aircraft of radio-beacon signals. It is shown that the intensity of fields arising due to reflection from the ground and the aircraft is significant. The intensity of these fields is directly proportional to the conductivity of the underlying surface and the size of the aircraft.

#### AIR TRAFFIC CONTROL TODAY AND TOMORROW

THOMAS STONOR (National Air Traffic Services, London, England) Journal of Navigation (ISSN 0373-4633), vol. 44, May 1991, p. 143-151.

Copyright

An overview is presented of the current ATC situation in and around the UK and how the constantly growing congestion, with its attendant route and airport complications, is being addressed. Among the new systems being introduced, consideration is given to the Microwave Landing System, the Advanced Air Traffic Services system, Mode-S radar technology, Navstar, and the Global Navigation Satellite System. Some of the key issues addressed are the research, development and evaluation of air-ground data link technology, the analysis of improved route structures, airspace sectorization and air traffic procedures, and evaluation for wider application of conflict alert facilities and operational trials of the independent 'last ditch' airborne collision avoidance system.

## EUROPEAN STUDIES TO INVESTIGATE THE FEASIBILITY OF USING 1000 FT VERTICAL SEPARATION MINIMA ABOVE FL 290. I

M. E. COX (Eurocontrol, Brussels, Belgium), J. M. TEN HAVE (National Aerospace Laboratory, Amsterdam, Netherlands), and D. A. FORRESTER (Meteorological Office, Bracknell, England) Journal of Navigation (ISSN 0373-4633), vol. 44, May 1991, p. 171-183. refs

Copyright

In response to airline pressures for fuel economies, ICAO established a study program early in the 1980's to determine the feasibility of halving the vertical separation minimum (VSM) utilized above flight level (FL) 290 to 1000 ft. This paper describes a European contribution to this program. The aims and organization of the experimental work are outlined; the choice of methodology available to measure height-keeping errors is described; and an indication of the measurement accuracy achieved is given. It is shown that, whereas it would be technically feasible to introduce a 1000-ft VSM in the North Atlantic region, other measures would be necessary prior to using it in continental airspace.

## CURRENT STATUS AND FUTURE PROSPECTS OF AIR TRAFFIC CONTROL [SITUATION ACTUELLE ET FUTURE DU CONTROLE DE LA CIRCULATION AERIENNE]

BERNARD MIALLIER (Eurocontrol, Brussels, Belgium) Navigation (Paris) (ISSN 0028-1530), vol. 39, April 1991, p. 201-209. In French.

Copyright

A review of the current problems confronting air traffic control and the requirements for alleviating this situation is presented. ATC today is significantly constrained by current communication, navigation and surveillance limitations, most of which are the result of unreliable HF communication, line of sight propagation, voice communication that is not conducive to the exchange of diverse and complex data. Planning and coordination for correcting these problems are discussed. It is indicated that improvements between air and ground units can be realized, and an adaptation to traffic demand where automated assistance will help in reducing the control workload per aircraft can be achieved.

FLIGHT TESTS SHOW POTENTIAL BENEFITS OF DATA LINK AS PRIMARY COMMUNICATION MEDIUM

CHARLES H. SCANLON and CHARLES E. KNOX (NASA, Langley Research Center, Hampton, VA) International Aeronautical Telecommunications Symposium on Data Link Integration, McLean,

VA, May 20-23, 1991, Paper. 13 p.

Message exchange for air traffic control (ATC) purposes via data link offers the potential benefits of increasing the airspace system safety and efficiency. This is accomplished by reducing communication errors and relieving the overloaded ATC radio frequencies, which hamper efficient message exchanges during peak traffic periods in many busy terminal areas. However, the many uses and advantages of data link create additional questions concerning the interface among the human-users and the cockpit and ground systems. A flight test was conducted in the NASA Langley B-737 airplane to contrast flight operations using current voice communications with the use of data link for transmitting both strategic and tactical ATC clearances during a typical commercial airline flight from takeoff to landing. Commercial airplane pilots were used as test subjects.

## ANGLE-ONLY TRACKING FILTER IN MODIFIED SPHERICAL COORDINATES

DAVID V. STALLARD Journal of Guidance, Control, and Dynamics (ISSN 0731-5090), vol. 14, May-June 1991, p. 694-696. refs

Copyright

The process of choosing an efficient coordinate system for angle-only tracking is extended to three dimensions with modified spherical coordinates. The modified spherical coordinates filter has six state variables: two angles, their derivatives, inverse range, and range rate over range, which are transformable into Cartesian position and velocity. The six-state filter successfully estimates the equivalents of position and velocity in three dimensions for a nonmaneuvering target, using only moderate accelerations of the tracking aircraft. Although the particular application is for 'track-while-scan' by an aircraft, the algorithm could also be used by a homing missile with a faster data rate.

## A91-39756 PULSE DOPPLER SIGNATURE OF A ROTARY-WING AIRCRAFT

BARRY D. BULLARD and PATRICK C. DOWDY (Georgia Institute of Technology, Atlanta) IEEE Aerospace and Electronic Systems Magazine (ISSN 0885-8985), vol. 6, May 1991, p. 28-30. Copyright

Field measurements of a modified Sikorsky S-55 helicopter target were carried out to investigate rotary-wing aircraft Doppler radar signature phenomenology. The results of the data analysis with regard to classification and identification of the aircraft based on its signature are presented. It was found that using the Doppler radar return and appropriate feature extraction techniques, the helicopter's design features can be estimated. Target backscatter from the main rotor blades, tail rotor blades, or hub can be used for target detection, acquisition, and classification as a rotary-wing aircraft. The extraction of configuration and blade count features can further define the helicopter for identification.

#### A91-39776 HIGH GAIN AIRBORNE ANTENNA FOR SATELLITE COMMUNICATIONS

SHINICHI TAIRA, MASATO TANAKA, and SHINGO OHMORI (Communications Research Laboratory, Kashima, Japan) IEEE Transactions on Aerospace and Electronic Systems (ISSN 0018-9251), vol. 27, March 1991, p. 354-360. refs Copyright

The performance of an airborne phased-array antenna, which was developed and evaluated onboard a commercial aircraft using the Engineering Test Satellite V (ETS-V), is reported. The system requirements and the antenna configuration that satisfies them are described. The radiation pattern, gain and axial ratio, noise temperature and ratio of gain to noise temperature, and environmental characteristics are presented. The results obtained by the flight experiments demonstrate that the performance of the antenna is the same as that on the ground, so that the antenna is suitable for installation in an aircraft for satellite communications.

#### 406 MHZ ELT SIGNAL SPECTRA FOR SARSAT

GARY VRCKOVNIK (Defence Research Establishment Ottawa, Canada) and CHARLES R. CARTER (McMaster University, Hamilton, Canada) IEEE Transactions on Aerospace and Electronic Systems (ISSN 0018-9251), vol. 27, March 1991, p. 388-407, NSERC-supported research. refs

Copyright

The signal format and spectral properties of the 406-MHz emergency locator transmitter (ELT) used in the search and rescue satellite aided tracking (Sarsat) system are examined. The ELT improves location estimate accuracies and can relay information about the particular aircraft and its problem, by means of the digitally modulated message fields. It is shown that due to the RF signal frequency characteristics and the Doppler shift, processing must be performed over a frequency band of approximately 25 kHz. Through the use of the fast Fourier transformation (FFT), the frequency spectrum of the ELT is analyzed, taking account of effects due to noise, multiple simultaneously received signals, and Doppler shift. It is demonstrated that the FFT provides an effective means for detecting and recognizing the presence of one or more ELT signals over this 25-kHz frequency band. Some recommendations are made to improve the spectral characteristics and the performance of the ELT. I.E.

AIRBORNE COLLISION AVOIDANCE SYSTEM (ACAS) IN CONTROLLED AIR TRAFFIC. ASPECTS OF RECIPROCAL INFLUENCE IN SECONDARY SURVEILLANCE RADAR (SSR) RADIO LOADS [BORDKOLLISIONSSCHUTZSYSTEME IM KRONTROLLIERTEN LUFTVERKEHR ASPEKTE GEGENSEITIGER BEEINFLUSSUNG IM SSR FUNKFELD]
ANDREAS HERBER and ROLAND MALLWITZ Nov. 1990 45 p In GERMAN

(ETN-91-99253) Avail: NTIS HC/MF A03

The aim was a qualitative and quantitative evaluation of potential reciprocal influences in secondary surveillance radar (SSR) radio loads. This was made possible by an interpretation of the results of the radio load measurements and by an analysis of existing specifications for the various airborne collision avoidance system (ACAS). Definitive statements are impossible on account of the continuously changing boundary conditions, such as the number of active ground stations. It was shown by the algorithms contained in all II/III ACAS for interference limitations, that the performance realized additionally in the radio loads by all instruments for a maximum of 280 interrogations is limited within a perimeter of 30 nautical miles. It appears differently for ACAS I instruments, where this system is hardly active on account of high interrogation numbers. The observation area is limited to 5 nautical miles. It was concluded that the actions of ACAS II/III on the air traffic control are possible with secondary radar.

Technical Report, Nov. 1989 - Nov. 1990
L. F. PERSELLO Nov. 1990 61 p

(AD-A232668; DOT/FAA/CT-TN90/48) Avail: NTIS HC/MF A04 CSCL 17/7

This report describes flight tests conducted by the Federal Aviation Administration (FAA) Technical Center to examine the performance of the Differential Global Positioning System (DGPS) in the terminal area. The tests employed a Convair 580 (CV-580) and a pair of Motorola Eagle Mini Rangers. With the advent of a maturing Global Positioning System (GPS) constellation, the FAA is assuming a more intensive stance in addressing the many questions/problems associated with GPS. These DGPS tests investigated the obtainable accuracy under static and dynamic conditions. The static tests employed survey points as a baseline. The dynamic tests incorporated terminal area flight profiles and nonprecision approaches using a laser tracker as a base line. The accuracy performance of DGPS showed an order of magnitude improvement in the static environment and a 4 to 5 fold improvement in the dynamic environment over stand alone GPS. The DGPS tests were conducted in an effort to build an FAA DGPS data base to aid in addressing GPS questions/problems.

NAVIGATION, GUIDANCE, AND TRAJECTORY OPTIMIZATION FOR HYPERSONIC VEHICLES

R. L. SCHULTZ, M. J. HOFFMAN, A. M. CASE, and S. I. SHEIKH

In AGARD, Hypersonic Combined Cycle Propulsion 22 p
1990 Sponsored in part by AF

Copyright Avail: NTIS HC/MF A20; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

A computationally efficient, real time trajectory optimization and guidance approach for hypersonic aircraft is described. The optimization algorithms compute, in-flight, minimum fuel trajectories within constraints from the current aircraft position to its final destination. In-flight trajectory computation can provide a high degree of vehicle autonomy which could greatly reduce aircraft ground support costs. The optimization approach is based on Euler-Lagrange theory and energy state approximations. A 3-D, spherical earth, aircraft motion model, with constraints on temperature, dynamic pressure and stall, is used. An exact optimal iterative solution and an approx, closed form feedback solution method are developed. In the exact approach, solutions are computed by iteration on adjoint constants. Each iteration requires a complete forward trajectory integration. In the approx. closed form feedback approach, the adjoint constants are expressed in terms of the states. No forward trajectory calculations are required. thus, the computations are minimal. Minimum fuel climb to orbit, powered abort, and unpowered abort trajectories are computed with both methods. The approx. closed form feedback solution closely matches the optimal iterative solution. A computationally efficient method for generating unpowered descent footprints is also described. Footprints are used to identify candidate landing sites under an engine failure or other emergency conditions, and to initiate final descent. A hypersonic vehicle guidance, navigation, and control configuration using the optimal closed form feedback guidance and the footprint generator is described.

### ROTOR-FUSELAGE DYNAMICS OF HELICOPTER AIR AND GROUND RESONANCE

ROBERT A. ORMISTON (U.S. Army, Aeroflightdynamics Directorate, Moffett Field, CA) American Helicopter Society, Journal (ISSN 0002-8711), vol. 36, April 1991, p. 3-20. refs Copyright

An analytical investigation of the air- and ground-resonance characteristics of simplified hingeless-rotor helicopter configurations was undertaken. The objectives were to identify and interpret the unique characteristics of coupled rotor-body modes that determine air-resonance stability characteristics, as contrasted to ground-resonance phenomena. The study examined the influence on air-resonance stability of unusual rotor-body modal characteristics such as nonoscillatory body modes. The results indicate that air-resonance instability does not require distinct coalescences of lead-lag and rotor-body modal frequencies, and unusual rotor-body frequency characteristics do not significantly alter the occurrence of air-resonance instability or the effectiveness of aero-elastic couplings. The character of air-resonance and flap-lag instabilities was found to change significantly at high rotor speeds for high-Lock number and low-inertia configurations. It was found that the rotor-body modes that participate in both air and ground resonance can be related to one another. Author

#### A91-36360 GROUND RESONANCE OF A HELICOPTER WITH INTER-CONNECTED BLADES

A. ROSEN (Technion - Israel Institute of Technology, Haifa) and N. M. SELA American Helicopter Society, Journal (ISSN 0002-8711), vol. 36, April 1991, p. 82-85. refs Copyright

The ground resonance problem of a helicopter with a rotor incorporating interconnected blades is analyzed. The blades are interconnected with springs and dampers. In analyzing such a problem, terms not found in rotors without interblade coupling are encountered. The classic Multiblade Coordinate Transformation cannot deal with these terms, and a Modified Multiblade Coordinate Transformation is derived. The set of constant coefficient equations is obtained, using the modified transformation. Examination of the equations reveals that the interconnecting springs and dampers are more effective than blade-to-hub springs and dampers, for most existing rotors.

### THE DESIGN, MANUFACTURE, AND TEST OF A ONE-PIECE THERMOPLASTIC WING RIB FOR TILTROTOR AIRCRAFT

E. J. SHAHWAN (Bell Helicopter Textron, Inc., Fort Worth, TX) Society of Manufacturing Engineers, Conference on Fabricating Composites '90, Arlington, TX, Oct. 8-11, 1990. 22 p. (SME PAPER EM90-665) Copyright

Existing tiltrotor aircraft wing ribs, fabricated from carbon/epoxy thermoset materials, use five stiffeners and two cords attached to the rib web by approximately 150 mechanical fasteners. This program aims to reduce aircraft weight and cost by designing a one-piece thermoplastic wing rib. Full-scale thermoplastic ribs are made using various processes, then structurally tested to validate the design concept. To reduce weight and cost, a cost-sharing program was implemented between Bell Helicopter Textron, incorporated and four major thermoplastic fabricators; this consists of designing, fabricating, and testing a thermoplastic wing rib. This paper addresses design concept, material characterization, proposed tooling and manufacturing approach, structural testing, and preliminary cost and weight savings to support program objectives.

#### TOWARD ENHANCED FIGHTER COMBAT EFFECTIVENESS

Aerospace Engineering (ISSN 0736-2536), vol. 11, May 1991, p. 8-12.

Copyright

A continuing USAF development program concentrates on integrating and demonstrating critical technologies that will improve fighter aircraft survivability during air combat engagements. Emphasis of the Integrated Control and Avionics for Air Superiority (ICAAS) program is centered on beyond-visual-range multiple target attack capability, with provisions for effective transition to close-in combat. ICAAS development is divided into five primary functions: tactics, attack management, attack guidance, defensive assets manager, and performance monitor. Each of these functions is discussed along with total system integration. A specific ICAAS approach has been developed, and the software/hardware components have been incorporated into the system.

### COMMERCIAL AIRCRAFT FUEL EFFICIENCY POTENTIAL THROUGH 2010

DAVID L. GREENE (Oak Ridge National Laboratory, TN) IN: IECEC-90; Proceedings of the 25th Intersociety Energy Conversion Engineering Conference, Reno, NV, Aug. 12-17, 1990. Vol. 4. New York, American Institute of Chemical Engineers, 1990, p. 106-111. Previously announced in STAR as N91-12671. refs Copyright

Aircraft are second only to motor vehicles in the use of motor fuels, and air travel is growing twice as fast. Since 1970 air travel has more than tripled, but the growth of fuel use has been restrained by a near doubling of efficiency, from 26.2 seat miles per gallon (SMPG) in 1970 to about 49 SMPG in 1989. This paper explores the potential for future efficiency improvements via the replacement of existing aircraft with '1990's generation' and 'post 2000' aircraft incorporating advances in engine and

airframe technology. Today, new commercial passenger aircraft deliver 50 to 70 SMPG. New aircraft types scheduled for delivery in the early 1990's are expected to achieve 65 to 80 SMPG. Industry and government researchers have identified technologies capable of boosting aircraft efficiencies to the 100 to 150 SMPG range. Under current industry plans, which do not include a post-2000 generation of new aircraft, the total aircraft fleet should reach the vicinity of 65 SMPG by 2010. A new generation of 100 to 150 SMPG aircraft introduced in 2005 could raise the fleet average efficiency to 75 to 80 SMPG in 2010. In any case, fuel use will likely continue to grow at from 1 to 2 percent per yr. hrough 2010.

SANKAR (Georgia Institute of Technology, Atlanta) Journal of Aircraft (ISSN 0021-8669), vol. 28, March 1991, p. 216-224. Research supported by Bell Helicopter Textron, Inc. and U.S. Army. Previously announced in STAR as N90-20981. refs Copyright

An airfoil design procedure is described that was incorporated into an existing 2-D Navier-Stokes airfoil analysis method. The resulting design method, an iterative procedure based on a residual-correction algorithm, permits the automated design of airfoil sections with prescribed surface pressure distributions. The inverse design method and the technique used to specify target pressure distributions are described. It presents several example problems to demonstrate application of the design procedure. It shows that this inverse design method develops useful airfoil configurations with a reasonable expenditure of computer resources.

## A91-38752 DESIGNING WITH COMPOSITES - A STUDY OF DESIGN PROCESS

S. R. SHANKAR, A. SHARKAWY, C. P. BURGER, and D. G. JANSSON (Texas A & M University, College Station) IN: Composite material technology 1990; Proceedings of the Symposium, 13th ASME Annual Energy-Sources Technology Conference and Exhibition, New Orleans, LA, Jan. 14-18, 1990. New York, American Society of Mechanical Engineers, 1990, p. 1-6. refs

Utilizing a detailed examination of the numerous design decisions in the design of a complex composite aircraft part, it is shown that the dependence of the design process on manufacturing issues is uniquely strong in the design of composite parts and assemblies. Although this dependence is true for design in general, it is amplified by the high degree of coupling between functional

and production requirements which characterize the utilization of composite materials. The findings presented in this paper point to a methodology for designing with composites. Furthermore, a model for study of other design activity is suggested by the useful insights developed by this approach.

### DEMONSTRATION OF A LASER ORDNANCE INITIATION SYSTEM IN AN F-16 SLED

JOHN A. COBBETT and MURPHY J. LANDRY (Scot, Inc., Downers Grove, IL) IN: Annual SAFE Symposium, 27th, New Orleans, LA, Dec. 5-8, 1989, Proceedings. Newhall, CA, SAFE Association, 1990, p. 1-3.

A feasibility study demonstrating certain key aspects of the Laser Ordnance Initiation System is presently conducted. To demonstrate its potential for aircrew egress, a static F-16 sled at Holloman AFB is utilized. The Laser Ordnance Initiation System will jettison the canopy by an initial mechanical actuation of two pyrolasers. Laser energy produced by each pyrolaser is transmitted through a fiber-optic circuit to four different initiation points. At each initiation point, an existing ordnance device inherent to the F-16 is activated redundantly and the canopy is jettisoned. Prior to this demonstration, breadboard tests were conducted utilizing electrical, high-pressure gas, and mechanically actuated pyrolasers in a test setup similar to the sled.

## A91-39380 DEVELOPMENT AND DEMONSTRATION OF CREST SUBSYSTEMS

D. E. SWANSON (Boeing Military Airplanes, Seattle, WA) IN: Annual SAFE Symposium, 27th, New Orleans, LA, Dec. 5-8, 1989, Proceedings. Newhall, CA, SAFE Association, 1990, p. 14-18. Copyright

The designs and tests for each of the major CREST program subsystems are described. The subsystems include a graphite epoxy seat structure, controllable thrust catapult, windblast protection system capable of protection up to 700 KEAS, and an avionics system that includes advanced sensors and high-speed microprocessors. Results from structural proof load tests, windblast tests, wind tunnel tests, seat/man separation tests, and catapult dynamic tests are presented. The adaptive performance of components for an advanced ejection seat including windblast protection, adaptive restaint, digital flight control, and advanced sensors was demonstrated. The findings provide the engineering data required to proceed to full-scale ejection tests during the next phase of the CREST program.

#### A91-39382

#### FIGHTER ESCAPE SYSTEM - THE NEXT STEP FORWARD

BRIAN A. MILLER (Martin-Baker Aircraft Co., Ltd., Higher Denham, England) IN: Annual SAFE Symposium, 27th, New Orleans, LA, Dec. 5-8, 1989, Proceedings. Newhall, CA, SAFE Association, 1990, p. 53-57. Previously announced in STAR as N90-20059. Copyright

Ejection seats have become increasingly complex, heavier and bulkier in recent years. This growth in response to the increasing demands for greater performance, under more severe conditions. It is also due to the relocation onto the seat of equipment which was previously aircraft mounted such as anti-g valve, oxygen regulator, NBC equipment, and OBOGS auxiliary oxygen equipment. In the Tornado, the Mk10A ejection seat even gained outlets for the cabin conditioning system, becoming the world's first air conditioned ejection seat. This trend has persisted for some 15 years, but now new design derivers are becoming dominant with an increasing and urgent need for lightweight and low cost. The Martin-Baker developments of the past 15 years are briefly reviewed and the new trends which are shaping future Fighter Escape Systems discussed.

## A91-39385 EJECTION SEAT ROCKET CATAPULT DESIGN FOR REDUCED G FIELD INFLUENCE

CRAIG WHEELER and FRANK COSTIGAN (U.S. Navy, Naval Ordnance Station, Indian Head, MD) IN: Annual SAFE Symposium, 27th, New Orleans, LA, Dec. 5-8, 1989, Proceedings. Newhall, CA, SAFE Association, 1990, p. 108-113.

Copyright

Modern aircraft with high G maneuverability require an aircrew ejection seat that can perform under high G-loads. Analytical methods were used to study design methods that could decrease the influence of high G on catapult performance. Computer simulations of an existing catapult and theoretical designs were performed. The computer program's accuracy was validated by comparing the results to static firings at normal and high Gs. Simulations were performed at various G loads, temperatures, and seat weights. The study showed that the propellant burning rate exponent contributed significantly towards the sensitivity of the catapult performance at high impressed Gs. Low-pressure catapult designs provide advantages over high-pressure designs by permitting the use of a low exponent propellant burning rate that reduces temperature and G-field sensitivity.

#### THE MINIPAC II EJECTION SEAT PROGRAM

ROBERT B. CALKINS (McDonnell Douglas Corp., Long Beach, CA) IN: Annual SAFE Symposium, 27th, New Orleans, LA, Dec. 5-8, 1989, Proceedings. Newhall, CA, SAFE Association, 1990, p.

Copyright

The Minipac II ejection seat was developed to provide a lightweight, compact, and inexpensive ejection seat for smaller, low-speed aircraft such as turbo trainers and helicopters. This paper describes the design and performance of the Minipac II seat. By limiting the maximum speed to 380 keas, performance close to that of ACES II was achieved without resorting to expensive sequencing. The seat envelope is from zero altitude-zero speed to 380 keas at 50,000 feet. High aft visibility and long scheduled maintenance intervals are the features. Manual over-the-side bailout is an option that is still available.

#### A91-39394 HARDWARE-IN-THE-LOOP TESTING OF THE CREST **EJECTION SEAT CONTROL SYSTEM**

G. J. BURMEISTER and B. M. FRITCHMAN (Boeing Co., Advanced Systems Div., Seattle, WA) IN: Annual SAFE Symposium, 27th, New Orleans, LA, Dec. 5-8, 1989, Proceedings. Newhall, CA, SAFE Association, 1990, p. 181-186.

Copyright

The purpose of the Crew Escape Technologies (CREST) program is to demonstrate new technologies for ejection seats. These seats must be capable of meeting new expanded escape envelope requirements being established by the high-performance capabilities of existing and planned fighter aircraft. These requirements include active attitude and trajectory control of the ejection seat, catapult-acceleration control, propulsion-acceleration control, wind-blast protection, adaptive pilot restraints, and the parachute-deployment attitude and timing. Control system software for control of the CREST ejection seat was written during the current phase IIB of the CREST contract. This software will be used in phase III sled track tests at Holloman Air Force Base.

#### NORTHROP ADVANCED FIGHTER CREW PROTECTION SYSTEM. I - ENGINEERING DEVELOPMENT. II - SYSTEM

DEVELOPMENT, TEST AND EVALUATION

JOHN DAMRON (ILC Dover, Frederica, DE) and SAM PUMA (Northrop Corp., Aircraft Div., Hawthorne, CA) IN: Annual SAFE Symposium, 27th, New Orleans, LA, Dec. 5-8, 1989, Proceedings. Newhall, CA, SAFE Association, 1990, p. 187-194.

Copyright

The present paper describes the development of an advanced fighter crew protection system, an integrated crew system that protects from hostile environments (altitude, acceleration, ejection, thermal, chemical, biological, nuclear, directed radiation, and

munitions) while enhancing mission performance. Descriptions of the following system components are provided: suit assembly, helmet assembly, partial pressure suit, composite assembly, microclimate conditioning subsystem, portable ventilation system, and also portable test equipment. Preliminary results are reported from tests conducted to prove the concept: windblast, explosive atmosphere, heat load, chemical agent simulant, centrifuge, altitude chamber, cockpit compatibility, water immersion, and flight test.

#### CANOPY BREAKING SYSTEM FOR NON-DELAY PILOT RESCUE

RALPH KOCH (Dornier GmbH, Friedrichshafen, Federal Republic of Germany) and HARTMUT GEHSE (Dornier Luftfahrt GmbH, Friedrichshafen, Federal Republic of Germany) IN: Annual SAFE Symposium, 27th, New Orleans, LA, Dec. 5-8, 1989, Proceedings. Newhall, CA, SAFE Association, 1990, p. 207-210.

Copyright

Technology for the accelerated rescue of a pilot from his cockpit is discussed. Consideration is given to the development of a new canopy-breaking system which does not impair the pilot's view and offers the following advantages: rescue time in uncontrollable aircraft is shortened; bird strike risk is reduced; splintered glass is avoided when the canopy is fragilized and opened and fractured glass is removed from the pilots' ejection path in a defined way; and the ejection path is immediately opened while an optimally controlled transparency structure is maintained. Schemes illustrate the trial and future setup of cutting-cord installation; calculated stress curves for two critical points and crack formation observed during testing; the position and time dependence of calculated stress lines within the transparency half; and the cutting cord P.D. arrangement.

#### APPLICATION OF MULTIPLE-INPUT/SINGLE-OUTPUT ANALYSIS PROCEDURES TO FLIGHT TEST DATA

J. K. SRIDHAR (National Aeronautical Laboratory, Bangalore, India) and G. WULFF (DLR, Institut fuer Flugmechanik, Brunswick, Federal Republic of Germany) Journal of Guidance, Control, and Dynamics (ISSN 0731-5090), vol. 14, May-June 1991, p. 645-651. refs

Copyright

A computer program for the analysis of correlated multiple-input/single-output systems has been developed using the techniques of Bendat. This iterative procedure allows spectral separation to enable sequential as well as combined inspection of input/output relationships. The analogy of conditioning of spectral density functions to that of Gaussian elimination has been used for efficient realization of the algorithm. Described are the method and its applications to flight test data of two research vehicles, a helicopter and a new in-flight simulator. The examples show the detection of extraneous noise at the output caused by a fewer number of inputs together with the investigation of the control buildup in the helicopter case, and in the other case the influence of the autotrim system of the in-flight simulator on its direct lift control flaps. The results and conclusions are drawn based on the investigation of spectra and coherence functions.

FLEXURE VIBRATION TEST METHOD OF AVIATION TUBE XU CHEN and JIN LIU (Xian Aircraft Industry Co., People's Republic Acta Aeronautica et Astronautica Sinica (ISSN 1000-6893), vol. 11, Nov. 1990, p. A641-A643. In Chinese, with abstract in English. refs

Two standard procedures for flexural-vibration testing of aircraft hydraulic tubing are discussed: ISO TC 20/SC 10 N836 and N925 (1985) and U.S. MIL-F 18280D and 18280E supplements (1983 and 1986). The crucial importance of tubing reliability is emphasized, and particular attention is given to cantilever-beam vs simple-beam testing, specimen length estimation, the transformation of static strain to oil-pressure-induced stress, strain or stress control, measurement errors related to specimen diameter, and errors due to strain-gage size and position.

A91-40174#

#### A NUMERICAL METHOD FOR SIMULATING DROP TEST OF **LANDING GEARS**

XUEREN NI (Xian Aircraft Co., People's Republic of China) Acta Aeronautica et Astronautica Sinica (ISSN 1000-6893), vol. 11, Nov. 1990, p. A647-A649. In Chinese, with abstract in English.

The theoretical basis and implementation of an algorithm for estimating the discharge coefficient of an aircraft landing gear without the need for conventional drop testing are described. The derivation of the method is outlined, and typical results are presented in graphs. The usefulness of the method in the aircraft design phase is also indicated. D.G.

A91-40203

#### LANDING GEAR DROP TESTING

Aerospace Engineering (ISSN 0736-2536), vol. 11, June 1991, p. 42-44.

Preliminary research has indicated that applying active-control technology to the landing gears could reduce ground loads applied to the airframe. Utilizing the drop test apparatus, researchers dropped the nose gear vertically with lift at 1.37 m/s in both active and passive modes. A 1-g lift simulation was obtained by employing crushable aluminum honeycomb to stop the drop carriage (upper mass) vertical acceleration. It is concluded that based on the drop tests, the concept derived can reduce significantly the loads transmitted by the gear to the airframe during landing and ground operations.

COMANCHE - TOMORROW'S HIGH-TECH HELICOPTER

STEVEN ASHLEY Mechanical Engineering (ISSN 0025-6501), vol. 113, June 1991, p. 40-45.

Copyright

The RAH-66 Comanche helicopter for whose production the U.S. Army has recently signed a \$34 billion contract is a two-crewmember armed scout helicopter, comparable in weight to the AH-1 Cobra helicopter gunship, whose armaments are primarily oriented to the destruction of ground forces. Air-to-air capabilities are also an intrinsic element of the design, making this the first U.S. rotary wing aircraft thus equipped. Unique features of the Comanche include a damage-resistant all-composite airframe, a maneuverable optimized fan-in-fin tail rotor system, and cockpit volumes that are pressurized for protection against chemical and biological warfare. Retractable weapons carriage and landing gear systems enhance stealth performance. Power is furnished by two 1200-shp T800 turboshaft engines.

#### EFFECTS OF CANARD POSITION ON THE AERODYNAMIC CHARACTERISTICS OF A CLOSE-COUPLED CANARD CONFIGURATION AT LOW SPEED

D. HUMMEL (Braunschweig, Technische Universitaet, Brunswick, Federal Republic of Germany) and H.-CHR. OELKER (Dornier Luftfahrt GmbH, Friedrichshafen, Federal Republic of Germany) Zeitschrift fuer Flugwissenschaften und Weltraumforschung (ISSN 0342-068X), vol. 15, no. 2, 1991, p. 74-88. Previously announced in STAR as N90-28519. refs

(Contract DFG-HU-254/8)

Copyright

Comprehensive wing-tunnel investigations were carried out on a close-coupled A = 2.31 delta-canard configuration at low speed. Based on three-component, surface pressure, and flowfield measurements as well as on oilflow patterns, the flow about the coplanar normal configuration may be regarded as well understood. Three parameters describing the position of the canard relative to the wing were varied systematically within certain limits: vertical distance (3 locations: high, coplanar, low), longitudinal distance (3 locations: front, mid, rear), and canard setting angle (-12 deg is less than or equal to epsilon is less than or equal to 12 deg). The results of three-component measurements are presented and the corresponding flow structure is analyzed by means of pressure distribution measurements and oilflow patterns. For a large variety of parameter combinations in the vicinity of the normal configuration the same state of the flow with two separate vortex systems for canard and wing was found, and the effects of different canard positions relative to the wing on the aerodynamic coefficients could be explained by this mechanism. For low canard positions and large setting angles, however, the formation of vortices on the lower surface of the wing as well as the merging of the canard vortices with the wing vortex system on the upper surface was observed. This flow structure leads to abrupt changes in the aerodynamic coefficients which are unacceptable for practical flight conditions. Author

### VECTORED PROPULSION, SUPERMANEUVERABILITY AND ROBOT AIRCRAFT

BENJAMIN GAL-OR (Technion - Israel Institute of Technology, Haifa) Research sponsored by Teledyne CAE, General Electric Co., USAF, and General Dynamics Corp. New York, Springer-Verlag, 1990, 276 p. refs

Copyright

The emergence of digital flight control/engine control systems affords airframe and propulsion system designers opportunities for much higher degrees of integration between propulsion and aerodynamics, yielding revolutionary levels of performance. The present work offers a comprehensive consideration of these possibilities in the case of vectorable-thrust propulsion systems in which aircraft agility is enhanced by multiaxis thrust vectoring and reaction-control; attention is given to the application of such

systems to not only piloted, but also remotely piloted and robotic aircraft. The consequences of external and internal (nozzle-integral) methods of thrust vectoring are discussed.

REAL TIME ESTIMATION OF AIRCRAFT ANGULAR ATTITUDE

G. SHADMON Apr. 1987 16 p

(IAITIC-87-1004; ITN-88-85003) Avail: NTIS HC/MF A03

A new method is presented for estimating aircraft angular attitude under real time conditions. The basis for the estimation is the requirement of best possible compatibility between the current estimate and the time history of the past measurements. The characteristics of the estimation technique are: (1) use of the quaternion formalism on characterizing the rotational motion; (2) adoption of the Least Square (LS) method as the tool of extracting the estimated quaternion out of the foregoing requirement; and (3) incorporation of the fading memory technique as a means of reducing the sensitivity to modelling errors. The main advantage of that method is its extremely small computation burden. This is reflected by a lack of the usual operations of matrix inversion and matrix propagation in time. Included are the review of the pertinent quaternion properties, the derivation of the estimation method, and the application to a real case.

Copyright Avail: NTIS HC/MF A17; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

Despite many years of experience, some confusion still exists concerning the nature, purpose, and application of the flying qualities specifications. Much of this confusion stems from the form of the requirements themselves. A question frequently raised is whether flying qualities are pilot-oriented properties or whether they are the parameters defined in the requirements of the flying qualities specification. This question arises from the fact that most of the objective criteria in the specification are not closed-loop (pilot-in-the-loop) performance criteria or pilot acceptance criteria, but rather are criteria on open-loop (pilot-out-of-the loop) characteristics of the augmented aircraft. Another source of confusion concerns the role of the specification itself: is it only a contractual document, or is it also a design guide. If the latter, is it equally effective in both roles. Consideration of the above questions leads to yet another. If the specification is intended as a design guide and the criteria are open-loop properties instead of closed-loop properties, which is more important: pilot satisfaction with closed-loop performance or compliance with the open-loop requirements? These questions are addressed by reviewing the background of the United States military flying qualities specifications. The advantages and disadvantages of different types of requirements are discussed. The way the specification is used by the USAF Aeronautical Systems Division Program offices is described.

FLYING QUALITIES EXPERIENCE ON THE AMX AIRCRAFT
BAVA RENZO In AGARD, Flying Qualities 20 p Feb. 1991
Copyright Avail: NTIS HC/MF A17; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

The AMX is a subsonic ground attack aircraft with a fly-by-wire flight control system (FCS) built into a digital flight control computer. From the flight mechanics point of view, it was designed against the MIL-F87985-C requirement. For some specific flight tasks, the need of more demanding requirements was envisaged. Modern handling qualities criteria were applied in the area of longitudinal and lateral-directional precision tracking task and pilot-induced oscillation (PIO) tendencies to cope with operational problems. High incidence criteria were used in the design and evaluation of control modifications which improve the flying qualities in the stall and post stall regions. Comparisons between analytical predictions, manned simulation, and in-flight results were made. Indications of agreement or disagreement with data and new criteria are presented.

DO CIVIL FLYING QUALITIES REQUIREMENTS ADDRESS MILITARY MISSIONS FOR OFF-THE-SHELF PROCUREMENT

G. THOMAS BLACK, WALTER A. GRADY (Test Wing, 4950th, Wright-Patterson AFB, OH), and DANN C. MCDONALD In AGARD, Flying Qualities 8 p Feb. 1991

Copyright Avail: NTIS HC/MF A17; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

Off-the-shelf procurement of civil aircraft for use by the military services is a tradition dating back to the earliest days of aviation. This relieves the military of the responsibility for development costs, takes advantage of civil designs already in existence, and has resulted in the development of many capable military aircraft. However, while civil aircraft missions have remained relatively unchanged for over half a century, new military mission have continued to evolve. Yet, the military services still procure civil certified aircraft to accomplish these demanding missions. In the United States, Federal Aviation Regulations 23 and 25 and their predecessors are the certification standards for civil aircraft. The primary objective of these regulations is to insure a minimum standard of airworthiness. Flying qualities requirements make up only a small portion of these regulations, and address primarily static stability characteristics. This has sometimes led to undesirable flying qualities when attempting to perform demanding military mission with civil certificated aircraft. The unique military missions are addressed in the U.S. military flying qualities specification, MIL-STD-1797A, and its predecessors (MIL-F-8785 series). These military specification requirements are compared to the civil requirements to substantiate their applicability to off-the-shelf procurement. Specifically, where military and civil missions differ, military flying qualities requirements should be invoked. To illustrate this, several examples are examined. Finally, the future of off-the-shelf procurement is contemplated, some implications discussed, and recommendations made.

METRICS FOR ROLL RESPONSE FLYING QUALITIES
MARIO INNOCENTI In AGARD, Flying Qualities 11 p Feb.
1991

Copyright Avail: NTIS HC/MF A17; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

Roll characteristics of highly augmented aircraft during compensating tasks such as tracking and landing are shown to present degraded flying qualities and unstable oscillations similar to those observed in the pitch axis. The ideas behind Gibson's method are extended to develop handling qualities criteria for the roll axis control system. The analysis is performed using an existing data base for highly augmented class IV aircraft and parameters such as roll time constant, systems delay, and loop sensitivity are considered for designing for good handling qualities and to evaluate control systems performance. Levels of flying qualities are determined in the time domain as well as in the frequency domain for both tracking and landing tasks. The presence of pilot induced oscillations and roll ratcheting are identified.

Flight testing has amply demonstrated the serious flying qualities deficiencies that can occur from excessive control system delay. Delay outside of the control system, yet within the pilot's cuing environment, can be potentially as deleterious as control system delay effects. Summarized here are the results of flight tests to evaluate the effect on flying qualities on time delay in the pilot's cuing environment introduced outside the flight control system. These delays were introduced in the tactile cuing, head-up display visual cuing, and the motion and visual cuing during the simulation of fighter aircraft.

## AN INITIAL STUDY INTO THE INFLUENCE OF CONTROL STICK CHARACTERISTICS ON THE HANDLING QUALITIES OF A FLY-BY-WIRE HELICOPTER

J. MURRAY MORGAN *In* AGARD, Flying Qualities 13 p Feb. 1991 Sponsored in part by Department of National Defence, Ottawa, Ontario

Copyright Avail: NTIS HC/MF A17; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

A piloted experiment was flown using the Institute for Aerospace Research Bell 205A variable stability helicopter. The experimental variables were the static and dynamic characteristics of a conventional center-mounted cyclic controller. The cyclic controller characteristics were changed by varying the mass and spring gradient to provide five basic cases, while for each case the dynamics of the stick were varied to provide critically damped, underdamped, and overdamped models. Two pilots were asked to fly a variety of tasks designed to exercise three fundamental modes of helicopter flight, high frequency stabilization, gross single axis tasks with off axis stabilization and simultaneous multi axis control. The stick sensitivity was adjusted in proportion to the spring gradient to give constant static sensitivity with respect to applied force. A first order filter was incorporated on an optional basis to reduce the command response bandwidth of the roll channel to the Level 1/Level 2 boundary of the ADS-33C criterion for divided attention operation. The results achieved indicate that cyclic stick characteristics are of considerably less importance than had been previously thought, that large values of overdamping can be tolerated even in low frequency sticks, but that underdamped sticks should be avoided especially if the resonant frequency of the stick is close to an undesirable and easily excited aircraft mode. There was a suggestion that a boundary based on undamped natural frequency also existed. The results did not support the contention that inertia alone is enough to specify an acceptable/unacceptable boundary for stick design. Author

## N91-23126# Test Squadron (6510th), Edwards AFB, CA. B-1B HIGH AOA TESTING IN THE EVALUATION OF A STALL INHIBITOR SYSTEM

MARK S. SOBOTA In AGARD, Flying Qualities 21 p Feb 1991

Copyright Avail: NTIS HC/MF A17; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

High angle-of-attack (AOA) B-1B flight tests were conducted to evaluate a flight control Stall Inhibitor System/Stability Enhancement Function (SIS/SEF). The SIS/SEF system was integrated into the basic B-1B flight control system because of an inherent stability problem in the B-1 aircraft design. The problem lies in the fact that aerodynamically the B-1 was stability limited and not lift limited. This resulted in a lack of longitudinal stability while operating at high AOA conditions with no warning or natural cues to the pilot that the aircraft was approaching an unstable region. To safely utilize all the available AOA at the higher gross weights demanded, some means of providing 'apparent' stability was essential to provide cues to the pilot of these stability limitations. Significant test results of the SIS/SEF flight test program are presented.

### FLYING QUALITIES OF THE X-29 FORWARD SWEPT WING AIRCRAFT

LAWRENCE A. WALCHLI (Wright Research Development Center, Wright-Patterson AFB, OH.) and ROGERS E. SMITH *In* AGARD, Flying Qualities 13 p Feb. 1991

Copyright Avail: NTIS HC/MF A17; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive CSCL 01/3

An overview of the X-29 Forward Swept Wing Technology Demonstrator traces its development and test path during past years. Brief descriptions of the aircraft and its flight control system provide insight for evaluating this unique vehicle. The baseline flight control system provided a starting point for safe concept evaluation and envelope expansion for the aircraft. Subsequent up-dates resulted in performance levels favorably comparable to current fighter aircraft. Efforts are described for the current expansion of the X-29's capabilities into the high angle-of-attack (AOA) regime of flight. Control law changes have permitted all axis maneuvering to 40 deg AOA with pitch excursions to 66 deg, thereby exploiting the full potential of the X-29 forward swept wing configuration.

The realization and utilization of the helicopter airborne simulator ATTHeS (Advanced Technology Testing Helicopter System) are described. The explicit model following control system which is designed for ATTHeS is briefly presented. The potential is reviewed of the simulation system which is illustrated by the overall system performance identified from flight test data. Due to the implemented explicit model following systems, the in-flight simulation facility is provided with the capability of a flexible and broad variation of stability and control characteristics. Finally, results of a bandwidth phase delay study are presented and the influence of coupling on handling qualities evaluation is discussed.

AĞİLİTY: A RATIONAL DEVELOPMENT OF FUNDAMENTAL METRICS AND THEIR RELATIONSHIP TO FLYING QUALITIES C. J. MAZZA In AGARD, Flying Qualities 7 p Feb. 1991 Copyright Avail: NTIS HC/MF A17; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

The results of the first phase of a three year agility program are presented. A highly valuable approach was produced for developing a rational concept of agility and for relating agility to the flight dynamics, maneuvering performance, and to the design of the aircraft. The flight mechanics of a rigid aircraft in three-space maneuvering flight are examined with respect to total velocity, acceleration, and the time-rate-of-change of accleration. The terms of the expanded 'agility vector' are interpreted with regard to their potential for providing a rational basis for the evaluation of any given set of agility metrics and for suggesting, directly, a new set of metrics. A potential form of agility is offered for which a readily acceptable relationship is traced to both flying qualities and maneuvering performance.

## A REVIEW OF HIGH ANGLE OF ATTACK REQUIREMENTS FOR COMBAT AIRCRAFT

K. MCKAY and M. J. WALKER In AGARD, Flying Qualities 12 p Feb. 1991

Copyright Avail: NTIS HC/MF A17; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

Design of an aircraft for use at high angles of attack can have major implications on the configuration which is chosen. The objective is to review the implications of designing for high angle of attack on configuration. This naturally leads onto consideration of agility and the criteria which could be used in the early design stages to ensure an aircraft is adequately agile.

N91-23132 Stanford Univ., CA. A NEW ARCHITECTURE AND EXPERT SYSTEM FOR AIRCRAFT DESIGN SYNTHESIS Ph.D. Thesis MASAMI TAKAI 1990 223 p

Avail: Univ. Microfilms Order No. DA9102359 Described here is a new program architecture which satisfies the requirement that preliminary design tools accommodate unprecedented extendability in both the sets of variables used to describe the design and the set of analysis routines. In this architecture, a set of procedural modules are compiled separately and linked with the main executive program. Unlike conventional programs, the subroutines and order of execution are selected by the system during the computation, based on the desired output and on the currently available results in the database. The method can greatly improve the efficiency of aircraft design optimization by generating the computational path for a given objective function and avoiding redundant calculations made by conventional methods with rigid program structures. The quasi-procedural architecture is enhanced by a rule-based expert system. The expert system warns of problems with the current design and suggests solutions to make the design feasible. For design optimization, the expert system can identify the active constraints and suggest a set of design variables to satisfy the constraints while best retaining the

DAVID F. VORACEK and ROBERT CLARKE Apr. 1991 15 p Presented at the 32nd AIAA Structures, Structural Dynamics, and Materials Conference, Baltimore, MD, 8-10 Apr. 1991 Previously announced in IAA as A91-32012

(NASA-TM-101735; H-1687; NAS 1.15:101735; PAPER-91-1053) Avail: NTIS HC/MF A03 CSCL 01/3

High angle-of-attack flight regime research is currently being conducted for modern fighter aircraft at the NASA Ames Research Center's Dryden Flight Research Facility. This flight regime provides enhanced maneuverability to fighter pilots in combat situations. Flight research data are being acquired to compare and validate advanced computational fluid dynamic solutions and wind-tunnel models. High angle-of-attack flight creates unique aerodynamic phenomena including wing rock and buffet on the airframe. These phenomena increase the level of excitation of the structural modes, especially on the vertical and horizontal stabilizers. With high gain digital flight-control systems, this structural response may result in an aeroservoelastic interaction. A structural interaction on the X-29A aircraft was observed during high angle-of-attack flight testing. The roll and yaw rate gyros sensed the aircraft's structural modes at 11, 13, and 16 Hz. The rate gyro output signals were then amplified through the flight-control laws and sent as commands to the flaperons and rudder. The flight data indicated that as the angle of attack increased, the amplitude of the buffet on the vertical stabilizer increased, which resulted in more excitation to the structural modes. The flight-control system sensors and command signals showed this increase in modal power at the structural frequencies up to a 30 degree angle-of-attack. Beyond a 30 degree angle-of-attack, the vertical stabilizer response, the feedback sensor amplitude, and control surface command signal amplitude remained relatively constant. Data are presented that show the increased modal power in the aircraft structural accelerometers, the feedback sensors, and the command signals as a function of angle of attack. This structural interaction is traced from the aerodynamic buffet to the flight-control surfaces.

N91-23134# Systems Control Technology, Inc., Arlington, VA. AIR AMBULANCE HELICOPTER OPERATIONAL ANALYSIS **Final Report** 

ROBERT NEWMAN May 1991 168 p (Contract DTFA01-87-C-00014) (DOT/FAA/RD-91/7) Avail: NTIS HC/MF A08

This study of visual flight rules (VFR) weather minimums and operational areas for helicopter emergency medical service operators is based on operator responses to a questionnaire. The national average VFR operational weather minimums for all respondents was determined. Also, an estimate of the percentage of time that each respondent can not fly because of ceiling and/or visibility below their VFR operating minimums was determined, as was the average percentage of time all responders can not fly. Analysis of the data indicated that on the average the operators have voluntarily adopted stricter minimums than recommended in the current FAA Advisory Circular (AC) 135-14, 'Emergency Medical Services/Helicopter (EMS/H).' Furthermore, the analysis indicated that on the average the operators have more restrictive daylight minimums than those in the proposed change to AC 135-14 and less restrictive night minimums than those in the proposed change. Some general observations about minimums for operations in mountainous areas are also provided. The coverage areas reported by the operators were plotted on two maps of the United States, one for the local coverage areas and one for the cross country coverage areas. From these maps, the percentage of coverage for the conterminous United States, each FAA region, and each state were determined. The weather data were also averaged over each state and used to determine the percentage of time that coverage is available in areas where EMS/H service is provided. The FAA is in the process of determining if there is an economic justification for the improvement of low altitude communication, navigation, and surveillance services within the National Airspace System (NAS). A recent FAA survey, Rotorcraft Low Altitude CNS Benefit/Cost Analysis (DOT/FAA/DS-89-11, Sept. 1989) found that the helicopter ambulance mission is a source of significant social benefit. The results of the Air Ambulance Helicopter Operational Analysis provides data which will support further analysis of the benefits of air ambulance helicopters in an IFR environment.

THE LIMITS OF THE LANDING PROCESS OF AIRCRAFT HANNS-JUERGEN PETERS Apr. 1990 120 p in GERMAN; ENGLISH summary

(DLR-FB-90-49; ISSN-0939-2963; ETN-91-99069) Avail: NTIS HC/MF A06; DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Fed. Republic of Germany, HC 45 DM

A Monte Carlo model is used for examining the aircraft landing process. Distributions of arrivals in Terminal Maneuvering Area (TMA) and admissible minimal distances in final approach are the input data. The arrival distribution of some airports are replaced by the Poisson distribution, which is modified by variation of its parameter lambda. In the model, the aircraft distances can be changed by integer steps of one minute. Different distances are necessary to meet German special safety rules, with respect to air vortices caused by preflying aircraft. Results yielded are the maximal numbers of aircrafts in final approach, average rates of landings per hour depending on lambda, and aircraft distances.

## LONG TIME MEASUREMENTS OF LANDING GEAR LOADS ON SAAB SF-340 COMMUTER AIRCRAFT

A. I. GUSTAVSSON, A. F. BLOM, and L. HELMERSSON (Saab-Scania, Linkoping, Sweden) Dec. 1990 27 p Sponsored by Swedish Board for Technical Development; Swedish Civil Aviation Administration; and Saab-Scania, Linkoeping, Sweden (FFA-TN-1990-53; ETN-91-99107) Avail: NTIS HC/MF A03

Strain gauge measurements of forces acting on the nose gear and main gears of the commuter aircraft SAAB SF-340 are reported. During initial flight tests, forces in the longitudinal, transversal, and vertical directions were measured for various maneuvers such as takeoff, landing, taxling, and towing. The investigation revealed high transversal loads at the main gears at touch down. The nose gear is most severely strained when steering during taxiing run and when the aircraft is towed connected to a tractor with a tow bar. The results from such initial measurements formed the basis for a subsequent investigation with on line data acquisition of landing gear loads on a commuter aircraft in service at Swedair AB. The data acquisition system and the data analysis methods are described. The data acquisition was continuously carried out during nearly six months including various parameters such as different aircraft weight and static landing gear loads. Results from these measurements are presented as cumulative exceedances of longitudinal, transversal, and vertical loads obtained from the rainflow count analyses performed online during the measurements.

RESULTS OF CORRELATIONS FOR TRANSITION LOCATION ON A CLEAN-UP GLOVE INSTALLED ON AN F-14 AIRCRAFT AND DESIGN STUDIES FOR A LAMINAR GLOVE FOR THE X-29 AIRCRAFT ACCOUNTING FOR SPANWISE PRESSURE GRADIENT

S. H. GORADIA (Vigyan Research Associates, Inc., Hampton, VA.), P. J. BOBBITT, H. L. MORGAN, J. C. FERRIS, and WILLIAM D. HARVEY *In its* Transonic Symposium: Theory, Application and Experiment, Volume 2 p 167-227 Apr. 1989

Avail: NTIS HC/MF A11 CSCL 01/1

Results of correlative and design studies for transition location, laminar and turbulent boundary-layer parameters, and wake drag for forward swept and aft swept wings are presented. These studies were performed with the use of an improved integral-type boundary-layer and transition-prediction methods. Theoretical predictions were compared with flight measurements at subsonic and transonic flow conditions for the variable aft swept wing F-14 aircraft for which experimental pressure distributions, transition locations, and turbulent boundary-layer velocity profiles were measured. Flight data were available at three spanwise stations for several values of sweep, freestream unit Reynolds number, Mach numbers, and lift coefficients. Theory/experiment correlations indicate excellent agreement for both transition location and turbulent boundary-layer parameters. The results of parametric studies performed during the design of a laminar glove for the forward swept wing X-29 aircraft are also presented. These studies include the effects of a spanwise pressure gradient on transition location and wake drag for several values of freestream Reynolds numbers at a freestream Mach number of 0.9. Author

# N91-24158# Wichita State Univ., KS. FEASIBILITY STUDY IN CRACK DETECTION IN AIRCRAFT STIFFENED PANELS BY PULSE PROBING AND DECONVOLUTION

JORGE E. TALIA, BEHNAM BAHR, and HAMID M. LANKARANI In its Program Plans for Aviation Safety Research 6 p Dec. 1990

Avail: NTIS HC/MF A04

The main objective is to assess the use of changes in dynamic characteristics of a structure or its spectroscopy to detect crack formation. The first approach is to excite the structure harmonically over a range of frequencies and recover the natural frequencies of vibration and modal damping parameters from the analysis of the steady state responses. The preferred approach is to excite the structure with an appropriate pulse and extract the dynamic Green's function from the corresponding transient response.

CSCL 01/3

The results are presented for the Douglas Aircraft Company system studies related to high speed civil transports (HSCTs). The system studies were conducted to assess the environmental compatibility of a HSCT at a design Mach number of 3.2. Sonic boom minimization, exterior noise, and engine emissions were assessed together with the effect of a laminar flow control (LFC) technology on vehicle gross weight. The general results indicated that (1) achievement of a 90 PLdB sonic boom loudness level goal at Mach 3.2 may not be practical; (2) the high flow engine cycle concept shows promise of achieving the side line FAR Part 36 noise limit but may not achieve the aircraft range design goal of 6,500 nautical miles; (3) the rich burn/quick quench (RB/QQ) combustor concept shows promise for achieving low EINO(sub x) levels when combined with a premixed pilot stage/advanced

technology high power stage duct burner in the P and W variable stream control engine (VSCE); and (4) full chord wing LFC has significant performance and economic advantages relative to the turbulent wing baseline.

THE EFFECTS ON AERODYNAMIC PERFORMANCE OF DESIGNING SUPERSONIC WINGS FOR LAMINAR FLOW CONTROL Interim Report

CARL P. TILMANN 30 Jan. 1991 90 p (AD-A233040; WL-TM-91-303) Avail: NTIS HC/MF A05 CSCL

A preliminary technique has been developed for the design of wings to be used with supersonic hybrid method laminar flow control systems. This technique has been used to evaluate the effects on aerodynamic performance of designing supersonic wings for laminar flow control. In this design method, a wing is cambered such that it produces and upper-surface streamwise pressure distribution which is favorable for use in a hybrid laminar flow control (HLFC) system, while maintaining a spanwise lifting distribution which will minimize drag-due-to-lift. An existing linear-theory computer program is used to calculate the wing camber definition that produces a desired pressure distribution on the upper surface of the wing with a specified thickness profile. This method was applied to an array of arrow-wings varying in aspect ratio and taper ratio. Each wing planform was then camber-optimized for minimum cruise drag-due-to-lift using current preliminary wing design methods, which optimize the wing's camber of lifting load distribution without regard to the boundary layer type. The total drag of each wing is then estimated by the superposition of zero-lift wave drag, skin friction drag, and drag-due-to-lift. The true effectiveness of laminar flow control wings could then be evaluated by weighing the benefit of the reduced friction drag against the penalty of increased drag-due-to-lift which would be displayed by a wing designed for a laminar flow control

N91-24198\*# Advanced Technologies, Inc., Newport News, VA. SOFT HUB FOR BEARINGLESS ROTORS

PETER G. C. DIXON Jun. 1991 98 p (Contract NAS2-13157)

(NASA-CR-177586; A-91158; NAS 1.26:177586) Avail: NTIS HC/MF A05 CSCL 01/3

Soft hub concepts which allow the direct replacement of articulated rotor systems by bearingless types without any change in controllability or need for reinforcement to the drive shaft and/or transmission/fuselage attachments of the helicopter were studied. Two concepts were analyzed and confirmed for functional astructural feasibility against a design criteria and specifications established for this effort. Both systems are gimballed about a thrust carrying universal elastomeric bearing. One concept includes a set of composite flexures for drive torque transmittal from the shaft to the rotor, and another set (which is changeable) to impart

hub tilting stiffness to the rotor system as required to meet the helicopter application. The second concept uses a composite bellows flexure to drive the rotor and to augment the hub stiffness provided by the elastomeric bearing. Each concept was assessed for weight, drag, ROM cost, and number of parts and compared with the production BO-105 hub.

**EVALUATION OF CLOUD DETECTION INSTRUMENTS AND** PERFORMANCE OF LAMINAR-FLOW LEADING-EDGE TEST ARTICLES DURING NASA LEADING-EDGE FLIGHT-TEST **PROGRAM** 

RICHARD E. DAVIS, DAL V. MADDALON, RICHARD D. WAGNER, DAVID F. FISHER, and RONALD YOUNG (National Aeronautics and Space Administration. Hugh L. Dryden Flight Research Facility, Edwards, CA.) Apr. 1989 58 p (NASA-TP-2888; L-16509; NAS 1.60:2888) Avail: NTIS HC/MF

A04 CSCL 01/3

Summary evaluations of the performance of laminar-flow control (LFC) leading edge test articles on a NASA JetStar aircraft are presented. Statistics, presented for the test articles' performance in haze and cloud situations, as well as in clear air, show a significant effect of cloud particle concentrations on the extent of laminar flow. The cloud particle environment was monitored by two instruments, a cloud particle spectrometer (Knollenberg probe) and a charging patch. Both instruments are evaluated as diagnostic aids for avoiding laminar-flow detrimental particle concentrations in future LFC aircraft operations. The data base covers 19 flights in the simulated airline service phase of the NASA Leading-Edge Flight-Test (LEFT) Program.

NASA-LARC FLIGHT-CRITICAL DIGITAL SYSTEMS **TECHNOLOGY WORKSHOP** 

C. W. MEISSNER, JR., ed., J. R. DUNHAM, ed., and G. CRIM, ed. Apr. 1989 191 p Workshop held in Hampton, VA, 13-15

(NASA-CP-10028; REPT-412U-3181-29; NAS 1.55:10028) Avail: NTIS HC/MF A09 CSCL 01/3

The outcome is documented of a Flight-Critical Digital Systems Technology Workshop held at NASA-Langley December 13 to 15 1988. The purpose of the workshop was to elicit the aerospace industry's view of the issues which must be addressed for the practical realization of flight-critical digital systems. The workshop was divided into three parts: an overview session; three half-day meetings of seven working groups addressing aeronautical and space requirements, system design for validation, failure modes, system modeling, reliable software, and flight test; and a half-day summary of the research issues presented by the working group chairmen. Issues that generated the most consensus across the workshop were: (1) the lack of effective design and validation support tools to enable engineering of with highly-integrated, flight-critical digital systems, and (2) the lack of high quality laboratory and field data on system failures especially due to electromagnetic environment (EME).

FIRE DETECTION SYSTEM FOR AIRCRAFT CARGO BAYS

MICHAEL L. PARSONS, PETER HUTCHINS, and VINCENT Y. TSENG (Pacific Scientific Co., HTL/Kin-Tech Div., Duarte, CA) IN: Infrared detectors and focal plane arrays; Proceedings of the Meeting, Orlando, FL, Apr. 18, 19, 1990. Bellingham, WA, Society of Photo-Optical Instrumentation Engineers, 1990, p. 312-324.

Copyright

The paper presents a fire detection system meeting the FAA regulations, based on infrared detection technology coupled with a Fresnel scanning optical system. The system utilizes a dual-computer controller unit, and its sensor is responsive to either overheating or fire conditions. Attention is given to such system components as a thermal imaging module, scan motor, infrared detector, amplifier, decision and fault-detection logic, and interfaces. Controller functions and communications are outlined as well as system timing. Performance characteristics and compliance with the FAA regulations are discussed.

#### VELOCITY SENSOR FOR AN AIRBORNE OPTICAL AIR DATA SYSTEM

ANTHONY E. SMART (Spectron Development Laboratories, Costa Mesa, CA) Journal of Aircraft (ISSN 0021-8669), vol. 28, March 1991, p. 163, 164. Copyright

The feasibility of an optical air data sensor (OADS) based on sheet-pair transit-time velocimetry has been demonstrated on an F-16 from sea level to 50,000 ft and up to supersonic speeds during exposure to bright sunlight, clouds, and smoke. Measurements corresponded well with conventional pneumatic airspeed and attitude measurements, with significantly better response time and data rates exceeding 100/s. The prototype system proved reliable on all flights and retained acceptable calibration.

#### ADVANCED AIRBORNE OXYGEN SENSORS

M. W. HARRAL (Normalair-Garrett, Ltd., Yeovil, England) Annual SAFE Symposium, 27th, New Orleans, LA, Dec. 5-8, 1989. Proceedings. Newhall, CA, SAFE Association, 1990, p. 129-134. Copyright

This paper discusses the development of an advanced oxygen sensor. A study of the available technology was undertaken and solid-electrolyte (zirconia) sensors were indentified as the most suitable candidates for aircraft applications. Following a program of laboratory tests, a potentiometric type of sensor was selected for use in a flight-weight prototype monitor. This unit has completed safety-of-flight testing and will be flown in late 1989 on the British Aerospace Experimental Aircraft Programme demonstrator aircraft.

As part of the NASA/FAA National Integrated Windshear Program, a measurable windshear hazard index has been defined that can be remotely sensed from an aircraft, to give the pilot information about the wind conditions along the flight path. A technology analysis and end-to-end performance simulation measuring signal-to-noise ratios and resulting wind velocity errors for competing coherent laser radar (lidar) systems have been carried out. The results show that a Ho:YAG lidar at a wavelength of 2.1 microns and a CO2 lidar at 10.6 microns can give the pilot information about the line-of-sight component of a windshear threat from his present position to a region extending 2-4 km in front of the aircraft. This constitutes a warning time of 20-40 s, even in conditions of moderately heavy precipitation. **Author**

#### MODEL FOR IR SENSOR PERFORMANCE EVALUATION -**APPLICATIONS AND RESULTS**

W. T. KREISS (Horizons Technology, Inc., San Diego, CA), A. TCHOUBINEH (U.S. Navy, Pacific Missile Test Center, Point Mugu, CA), and W. LANICH (USAF, Wright Research and Development Center, Wright-Patterson AFB, OH) IN: Infrared imaging systems: Design, analysis, modeling, and testing; Proceedings of the Meeting, Orlando, FL, Apr. 16-18, 1990. Bellingham, WA, Society of Photo-Optical Instrumentation Engineers, 1990, p. 190-207. Research sponsored by USAF and U.S. Navy. Copyright

This paper presents the results of initial testing of a computer simulation model which has been designed for use by persons not necessarily expert in all or any of the disciplines involved in signature analysis, and which can be utilized for evaluating sensor system performance and prediction of sensor acquisition ranges. The ATIMS III airborne turret infrared measurement system, flight experiments, and the IASPM simulation model are described. Analysis of preliminary results comparing experimental data with simulated data for the 2 - 5 and 8 - 12 micron IR bands reveal the potential of the model for simulating a multitude of sensor-observed phenomena. Model strengths and shortcomings are discussed.

Scientific American (ISSN 0036-8733), vol. 265, GARY STIX July 1991, p. 94-99, 102, 104, 106. refs

The expanded role of computers in the newest generation of jet aircraft is discussed. The development of automation in aircraft from the early 20th century to the present is reviewed, and the need for further automation is pointed out. The effect of extensive automation on the cockpit crew is assessed.

#### N91-23145# Naval Postgraduate School, Monterey, CA. AN ENGINEERING STUDY OF ALTITUDE DETERMINATION **DEFICIENCIES OF THE SERVICE AIRCRAFT** INSTRUMENTATION PACKAGE (SAIP) M.S. Thesis

STEVEN R. EASTBURG 1991 125 p (AD-A232055) Avail: NTIS HC/MF A06 CSCL 01/4

Altitude determination errors of the U.S. Navy's Service Aircraft Instrumentation Package (SAIP), an airborne positioning pod, were examined in a multifaceted study involving in-flight evaluations, wind tunnel testing, and pressure sensitivity experiments. The original objectives of the research related to identifying aerodynamic sources of pod static pressure inaccuracies and recommending specific remedies to alleviate these errors. After an extensive evaluation, results revealed that the problem exists not in the aerodynamic measurement performance of the probe, but in the electronic circuitry residing within the Air Data Unit (ADU). The ADU houses multiple pressure transducers, each associated with different static and dynamic pressure ports, in a single module. This circuit configuration leads to electrical interference and an attendant degradation of the static pressure output voltage. Accurate static pressure voltages, which can be subsequently converted into appropriate SAIP barometric altitudes, are obtained by electrically isolating the three ADU dynamic pressure transducers from the single operative static pressure transducer and remaining ADU circuitry.

### MECHÁNICAL COMPONENT DIAGNOSTIC SYSTEM Final Report, Oct. 1987 - May 1990 R. A. SEWERSKY Jan. 1991 56 p

(Contract DAAJ02-87-C-0015)

(AD-A232126; SER-701-640; AVSCOM-TR-90-D-24) Avail: NTIS HC/MF A04 CSCL 01/3

The Mechanical Component Diagnostic System (MCDS) research and development (R and D) program was designed to investigate and demonstrate the benefits of onboard data

recording/processing and rotor tuning equipment for monitoring and diagnosis of mechanical subsystems on rotorcraft. The payoffs for such a concept include reduced aircraft vibration levels (with extended MTBF of electronics and mechanical systems as well as reduced crew fatigue), reduced maintenance flights, and early warning of component failures. This program demonstrates an approach to a practical, automated system which monitors certain mechanical subsystems, provides inflight vibration and control system status, and prescribes corrective actions to the maintainer. Various monitoring components were developed and integrated to demonstrate the concept.

#### A91-38007 ADVANCED AIRCRAFT SECONDARY POWER SYSTEM DESIGN

J. WOODS, I. S. MEHDI (Boeing Co., Seattle, WA), and C. S. RUBERTUS (USAF, Wright Research and Development Center, Wright-Patterson AFB, OH) IN: IECEC-90; Proceedings of the 25th Intersociety Energy Conversion Engineering Conference, Reno, NV, Aug. 12-17, 1990. Vol. 1. New York, American Institute of Chemical Engineers, 1990, p. 505-510. USAF-supported research. Copyright

The requirements, the secondary power system design, and the results of a trade study for an advanced aircraft secondary power system design (AASPSD) are described. The aircraft selected for this study was a Mach 6 vehicle. The three AASPSD configurations studied were a conventional system with hydraulic actuation and turbine-driven fuel pumps, a more-electric system with electromechanical actuators (EMAs) and turbine-driven fuel pumps, and an all-electric system with EMAs and electrically driven fuel pumps. The electrical system for each of the configurations utilized a three-channel architecture feeding electrical load management centers (ELMCs). The trade study results on these three system configurations included comparison of weight, volume, reliability, redundance, cost, and performance. It is concluded that the three systems investigated in the detailed design phase of contract will provide adequate redundancy, reliability, survivability, and performance. The more-electric system is shown to have a definite advantage in weight and cost, and the highest score in the trade study. The all-electric system provides a lower overall mean time between failure. This should be reflected in lower maintenance costs and better flight readiness over the life of the aircraft.

#### AIRCRAFT ELECTRICAL SYSTEM COMPUTER SIMULATION

IN: IECEC-90; E. J. WOODS (Boeing Co., Seattle, WA) Proceedings of the 25th Intersociety Energy Conversion Engineering Conference, Reno, NV, Aug. 12-17, 1990. Vol. 2. New York, American Institute of Chemical Engineers, 1990, p. 84-89. refs

Copyright

Computer simulation results are presented for a single channel of an aircraft electrical system with rectified power loads. The computer model included a generator, ac load with resistance and inductance, and a resistive dc load. Generator models included a wound field model with field control and direct and quadrature axis damper windings, a simplified permanent magnet generator with mutual inductance between stator windings, and a simplified wound field model with mutual inductances and field control. The simulation was implemented on EASY5, a modeling program which utilizes both standard components and user-generated FORTRAN components. The rectifier and some generator models were implemented as FORTRAN components. Steady-state computer runs for the system included various ac and dc load levels. Loads were switched to produce transient conditions. The results are presented in the form of computer-generated plots which show system response.

#### A91-38178 PRISMATIC SEALED NI-CD BATTERY FOR AIRCRAFT **POWER**

MENAHEM ANDERMAN (Acme Advanced Energy Systems, Tempe, AZ), GABOR BENCZUR-URMOSSY, and FRIEDRICH HASCHKA (Deutsche Automobilgesellschaft mbH, Esslingen, Federal Republic of Germany) IN: IECEC-90; Proceedings of the 25th Intersociety Energy Conversion Engineering Conference, Reno, NV, Aug. 12-17, 1990. Vol. 6. New York, American Institute of Chemical Engineers, 1990, p. 143-148.

Copyright

A fast-charging high-power prismatic sealed Ni-Cd battery with a fiber structured electrode has been developed. The battery is designed to exceed essentially all performance attributes of a vented sintered plate aircraft battery, yet it will not require any maintenance. The flexible integrity of the fiber structure electrode supports thousands of deep cycles without electrode degradation. Over 5000 cycles have been measured on vented fiber nickel-cadmium (FNC) cells at a typical 60 percent depth of discharge test. Data obtained to date suggest that the sealed FNC cells may match this performance. Of particular interest to aircraft applications is the ability of the cell to withstand thousands of short high-current loads during the start of an aircraft engine. Data obtained in such tests are discussed.

#### CYCLE ANALYSIS FOR A SUPERSONIC THROUGH FLOW **FAN ENGINE**

PENG SHAN and DEPING TAO (Beijing University of Aeronautics and Astronautics, People's Republic of China) Journal of Propulsion Technology (ISSN 1001-4055), April 1991, p. 31-39. In Chinese, with abstract in English. refs

A computer program for evaluating supersonic throughflow (STF) fan engine thermodynamic quality and optimizing the cycle variables has been developed. Results from applying the program to an STF fan engine equipped for transport with cruise Mach number 2.7 are reported. At cruise conditions, the specific fuel consumption is 2 percent or more lower in the STF fan engine than in the conventional turbofan engine and 8 percent or more lower than in the turbojet engine. At takeoff conditions, the STF fan engine has lower specific fuel consumption than the other types. When the entrance area of the STF fan inlet is designed at the takeoff state for a transport mission profile, the mass flow at other mission states can be fully obtained.

#### HYPERSONIC COMBINED CYCLE PROPULSION

Dec. 1990 474 p In ENGLISH and FRENCH Symposium held in Madrid, Spain, 28 May - 1 Jun. 1990 (AGARD-CP-479; ISBN-92-835-0594-8) Copyright Avail: NTIS HC/MF A20; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

The proceedings of the symposium are presented. The symposium was arranged in the following sessions: (1) Technical review of hypersonic propulsion/mission requirements; (2) Propulsion concepts; (3) Air intake flow; (4) Turbomachinery; (5) Combustion and ram/scramjets; (6) Nozzle flow; and (7) High temperature materials. The present status in the broad subject of contributing to hypersonic combined cycle propulsion is discussed. Considerable progress in design and analysis, using computational fluid dynamics techniques are reported.

The change in the concept of hypersonic speed with time is briefly discussed. The evolution of the hypersonic propulsion is restricted to the history of the ramjets. Considering the abundance of literature on the subject, only the most remarkable achievements are reviewed. Less divulged historical events, such as the propulsion of helicopters by ramjets, are discussed in more detail, and special attention is given to the contributions of Spain to supersonic combustion. The present state of the hypersonic propulsion is examined. Some of the most demanding problems facing the propulsion system of the Aerospace Plane and the Hypersonic Cruise Aircraft are reviewed.

France has the potential for theoretical and experimental research on the ramjet engine which would allow its operational programs such as ASMP (Air Surface Medium Range by nuclear stress). The direction of these studies evolved trends for the future, especially in the area of very high speed and the use of combined engines. This is due in large part to significant national action on the ramjet engine during the period of 1951 to 1972, during which a number of flight tests or ground tests has proven the concepts of the conventional ramjet engine and the combined turbo-ramjet, as well as the dual mode hypersonic ramjet, the latter comes from a subsonic combustion after supersonic. These fixed point tests, on a large scale, were done in the ONERA wind tunnel at Modane. At the request of the organizers of the symposium, the status, main work, and results are reviewed which was conducted during this period in France. An analysis is made of the data. It is hoped that it will lead to more research on the hypersonic propulsion ramjet engine. Transl. by E.R.

Copyright Avail: NTIS HC/MF A20; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

For supersonic and hypersonic flight conditions with ramjets, trajectory calculations have to be coupled with the engine performances. In space transportation systems ramjet will be used in a relatively wide range of Mach numbers, and therefore not always near the optimum design point. Optimization of several physical parameters along the trajectory will be inevitable. Some of these parameters are discussed along with their importance for an ascent trajectory, having a minimum fuel requirement. Author

Since 1986 the French Space Agency, CNES, is sponsoring some comparative studies of different concepts of combined cycle engines made jointly by SNECMA, SEP, and ONERA. SNECMA and SEP recently joined their efforts in combined cycle propulsion by creating a common Joint Venture named HYPERSPACE. The recent progress of comparative studies of different combined cycle engine systems is presented focusing on the following concepts: (1) the turborocket family including the turbo rocket-ramjet and the turbo expander-ramjet; (2) the turbojet family with the turbofan-ramjet and the turboramjet; (3) the rocket-ramjet; (4) the liquefied air rocket; (4) the cooled air rocket; and (5) the scramjet which is also presently in progress. The comparison of these concepts include their theoretical performance, some design considerations and an approximate evaluation of the technological difficulties with each concept.

HYPERSONIC PROPULSION: STATUS AND CHALLENGE

R. WAYNE GUY In AGARD, Hypersonic Combined Cycle Propulsion 19 p Dec. 1990

Copyright Avail: NTIS HC/MF A20; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive CSCL 21/5

Scientists in the U.S. are again focusing on the challenge of hypersonic flight with the proposed National Aerospace Plane (NASP). This renewed interest has led to an expansion of research related to high speed airbreathing propulsion, in particular, the supersonic combustion ramjet, or scramjet. The history is briefly traced of scramjet research in the U.S., with emphasis on NASA sponsored efforts, from the Hypersonic Research Engine (HRE) to the current status of today's airframe integrated scramjets. The challenges of scramjet technology development from takeover to orbital speeds are outlined. Existing scramjet test facilities such as NASA Langley's Scramjet Test Complex as well as new high Mach number pulse facilities are discussed. The important partnership role of experimental methods and computational fluid dynamics is emphasized for the successful design of single stage to orbit vehicles.

AIRBREATHING PROPULSION FOR SPACE TRANSPORT: NEW CONCEPTS, SPECIAL PROBLEMS AND ATTEMPTS AT SOLUTIONS

H. KUENKLER In AGARD, Hypersonic Combined Cycle Propulsion 14 p Dec. 1990

Copyright Avail: NTIS HC/MF A20; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

The design requirements of airbreathing propulsion for space transport application strongly depend on the particular mission demands and differ markedly from those of conventional airbreathing propulsion systems. Especially the low thrust densities and high thermal loads at high Mach numbers demands a systematic approach to design and selection of possible propulsion concepts. Main problems of propulsion system concepts and of their development as well as to present attempts for possible solutions are discussed.

TURBOJET POTENTIAL FOR HYPERSONIC FLIGHT
JEFFREY M. STRICKER and DOUGLAS J. ESSMAN In AGARD, Hypersonic Combined Cycle Propulsion 11 p Dec. 1990

Copyright Avail: NTIS HC/MF A20; Non-NATO Nationals requests available only from AGAD/Scientific Publications Executive

Over the past few years, interest in manned hypersonic flight has increased significantly. The disadvantages of a three mode propulsion system (turbojet/ramjet/scramjet) are the complexity, weight, and costs which accompany it. Inlet and exhaust geometry

variations required for proper integration play a major role. The utilization is explored of the turbine engine for aircraft propulsion up to the scramjet transition. Examination of the uninstalled cycle performance is presented as well as an assessment of installed engine operation in a hydrogen fueled aircraft. Both non-afterburning and afterburning turbine engines are compared to turboramjet and air turboramjet (ATR) engines for a Mach 5 long duration cruise mission along with a pure acceleration mission, i.e., the turbomachinery is used to accelerate the vehicle to a Mach number where the scramjet can take over. From this assessment, a baseline engine configuration/cycle is defined for feasibility studies and critical technology identification. A discussion of the feasibility of the perferred concept from an engine component by component standpoint is provided as well as a discussion of technology risk compared to the state of the art. COMPACT HEAT EXCHANGER FOR AN INVERSE COMPONENTS ENGINE [ECHANGEUR COMPACT POUR MONTEUR A COMPOSANTS INVERSES (MCI)]

YVES RIBAUD /n AGARD, Hypersonic Combined Cycle Propulsion 10 p Dec. 1990 In FRENCH; ENGLISH summary Copyright Avail: NTIS HC/MF A20; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

A presizing study on a counter current heat exchanger fitted for the inverse components engine (ICE) was performed first using analytical calculations and then with a calculation code. The first calculation results show that the heat exchanger integration on the engine axis seems to be possible without a too great penalty on weight and length. The future main research purpose will be directed towards the reduction of the turbine exhaust section.

DESIGN CONSIDERATIONS FOR COMBINED AIR BREATHING-ROCKET PROPULSION SYSTEMS

DAVID L. KORS *In* AGARD, Hypersonic Combined Cycle Propulsion 13 p Dec. 1990 Previously announced in IAA as A91-14442

(AIAA-90-0098) Copyright Avail: NTIS HC/MF A20; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

Combined air breathing rocket propulsion systems have been studied and carried through proof of principle demonstrations during the last three decades. Currently, a number of countries are studying and in some cases actually starting development of demonstrator vehicles for hypersonic flight which use combinations of air breathing and rocket propulsion. A summary of this activity including the propulsion options being studied is discussed. This type of propulsion is much more revolutionary in nature than most previous propulsion developments and thus results in technology challenges that are even more severe than those faced by either conventional air breathing propulsion or rocket designers. These include: (1) propulsion/vehicle integration; (2) engine stability over a wide operating range; (3) high performance over a wide operating range; (4) system level thermal management; and (5) advanced

materials. A discussion of these technical issues including the impact of underachieved development goals on system level performance is also included.

SUPERSONIC-HYPERSONIC INLET STUDIES FOR AEROSPACEPLANE

C. SANS, P. CHAMPIGNY, P. DUVEAU, and C. GINOVART In AGARD, Hypersonic Combined Cycle Propulsion 11 p Dec. 1990 In FRENCH; ENGLISH summary

Copyright Avail: NTIS HC/MF A20; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

Recent improvements in technology have allowed the design of rockets to launch satellites. Reusable shuttles were then used to limit launch costs. A new stage is needed for horizontal takeoff and landing aerospace planes. These single or two stage vehicles will need new propulsion systems, able to provide enough thrust in the whole flight corridor. Mixed propulsion systems seem to be well adapted to this need. During atmospheric flight air breathing engines are necessary to improve performances. Thus inlets will have to be installed. The success of this project will depend on the choice of the inlets, for which mass flow ratios is a paramount objective. Pressure recovery seems to be of less importance at high Mach numbers because of structural stresses. Current design methods are examined which are based on: (1) semiempirical predictions, using experimental data bases, shock boundary layer interaction laws, shock and side overflow losses; (2) 2-D and 3-D Euler codes taking into account the internal bleed effects; and (3) Navier-Stokes codes for specific problems. Some examples of inlet design are presented for rocket ramrocket engines. Problems of inlet integration are presented. Author

## DESIGN TECHNIQUES FOR DUAL MODE RAM-SCRAMJET COMBUSTORS

F. S. BILLIG, S. CORDA, and P. P. PANDOLFINI In AGARD, Hypersonic Combined Cycle Propulsion 20 p Dec. 1990 Copyright Avail: NTIS HC/MF A20; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

A disciplined analytical method that describes the different engine operating modes and internal flow structures in dual mode ram-scramjet combustors is presented. Solutions for physical systems are dependent on empirical data bases from unit process experiments which include shock trains, jet penetration, and mixing. A synopsis of an experimental data base is presented and the method by which it is embodied in the analytical models is discussed. The models are then applied to develop design procedures for combustor-inlet isolators, discrete hole injectors, controlled shear layer mixing, and establishes the efficacy of sudden expansion steps for anchoring shock trains.

## PERFORMANCE CHARACTERISTICS OF HYPERSONIC DETONATION WAVE RAMJETS

T. M. ATAMANCHUK and J. P. SISLIAN *In* AGARD, Hypersonic Combined Cycle Propulsion 13 p Dec. 1990 Previously announced in IAA as A90-42188

Copyright Avail: NTIS HC/MF A20; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

One method of heat addition to a supersonic flow is by means of shock-induced combustion or in this particular study a detonation wave. In order to assess the performance potential of a propulsion utilizing such a mode of heat addition a first order inviscid computational scheme based on Godunov's method was developed. This computational method was chosen since it allows the tracking of flow-field discontinuities such as shocks and slipstreams, thus making it possible to generate a vehicle geometry operating at design conditions for given freestream conditions. This same code was also used to determine the flow-field generated by a given body geometry at off-design conditions. Pressures acting

on these planar and axisymmetric bodies were calculated and used to determine various performance parameters over a range of Mach numbers. Two configurations consisting of multiple shock external and internal inlet compression, followed by an oblique Chapman-Jouquet detonation wave, were considered. Aerodynamic performance of planar multiple external shock inlet compression acting as lifting-propulsive bodies engine-airframe configurations) were also investigated. Off-design performance of these geometries was evaluated by varying the heat addition to the flow in order to obtain the desired thrust-to-dray ratio. For most body geometries operating at flight Mach numbers less than the design Mach number, it was found that no value of heat addition would maintain the design thrust-to-drag ratio. However, for flight Mach numbers greater than the design Mach number it was found that there usually existed at least two values, and in some cases three, of heat addition which would give the design thrust-to-drag ratio.

Wave combustors, which include the oblique detonation wave engine (ODWE), are attractive propulsion concepts for hypersonic flight. These engines utilize oblique shock or detonation waves to rapidly mix, ignite, and combust the air-fuel mixture in thin zones in the combustion chamber. Benefits of these combustion systems include shorter and lighter engines which require less cooling and can provide thrust at higher Mach numbers than conventional scramjets. The wave combustor's ability to operate at lower combustor inlet pressures may allow the vehicle to operate at lower dynamic pressures which could lessen the heating loads on the airframe. The research program at NASA-Ames includes analytical studies of the ODWE combustor using Computational Fluid Dynamics (CFD) codes which fully couple finite rate chemistry with fluid dynamics. In addition, experimental proof-of-concept studies are being performed in an arc heated hypersonic wind tunnel. Several fuel injection design were studied analytically and experimentally. In-stream strut fuel injectors were chosen to provide good mixing with minimal stagnation pressure losses. Measurements of flow field properties behind the oblique wave are compared to analytical predictions.

# N91-23170# Prins Maurits Lab. TNO, Rijswijk (Netherlands). THEORETICAL AND EXPERIMENTAL PERFORMANCE OF A SOLID FUEL RAMJET COMBUSTION CYCLE FOR HYPERSONIC FLIGHT CONDITIONS

P. J. M. ELANDS, P. A. O. G. KORTING, R. G. VERAAR, and P. DIJKSTRA (Technische Univ., Delft, Netherlands) *In* AGARD, Hypersonic Combined Cycle Propulsion 11 p Dec. 1990 Copyright Avail: NTIS HC/MF A20; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

A research program was performed to validate a numerical simulation of the flow and combustion process in the combustion chamber of a solid fuel ramjet with experimental results. Operating conditions were chosen to represent a sustained missile flight at Mach 4 at an altitude of 13 km. Experimental data were obtained by burning cylindrical fuel grains made of polyethylene and hydroxyl terminated polybutadiene in a solid fuel ramjet using a connected pipe facility. For numerical simulation a computer code was developed, describing rotational symmetric steady-state turbulent reacting flows through channels with and without a sudden expansion. Calculations were performed using polyethylene as a fuel. For the validation emphasis was laid on the regression rate. The results show that the computer code predicts the mean regression rate with reasonable accuracy. The value for the effective heat of gasification is found to be very important. The

experiments and the calculations performed show the feasibility to apply a solid fuel ramjet for sustained hypersonic flight at these conditions.

#### THE 2-D SUPERSONIC NOZZLE DESIGN

MICHAEL GOEING and JOERG HEYSE /n AGARD, Hypersonic Combined Cycle Propulsion 10 p Dec. 1990 Copyright Avail: NTIS HC/MF A20; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

A method based on the theory of characteristics is presented for two-dimensional, supersonic nozzle design. Individual nozzle configurations for different applications are obtained by combining the geometric attributes of the symmetric, single expansion ramp, and Prandtl-Meyer type expansion nozzles. Corresponding to the design criteria, such as minimum length and optimum thrust efficiency, relations between desired properties of the flow field and nozzle geometry parameters are found, and a family of length-optimized, two-dimensional, supersonic nozzles is defined. The method can be applied for the design of wind tunnel and steam turbine nozzles as well as for thrust nozzle design of high Mach number aircraft.

Detailed flow measurements were taken inside an isolated axial compressor rotor operating subsonically near peak efficiency. Laser anemometer measurements were made with two inlet velocity profiles. One profile consisted of an unmodified baseline flow, and the second profile was distorted by placing axisymmetric screens on the hub and shroud well upstream of the rotor. A primary flow is defined in the rotor and deviations from this primary flow for each inlet flow condition identified. A comparison between the two flow deviations is made to assess the development of a passage vortex due to the distortion of the inlet flow. A comparison of experimental results with computational predictions from a Navier-Stokes solver showed good agreement between predicted and measured flow. Measured results indicate that a distorted inlet profile has minimal effect on the development of the flow in the rotor passage and the resulting passage vortex. Author

#### 07 AIRCRAFT PROPULSION AND POWER

Nowadays, cooling measurements are being made of the increase in inlet temperature. In order to increase the gas turbine efficiency, it is necessary to take into consideration the influence of cooling air outlet, which cools the turbine blade, on the main flow. A newly designed rotating unit is used to test the aerodynamics of the air-cooled turbine. The influence of cooling the air outlet from the shroud ring at the moving blade tip on the performance was investigated. Also, the influence of the outlet angle, moving blade tip clearance, etc. were investigated. Some of the conclusions made from the results are as follows: (1) with increase in blade tip clearance, the flow rate at the turbine entrance almost uniformly increases at an arbitrary expansion ratio; (2) the thermal isolation efficiency, as defined by use of main flow only, uniformly increases at an arbitrary expansion ratio, in the case where cooling air exists; and (3) the thermal isolation efficiency, where cooling air is also regarded as an operating fluid, is equal regardless of whether or not cooling air exists, while the existence of the cooling air outlet produced a similar effect given the reduction in blade tip clearance.

ADVANCED ICE PROTECTION SYSTEMS TEST IN THE NASA

### ADVANCED ICE PROTECTION SYSTEMS TEST IN THE NASA LEWIS ICING RESEARCH TUNNEL

THOMAS H. BOND, JAIWON SHIN, and GEERT A. MESANDER (Oklahoma City Air Logistics Center, Tinker AFB, OK.) 1991 12 p Presented at the 47th Annual Forum and Technology Display, Phoenix, AZ, 6-8 May 1991; sponsored by American Helicopter Society

(NASA-TM-103757; E-6013; NAS 1.15:103757) Avail: NTIS HC/MF A03 CSCL 21/5

Tests of eight different deicing systems based on variations of three different technologies were conducted in the NASA Lewis Research Center Icing Research Tunnel (IRT) in June and July 1990. The systems used pneumatic, eddy current repulsive, and electro-expulsive means to shed ice. The tests were conducted on a 1.83 m span, 0.53 m chord NACA 0012 airfoil operated at a 4 degree angle of attack. The models were tested at two temperatures: a glaze condition at minus 3.9 C and a rime condition at minus 17.2 C. The systems were tested through a range of icing spray times and cycling rates. Characterization of the deicers was accomplished by monitoring power consumption, ice shed particle size, and residual ice. High speed video motion analysis was performed to quantify ice particle size.

### MODEL ROTOR ICING TESTS IN THE NASA LEWIS ICING RESEARCH TUNNEL

ROBERT J. FLEMMING, RANDALL K. BRITTON (Sverdrup Technology, Inc., Brook Park, OH.), and THOMAS H. BOND 1991 27 p Presented at the 68th Meeting of the Fluid Dynamic Panel Specialists Meeting on the Effects of Adverse Weather on Aerodynamics, Toulouse, France, 29 Apr. - 1 May 1991; sponsored by AGARD

(NASA-TM-104351; E-6136; NAS 1.15:104351) Avail: NTIS HC/MF A03 CSCL 21/5

Tests of a lightly instrumented two-bladed teetering rotor and a heavily instrumented sub-scale articulated main rotor were conducted in the NASA Lewis Research Center Icing Research Tunnel (IRT) in August 1988 and September and November 1989. The first was an OH-58 tail rotor which had a diameter of 1.575 m and a blade chord of 0.133 m, and was mounted on a NASA designed test rig. The second, a four bladed articulated rotor, had a diameter of 1.83 m with 0.124 m chord blades specially fabricated for the experiment. This rotor was mounted on a Sikorsky Aircraft Powered Force Model, which enclosed a rotor balance and other measurement systems. The models were exposed to variations in temperature, liquid water content, and medium droplet diameter, and were operated over ranges of advance ratio, shaft angle, tip Mach number (rotor speed), and weight coefficient to determine the effect of these parameters on ice accretion. In addition to strain gage and balance data, the test was documented with still,

video, and high speed photography, ice profile tracing, and ice molds. Presented here are the sensitivity of the model rotors to the test parameters and a comparison of the results to theoretical predictions.

## A CFD STUDY OF JET MIXING IN REDUCED FLOW AREAS FOR LOWER COMBUSTOR EMISSIONS

C. E. SMITH, M. V. TALPALLIKAR (CFD Research Corp., Huntsville, AL.), and J. D. HOLDEMAN 1991 17 p Presented at the 27th Joint Propulsion Conference, Sacramento, CA, 24-27 Jun. 1991; sponsored by AIAA, SAE, ASME, and ASEE Original contains color illustrations (Contract NAS3-25967)

The Rich-burn/Quick-mix/Lean-burn (RQL) combustor has the potential of significantly reducing NO(x) emissions in combustion chambers of High Speed Civil Transport aircraft. Previous work on RQL combustors for industrial applications suggested the benefit of necking down the mixing section. A 3-D numerical investigation was performed to study the effects of neckdown on NO(x) emissions and to develop a correlation for optimum mixing designs in terms of neckdown area ratio. The results of the study showed that jet mixing in reduced flow areas does not enhance mixing, but does decrease residence time at high flame temperatures, thus reducing NO(x) formation. By necking down the mixing flow area by 4, a potential NO(x) reduction of 16:1 is possible for annual combustors. However, there is a penalty that accompanies the mixing neckdown: reduced pressure drop across the combustor swirler. At conventional combustor loading parameters, the pressure drop penalty does not appear to be excessive.

Emphasis is on a high percentage of dilute ion engines. It is shown that a solution allowing the best performances may be conflicting, particularly for the motor position in the plane, the safety, and the acoustic nuisances. Motor manufacturers have consistently exchange their views, while taking into account their own interests, in order to reach the best compromise. Original solutions result from economic necessity. More and more performing design tools are being developed in order to meet with the requirements of program leaders. Computer alded design plays an important part in shape creation. Composite materials are widely used. Airborne computer operated jet engines are being introduced. It is shown that competition is a factor of progress, with the example of thrust inverters. Improvements were realized in the integration of high dilution engines, with regard to mass, fuel consumption, power plant drag and acoustic nuisance.

MIXING OF MULTIPLE JETS WITH A CONFINED SUBSONIC

### CROSSFLOW. SUMMARY OF NASA-SUPPORTED EXPERIMENTS AND MODELING

JAMES D. HOLDEMAN 1991 49 p Presented at the 27th Joint Propulsion Conference, Sacramento, CA, 24-27 Jun. 1991; sponsored by AIAA, SAE, ASME and the American Socienty for **Electrical Engineers** 

(NASA-TM-104412; E-6239; NAS 1.15:104412; AIAA-91-2458)

Avail: NTIS HC/MF A03 CSCL 21/5

Experimental and computational results on the mixing of single. double, and opposed rows of jets with an isothermal or variable temperature mainstream in a confined subsonic crossflow are summarized. The studies were performed to investigate flow and geometric variations typical of the complex 3-D flowfield in the dilution zone of combustion chambers in gas turbine engines. The principal observations from the experiments were that the momentum-flux ratio was the most significant flow variable, and that temperature distributions were similar (independent of orifice diameter) when the orifice spacing and the square-root of the momentum-flux ratio were inversely proportional. The experiments and empirical model for the mixing of a single row of jets from round holes were extended to include several variations typical of gas turbine combustors. Combinations of flow and geometry that gave optimum mixing were identified from the experimental results. Based on results of calculations made with a 3-D numerical model, the empirical model was further extended to model the effects of curvature and convergence. The principle conclusions from this study were that the orifice spacing and momentum-flux relationships were the same as observed previously in a straight duct, but the jet structure was significantly different for jets injected from the inner wall wall of a turn than for those injected from the outer wall. Also, curvature in the axial direction caused a drift of the jet trajectories toward the inner wall, but the mixing in a turning and converging channel did not seem to be inhibited by the convergence, independent of whether the convergence was radial or circumferential. The calculated jet penetration and mixing in an annulus were similar to those in a rectangular duct when the orifice spacing was specified at the radius dividing the annulus Author into equal areas.

Avail: NTIS HC/MF A03 CSCL 21/5

Future aeropropulsion gas turbine combustion requirements call for operating at very high inlet temperatures, pressures, and large temperature rises. At the same time, the combustion process is to have minimum pollution effects on the environment. Aircraft gas turbine engines utilize liquid hydrocarbon fuels which are difficult to uniformly atomize and mix with combustion air. An approach for minimizing fuel related problems is to transform the liquid fuel into gaseous form prior to the completion of the combustion process. Experimentally obtained results are presented for vaporizing and partially oxidizing a liquid hydrocarbon fuel into burnable gaseous components. The presented experimental data show that 1200 to 1300 K reaction product gas, rich in hydrogen, carbon monoxide, and light-end hydrocarbons, is formed when flowing 0.3 to 0.6 fuel to air mixes through a catalyst reactor. The reaction temperatures are kept low enough that nitrogen oxides and carbon particles (soot) do not form. Results are reported for tests using different catalyst types and configurations, mass flowrates, input temperatures, and fuel to air ratios.

The study was conducted to identify high payoff technologies for year 2000 small gas turbine applications and to provide a technology plan for guiding future research and technology efforts. A regenerative cycle turboprop engine was selected for a 19 passenger commuter aircraft application. A series of engines incorporating eight levels of advanced technologies were studied and their impact on aircraft performance was evaluated. The study indicated a potential reduction in fuel burn of 38.3 percent. At \$1.00 per gallon fuel price, a potential DOC benefit of 12.5 percent would be achieved. At \$2.00 per gallon, the potential DOC benefit would increase to 17.0 percent. Four advanced technologies are recommended and appropriate research and technology programs were established to reach the year 2000 goals. Author

A study of small gas turbine engines was conducted to identify high payoff technologies for year-2000 engines and to define companion technology plans. The study addressed engines in the 186 to 746 KW (250 to 1000 shp) or equivalent thrust range for rotorcraft, commuter (turboprop), cruise missile (turbojet), and APU applications. The results show that aggressive advancement of high payoff technologies can produce significant benefits, including reduced SFC, weight, and cost for year-2000 engines. Mission studies for these engines show potential fuel burn reductions of 22 to 71 percent. These engine benefits translate into reductions in rotorcraft and commuter aircraft direct operating costs (DOC) of 7 to 11 percent, and in APU-related DOCs of 37 to 47 percent.

The study further shows that cruise missile range can be increased

by as much as 200 percent (320 percent with slurry fuels) for a

year-2000 missile-turbojet system compared to a current rocket-powered system. The high payoff technologies were identified and the benefits quantified. Based on this, technology plans were defined for each of the four engine applications as recommended guidelines for further NASA research and technology efforts to establish technological readiness for the year 2000.

SMALL ENGINE COMPONENT TECHNOLOGY (SECT)
STUDIES Final Report

P. K. MEYER and L. HARBOUR Mar. 1986 139 p (Contract NAS3-24543; DA PROJ. 1L1-61101-AH-45) (NASA-CR-175080; NAS 1.26:175080; AVSCOM-TR-86-C-9; FSCM-24235; REPT-074-021-M-005) Avail: NTIS HC/MF A07 CSCL 21/5

A study was conducted to identify component technology requirements for small, expendable gas turbine engines that would result in substantial improvements in performance and cost by the year 2000. A subsonic, 2600 nautical mile (4815 km) strategic cruise missile mission was selected for study. A baseline (state-of-the-art) engine and missile configuration were defined to evaluate the advanced technology engines. Two advanced technology engines were configured and evaluated using advanced component efficiencies and ceramic composite materials; a 22:1 overall pressure ratio, 3.85 bypass ratio twin-spool turbofan; and an 8:1 overall pressure, 3.66 bypass ratio, single-spool recuperated turbofan with 0.85 recuperator effectiveness. Results of mission analysis indicated a reduction in fuel burn of 38 and 47 percent compared to the baseline engine when using the advanced turbofan and recuperated turbofan, respectively. While use of either advanced engine resulted in approximately a 25 percent reduction in missile size, the unit life cycle (LCC) cost reduction of 56 percent for the advanced turbofan relative to the baseline engine gave it a decisive advantage over the recuperated turbofan with 47 percent LCC reduction. An additional range improvement of 10 percent results when using a 56 percent loaded carbon slurry fuel with either engine. These results can be realized only if significant progress is attained in the fields of solid lubricated bearings, small aerodynamic component performance, composite ceramic materials and integration of slurry fuels. A technology plan outlining prospective programs in these fields is presented. Author

## SMALL ENGINE COMPONENT TECHNOLOGY (SECT) STUDY Final Report

T. R. LARKIN Mar. 1986 156 p (Contract NAS3-24542; DA PROJ. 1L1-61101-AH-45) (NASA-CR-175081; EDR-12422; NAS 1.26:175081; AVSCOM-TR-86-C-8) Avail: NTIS HC/MF A08 CSCL 21/5

The objective of this study is to identify high payoff technologies for year 2000 small gas turbine engines, and to provide a technology plan to guide research and technology efforts toward revolutionizing the small gas turbine technology base. The goal is to define the required technology to provide a 30 percent reduction in mission fuel burned, to reduce direct operating costs by at least 10 percent, and to provide increased reliability and durability of the gas turbine propulsion system. The baseline established to evaluate the year 2000 technology base was an 8-passenger commercial tilt-rotor aircraft powered by a current technology gas turbine engine. Three basic engine cycles were studied: the simple cycle engine, a waste heat recovery cycle, and a wave rotor engine cycle. For the simple cycle engine, two general arrangements were considered: the traditional concentric spool arrangement and a nonconcentric spool arrangement. Both a regenerative and a recuperative cycle were studied for the waste heat recovery Author cycle.

B. SINGH Mar. 1986 102 p Prepared for Army Aviation

Systems Command, Cleveland, OH (Contract NAS3-24541; DA PROJ. 1L1-61101-AH-45) (NASA-CR-175079; NAS 1.26:175079; AVSCOM-TR-86-C-10; TELEDYNE-CAE-2224) Avail: NTIS HC/MF A06 CSCL 21/5

Small advanced (450 to 850 pounds thrust, 2002 to 3781 N) gas turbine engines were studied for a subsonic strategic cruise missile application, using projected year 2000 technology. An aircraft, mission characteristics, and baseline (state-of-the-art) engine were defined to evaluate technology benefits. Engine performance and configuration analyses were performed for two and three spool turbofan and propfan engine concepts. Mission and Life Cycle Cost (LCC) analyses were performed in which the candidate engines were compared to the baseline engines over a prescribed mission. The advanced technology engines reduced system LCC up to 41 percent relative to the baseline engine. Critical aerodynamic, materials, and mechanical systems turbine engine technologies were identified and program plans were defined for each identified critical technology.

MODEL 320-2: A COMPACT ADVANCED UAV TURBOJET

ELI H. BENSTEIN, BRIAN CASSEM, and KATHY ELLIOTT In

Johns Hopkins Univ., The 1990 JANNAF Propulsion Meeting,

Volume 1 p 285-294 Oct. 1990

Avail: NTIS HC/MF A20

The Model 320-2 is a 355 lb. thrust, outgrowth/up-rating of the family of small turbojets. It follows the thrust growth pattern of its predecessor J69 engines: a 40 percent increase is achieved by supercharging the simple centrifugal stage of the basic 320 turbojet with a high pressure ratio transonic axial stage, without change of engine diameter or core flowpath. The turbine was predesigned to allow for the increased work level without excessive efficiency loss. The engine retains the simple/low parts count design of the new family, which leads to very low production cost targets. Thus, for the intended expendable or limited life/reusable applications, a compact, high-performance, high-technology missile or unmanned air vehicle (UAV) powerplant results. aerodynamic gas path is presented. The origins of the Model 320-2 is outlined, including its subsystems, the source for the down-scaled supercharging axial, and the approach to deletion of an inlet bleed valve at the 7.85:1 pressure ratio of the compressor. Engine test data are presented in comparison to model predictions, and projections are made for future directions for development.

#### A91-36358 STABILITY OF HINGELESS ROTORS IN HOVER USING THREE-DIMENSIONAL UNSTEADY AERODYNAMICS

OH J. KWON, DEWEY H. HODGES, and LAKSHMI N. SANKAR (Georgia Institute of Technology, Atlanta) American Helicopter Society, Journal (ISSN 0002-8711), vol. 36, April 1991, p. 21-31. refs

(Contract DAAG29-82-K-0094; DAAL03-88-C-0003) Copyright

The effect of three-dimensional lifting surface aerodynamics on coupled flap-lag-torsion aeroelastic stability and response of two-bladed rotor models in the hovering flight conditions is analyzed using a three-dimensional unsteady panel method aerodynamic model coupled to a structural dynamic model of a hingeless ror with elastic blades. For a simplified rotor, three-dimensional tip and realistic wake effects are found to have a nonnegligible effect on the steady equilibrium deflections. A correlation with experimental results demonstrates the improved capability of the

unsteady three-dimensional panel method aerodynamic model to predict the lead-lag damping of the two-bladed hingeless rotor model throughout the ranges of thrust, precone, droop, and pitch flexibility considered.

### A NEW METHOD FOR ESTIMATING AIRSPEED, ATTACK ANGLE AND SIDESLIP ANGLE

REN DA (Northwestern Polytechnical University, Xian, People's Republic of China) and R. BROCKHAUS (Braunschweig, Technische Universitaet, Brunswick, Federal Republic of Germany) Northwestern Polytechnical University, Journal (ISSN 1000-2758), vol. 9, April 1991, p. 125-130. In Chinese, with abstract in English. refs

A nonlinear Kalman filter (NLKF) is presently used in place of a state observer in order to estimate aircraft airspeed, attack angle, and sideslip angle, on the basis of inertial navigation system information on aircraft rotation speed, attitude, and acceleration. A detailed analysis is conducted of NLKF errors by comparing simulated aircraft motions with NLKF estimates. NLKF performance is also compared with real flight test data. Airspeed estimation error is established to be less than 1 m/sec, while attack-angle and sideslip-angle estimation errors are of less than 1 deg. O.C.

## METHODOLOGY FOR THE ANALYTICAL ASSESSMENT OF AIRCRAFT HANDLING QUALITIES

RONALD A. HESS (California, University, Davis) IN: Control and dynamic systems. Vol. 33 - Advances in aerospace systems dynamics and control systems. Pt. 3. San Diego, CA, Academic Press, Inc., 1990, p. 129-149. refs

Copyright

A theory for aircraft handling qualities is proposed and interpreted in terms of structural model of the human pilot. This methodology was developed based on the data from manned simulations involving 35 aircraft configurations in both single and multiloop tasks. It is noted that this methodology provides a framework within which to interpret the pilot's preference for an optimum control system sensitivity.

## A91-37778# RE-ENTRY FLIGHT CONTROL OF SPACE PLANE USING APPROXIMATE PERFECT SERVO

TADASHI SATO, TATSUO CHUBACHI (Iwate University, Morioka, Japan), SHOKICHI KANNO (Ichinoseki National College of Technology, Japan), and HIROBUMI OHTA (Nagoya University, Japan) Japan Society for Aeronautical and Space Sciences, Transactions (ISSN 0549-3811), vol. 33, Feb. 1991, p. 176-190. refs

The flight control system for reentry flight of a space plane is designed in this paper using the approximate perfect servo. The plane is sometimes almost unstable under the effect of shock wave. The term 'approximate perfect servo' means that the input/output transfer matrix is approximately equal to unit matrix. This system is effective to eliminate the effects of strong nonlinearity of angular velocity transformation matrix in the dynamics of three-dimensional motions of aircraft. The method is simple and easy to implement, and does not need any computation of aircraft dynamics. The designed system is robust and stable irrespective of the change of flight conditions and the variation of aircraft dynamics. Simulation studies on the reentry flight of space plane are given to substantiate the proposed method.

#### A91-37779# IMPROVEMENT OF ATMOSPHERIC FLIGHT PERFORMANCE OF A SPACE VEHICLE THROUGH SENSITIVITY MINIMIZATION

YUKINOBU NAKAMURA (Nissan Motor Co., Ltd., Tokyo, Japan), MAKOTO KOBAYAKAWA (Kyoto University, Japan), and HIROYUKI IMAI (Setsunan University, Osaka, Japan) Japan Society for Aeronautical and Space Sciences, Transactions (ISSN 0549-3811), vol. 33, Feb. 1991, p. 191-203. refs

This paper considers the problem of improving controlled atmospheric flight performance of a winged space vehicle. The problem is shown to be formulated as an H(infinity)-sensitivity minimization problem. It is shown that if the weighting function satisfies a certain condition the optimization problem can be solved easily and the resulting optimal sensitivity function turns out to be proportional to the inverse of the weighting function. Through a

discussion on a geometric relationship between the sensitivity and the complementary sensitivity functions, a guideline is presented for choosing the weighting function. This guideline provides a good design tradeoff between those sensitivity functions only through sensitivity minimization. A numerical simulation is carried out for demonstrating the proposed method.

### EVOLUTION OF AIRPLANE STABILITY AND CONTROL - A DESIGNER'S VIEWPOINT

JAN ROSKAM (Kansas, University, Lawrence) Journal of Guidance, Control, and Dynamics (ISSN 0731-5090), vol. 14, May-June 1991, p. 481-491. refs

Stability and control developments affecting aircraft design are reviewed. The paper consists of three sections covering years before and through World War I, years between World War I and World War II, and years since World War II. The works of Draper, Combs, Cayley, Bryan, and other related to stability and control issues are highlighted, and emphasis is placed on Routh's stability criteria. The effect of lateral and directional stability on the dynamic stability behavior is discussed, and examples of control-surface, tab, and bob-weight applications are presented. The effects of configuration on the fuselage-induced shift of the aerodynamic center, and aeroelasticity and wheel-control force on roll performance are outlined. Roll coupling stability boundaries, the equivalent stability derivative concept, and the pitch break behavior as a function of the horizontal tail location are covered.

### THE DESIGN AND SIMULATION OF AN INTELLIGENT FLIGHT CONTROL SYSTEM

CHANGSHENG JIANG and ZHONGHAN HU (Nanjing Aeronautical Institute, People's Republic of China) Acta Aeronautica et Astronautica Sinica (ISSN 1000-6893), vol. 12, Jan. 1991, p. A46-A53. In Chinese, with abstract in English. refs

The design of an intelligence automatic flight control system is discussed. The basic structure of the system, the basic rule of intelligence control for simulating human behavior, the division of a characteristic model, and the construction of intelligence control laws are suggested. Based on the principles mentioned above, the knowledge base, the data base, the rule base, and inference mechanism of the system are designed. It is demonstrated by digital simulation for some kinds of aircraft that this system has excellent control performance, strong robustness and adaptability, and good decoupling function.

TESTING THE TILTROTOR FLIGHT CONTROL SYSTEM

Aerospace Engineering (ISSN 0736-2536), vol. 11, June 1991, p. 37-40.

Copyright

A review is presented of the V-22 tiltrotor's fly-by-wire digital flight control system (FCS) and the test system used, beginning at the lowest possible level, and again at each succeeding level, until the complete system is assembled on the aircraft for first flight. Extensive verification testing was performed on the FCS software to ensure that it operates in accordance with the detailed functional requirements established in the program performance specification for each computer program. The primary reason for validating the FCS was to successfully integrate the separate pieces of hardware (hydraulic components, computers, sensors, electrical system) into a fully functional whole. Additional details are provided R.E.P. for testing performed on the specific systems.

#### THE DEVELOPMENT OF ALTERNATE CRITERIA FOR FBW HANDLING QUALITIES

J. C. GIBSON In AGARD, Flying Qualities 13 p Copyright Avail: NTIS HC/MF A17; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

Provision of robust flight control systems and structural mode stability margins and carefree handling in highly unstable combat aircraft with a wide range of store loading requires new methods for handling qualities optimization. The possibilities for new control modes and task-tailored handling were greatly enhanced by modern controls. This has led to development of many alternate criteria which were tried and tested in two digital fly by wire (FBW) research aircraft, the Experimental Aircraft Program (EAP) and Jaguar FBW, and were further developed for use in European fighter aircraft (EFA). They cover the field of flight path and attitude bandwidth, tracking dynamics and sensitivity, pilot-induced oscillation (PIO) prevention, and enhanced lateral directional damping. Derived as design guidelines with the facility to design for optimum rather than merely acceptable handling, more research is needed into formal boundaries for levels 1, 2, and 3 specifications. The criteria are reviewed and some are illustrated by example. Author

Deutsche Forschungsanstalt fuer Luft- und N91-23114# Raumfahrt, Brunswick (Germany, F.R.). Inst. fuer Flugmechanik. DEVELOPMENT OF MIL-8785C INTO A HANDLING QUALITIES SPECIFICATION FOR A NEW EUROPEAN FIGHTER **AIRCRAFT** 

E. BUCHACKER, H., GALLEITHNER, R. KOEHLER, and M. MARCHAND In AGARD, Flying Qualities 16 p Copyright Avail: NTIS HC/MF A17; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

For the development of the Tornado, which started in the sixties, a draft version of MIL 8785B was used as a guideline and specification for the flying qualities the airplane should have. No consideration was given at that time to the fact that requirements, which were based on mathematical models of the airplane, only considered the flight mechanics of the bare airframe. In most cases, a new airplane is sold on performance promises. The fact that a pilot has to be able to fly an airplane safely and efficiently in order to achieve full performance, especially in a combat airplane, is often forgotten. The Armed Forces are repeatedly disappointed with their aircraft when it becomes clear that it is impossible to achieve the promised performance for reasons of conflicting flying qualities issues which demand other than performance optimal trim schedules. This, coupled with the fact that there was not a lot of flying qualities research within the nations participating in the Tornado program, led to the situation that it is was more or less only during flight tests that the user realized the problems involved with full authority full time flight control systems. In the meantime, however, some research efforts have been initiated by government and industry that have provided some second thoughts on flying qualities requirements for highly augmented airplanes with a basically unstable pitch axis. Together with industry, the four nations involved in the European Fighter Aircraft (EFA) Program decided to initiate an effort to generate a flying qualities specification for EFA based on the MIL-F-8785C. Some of the issues discussed include the following: the equivalent system approach, high order requirements for the pitch axis, the carefree handling issue, roll performance, small lateral directional inputs, air combat, and stall and spin.

#### HANDLING QUALITIES OF HIGHLY AUGMENTED UNSTABLE AIRCRAFT SUMMARY OF AN AGARD-FMP WORKING GROUP **EFFORT**

HORST WUENNENBERG In AGARD, Flying Qualities 6 p Feb. 1991

Copyright Avail: NTIS HC/MF A17; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

Methods and criteria which were found to be useful as design guides and for the evaluation of handling qualities of highly augmented aircraft are presented. It was the unanimous opinion of the members of the working group that no one method or criterion is adequate by itself, and that several or even all of the recommended criteria should be checked. Experience has shown that one metric may not show a deficiency that will be exposed by other criteria. Alternately, a configuration that passes several of the proposed criteria has a high probability of being accepted as desirable by most pilots. The major topics covered by the Author working group's report are listed.

### DETERMINATION OF DECISION-HEIGHT WINDOWS FOR DECELERATING IMC APPROACHES IN HELICOPTERS

ROGER H. HOH (Hoh Aeronautics, Inc., Lomita, CA.), S. W. BAILLIE, S. KERELIUK, and JOSEPH J. TRAYBAR *In* AGARD, Flying, Qualities 17 p Feb. 1991 Prepared in cooperation with Federal Aviation Administration, Atlantic City, NJ

Copyright Avail: NTIS HC/MF A17; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

The basic limitations were defined of the pilot plus rotorcraft in making the transition from a very low decision height to a steady hover over the helipad. The term 'decision-height window' is defined as the limits of glideslope/localizer tracking errors, and groundspeed variations, that can exist at breakout to allow a safe visual transition to hover. The dimensions of the decision-height window can have a significant impact on the required rotorcraft handling qualities, and for setting autopilot coupler and flight director performance standards for decelerating instrument approaches in rotorcraft.

## N91-23190 California Univ., Los Angeles. INTEGRATED MULTIDISCIPLINARY OPTIMIZATION OF ACTIVELY CONTROLLED FIBER COMPOSITE WINGS Ph.D. Thesis

ELIEZER LIVNE 1990 432 p

Avail: Univ. Microfilms Order No. DA9105834

The synthesis of actively controlled fiber composite wings is formulated as a multidisciplinary design optimization problem. An integration of analysis techniques spanning the disciplines of structures, aerodynamics, and controls is described. A rich variety of behavior constraints can be treated including stress, displacement, control surface travel and hinge moment, natural frequency, aeroservoelastic stability, gust response, and handling quality constraints as well as performance measures in terms of drag/lift coefficients, drag polar shape, required load factor on roll rate, and wing mass. The design space includes a simultaneous treatment of structural, aerodynamic, and control system design variables. Capabilities and accuracy of the analysis and related behavior sensitivity analysis are discussed. Applicability of approximation concepts to the multidisciplinary optimization problem is examined by studying typical aeroservoelastic stability, gust response, and performance related constraints. The high computational efficiency of the combined analysis and sensitivity as well as the good quality of key behavior constraint approximations set the stage for the optimization of actively controlled fiber composite wings in a practical preliminary design context. Design studies of different wing configurations demonstrate the power of the new technology and offer better understanding of the multidisciplinary interactions inherent to this complex problem.

KNUT WILHELM and ANTON M. H. NIEUWPOORT (Fokker B.V., Schipol-Oost, Netherlands) Nov. 1990 51 p (DLR-FB-90-35; ISSN-0939-2963; ETN-91-99063) Avail: NTIS HC/MF A04; DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Fed. Republic of Germany, HC 20.50 DM

The handling qualities evaluation is a very important part of the overall flight control system development process. For determining the flight characteristics of highly augmented aircraft there are basically two methods: evaluation using pilots under operational conditions and numerical handling qualities evaluation using mathematical models of the aircraft. Both methods are addressed with main emphasis laid on those techniques suitable for handling qualities analysis of highly augmented aircraft. The important role of system identification in the handling qualities evaluation process is presented.

# N91-23192# Aerospatiale, Toulouse (France). THE ELECTRICAL FLIGHT CONTROL SYSTEM OF A320 AIRBUS: A FAULT TOLERANT SYSTEM [LES COMMANDES DE VOL ELECTRIQUES DE L'AIRBUS A320: UN SYSTEME TOLERANT AUX FAUTES]

DOMINIQUE BRIERE and PASCAL TRAVERSE 1991 6 p In FRENCH; ENGLISH summary Presented at 7th International Conference on Reliability and Maintenance, Brest, France, 1990 (REPT-911-111-103; ETN-91-99267) Avail: NTIS HC/MF A02

The A 320 Airbus is the first civil aircraft equipped with an electrical flight control system. This system is based on very stringent dependability constraints, both in terms of safety and

availability. The basic building blocks are control and monitoring computers. The control channel is in charge of the function of the computer, for instance, to slave a control surface. The monitoring channel is used to detect a possible failure of the control channel. A high level of redundancy is built in the system Particular attention is drawn to possible external stresses. The system is built to tolerate both hardware and software design faults.

#### SIMULATION EVALUATION OF A SPEED-GUIDANCE LAW FOR HARRIER APPROACH TRANSITIONS

VERNON K. MERRICK, ERNESTO MORALEZ, MICHAEL W. STORTZ, GORDON H. HARDY, and RONALD M. GERDES (SYRE Corp., Moffett Field, CA.) Apr. 1991 34 p (NASA-TM-102853; A-90247; NAS 1.15:102853) Avail: NTIS HC/MF A03 CSCL 01/3

An exponential-deceleration speed guidance law is formulated which mimics the technique currently used by Harrier pilots to perform decelerating approaches to a hover. This guidance law was tested along with an existing two-step constant deceleration speed guidance law, using a fixed-base piloted simulator programmed to represent a YAV-8B Harrier. Decelerating approaches to a hover at a predetermined station-keeping point were performed along a straight (-3 deg glideslope) path in headwinds up to 40 knots and turbulence up to 6 ft./sec. Visibility was fixed at one-quarter nautical mile and 100 ft. cloud ceiling. Three Harrier pilots participated in the experiment. Handling qualities with the aircraft equipped with the standard YAV-8B rate damped attitude stability augmentation system were adequate (level 2) using either speed guidance law. However, the exponential deceleration speed guidance law was rated superior to the constant-deceleration speed guidance law by a Cooper-Harper handling qualities rating of about one unit independent of the level of wind and turbulence. Replacing the attitude control system of the YAV-8B with a high fidelity model following attitude flight controller increased the approach accuracy and reduced the pilot workload. With one minor exception, the handling qualities for the approach were rated satisfactory (level 1). It is concluded that the exponential deceleration speed guidance law is the most cost effective.

The establishment of a B-1 test bed is chronicled from identification of the requirement to the initial measurements program. Disassembly, modification, and reassembly of the airframe are covered. Future modifications and measurements are previewed. The facilities at which the B-1 test bed is located are briefly discussed.

#### A91-39396 SIMULATION OF G(X) FORCES USING HORIZONTAL IMPULSE ACCELERATORS

RICHARD P. WHITE, JR. and MARTIN G. VOGEL (Systems Research Laboratories, Inc., Dayton, OH) IN: Annual SAFE Symposium, 27th, New Orleans, LA, Dec. 5-8, 1989, Proceedings. Newhall, CA, SAFE Association, 1990, p. 195-201. Copyright

The success achieved in the development of effective ejections systems is attested by the number of lives these systems have saved. During the development of these life-saving systems, many tests are conducted on the subsystems to ensure their adequacy of performance in the dynamic environment associated with a high speed ejection. The dynamic loadings which the systems are designed to resist are generally based on the limits on the human body. The establishment of these human limits has been gained from data obtained during tests conducted on humans up to safe G(x) levels and by the use of human analogs at the G(x) levels that are anticipated during high speed ejections. Analysis of these data, in association with physiological data of the human body, has led to a set of guidelines that is used to design the dynamic and structural characteristics of ejection seats and the restraint system. ## A91-40556# AN INTRODUCTION TO TESTING PARACHUTES IN WIND TUNNELS

J. M. MACHA (Sandia National Laboratories, Albuquerque, NM) AlAA, Aerodynamic Decelerator Systems Technology Conference, 11th, San Diego, CA, Apr. 9-11, 1991. 11 p. refs (Contract DE-AC04-76DP-00789) (AIAA PAPER 91-0858)

This paper reviews some of the technical considerations and current practices for testing parachutes in conventional wind tunnels. Special challenges to the experimentalist caused by the fabric construction, flexible geometry, and bluff shape of parachutes are discussed. In particular, the topics of measurement technique, similarity considerations, and wall interference are addressed in a summary manner. Many references are cited which provide detailed coverage of the state of the art in testing methods.

The main objectives of this work is to demonstrate the potential of a cryogenic adaptive nozzle to generate quiet (low disturbance) supersonic flow. A drive system was researched for the Fluid Mechanics Laboratory (FML) Laminar Flow Supersonic Wind Tunnel (LFSWT) using a pilot tunnel. A supportive effort for ongoing Proof of Concept (PoC) research leading to the design of critical components of the LFSWT was maintained. The state-of-the-art in quiet supersonic wind tunnel design was investigated. A supersonic research capability was developed within the FML.

PRECISION RUNWAY MONITOR DEMONSTRATION REPORT **Final Report** 

Feb. 1991 133 p

(AD-A232671; DOT/FAA/RD-91/5) Avail: NTIS HC/MF A07 CSCL 01/5

This report is prepared as the result of a development and demonstration project to increase landing capacity on closely spaced parallel runways. The project developed new equipment and procedures, and demonstrated them in a variety of ways at two different airports. The new monitoring equipment consists of radars and displays. The systems installed at Raleigh, NC included an electronically scanned antenna capable of half-second update intervals, while the Memphis, TN installation provided a mechanically rotating back-to-back antenna with a 2.4-second update interval. In addition, both sites provided enhanced high-resolution color ATC display systems. The purpose of the report is to present findings relevant to a decision concerning whether or not the current standard for runway separation of 4,300 ft can be reduced to 3,400 ft when the precision runway monitor equipment is utilized. The 3,400-ft separation was the spacing demonstrated most often in both simulations and flight tests. The demonstration produced a broad recognition that both systems could be used to monitor parallel runways spaced at 3400 feet apart.

#### LITERATURE REVIEW ON GEOTEXTILES TO IMPROVE **PAVEMENTS FOR GENERAL AVIATION AIRPORTS Final** Report

DEWEY W. WHITE, JR. Feb. 1991 61 p (AD-A232871; WES/MP/GL-91-3) Avail: NTIS HC/MF A04 **CSCL 13/2** 

This report covers a literature search and review to obtain information on geotextile applications related to pavement construction. Applicable information from this study would be used to prepare guidelines on design application, material specifications, performance criteria, and construction procedures for improving subgrade support with geotextiles in general aviation airport pavements. The study revealed that there are numerous design procedures available for using geotextiles in aggregate surfaced pavements and flexible pavement road construction. However, there is no generally accepted procedure for either type construction. The state-of-the-art has not advanced to the point where design procedures for using geotextiles in paved airport construction are available. Construction/installation procedures are available for using geotextiles in aggregate surfaced pavements

and flexible pavements for roads, and these may be used as an aid in recommending procedures for airport construction.

NATIONAL TRANSONIC FACILITY STATUS

L. W. MCKINNEY, W. E. BRUCE, JR., and B. B. GLOSS In its Transonic Symposium: Theory, Application and Experiment, Volume Apr. 1989

Avail: NTIS HC/MF A11 CSCL 14/2

The National Transonic Facility (NTF) was operational in a combined checkout and test mode for about 3 years. During this time there were many challenges associated with movement of mechanical components, operation of instrumentation systems, and drying of insulation in the cryogenic environment. Most of these challenges were met to date along with completion of a basic flow calibration and aerodynamic tests of a number of configurations. Some of the major challenges resulting from cryogenic environment are reviewed with regard to hardware systems and data quality. Reynolds number effects on several configurations are also discussed.

#### ADVANCED HYPERVELOCITY AEROPHYSICS FACILITY WORKSHOP

ROBERT D. WITCOFSKI, comp. and WILLIAM I. SCALLION, comp. May 1989 170 p Workshop held in Hampton, VA, 10-11 May 1988

(NASA-CP-10031; NAS 1.55:10031) Avail: NTIS HC/MF A08 **CSCL 14/2** 

The primary objective of the workshop was to obtain a critical assessment of a concept for a large, advanced hypervelocity ballistic range test facility powered by an electromagnetic launcher, which was proposed by the Langley Research Center. It was concluded that the subject large-scale facility was feasible and would provide the required ground-based capability for performing tests at entry flight conditions (velocity and density) on large, complex, instrumented models. It was also concluded that advances in remote measurement techniques and particularly onboard model instrumentation, light-weight model construction techniques, and model electromagnetic launcher (EML) systems must be made before any commitment for the construction of such a facility can be made.

AN EXPERIMENTAL EVALUATION OF COMBUSTOR LINER MATERIALS FOR SOLID FUEL RAMJET TESTING

In Johns Hopkins Univ., The 1990 JANNAF J. Volume 1 p 227-234 Oct. 1990 J. B. OPPELT Propulsion Meeting, Volume 1 p 227-234 Avail: NTIS HC/MF A20

The investigation determined the survivability and effect on combustion efficiency of several candidate liner materials for ramjet solid fuel screening tests. A liner is necessary both to protect the combustor walls and to reduce heat loss from the combustion chamber. This heat loss can result in incomplete combustion and poor performance. Both a hydrocarbon and a boron fuel were used to compare the liner's effect on the combustion of these fuel types. A finite element heat conduction model constructed prior to testing indicated that the boron nitride (BN) liner would allow nearly the heat loss of stainless steel, and thus, result in poor measured performance compared to a better insulated combustor. The results of the testing show this to be true for the hydrocarbon fuel. Slag deposits on the liner walls from the boron fuel help insulate the liners and reduced their effect on measured performance. A ceramic liner of a boron nitride/aluminum nitride composition (BN/AIN) withstood the thermal environment and insulated well. Measured combustion efficiency was higher for the BN/AIN liner than for DC 93-104, the accepted liner of choice for ramjet testing. This showed that the choice of liner material can affect performance results, and in the case of DC 93-104, indicated care must be taken to use an adequate thickness of insulator.

A highly sensitive method for detecting trace amounts of water in aviation kerosenes using direct gas chromatography is demonstrated for T-6 and T-1 fuels and naphthyl. The chromatographic analysis was carried out under the following optimal conditions: gas (helium) flow rate, 40 cu cm/min; evaporator temperature, 300 C; column temperature, 100 C; detector temperature, 120 C; detector current, 120 mA; and sample volume, 0.1-0.2 ml. Typical chromatograms of the aviation kerosenes are presented. The sensitivity of the method is 0.0001 percent by mass or better; the results are reproducible to within 10 percent.

A91-38129 METHANOL - AN ENVIRONMENTALLY ATTRACTIVE ALTERNATIVE COMMERCIAL AVIATION FUEL

ROBERT O. PRICE (Harmsworth Associates, Laguna Hills, CA) IN: IECEC-90; Proceedings of the 25th Intersociety Energy Conversion Engineering Conference, Reno, NV, Aug. 12-17, 1990. Vol. 4. New York, American Institute of Chemical Engineers, 1990, p. 331-336. refs

Copyright

Southern California's reliance on petrolium-fueled transportation has resulted in significant air pollution problems within the South Coast Air Basin. To deal with this issue, recently enacted state legislation has proposed mandatory introduction of clean alternative fuels into ground transportation fleets operating within this area. The commercial air transportation sector, however, also exerts a significant impact on regional air quality which may result in exceeding emission gains achieved in the ground transportation sector. The author addresses the potential, through the implementation of methanol as a commercial aviation fuel, to improve regional air quality within the Basin. This perceived benefit has formed the basis for a proposal, recently submitted to the California Energy Commission, to flight test and demonstrate methanol as an environmentally preferable fuel in aircraft turbine

A91-38802 MODELING OF CREEP-FATIGUE INTERACTION EFFECTS ON **CRACK GROWTH** 

KENNETH R. BAIN (General Electric Co., Cincinnati, OH) and REGIS M. PELLOUX (MIT, Cambridge, MA) IN: Elevated temperature crack growth; Proceedings of the Symposium, ASME Winter Annual Meeting, Dallas, TX, Nov. 25-30, 1990. New York, American Society of Mechanical Engineers, 1990, p. 1-6. refs

The accurate prediction of fatigue crack growth rates at elevated temperature has become a critical problem in the design of advanced gas turbine engines. A typical mission for gas turbine materials has significant cyclic loads combined with both high temperature and extended holds at load. Performing a matrix of tests which allows interpolative modeling of these parameters can be very expensive and the models themselves may have limited effectiveness. A model based on linear superposition of creep crack growth and fatigue crack growth will not only allow accurate prediction of fatigue crack growth rates for a wide variety of cycling conditions, but will reduce the number of tests required to estimate the behavior of a material to only three tests. A mechanistic model for predicting the effects of R-ratio, hold time, frequency, and temperature on fatigue crack growth has been developed which accurately predicts all of these effects. Author

A91-38809 FATIGUE CRACK GROWTH IN MONOLITHIC TITANIUM **ALUMINIDES** 

F. K. HAAKE, D. P. DELUCA, K. P. HOLLAND (Pratt and Whitney Group, West Palm Beach, FL), and G. C. SALIVAR (Florida Atlantic University, Boca Raton) IN: Elevated temperature crack growth; Proceedings of the Symposium, ASME Winter Annual Meeting, Dallas, TX, Nov. 25-30, 1990. Copyright

Tactical aircraft engine designs depend on advanced materials technology to meet performance and durability goals. Monolithic titanium aluminides are currently being developed for potential use in gas turbine engine components where they offer strength and stiffness advantages at temperatures above conventional titanium alloy capabilities. The primary limitations of these alloys have been low ductility at low temperatures and uncertainty about fatigue and fracture capabilities. This paper will address fatigue crack growth of alpha-2 titanium aluminides. The effects of temperature, stress ratio, and frequency on fatigue crack growth rates will be reviewed. Some observations on crack closure in the near-threshold region will be presented. The crack growth behavior of these alloys will be compared to conventional titanium alloys. Finally, some conclusions will be drawn about the potential use of these materials in future engines.

#### A91-38812 FATIGUE CRACK GROWTH MODELING AT ELEVATED TEMPERATURE USING FRACTURE MECHANICS

T. NICHOLAS (USAF, Wright Research and Development Center, Wright-Patterson AFB, OH) IN: Elevated temperature crack growth; Proceedings of the Symposium, ASME Winter Annual Meeting, Dallas, TX, Nov. 25-30, 1990. New York, American Society of Mechanical Engineers, 1990, p. 107-112. refs (Contract AF PROJECT 2302P1)

Copyright

Crack growth rates at elevated temperature are represented at the sum of cycle- and time-dependent terms. Parameters are introduced to account for environmental degradation as well as the blunting effect due to creep or stress relaxation under sustained-load hold times. A new model is shown to have sufficient flexibility to represent a wide variety of elevated temperature crack growth rate behavior. Growth rates in a nickel-base superalloy and a titanium aluminide alloy are well represented by the model which uses the linear elastic fracture mechanics parameter, K. Numerical examples are presented which illustrate the various **Author** features of the model.

#### A91-38819\* General Electric Co., Cincinnati, OH. APPLICATION OF PATH-INDEPENDENT INTEGRALS TO **ELEVATED TEMPERATURE CRACK GROWTH**

K. S. KIM and R. H. VAN STONE (GE Aircraft Engines, Cincinnati, OH) IN: Elevated temperature crack growth; Proceedings of the Symposium, ASME Winter Annual Meeting, Dallas, TX, Nov. 25-30, 1990. New York, American Society of Mechanical Engineers, 1990, p. 155-167. refs

(Contract NAS3-23940)

The applicability of the J-integral in elasto-plastic fracture mechanics is limited to isothermal, monotonic loading conditions from the theoretical viewpoint, while in many applications, for instance gas turbine engines, crack growth occurs in the presence of cyclic inelastic loading, thermomechanical loading and temperature gradients. A number of path-independent (P-I) integrals have been proposed which do not have the restrictions of the J-integral. A review indicates that four of these integrals, although they are not the classical conservation integrals, path-independent under these complex loading conditions. This paper describes a combined analytical and experimental effort to evaluate the ability of these four P-I integrals to correlate the crack growth data of Alloy 718 at elevated temperatures. Results for uniform temperature, 538 C, cases indicate that all these integrals are capable of correlating the crack growth data over a wide range of cyclic plasticity.

The Integrated High Performance Turbine Engine Technology (IHPTET) Initiative and the development of manned hypersonic vehicles represent major new requirements for materials having high weight-specific properties and good environmental resistance at elevated temperatures. In their monolithic form, and as a matrix material for continuous fiber composites, titanium aluminides are important candidates to fill these needs in the intermediate-temperature regime of 600 C to 1000 C. Before these materials can become flight worthy, however, they must demonstrate reliable mechanical behavior over the range of anticipated service conditions. This paper outlines current trends toward utilization of titanium aluminides in aerospace structures, and a summary of a broad range of mechanical properties characteristic of various titanium aluminide materials is presented. Finally, the mechanical properties of monolithic and composite titanium aluminide materials are compared and contrasted with properties of a competing state-of-the-art titanium alloy and a nickel-base superalloy.

A helicopter emergency external-stores jettison system accommodating an experimental simplified mounting system is presented. The system's conceptual approach is described, including store interface, attachment, functional mechanisms, and system initiation. It is novel both in the stores' mounting interface logic and in the modifications to existing technology for the components. Two nonfragmenting 'ridge cut' explosive bolts were mounted in each 600-pound store to interface with a simple plate on the aircraft. Starting designs with proven technology and functional margins were demonstrated by analysis and test through the design and development. Design details of the system's components, from the explosive bolt to the initiation handle, are described.

#### A91-39690# KINETIC STUDY OF A HOMOGENEOUS PROPELLANT PRIMARY FLAME, WITH AND WITHOUT ADDITIVE

Copyright

A pseudo-detailed mechanism is presented as an initial kinetic scheme, which is then reduced to three reactions, a homogeneous one summarizing the different reactions between the gaseous species, and two heterogeneous reactions describing the consumption of solid carbon particles in the flow. The mass fraction of NO2 is considered as the degree of progress of the reaction and the heat production rate is expressed as a function of the mass fraction of NO2 and the power 0.4 of the pressure. Comparison of the results obtained when taking or not taking mass and thermal diffusions into account demonstrates the validity of the simplified approach employed to determine the solution of a kinetic problem applied to the study of a premixed flame stabilized on a double base solid propellant grain.

#### A91-40178 NON METALLIC MATERIALS FOR GAS TURBINE ENGINES -ARE THEY REAL?

CHESTER T. SIMS (Rensselaer Polytechnic Institute, Troy, NY) Advanced Materials and Processes (ISSN 0882-7958), vol. 139, June 1991, p. 32-39. refs Copyright

Since the thrust efficiency of gas turbines is maximized with increasing turbine inlet temperature, efforts are underway to achieve the 2200 C stoichiometric combustion temperature of commercial jet fuels, which is about 500 C above current temperatures; such

#### 11 CHEMISTRY AND MATERIALS

an operating temperature, however, entails improvements in turbine structural materials' performance levels which have for several years been addressed by research with low-density ceramics and intermetallics. Typical monolithic nonoxide ceramics investigated have been Si3N4, SiC, and Si-Al-O-N, while oxides encompass Al2O3 and ZrO2, and intermetallics include the Ni and Nb aluminides. It is judged that all such efforts have fallen far short of expectations, and that higher combustion temperatures will more easily and economically be accommodated by more refined use of superalloy blading and ceramic thermal-barrier coatings.

It is shown that, in aeronautics, each material innovation is the cause of reactions in other competitive materials. The evolution of metallic and organic materials is considered. Aluminum alloys improvements were made with regard to fatigue strength, corrosion behavior, and damage tolerances. Newly developed aluminum lithium alloys showed a 9 pct. mass gain potential. New aluminum alloys, new titanium alloys, and new steels are presented. Titanium alloys are discussed. Titanium superplastic forming and diffusion bonding is illustrated. Landing gear steels and structural steel properties are given. Metallic Matrix Composite (MMC) evolution is presented. Aluminum matrix material characteristics are given. New materials for civil aircrafts are presented. A marked evolution towards composite material utilization is focused.

N91-23251# Aerospatiale Aguitaine, Saint-Medard en Jalles (France). Strategic and Space Div. OXIDATION RESISTANT CARBON/CARBON MATERIALS

O. FRANC and JEAN-LUC MACRET 1991 5 p (REPT-911-430-105; ETN-91-99277) Avail: NTIS HC/MF A01

A research and development program in Ceramic Matrix Composites (CMC) and oxidation resistant Carbon/Carbon (C/C lnox) is discussed. The proposal for C/C lnox to be used for the nose cap and wing leading edge of the Hermes Spaceplane is discussed. The fabrication of C/C material (weaving and densification) and C/C PAO (Protection Against Oxidation) including silicidation and PAO for leading edges and nose caps are described. C/C is concluded to have an excellent stability of properties in temperatures up to 3000 C but due to oxidation sensitivity a PAO is needed for application on space planes.

Aerospatiale Aquitaine, Saint-Medard en Jalles N91-23262# (France). Strategic and Space Div. HOW TO KNOW CMC

F. ALBUGUES and P. PERES 1991 13 p Previously announced as N91-11865

(REPT-911-430-130; ETN-91-99302) Avail: NTIS HC/MF A03

Thermostructural development of CMC (Ceramic Matrix Composites) is summarized. Nondestructive test methods, mechanical characterization and mathematical modeling are discussed. Production of structural composite materials for use in wing leading edges and nose caps of reusable space vehicles is addressed. Mechanical test validity of test sample, fracture behavior modeling and mechanical tests related to microstructure are described. The synergy of the different approaches presented is concluded to give much information and elements of behavior understanding for the 'young materials' that are CMC.

THE EFFECTS OF CONTROLLING VORTEX FORMATION ON THE PERFORMANCE OF A DUMP COMBUSTOR Ph.D. Thesis KEITH ROBERT MCMANUS 1990 223 p

Avail: Univ. Microfilms Order No. DA9102314

The use of flow control methods to improve the performance of air breathing combustors, specifically with respect to controlling both volumetric energy release and combustion instability, is investigated. The flow control techniques were chosen for their ability to control vortex formation near the inlet of the combustor. Periodic spanwise forcing of the inlet boundary layer was used to control the spanwise vortex shedding process in the combustor. Delta wing vortex generators and vortex generator jets were used to introduce streamwise vorticity into the flow. These control strategies were applied separately and together to a laboratory-scale dump combustor, and the effects on combustor performance were determined. The effect of spanwise forcing on both nonreacting and reacting flowfields was to modulate the formation of spanwise coherent vortex structures just downstream of the flow separation. In the nonreacting flowfield, the shear layer spreading rate was increased when forcing was applied. In the reacting flow, forcing caused a modulation of the flame structure. Dissert. Abstr.

N91-24358\*# Boeing Commercial Airplane Co., Seattle, WA. ENVIRONMENTAL EXPOSURE EFFECTS ON COMPOSITE MATERIALS FOR COMMERCIAL AIRCRAFT Final Report, 22

Nov. 1977 - 31 Dec. 1990 DANIEL J. HOFFMAN and WILLIAM J. BIELAWSKI Jan. 1991

(Contract NAS1-15148)

(NASA-CR-187478; NAS 1.26:187478) Avail: NTIS HC/MF A07 **CSCL 11/4** 

A study was conducted to determine the effects of long term flight and ground exposure on three commercially available graphite-epoxy material systems: T300/5208, T300/5209, and T300/934. Sets of specimens were exposed on commercial aircraft and ground racks for 1, 2, 3, 5, and 10 years. Inflight specimen sites included both the interior and exterior of aircraft based in Hawaii, Texas, and New Zealand. Ground racks were located at NASA-Dryden and the above mentioned states. Similar specimens were exposed to controlled lab conditions for up to 2 years. After each exposure, specimens were tested for residual strength and a dryout procedure was used to measure moisture content. Both room and high temperature residual strengths were measured and expressed as a pct. of the unexposed strength. Lab exposures included the effects of time alone, moisture, time on moist specimens, weatherometer, and simulated ground-air-ground cycling. Residual strengths of the long term specimens were compared with residual strengths of the lab specimens. Strength retention depended on the exposure condition and the material system. Results showed that composite materials can be successfully used on commercial aircraft if environmental effects Author are considered.

N91-24451\*# Ford Motor Co., Dearborn, Ml. IMPROVED SILICON CARBIDE FOR ADVANCED HEAT **ENGINES Final Technical Report** THOMAS J. WHALEN May 1989

(Contract NAS3-24384) (NASA-CR-182289; NAS 1.26:182289) Avail: NTIS HC/MF A04 CSCL 11/3

The development of high strength, high reliability silicon carbide parts with complex shapes suitable for use in advanced heat engines is studied. Injection molding was the forming method selected for the program because it is capable of forming complex parts adaptable for mass production on an economically sound basis. The goals were to reach a Weibull characteristic strength of 550 MPa (80 ksi) and a Weibull modulus of 16 for bars tested in four-point loading. Statistically designed experiments were performed throughout the program and a fluid mixing process employing an attritor mixer was developed. Compositional improvements in the amounts and sources of boron and carbon used and a pressureless sintering cycle were developed which provided samples of about 99 percent of theoretical density. Strengths were found to improve significantly by annealing in air. Strengths in excess of 550 MPa (80 ksi) with Weibull modulus of about 9 were obtained. Further improvements in Weibull modulus to about 16 were realized by proof testing. This is an increase of 86 percent in strength and 100 percent in Weibull modulus over the baseline data generated at the beginning of the program. Molding yields were improved and flaw distributions were observed to follow a Poisson process. Magic angle spinning nuclear magnetic resonance spectra were found to be useful in characterizing the SiC powder and the sintered samples. Turbocharger rotors were molded and examined as an indication of the moldability of the mixes which were developed in this program.

ADVANCED THERMALLY STABLE JET FUELS
DEVELOPMENT PROGRAM ANNUAL REPORT. VOLUME 3:
FUEL LUBRICITY Interim Technical Report, Jun. 1989 - Oct.
1990

JOHN P. CUELLAR, JR. 15 Jan. 1991 28 p (Contract DE-AC04-76DP-00789; FY1455-89-N-0635) (AD-A232793; WRDC-TR-90-2079-VOL-3) Avail: NTIS HC/MF A03 CSCL 21/4

A program to evaluate the effects of additives on JP-8 fuel lubricity at high temperatures is described. Operating temperatures up to 163 C were examined, with a subsequent program goal of 315 C. Baseline data were obtained using the Ball-on-Cylinder Lubricity Evaluator (BOCLE). High-temperature data were obtained with an apparatus known as the Cameron-Plint High Frequency Reciprocating Machine. The most significant effect of variables observed was a consequence of a change in wear specimen material from 52100 steel to M-50 steel--the latter considered to be representative of advanced fuel system designs. Use of M-50 wear coupons resulted in considerably reduced wear levels with only slight separation between neat or additized fuels. M-50 specimen roughness was a major influence in wear level. At finalized test conditions, a dibasic acid ester, di(2-ethylhexyl) adipate, was found to give the lowest wear values when used as an additive in clay-treated JP-8, although distinctions between the various additized fuels were not large.

AN ISENTROPIC COMPRESSION-HEATED LUDWEIG TUBE TRANSIENT WIND TUNNEL

PATRICK J. MAGARI and JOHN E. LAGRAFF (Syracuse University,

NY) Experimental Thermal and Fluid Science (ISSN 0894-1777), vol. 4, May 1991, p. 317-332. refs (Contract NAG3-621) Copyright

Theoretical development and experimental results show that the Ludweig tube with isentropic heating (LICH) transient wind tunnel described is a viable means of producing flow conditions that are suitable for a variety of experimental investigations. A complete analysis of the wave dynamics of the pump tube compression process is presented. The LICH tube operating conditions are very steady and run times are greater than those of other types of transient facilities such as shock tubes and gas tunnels. This facility is well suited for producing flow conditions that are dynamically similar to those found in a gas turbine, i.e., transonic Mach number, gas-to-wall temperature ratios of about 1.5, and Reynolds numbers greater than 10 to the 6th.

## A91-36698# NEW DEVELOPMENTS IN THE DYNAMIC AEROELASTIC STABILITY STUDY OF ROTOR BLADES

V. GIURGIUTIU, L. GAITA (Institutul National pentru Creatie Stiintifica si Tehnica, Bucharest, Rumania), and F. ONCESCU (Polytechnic Institute, Bucharest, Rumania) Revue Roumaine des Sciences Techniques, Serie de Mecanique Appliquee (ISSN 0035-4074), vol. 35, Mar.-Apr. 1990, p. 137-146. refs

Improvements to a method originally developed for the analysis of the dynamic aeroelastic stability of rotor blades are discussed. These include the capability to handle hinge-blade boundary conditions, rotating torsion models, cone angle correction, and the use of lag damper. A two-point boundary problem is used as an example. The problem is solved using the shooting method and the Galerkin expansion with rotating torsion modes.

### ROBOTIC SENSORS FOR AIRCRAFT PAINT STRIPPING

RICHARD J. WENIGER (Southwest Research Institute, San Antonio, TX) Society of Manufacturing Engineers, Conference on Aerospace Automation and Fastening, Arlington, TX, Oct. 9-11, 1990. 12 p.

(Contract F33615-86-C-5044)

(SME PAPER MS90-282) Copyright

Aircraft of all types need to have paint routinely removed from their outer surfaces. Any method needs to be controlled to remove all the paint and not damage the surface of the aircraft. Human operators get bored with the monotonous task of stripping paint from an aircraft and thus do not control the process very well. This type of tedious operation tends itself to robotics. A robot that strips paint from aircraft needs to have feedback as to the state of the stripping process, its location in respect to the aircraft, and the availability of stripping material. This paper describes the sensors used on the paint stripping robot being developed for the United States Air Force's Manufacturing Technology Program. Particular attention is given to the paint sensor which is the feedback element for determining the state of the stripping process.

### A91-36943 AUTOMATED CAD DESIGN FOR SCULPTURED AIRFOIL SURFACES

S. D. MURPHY and S. R. YEAGLEY (Textron, Inc., Danville, PA) Society of Manufacturing Engineers, Conference on Autofact '90, Detroit, MI, Nov. 12-15, 1990. 12 p.

(SME PAPER MS90-744) Copyright

The design of tightly tolerated sculptured surfaces such as those for airfoils requires a significant design effort in order to machine the tools to create these surfaces. Because of the quantity of numerical data required to describe the airfoil surfaces, a CAD approach is required. Although this approach will result in productivity gains, much larger gains can be achieved by automating the design process. This paper discusses an application which resulted in an eightfold improvement in productivity by automating the design process on the CAD system.

### THE PLANAR ELEMENTS METHOD FOR COMPUTING THE SCATTERING FIELD OF FLIGHT VEHICLE

GUOZHONG MA and JIADONG XU (Northwestern Polytechnical University, Xian, People's Republic of China) Northwestern Polytechnical University, Journal (ISSN 1000-2758), vol. 9, April 1991, p. 140-144. In Chinese, with abstract in English. refs

In order to both improve the accuracy and reduce the computation time of the EM scattering field of an electrically conductive body, a novel 'planar elements' method is proposed which allows the curved surface to be represented by a set of planar elements; the sum of these planar elements' field is taken to be the approximation of scattering characteristics for the entire body. This fast and accurate method can systematically employ the planar-elements information of aerodynamics calculations to compute a low radar cross-section vehicle's optimal configuration.

### MEASUREMENT OF CLUTTER SUPPRESSION USING A **QUADRAHEDRAL**

JOSEPH A. BRUDER (Georgia Institute of Technology, Atlanta) IN: Noise and clutter rejection in radars and imaging sensors; Proceedings of the 2nd International Symposium, Kyoto, Japan, Nov. 14-16, 1989. Amsterdam, Elsevier Science Publishers, 1990, p. 287-292.

Copyright

Sophisticated radar processing techniques for clutter suppression primarily rely upon the Doppler produced from a moving target to separate it from clutter. Actual measurements of a Doppler-producing target of known radar cross section (RCS) are necessary to fully evaluate the clutter rejection of a radar. This paper discusses the development of the 'Quadrahedral' reflector that provides an ideal 'moving target' Doppler-shifted return and includes the results of the moving target indication (MTI) improvement factor measurements performed in June of 1988 on the U.S. Customs SOWRBALL Aerostat Radar.

TRACK INITIATION USING MHT IN DENSE ENVIRONMENTS
HISAO IWAMA, YOSHIO KOSUGE, TOSHIKI AIBA, and
HIROMICHI KAWAZOE (Mitsubishi Electric Corp., Kamakura IN: Noise and clutter rejection in radars and imaging sensors; Proceedings of the 2nd International Symposium, Kyoto, Japan, Nov. 14-16, 1989. Amsterdam, Elsevier Science Publishers, 1990, p. 608-613.

Copyright

The use of a new method, multiple hypothesis tracking (MHT), to improve the performance of track initiation in dense environments is discussed. The MHT uses the detection and false alarm statistics of the sensor, the expected density of a new target, and the accuracy of the target estimates to obtain posterior probabilities for each observation. A number of candidate hypotheses are generated, and the posterior probabilities of the hypotheses are calculated recursively using the Bayes rule. Results of a computer simulation are presented to demonstrate the efficiency of the method.

RESIDUAL STRESS CONTROL IN DEVELOPING PROCESSES FOR THE MANUFACTURE OF COMPRESSOR BLADES FOR GAS TURBINE ENGINES [KONTROL' OSTATOCHNYKH NAPRIAZHENII PRI OTRABOTKE TEKHNOLOGICHESKIKH PROTSESSOV IZGOTOVLENIIA LOPATOK KOMPRESSOROV GTD]

### A91-37414# SUBSONIC AND SUPERSONIC COMBUSTION USING **NONCIRCULAR INJECTORS**

E. GUTMARK, K. C. SCHADOW, and K. J. WILSON (U.S. Navy, Naval Weapons Center, China Lake, CA) Journal of Propulsion and Power (ISSN 0748-4658), vol. 7, Mar.-Apr. 1991, p. 240-249.

Nonreacting and combustion tests were performed for subsonic, sonic, and supersonic conditions using noncircular injectors in a gas generator combustor. The noncircular injectors, including square, equilateral-, and isosceles-triangular nozzles, were compared to a circular injector. The flowfields of the jets were mapped with hot-wire anemometry and visualized using spark schlieren photography. The combustion characteristics were visualized by high-speed photography and thermal imaging, and the temperature distribution was measured by a rake of thermocouples. The present tests conducted at high Reynolds and Mach numbers confirmed earlier results obtained for the low range of these numbers, i.e., the combination of large-scale mixing at the flat sides with the fine-scale mixing at the vertices is benefical for combustion. Large-scale structures provide bulk mixing between the fuel and air, whereas fine-scale mixing contributes to the reaction rate and to better flameholding characteristics.

## ASYMPTOTIC THEORY OF BENDING-TORSION FLUTTER OF HIGH ASPECT RATIO WING IN THE TORSION CONTROLLED DOMAIN

GABRIEL KARPOUZIAN (U.S. Naval Academy, Annapolis, MD) AIAA Journal (ISSN 0001-1452), vol. 29, May 1991, p. 780, 781. Research supported by U.S. Naval Academy. Copyright

An asymptotic theory of bending-torsion flutter of a high aspect ratio wing with a unit-order bending-torsion stiffness ratio is developed. Two distinct (high and low) frequency domains are identified. For illustration, detailed analysis is carried out only in the high-frequency domain. The methodology is general and may be applicable to various wing configurations. To substantiate its adequacy, the classical case of a uniform unswept cantilever wing in an incompressible airflow is treated as a case study. The asymptotic results for flutter eigenvalues and mode shapes compare favorably with those obtained by a more exact treatment.

### DESIGN OF AIRCRAFT WINGS SUBJECTED TO GUST LOADS - A SAFETY INDEX BASED APPROACH

J.-S. YANG (Aerostructures, Inc., Arlington, VA) and E. NIKOLAIDIS (Virginia Polytechnic Institute and State University, Blacksburg) AIAA Journal (ISSN 0001-1452), vol. 29, May 1991, p. 804-812. refs

Copyright

A method for system reliability based design of aircraft wings is presented. The advanced first-order, second-moment (AFOSM) method is employed in evaluating reliability. A wing of a commuter aircraft designed by the FAA regulations is compared to one designed by system reliability optimization. Two cases are considered for which the correlation between failure modes is neglected or is accounted for, respectively. The results demonstrate the potential of system reliability optimization and the benefits from employing the AFOSM method. Furthermore, they allow us to identify the limitations of simple methods utilizing the first-order Ditlevsen bounds for evaluating system reliability and to assess the advantages of more sophisticated system reliability based methods that account for the correlation between the failure modes.

It is shown that, if a penalty function method is employed for optimization, the upper Ditlevsen bound can be used to approximate the system reliability without encountering any problems due to the discontinuity of the derivatives of the constraints.

### RADIATION TRANSMISSION IN ADVERSE WEATHER

STUART W. GREENWOOD (University Research Foundation, Greenbelt, MD) IEEE Aerospace and Electronic Systems Magazine (ISSN 0885-8985), vol. 6, April 1991, p. 3-6. refs

Copyright

A simplified practical approach to determining the effects of weather on the transmission of radiation at visible, infrared (IR), and millimeter (MM) wavelengths, with particular reference to the aircraft landing problem, is outlined. Passive landing systems are studied. Landing categories related to visibility are defined. An extinction coeffcient used to relate the effect of the atmosphere on the radiation detected by the human eye (or an imaging sensor onboard the aircraft) to the landing category and the calculation of this coefficient are discussed. The approach makes use of data from openly available literature. Results have been found useful in indicating the effects of adverse weather on Imaging sensor performance for an enhanced vision aircraft-mounted landing system. As an example of the technique, the method of determining the extinction coefficients in fog for infrared radiation is outlined.

### **VORTEX SHEDDING AND LOCK-ON IN BLUFF BODY WAKES**

O. M. GRIFFIN (U.S. Navy, Naval Research Laboratory, Washington, DC) and M. S. HALL (Science Applications International Corp., McLean, VA) IN: International Symposium on Nonsteady Fluid Dynamics, Toronto, Canada, June 4-7, 1990, Proceedings. New York, American Society of Mechanical Engineers, 1990, p. 209-218. U.S. Navy-supported research.

Copyright

The results of recent experiments demonstrate that the phenomenon of vortex shedding resonance or lock-on is observed also when a bluff body is placed in a superimposed mean plus periodic incident flow. This form of vortex shedding and lock-on exhibits a particularly strong resonance between the flow perturbations and the vortices, and provides one promising means for modification and control of the basic formation and stability mechanisms in the near-wake of a bluff body. Examples are also given of recent direct numerical simulations of the vortex lock-on in the oscillatory flow, and also flow modification using a passive device such as a splitter plate. Both agree well with the results of experiments. The lock-on phenomenon is discussed in the overall context of active and passive wake control on the basis of these and other recent results.

A capability for numerically simulating 2-D flows in temporally deforming geometries is described, with emphasis on flow with forced unsteadiness, particularly on the simulation and analysis of these flows. The simulation of forced unsteady flows makes the examination of fundamental unsteady flow mechanisms, such as dynamic stall and unsteady separation, possible. A turbulence model is being incorporated into the analysis so as to obtain solutions for the higher Reynolds numbers used in the experiments. The analysis is also of utility in studying fluid-structure interactions, free surfaces, metal-forming, and bio-fluid mechanics involving flow through passages with flexible walls.

The heat transfer in a sudden-expansion flow subjected to upstream periodic disturbances is investigated. In order to study the unsteady turbulent flow for the present symmetrical sudden-expansion flow, the phase-averaging technique of Hussain and Reynolds (1970) is used to derive the governing equations. The imposed periodic disturbances are found to increase the turbulent kinetic energy and the heat transfer rates at the wall. The phenomenon is discovered to be sensitive to the frequency of the imposed disturbances. At the optimum frequency and at a 3 percent disturbance level, the time-averaged heat transfer rate near the reattachment point can be increased by as much as 14 percent.

Copyright

The wake generated by a pitching airfoil is considered and a method for simulating flows past solid bodies and their wakes is described. Vorticity panels are used to represent the body, and vortex blobs are used to represent the wake. The rate at which vorticity is shed from the trailing edge is determined by simultaneously requiring the pressures along the upper and lower surface streamlines to approach the same value at the trailing edge and the circulation around the airfoil and its wake to remain constant. The numerical simulation reveals that the wake, which is originally smooth, eventually coils, or wraps, around itself, primarily under the influence of the velocity it induces on itself, and forms regions of relatively concentrated vorticity, called vortical structures. The computed spacing of the structures and the circulations around them are in good agreement with the

experimental results. A simulation of the interaction between vorticity in the oncoming stream and a stationary airfoil is considered as well.

The generation, reflection and propagation of flexural waves created by electroimpulsive deicing forces are demonstrated both experimentally and analytically in a thin circular plate and a thin semicylindrical shell. Analytical prediction of these waves with finite element models shows good correlation with acceleration and displacement measurements at discrete points on the structures studied. However, sensitivity to spurious flexural waves resulting from the spatial discretization of the structures is shown to be significant. Consideration is also given to composite structures as an extension of these studies.

The present conference discusses aspects of radial loading in centrifugal pumps, the animation of LDV measurements in a centrifugal pump, unsteady flow phenomena in a reversible Francis pump turbine, secondary flow inside a centrifugal pump impeller and its consequent performance, and measurements of the rotordynamic shroud forces for centrifugal pumps. Also discussed are a finite element analysis of the flow in a Francis turbine's labyrinth seal, the shape of a theoretical head-capacity curve for an impeller with a finite number of blades, the automated design of centrifugal impellers, and three-dimensional models of cavitation in rocket engine inducers.

TOWARD AUTOMATING THE DESIGN OF CENTRIFUGAL
IMPELLERS

S. N. J. AL-ZUBAIDY (United Arab Emirates University, Al Ain) IN: Fluid Machinery Forum - 1990; ASME Spring Meeting, Toronto,

Canada, June 4-7, 1990, Proceedings. New York, American Society of Mechanical Engineers, 1990, p. 41-47. refs

The paper describes a general method for the design of centrifugal compressor impellers. The proposed design procedure reduces the designer's interruption to the design process. This was achieved by coupling a quasi-three-dimensional flow analysis program with an optimization algorithm for solving nonlinear constraint programming problems, so that to ensure an acceptable diffusion schedule along the flow path. The design optimization was accomplished by a comparative sequence with a targeted distribution which was specified by the designer from the start. The resulting schedule matched relatively well the prescribed profile. The final calculated geometry showed the designed impeller to be well proportioned and not to be difficult to manufacture.

SENSITIVITY ANALYSIS, OPTIMIZATION, AND DATA SUPPORT IN FINITE ELEMENT SYSTEMS [ANALIZ CHUVSTVITEL'NOSTI, OPTIMIZATSIIA I IKH INFORMATSIONNOE OBESPECHENIE V MKE-SISTEMAKH]

V. A. ZARUBIN Raschety na Prochnost' (ISSN 0234-1905), no. 32, 1990, p. 151-168. In Russian. refs Copyright

Methods of sensitivity analysis and structural optimization are examined with particular reference to a finite element system for the design of aircraft structures, RIPAK. The discussion focuses on the use of data bases and expert systems for increasing the efficiency of software implementations of the above methods. Particular attention is given to the use of optimality criteria and mathematical programming methods.

### A GENERAL METHOD FOR ROTORDYNAMIC ANALYSIS

K.-H. BECKER and E. STEINHARDT (MTU Motoren- und Turbinen-Union Muenchen GmbH, Munich, Federal Republic of Germany) IN: Vibration and wear in high speed rotating machinery; Proceedings of the NATO Advanced Study Institute on Vibration and Wear Damage in High Speed Rotating Machinery, Troa, Portugal, Apr. 10-22, 1989. Dordrecht, Kluwer Academic Publishers, 1990, p. 263-277. refs

Copyright

A general method has been developed for rotordynamic analysis which employs FEM codes, modal-analysis results, and a postprocessing program, with a view to advanced aircraft gas turbine design. Attention is given to the program modules, which encompass (1) a squeeze-film damper, (2) the squeeze-film forces, (3) unbalance forces, (4) gyroscopic terms, and (5) rubs. Checks conducted with the reduced structures exhibit good accuracy, especially in the critically important lower frequencies. The large variety of reduction methods allows individual treatment of each component. Due to the modular organization of the program, its capabilities can be easily extended.

# A91-39590 THE CONTROL OF ROTOR VIBRATION USING SQUEEZE-FILM DAMPERS

R. HOLMES (Southampton, University, England) IN: Vibration

and wear in high speed rotating machinery; Proceedings of the NATO Advanced Study Institute on Vibration and Wear Damage in High Speed Rotating Machinery, Troa, Portugal, Apr. 10-22, 1989. Dordrecht, Kluwer Academic Publishers, 1990, p. 399-412. Copyright

A squeeze-film is an annulus of oil supplied between the outer race of a rolling-element bearing (or the bush of a sleeve bearing) and its housing. It is used as a multidirectional damping element for the control of rotor vibrations. This lecture describes the following roles of a squeeze-film damper when used in gas turbine and compressor applications as a means of reducing vibration and transmitted force due to unbalance; as an element in series with the stiffness of the bearing pedestal, and as an element in parallel with a soft spring in a vibration isolator. The effects of cavitation on performance are elucidated and the dangers of jump phenomena and subsynchronous response are discussed. Experimental work is described in which both roles of the squeeze-film damper are investigated and the results are compared with theoretical predictions.

### QUANTITATIVE ANALYSIS OF FLOW VISUALIZATIONS IN ONERA WATER TUNNELS

H. WERLE La Recherche Aerospatiale (English Edition) (ISSN 0379-380X), no. 6, 1990, p. 49-72. refs Copyright

Liquid and gas tracer visualizations in the water tunnels at Chatillon can in certain cases be used in quantitative analysis of steady and unsteady flows, to specify the velocity field or profile. The examples presented in this paper illustrate some of the possibilities of these methods, which can be analyzed in greater depth now by image procession. These examples reveal the broad applications of the methods, not only to boundary layers, separations, vortices and wakes, but also to a wide variety of plane, axisymmetrical and three-dimensional flows.

### DIALOGUE ON PROGRESS AND ISSUES IN STABILITY AND TRANSITION RESEARCH

M. V. MORKOVIN (Illinois Institute of Technology, Chicago) and E. RESHOTKO (Case Western Reserve University, Cleveland, OH) IN: Laminar-turbulent transition; Proceedings of the IUTAM Symposium, Toulouse, France, Sept. 11-15, 1989. Berlin and New York, Springer-Verlag, 1990, p. 3-29. refs Copyright

### 12 ENGINEERING

A development status evaluation is presented for experimental, analytical, and computational methods in flow stability and transition phenomena. Quiet supersonic wind tunnels constitute a major advancement in experimental methods, in conjunction with the simultaneous monitoring of numerous data channels. Recent analytical methods allow the characterization of convective, absolute, and global instabilities in terms of both degree of predictability and strange attractor-related behavior. Attention is given to advancements in the control of transition for drag reduction through pressure-gradient shaping, suction, cooling or heating, and wave cancellation.

### A91-39904 ON THE DEVELOPMENT OF TURBULENT SPOTS IN PLANE POISEUILLE FLOW

B. KLINGMANN and P. H. ALFREDSSON (Royal Institute of Technology, Stockholm, Sweden) IN: Laminar-turbulent transition; Proceedings of the IUTAM Symposium, Toulouse, France, Sept. 11-15, 1989. Berlin and New York, Springer-Verlag, 1990, p. 43-52. refs

Copyright

Results from an experimental study of the development of turbulent spots in plane Poiseuille flow is presented. Spots were triggered at a Reynolds number of 1600 by a loudspeaker-induced jet of high velocity. The initial disturbance was found to undergo a first stage of rapid expansion, in which sharp internal shear layers form, and subsequently break down to turbulence. This was first observed at locations away from the symmetry plane. After an initial development phase, the spot gets a self-similar shape. Oblique Tollmien-Schlichting waves were found at the wing-tips of the spot, where they reach amplitudes of more than 15 percent of the undisturbed centerline velocity.

### A91-39909 BOUNDARY LAYER CONTROL BY A LOCAL HEATING OF THE WALL

A. V. DOVGAL', V. IA. LEVCHENKO, and V. A. TIMOFEEV (AN SSSR, Institut Teoreticheskoi i Prikladnoi Mekhaniki, Novosibirsk, USSR) IN: Laminar-turbulent transition; Proceedings of the IUTAM Symposium, Toulouse, France, Sept. 11-15, 1989. Berlin and New York, Springer-Verlag, 1990, p. 113-121. refs

Copyright

The possibility of delaying natural transition in a boundary layer flow by means of heating, in order to obtain an extended laminar region, is experimentally investigated for the cases of two-dimensional flow over a flat plate, and three-dimensional flow corresponding to the conic flow over a swept wing. An account is given of conditions under which leading-edge heating delays transition to turbulent flow. Laminarization is obtainable after a decrease of the pressure gradient on the plate, which suppresses the cross-flow instability and thereby leaves the TW wave mechanism as the sole stimulus for transition.

# A91-39928 AN EVALUATION OF STABILITY-BASED METHODS FOR TRANSITION OF THREE-DIMENSIONAL FLOWS

H. H. CHEN and TUNCER CEBECI (California State University, Long Beach) IN: Laminar-turbulent transition; Proceedings of the IUTAM Symposium, Toulouse, France, Sept. 11-15, 1989. Berlin and New York, Springer-Verlag, 1990, p. 327-336. refs

Copyright

The current eigenvalue procedures, which assume the relationship between the two wave numbers alpha and beta in the Orr-Sommerfeld equation to predict transition in three-dimensional flows, are evaluated against the saddle-point method of Cebeci and Stewartson (1980) which computed this relationship by requiring functional determinant alpha/functional determinant beta to be real. Studies for an infinite swept wing indicate that all procedures agree well with the experimental data. The results for a prolate spheroid, however, indicate that the saddle-point method leads to satisfactory results, whereas that based on an assumed relationship between alpha and beta does not.

### RECEPTIVITY AND STABILITY OF THE BOUNDARY LAYER AT A HIGH TURBULENCE LEVEL

G. R. GREK, V. V. KOZLOV, and M. P. RAMAZANOV (AN SSSR, Institut Teoreticheskoi i Prikladnoi Mekhaniki, Novosibirsk, USSR) IN: Laminar-turbulent transition; Proceedings of the IUTAM Symposium, Toulouse, France, Sept. 11-15, 1989. Berlin and New York, Springer-Verlag, 1990, p. 511-521. refs

Copyright

The results of experimental studies on the boundary layer stability in gradient flow at high turbulence level are presented. The question is considered on the possibility of artificial generation, further development, and influence on laminar-turbulent transition of instability waves (Tollmien-Schlichting waves) in the boundary layer of the airfoil when the level of turbulence in the onflow constitutes 1.75 percent of the onflow velocity; the flow receptivity to disturbances and their control using the suction of the boundary layer are studied. Results of the investigations on the modeling of a turbulent spot generated from the solitary nonlinear wave packet are shown, and the characteristics of the development turbulent spot are presented at onflow turbulence degrees higher than that in earlier papers.

Disturbances in the swept Hiemenz flow are calculated by solving the Navier-Stokes equations. The spatially-evolving base flow is treated exactly, allowing a check of the 'local' stability theories. Different types of disturbances such as random noise, waves, and wave packets, are input near the attachment line, develop in space, and exit through an outflow boundary. They all generate streamwise vortices. The effect of the Reynolds number, of the time-dependence of the noise, and of nonlinearity, are investigated.

# THE TRANSIENT DYNAMIC PERFORMANCES OF A ROTOR-SFDB SYSTEM DURING PASSAGE THROUGH RESONANCE

JIANKANG XU (Xian Jiaotong University, People's Republic of China) Acta Aeronautica et Astronautica Sinica (ISSN 1000-6893), vol. 12, Jan. 1991, p. A25-A30. In Chinese, with abstract in English. refs

An experimental and theoretical investigation on the transient dynamic performances of a flexible rotor-SFDB system during passage through resonance is presented. The relationship among the boundary conditions of oil-film pressure, unbalanced load, speed range, and jump phenomenon is discussed and a parameter of critical unbalanced load for jump phenomenon, mu(cr), is introduced. The parameter mu(cr) should be considered as the limit value of unbalance load of the rotor system in engineering designs.

# PREFERENCE FOR AN INERTIAL DEGREE OF FREEDOM DESCRIBING THE TEETER MOTION OF WINDTURBINE AND HELICOPTER ROTORS

BERNHARDT WEYH (Universitaet Duisburg-Gesamthochschule, Federal Republic of Germany) and JOHANNES ACKVA (Gesellschaft fuer angewandte Mathematik und Mechanik, Wissenschaftliche Jahrestagung, Hanover, Federal Republic of Germany, Apr. 8-12, 1990, Vortraege. A91-40226 16-31) Zeitschrift fuer angewandte Mathematik und Mechanik (ISSN 0044-2267), vol. 71, no. 4, 1991, p. T 200-T 202. refs

When the rotating structure of a wind turbine or helicopter is coupled isotropically to the nonrotating one, time variance in the periodic coefficients of the linearized equations of motion can be eliminated by transformation of the generalized coordinates to the base of the rigid-fixed rotor. In this case, the eigenanalysis can be carried out analytically because the system has only two DOFs. In this paper, this idea is applied to two more complicated systems with teetering rotors. By considering an inertial teeter DOF, the stability investigation for both models leads to analytical expressions of limit speed which are applied to calculate stable parameter constellations for all rotor speeds of technical interest. In spite of the analytical simplifications required, a comparison with numerically calculated stability maps of nonsimple models shows excellent agreement.

K. W. HAFF, D. J. PRUETT, D. W. RAMEY, F. J. SCHULTZ, and J. A. TOMPKINS Mar. 1991 39 p (Contract DE-AC05-84OR-21400) (DE91-009743; ORNL/TM-11648) Avail: NTIS HC/MF A03

The Oak Ridge National Laboratory (ORNL) has been actively engaged in the development of radioluminescent (RL) lights for the past 10 years. Primary emphasis of the program at ORNL has been on the development and improvement of gas-tube technology lights that have been manufactured by private industry for over 30 years. The primary use of these lights until this time has been exit signs with some small numbers of applications in other areas. The goal of the ORNL program was to improve the light output and brightness of the lights to an acceptable level for use as airfield marker signs, runway lights, and taxiway lights. This goal was achieved in that a greater than 100 percent light output was obtained in commercial lights purchased for the U.S. Air Force and for the State of Florida. The results are presented of the radioluminescence tests for tritiated titanium.

### LEADING-EDGE-PASSAGE CONVECTIVE HEAT TRANSFER

R. C. HENDRICKS, M. J. BRAUN, V. CANACCI, and R. L. MULLEN (Case Western Reserve Univ., Cleveland, OH.) 1991 12 p Presented at the 4th International Symposium on Transport Phenomena in Heat and Mass Transfer, Sydney, Australia, 14-18 Jul. 1991; sponsored by New South Wales Univ.

(NASA-TM-103801; E-6093; NAS 1.15:103801) Avail: NTIS HC/MF A03 CSCL 20/4

Current and proposed high speed aircraft have high leading edge heat transfer (to 160 MW/sq m, 100 Btu/sq in/sec) and surface temperatures to 1370 K (2000 F). Without cooling, these surfaces could not survive. In one proposal the coolant hydrogen is circulated to the leading edge through a passage and returned to be consumed by the propulsion system. Simulated flow studies and visualizations have shown flow separation within the passage with a stagnation locus that isolates a zone of recirculation at the most critical portion of the passage, namely the leading edge itself. A novel method is described for mitigating the flow separation and the isolated recirculation zones by using a brush insert in the flow passage near the leading edge zone, thus providing a significant increase in heat transfer.

BRUCE J. HOLMES, inventor (to NASA) 2 Nov. 1990 18 p (NASA-CASE-LAR-13563-1; NAS 1.71:LAR-13563-1; US-PATENT-APPL-SN-608494) Avail: NTIS HC/MF A03 CSCL 20/4

### 12 ENGINEERING

A passive laminar flow crossflow vorticity control system includes an aerodynamic or hydrodynamic surface having geometric perturbations. The perturbations include peaks and valleys having a predetermined spacing and aligned approximately in a streamline direction to force the formation of crossflow vortices. This minimizes amplification and growth of the vortices, thus delaying transition to turbulence and reducing overall drag.

N91-23411 Pennsylvania State Univ., University Park. A COMPUTATIONALLY EFFICIENT MODELLING OF LAMINAR SEPARATION BUBBLES Ph.D. Thesis

PAOLO DINI 1990 169 p

Avail: Univ. Microfilms Order No. DA9104867

In predicting the aerodynamic characteristics of airfoils operating at low Reynolds numbers, it is often important to account for the effects of laminar (transitional) separation bubbles. Previous approaches to the modeling of this viscous phenomenon range from fast by sometimes unreliable empirical correlations for the length of the bubble and the associated increase in momentum thickness, to more accurate but significantly slower displacement thickness iteration methods employing inverse boundary layer formulations in the separated regions. Since the penalty in computational time associated with the more general methods is unacceptable for airfoil design applications, use of an accurate yet computationally efficient model is highly desirable. To this end, a semi-empirical bubble model was developed and incorporated into the Eppler and Somers airfoil design and analysis program. The generality and the efficiency were achieved by successfully approximating the local viscous/inviscid interaction, the transition location, and the turbulent reattachment process within the framework of an integral boundary-layer method. Comparisons of the predicted aerodynamic characteristics with experimental measurements for several airfoils show excellent and consistent agreement for Reynolds numbers from 2,000,000 down to Dissert. Abstr. 100,000.

N91-23413 Cornell Univ., Ithaca, NY. BLOCK IMPLICIT MULTIGRID SOLUTION OF THE EULER **EQUATIONS Ph.D. Thesis** 

YORAM YADLIN 1990 177 p Avail: Univ. Microfilms Order No. DA9106233

A diagonal implicit multigrid (BDIM) scheme was developed to solve the Euler equations of inviscid, compressible flows in three-dimensions, and was implemented within the framework of block structured grids. A multigrid alternating direction implicit (ADI) scheme was developed for a single-block grid in three dimensions, using a diagonalization procedure resulting in a computationally efficient code. The scheme was applied to compute transonic flow past a swept wing and found accurate and efficient. Ways to implement the multigrid ADI scheme on block-structured grids were investigated. Two modes of multigrid cycles were developed: one in which the multigrid cycle advances concurrently on all blocks (horizontal mode) and one in which the multigrid cycle advances independently in each block (vertical mode). The efficiency and accuracy of both modes were investigate by applying the schemes to compute transonic flow past the NACA-0012 airfoil. Both modes were implemented to run on a shared-memory parallel computer. Computations of transonic flow past a swept wing illustrate the accuracy and efficiency of the scheme. Speed-up results are presented to illustrate the ability of the scheme to calculate complex flows in the short turn around time required in any design Dissert. Abstr. application.

N91-23419 Michigan Univ., Ann Arbor. AN EXPERIMENTAL INVESTIGATION OF VORTEX PAIR INTERACTION WITH A CLEAN OR CONTAMINATED FREE SURFACE Ph.D. Thesis

AMIR HOSSEIN HIRSA 1990 148 p Avail: Univ. Microfilms Order No. DA9034438

The interaction between a pair of trailing vortices and a free surface was studied. The vortices were produced by a submerged delta wing and a negative angle of attack. In order to isolate and study the interaction, an apparatus was built to generate

reproducible vortex pairs with the same Reynolds number and Froude number as the trailing vortices. The apparatus consisted of a pair of counter rotating flaps which were moved by a computer controlled stepping motor. The vortex pairs generated with the flaps were laminar and remained laminar during the time that significant interaction with the free surface was observed. The Froude number for the vortices was low and the resulting surface deformations were small. Particle image velocimetry along with flow visualization were used to study the flow field. Striations were also observed during the interaction of the vortex pair with the free surface. The striations were found to be caused by cross-stream vortices which are stretched by the strain field between the trailing vortices and their images. Contaminants on the free surface were found to have a large influence on both the free surface deformations and the flow field of the vortices. Also, a Reynolds ridge on the free surface was observed on each side of the wake. The effect of surface contamination was studied by adding known amounts of an insoluble surfactant to the free surface. Surface depressions, termed scars, were observed above the primary vortices as well as the secondary vortices, although in the case on the secondary vortices the depression was much Dissert. Abstr. greater.

AERO-THERMAL INVESTIGATION OF A HIGHLY LOADED TRANSONIC LINEAR TURBINE GUIDE VANE CASCADE. A TEST CASE FOR INVISCID AND VISCOUS FLOW COMPUTATIONS

T. ARTS, M. LAMBERTDEROUVROIT, and A. W. RUTHERFORD Sep. 1990 91 p

(VKI-TN-174; ETN-91-99114) Avail: NTIS HC/MF A05

An experimental aerothermal investigation of a highly loaded transonic turbine nozzle guide vane mounted in a linear cascade arrangement is presented. The measurements were performed in a short duration isentropic light piston compression tube facility, allowing a correct simulation of Mach and Reynolds numbers as well as of the gas to wall temperature ratio compared to the values currently observed in modern aeroengines. The experimental program consisted of the following: (1) flow periodicity checks by means of wall static pressure measurements and Schlieren flow visualizations; (2) blade velocity distribution measurements by means of static pressure tappings; (3) blade convective heat transfer measurements by means of static pressure tappings; (4) blade convective heat transfer measurements by means of platinium thin films; (5) downstream loss coefficient and exit flow angle determinations by using a new fast traversing mechanism; and (6) free stream turbulence intensity and spectrum measurements. These different measurements were performed for several combinations of the free stream flow parameters looking at the relative effects on the aerodynamic blade performance and blade convective heat transfer of Mach number, Reynolds number, and freestream turbulence intensity. **FSA**

COMPUTATION OF INLET REFERENCE PLANE FLOW-FIELD FOR A SUBSCALE FREE-JET FOREBODY/INLET MODEL AND COMPARISON TO EXPERIMENTAL DATA Final Report, 1 Jan. 1989 - 31 Jul. 1990

M. D. MCCLURE and J. R. SIRBAUGH Feb. 1991 77 p Prepared in cooperation with Sverdrup Technology, Inc., Arnold AFS, TN (AD-A232101; AEDC-TR-90-21) Avail: NTIS HC/MF A05 CSCL 20/4

Ē

1

The computational fluid dynamics (CFD) computer code PARC3D was used to predict the inlet reference plane (IRP) flow field for a side-mounted inlet and forebody simulator in a free jet for five different flow conditions. The calculations were performed for free-jet conditions, mass flow rates, and inlet configurations that matched the free-jet test conditions. In addition, viscous terms were included in the main flow so that the viscous free-jet shear layers emanating from the free-jet nozzle exit were modeled. A

measure of the predicted accuracy was determined as a function of free-stream Mach number, angle-of-attack, and sideslip angle.

WATER-COOLING TECHNIQUE OF HIGH TEMPERATURE GAS **TURBINE BLADE** 

T. SAKUMA May 1990 26 p In JAPANESE: ENGLISH summary

(DE91-764238; CRIE-T-89059) Avail: NTIS HC/MF A03

A simulation code has been developed that can simulate the thermal stress and temperature distribution of water cooled blades with a concentric tube type open thermopsyphon. The code has proven that it is possible to keep the blade temperature under 600 C and the thermal stress under 20 kg/sq mm in a gas turbine with inlet gas temperature of 1500 C. Thus, the range of blade material selections is increased and the way is opened for the simplification of cooling structures which contributes to the reduction of manufacturing costs. Furthermore, a simulation code has also been developed that can simulate the thermal efficiency of the Brayton cycle of the water cooled gas turbine. The code has proven that higher thermal efficiency for blades and nozzles is obtained by a water cooling system than by the air or steam cooling systems that are currently under development.

### MODAL ANALYSIS OF MULTISTAGE GEAR SYSTEMS **COUPLED WITH GEARBOX VIBRATIONS**

F. K. CHOY, Y. F. RUAN, Y. K. TU (Akron Univ., OH.), J. J. ZAKRAJSEK, and D. P. TOWNSEND 1991 34 p Prepared for presentation at the International Conference on Motion and Power Transmissions, Hiroshima, Japan, 24-26 Nov. 1991; sponsored in part by Japan Society of Mechanical Engineers, ASME, I.Mech.E., VDI, I.E.T., CSME (Contract DA PROJ. 1L1-62211-A-47-A)

(NASA-TM-103797; E-6085; NAS 1.15:103797;

AVSCOM-TR-90-C-033) Avail: NTIS HC/MF A03 CSCL 13/9

An analytical procedure to simulate vibrations in gear transmission systems is presented. This procedure couples the dynamics of the rotor-bearing gear system with the vibration in the gear box structure. The model synthesis method is used in solving the overall dynamics of the system, and a variable time-stepping integration scheme is used in evaluating the global transient vibration of the system. Locally each gear stage is modeled as a multimass rotor-bearing system using a discrete model. The modal characteristics are calculated using the matrix-transfer technique. The gearbox structure is represented by a finite element models, and modal parameters are solved by using NASTRAN. The rotor-gear stages are coupled through nonlinear compliance in the gear mesh while the gearbox structure is coupled through the bearing supports of the rotor system. Transient and steady state vibrations of the coupled system are examined in both time and frequency domains. A typical three-geared system is used as an example for demonstration of the developed procedure.

MODEL SENSITIVITY IN STRESS-STRENGTH RELIABILITY **COMPUTATIONS Final Report** 

DONALD M. NEAL, WILLIAM T. MATTHEWS, and MARK G. VANGEL Jan. 1991 27 p Presented at the 36th ARD Conference on the Design Experiments in Army Research, Development and Testing

(AD-A232023; MTL-TR-91-3) Avail: NTIS HC/MF A03 CSCL

There has been a recent interest in determining high statistical reliability in risk assessment of aircraft components. This report identifies the potential consequences of incorrectly assuming a particular statistical distribution for stress or strength data used in obtaining the high reliability values. The computation of the reliability is defined as the probability of the strength being greater than the stress over the range of stress values. This method is often referred to as the stress strength model. A sensitivity analysis was performed involving a comparison of reliability results in order to evaluate the effects of assuming specific statistical distributions. Both known population distributions, and those that differed slightly from the known, were considered. Results showed substantial differences in reliability estimates even for almost nondetectable differences in the assumed distributions. These differences represent a potential problem in using the stress strength model for high reliability computations, since in practice it is impossible to ever know the exact (population) distribution. An alternative computation procedure is examined determination of a lower bound on the reliability values using extreme value distributions. This procedure reduces the possibility of obtaining nonconservative reliability estimates. Results indicated the method can provide conservative bounds when computing high reliability.

QUANTITATIVE NONDESTRUCTIVE EVALUATION: REQUIREMENTS FOR TOMORROW'S RELIABILITY

JOSEPH S. HEYMAN In NASA, Washington, Technology 2000, Volume 2 p 287-297 1991

Avail: NTIS HC/MF A16 CSCL 14/4

Quantitative Nondestructive Evaluation (QNDE) is the technology of measurement, analysis, and prediction of the state of material/structural systems for safety, reliability, and mission assurance. QNDE has impact on everyday life from the cars we drive, the planes we fly, the buildings we work or live in, literally to the infrastructure of our world. Here, researchers highlight some of the new sciences and technologies that are part of a safer, cost effective tomorrow. Specific technologies that are discussed are thermal QNDE of aircraft structural integrity, ultrasonic QNDE for materials characterization, and technology spinoffs from aerospace to the medical sector. In each case, examples are given of how new requirements result in enabling measurement technologies, which in turn change the boundaries of design/practice. Author

### N91-24309\*# Pratt and Whitney Aircraft, East Hartford, CT. APPLICATION OF CYCLIC DAMAGE ACCUMULATION LIFE PREDICTION MODEL TO HIGH TEMPERATURE COMPONENTS

RICHARD S. NELSON In NASA. Lewis Research Center, Structural Integrity and Durability of Reusable Space Propulsion Systems p 5-15 Apr. 1989 (Contract NAS3-23288)

Avail: NTIS HC/MF A12 CSCL 20/11

A high temperature, low cycle fatigue life prediction method was developed. This method, Cyclic Damage Accumulation (CDA), was developed for use in predicting the crack initiation lifetime of gas turbine engine materials, but it can be applied to other materials as well. The method is designed to account for the effects on creep-fatigue life of complex loading such as thermomechanical fatigue, hold periods, waveshapes, mean stresses, multiaxiality, cumulative damage, coatings, and environmental attack. Several

### 12 ENGINEERING

features of this model were developed to make it practical for application to actual component analysis, such as the ability to handle nonisothermal loading (including TMF), arbitrary cycle paths, and multiple damage modes. The CDA life prediction model was derived from extensive specimen tests conducted on cast nickel-base superalloy B1900 + Hf. These included both monotonic tests (tensile and creep) and strain-controlled fatigue experiments (uniaxial, biaxial, TMF, mixed creep-fatigue, and controlled mean stress). Additional specimen tests were conducted on wrought INCO 718 to verify the applicability of the final CDA model to other high-temperature alloys. The model will be available to potential users in the near future in the form of a FORTRAN-77 computer program.

### NOTCHED FATIGUE OF SINGLE CRYSTAL PWA 1480 AT TURBINE ATTACHMENT TEMPERATURES

T. G. MEYER, D. M. NISSLEY, and G. A. SWANSON (Pratt and Whitney Aircraft, East Hartford, CT.) In NASA. Lewis Research Center, Structural Integrity and Durability of Reusable Space Propulsion Systems p 17-23 Apr. 1989 (Contract NAS3-23939)

Avail: NTIS HC/MF A12 CSCL 20/11

The focus is on the lower temperature, uncoated and notched features of gas turbine blades. Constitutive and fatigue life prediction models applicable to these regions are being developed. Fatigue results are presented which were obtained thus far. Fatigue tests are being conducted on PWA 1480 single crystal material using smooth strain controlled specimens and three different notched specimens. Isothermal fatigue tests were conducted at 1200, 1400, and 1600 F. The bulk of the tests were conducted at 1200 F. The strain controlled tests were conducted at 0.4 percent per second strain rate and the notched tests were cycled at 1.0 cycle per second. A clear orientation dependence is observed in the smooth strain controlled fatigue results. The fatigue lifes of the thin, mild notched specimens agree fairly well with this smooth data when elastic stress range is used as a correlating parameter. Finite element analyses were used to calculate notch stresses. Fatigue testing will continue to further explore the trends observed thus far. Constitutive and life prediction models are being Author developed.

A NEW FACILITY TO STUDY THREE DIMENSIONAL VISCOUS FLOW AND ROTOR-STATOR INTERACTION IN TURBINES Progress Report

B. LAKSHMINARAYANA, C. CAMCI, and I. HALLIWELL (General Electric Co., Cincinnati, OH.) /n NASA. Lewis Research Center, Structural Integrity and Durability of Reusable Space Propulsion Systems p 223-236 Apr. 1989

Avail: NTIS HC/MF A12 CSCL 20/4

A description of the Axial Flow Turbine Research Facility (AFTRF) being built at the Turbomachinery Laboratory of the Pennsylvania State University is presented. The purpose of the research to be performed in this facility is to obtain a better understanding of the rotor/stator interaction, three dimensional viscous flow field in nozzle and rotor blade passages, spanwise mixing and losses in these blade rows, transport of wake through rotor passage, and unsteady aerodynamics and heat transfer of rotor blade row. The experimental results will directly feed and support the analytical and the computational tool development. This large scale low speed facility is heavily instrumented with pressure and temperature probes and has provision for flow visualization and laser Doppler anemometer measurement. The facility design permits extensive use of the high frequency response instrumentation on the stationary vanes and more importantly on the rotating blades. Furthermore it facilitates detailed nozzle wake, rotor wake, and boundary layer surveys. The large size of the rig also has the advantage of operating at Reynolds numbers Author representative of the engine environment.

### AVERAGE-PASSAGE FLOW MODEL DEVELOPMENT

JOHN J. ADAMCZYK, MARK L. CELESTINA, TIM A. BEACH, KEVIN KIRTLEY, and MARK BARNETT (United Technologies Research Center, East Hartford, CT.) In its Structural Integrity and Durability of Reusable Space Propulsion Systems p 247-251 Apr. 1989

Avail: NTIS HC/MF A12 CSCL 20/4

A 3-D model was developed for simulating multistage turbomachinery flows using supercomputers. This average passage flow model described the time averaged flow field within a typical passage of a bladed wheel within a multistage configuration. To date, a number of inviscid simulations were executed to assess the resolution capabilities of the model. Recently, the viscous terms associated with the average passage model were incorporated into the inviscid computer code along with an algebraic turbulence model. A simulation of a stage-and-one-half, low speed turbine was executed. The results of this simulation, including a comparison with experimental data, is discussed.

N91-24475# Magnavox Co., Fort Wayne, IN. SATURN: THE NEXT GENERATION RADIO FOR NATO

JAMES F. KEATING and THOMAS M. SCHUERMAN In AGARD, Electronic Counter-Counter Measures for Avionics Sensors and Communication Systems 9 p Feb. 1991

Copyright Avail: NTIS HC/MF A06; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

The Second Generation Antijam Tactical UHF Radio for NATO (SATURN) system is described along with the URC-126 radio which will meet SATURN requirements when it enters production for the USAF. As its name implies, the system approach was jointly developed with NATO countries as STANAG 4372. It is designed to meet UHF Voice and data communication requirements into the next century. The URC-126 radio will replace the ARC-164, and is being developed by the USAF as part of its Have Quick antijam program. The URC-126 will be the first of several SATURN radios. It has completed Full Scale Engineering Development and Qualification Testing using the USAF Have Quick 2A Fast Frequency Hopping (FFH) mode which is a precursor of SATURN. Production radios will have the full SATURN capability. The AF has also developed and qualified the GRC-234 which uses the Have Quick 2A FFH mode. Additionally, a SATURN radio is now in development for the European Fighter Aircraft (EFA).

VISCOUS DESIGN AND ANALYSIS METHODS FOR TRANSONIC COMPRESSOR BLADING Final Technical Report, 15 May 1989 - 30 Sep. 1990

MARK DRELA 13 Feb. 1991 167 p (Contract AF-AFOSR-0373-89; AF PROJ. 2307) (AD-A232902; AFOSR-91-0184TR) Avail: NTIS HC/MF A08

CSCL 20/4

A viscous/inviscid computational method for the design and analysis of quasi-3D cascades has been developed. The specific application targeted is supersonic compressor blading with splitter blades, although the method is applicable to any type of cascade. The method is an extension of the ISES viscous/inviscid methodology. A streamline-based inviscid Euler formulation is fully coupled to an integral boundary layer formulation to describe the overall viscous flowfield. Rotation and streamtube contraction effects have been incorporated. The method is accurate with regards to loading and loss, and is substantially faster than equivalent Navier-Stokes solvers. Inverse design and optimization capabilities are also implemented giving an effective design/analysis system. Existing supersonic splittered cascades were investigated to determine what characteristics are desirable or undesirable in this type of blading. Sensitivity studies indicate that tangential splitter position and splitter loading details have little influence on performance. Substantial improvements are possible if the splitter is moved aft into a tandem-blade arrangement with the main blade. Comparisons between computational results

and measured data strongly suggest that traditional supersonic cascade tests involve substantial three-dimensional effects which are not correctable by measured streamtube contraction. GRA

SIMULATION OF THE FLOW PAST AN IMPULSIVELY STARTED CYLINDER USING A DISCRETE VORTEX METHOD Final Report

FRANCOIS PEPIN 11 May 1990 152 p (Contract AF-AFOSR-0155-88; AF PROJ. 2308) (AD-A233066; AFOSR-91-0165TR) Avail: NTIS HC/MF A08 CSCL 20/4

Vortex methods are a powerful method for simulating incompressible flows at high Reynolds number. This work extends the basic method to include viscous effects in the presence of solid boundaries. The combination of a fully viscous vortex method with a fast parallel algorithm is used to simulate the flow past an impulsively started cylinder. Experiments have shown that this flow is characterized by the presence of secondary eddies within the main recirculating region. The numerical simulations successfully reproduced these secondary structures over a wide range of Reynolds number (Re = 550 to 9500). It was observed that the secondary phenomenon can lead to a major flow reorganization by drastically altering the transport of vorticity. At Re = 550, the vortex sheet smoothly rolls up into the primary vortex. For Re = 3000 and 9500, however, secondary eddies interfere with that process and the flux of vorticity is redirected toward the cylinder where it accumulates into a new vortical structure. The impulsive start is followed by a 1/(square root of t) singularity in the drag coefficients. The numerical simulations captured this behavior and the computed drag history for short times is in close agreement with the one predicted by a matched asymptotics analysis. GRA

COOLANT SIDE HEAT TRANSFER WITH ROTATION. TASK 3 REPORT: APPLICATION OF COMPUTATIONAL FLUID DYNAMICS

F. C. KOPPER, G. J. STURGESS, and P. DATTA Jan. 1989 91 p

(Contract NAS3-23691)

(NASA-CR-182109; NAS 1.26:182109; PWA-5930-29) Avail: NTIS HC/MF A05 CSCL 20/4

An experimental and analytical program was conducted to investigate heat transfer and pressure losses in rotating multipass passages with configurations and dimensions typical of modern turbine blades. The objective of this program is the development and verification of improved analysis methods that will form the basis for a design system that will produce turbine components with improved durability. As part of this overall program, a technique is developed for computational fluid dynamics. The specific objectives were to: select a baseline CFD computer code, assess the limitations of the baseline code, modify the baseline code for rotational effects, verify the modified code against benchmark experiments in the literature, and to identify shortcomings in the code as revealed by the verification. The Pratt and Whitney 3D-TEACH CFD code was selected as the vehicle for this program. The code was modified to account for rotating internal flows, and these modifications were evaluated for flow characteristics of those expected in the application. Results can make a useful contribution Author to blade internal cooling.

EFFECTS OF WING SWEEP ON IN-FLIGHT BOUNDARY-LAYER TRANSITION FOR A LAMINAR FLOW WING AT MACH NUMBERS FROM 0.60 TO 0.79

BIANCA TRUJILLO ANDERSON and ROBERT R. MEYER, JR. Jul. 1990 37 p Contains microfiche as supplement (NASA-TM-101701; H-1565; NAS 1.15:101701) Avail: NTIS HC/MF A03 CSCL 20/4

The variable sweep transition flight experiment (VSTFE) was

conducted on an F-14A variable sweep wing fighter to examine the effect of wing sweep on natural boundary layer transition. Nearly full span upper surface gloves, extending to 60 percent chord, were attached to the F-14 aircraft's wings. The results are presented of the glove 2 flight tests. Glove 2 had an airfoil shape designed for natural laminar flow at a wing sweep of 20 deg. Sample pressure distributions and transition locations are presented with the complete results tabulated in a database. Data were obtained at wing sweeps of 15, 20, 25, 30, and 35 deg, at Mach numbers ranging from 0.60 to 0.79, and at altitudes ranging from 10,000 to 35,000 ft. Results show that a substantial amount of laminar flow was maintained at all the wing sweeps evaluated. The maximum transition Reynolds number obtained was 18.6 x 10(exp 6) at 15 deg of wing sweep, Mach 0.75, and at an altitude Author of 10,000 ft.

N91-24556\*# National Aeronautics and Space Administration. Hugh L. Dryden Flight Research Facility, Edwards, CA. EFFECTS OF WING SWEEP ON BOUNDARY-LAYER TRANSITION FOR A SMOOTH F-14A WING AT MACH NUMBERS FROM 0.700 TO 0.825

BIANCA TRUJILLO ANDERSON and ROBERT R. MEYER, JR. May 1990 48 p Contains microfiche as supplement (NASA-TM-101712; H-1531; NAS 1.15:101712) Avail: NTIS HC/MF A03 CSCL 20/4

The results are discussed of the variable sweep transition flight experiment (VSTFE). The VSTFE was a natural laminar flow experiment flown on the swing wing F-14A aircraft. The main objective of the VSTFE was to determine the effects of wing sweep on boundary layer transition at conditions representative of transport aircraft. The experiment included the flight testing of two laminar flow wing gloves. Glove 1 was a cleanup of the existing F-14A wing. Glove 2, not discussed herein, was designed to provide favorable pressure distributions for natural laminar flow at Mach number (M) 0.700. The transition locations presented for glove 1 were determined primarily by using hot film sensors. Boundary layer rake data was provided as a supplement. Transition data were obtained for leading edge wing sweeps of 15, 20, 25, 30, and 35 degs, with Mach numbers ranging from 0.700 to 0.825, and altitudes ranging from 10,000 to 35,000 ft. Results show that a substantial amount of laminar flow was maintained at all the wing sweeps evaluated. The maximum transition Reynolds number of 13.7 x 10(exp 6) was obtained for the condition of 15 deg of sweep, M = 0.800, and an altitude of 20,000 ft.

SIMULATION OF A COMBINED-CYCLE ENGINE Final Report

JON VANGERPEN 10 Jun. 1991 47 p (Contract NAG3-957)

(NASA-CR-188232; NAS 1.26:188232) Avail: NTIS HC/MF A03 CSCL 10/2

A FORTRAN computer program was developed to simulate the performance of combined-cycle engines. These engines combine features of both gas turbines and reciprocating engines. The computer program can simulate both design point and off-design operation. Widely varying engine configurations can be evaluated for their power, performance, and efficiency as well as the influence of altitude and air speed. Although the program was developed to simulate aircraft engines, it can be used with equal success for stationary and automative applications.

Analysis is expected to play an important role in the design and validation of future aircraft structures. The need for the development of professional standards in order to implement the concept of analytical certification is presented. Standards for analysis and criteria for model definition are discussed in some detail

Construcciones Aeronauticas S.A., Madrid (Spain). N91-24642# Stress Office.

### NONLINEAR ANALYSIS OF COMPOSITE SHEAR WEBS WITH HOLES AND CORRELATION WITH TESTS

J. M. BLANCO SAIZ and A. BARRIO CARDABA Analytical Qualification of Aircraft Structures 17 p Apr. 1991 Copyright Avail: NTIS HC/MF A08; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

Since the use of composite materials is largely extended in aircraft construction, it is necessary to develop analytical calculations to avoid the present dependency on structural tests. With that objective, a test plan of 25 representative specimens of 9 different shear webs geometries with accessing, inspecting or lightening holes, enveloping the A320 tailplane design was performed, including simulated defects and impacts for two environmental conditions. Finite element linear and nonlinear analysis, using a very refined mesh, was performed to correlate test results. Very good correlation was found even in the postbuckling behavior of the structure. This analysis allows the prediction of the postbuckling capability of these structural elements Author and the derivation of a failure criteria.

Four areas of analysis in the qualification of aircraft structures made with composite materials are discussed. These areas are (1) statistics for material allowables, (2) damage tolerance modelling, (3) hygrothermal modelling, and (4) buckling of stiffened compression panels.

### N91-24649# Dassault-Breguet Aviation, Saint Cloud (France). INFLUENCE OF THE REFINEMENT OF STRUCTURAL **CALCULATION ON AIRCRAFT QUALIFICATION PROCEDURES**

C. PETIAU In AGARD, Analytical Qualification of Aircraft Structures 14 p Apr. 1991 In FRENCH; ENGLISH summary Copyright Avail: NTIS HC/MF A08; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

The effects of improvements of analytical methods on the process of airframe qualification are examined. Potentialities, weaknesses, and corresponding corrections are reviewed for the three main branches of structural analysis of aircraft: calculation of stress fields, determination of failure criteria in static and in fatigue, and calculation of loads, aeroelasticity, and flutter. Risks of errors are omnipresent, so the structure qualification must include a reliable process of detection and correction of errors. An organization plan for design and qualification is presented. Computer analysis plays a large role, while remaining controlled via a minimum number of relevant tests. Improvements in analytical methods assist design optimization by reducing the number of required tests and reducing the risk of failure during the main qualification tests. However, insufficient reliability of analytical methods, mainly the risk of human error, requires continued use of the main qualification tests.

ANALYTICAL METHODS FOR THE QUALIFICATION OF **HELICOPTER STRUCTURES** 

F. OCH In AGARD, Analytical Qualification of Aircraft Structures Apr. 1991

Copyright Avail: NTIS HC/MF A08; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

Due to the increasing costs of experimental testing, analytical methods are becoming the primary means of demonstrating structural integrity, durability, and crashworthiness of helicopter structures, both for civil and military use, when representative conditions such as temperature, moisture, cyclic loading, and impact have to be considered. The airframes of derivatives of the basic BO 105 have been qualified in the past without retesting because it could be shown that the structure conformed to those for which experience had demonstrated the structural analysis to be reliable. During the development of a composite fuselage for the BK 117. both an analytical and an experimental strength substantiation was performed, which corresponded very well and formed the basis for airworthiness qualification of this experimental helicopter under flight testing now. A large number of components in the dynamic system are designed primarily so that they will provide adequate fatigue strength, defined in terms of an endurance limit, or in terms of fatigue life. The analytical qualification of these fatigue critical structures, on the basis of measured fatigue loadings and calculated working S-N curves, is state-of-the-art in the helicopter industry. In the nonlinear domain, analytical methods are applied highly laminated elastomeric bearings and for the crashworthiness qualification of both crushable subcomponents and complete helicopters. The results gained so far allow the application of analytical methods, partly in combination with coupon or component testing, for the qualification of helicopter structures.

### US INDUSTRY ENTERS THE GREEN MAZE

BILL GREGORY Interavia Aerospace Review (ISSN 0020-6512), vol. 46, May 1991, p. 22-25. Copyright

A review is presented of the growing number of complex and often inconsistent environmental regulations forcing the U.S. aerospace industry to spend increasingly large amounts of money to clean up past messes and to insure that future operations comply with new laws. To reduce stratospheric ozone depletion and smog generation, regulations are amended to lower volatile compounds. New aircraft construction bays include under-floor systems for recovery of corrosion inhibitors which capture emissions from paint over-spray and solvent evaporation during wing cleaning, painting and sealing. It is pointed out that company environmental policy officers are concerned by criminalization of environmental regulations; in particular it is argued that recently revised federal sentencing guidelines compound the potential severity of penalties. Water waste disposal, Clean Air Act

provisions, solvents, adhesives and coatings problems and solid rocket motor waste disposal are discussed.

# AERONAUTICAL METEOROLOGY - SAFETY AND ECONOMICS OF COMMERCIAL AIR TRANSPORTS [METEOROLOGIE AERONAUTIQUE - LA SECURITE ET L'ECONOMIE DU TRANSPORT AERIEN]

JACQUES GOAS (Meteorologie Nationale, Boulogne-Billancourt, France) Navigation (Paris) (ISSN 0028-1530), vol. 39, April 1991, p. 239-243. In French. Copyright

The impact of meteorological parameters on the economics and safety of commercial air transportation is reviewed. Some 40 percent of fatal commercial transport accidents that have occurred since 1970 can be attributed in part to meteorological phenomena, e.g., hail, lightning, clear air turbulence, and wind shear. Consideration is given to the increasing severity of weather-related accidents in modern high-speed jet aircraft, as opposed to earlier piston engine types. Finally, the economic impact of operating high gross weight transport jet aircraft with regard to meteorological considerations, i.e., extended takeoff runs at high ambient temperatures, varying enroute climb and cruise altitudes due to changes of wind, weather and temperature, and meteorology at the destination/alternate airport, are discussed.

### THE LWC PARAMETER - SOME EXPERIMENTAL RESULTS

MAURIZIO BASSANI (Aeronautica Militare Italiana, Divisione Aerea Studi Ricerche e Sperimentazioni, Rome, Italy) Rivista di Meteorologia Aeronautica (ISSN 0035-6328), vol. 50, July-Dec. 1990, p. 141-148. refs

Analyses of four instances of icing conditions during flight tests are conducted from a meteorological standpoint. A summary of the test characteristics reported from a G222 aircraft equipped for icing certification is shown. Three events occurred near 12 UTC sounding, and one was between 12 and 18 UTC. Meteorological conditions at the time of the icing are inferred from conditions in the middle troposphere. LWC values are calculated and compared with observed data. A diffuse stability throughout the tropospheric region is indicated by the soundings, and the Appleman analysis shows favorable icing conditions. Airframe structure icing is limited to rime ice due to the lack of vertical motion. The LWC values found are shown to agree with observed values, although the value for the event corresponding to stratified cloud conditions must be linearly interpolated from time contiguous soundings. The Microcora sounding used here is shown to effectively calculate the LWC values for certain meteorological conditions.

### PRACTICAL CONSIDERATIONS IN OPTIMAL AND 4-DIMENSIONAL FLIGHT MANAGEMENT COMPUTATIONS

SAM LIDEN (Honeywell, Inc., Air Transport Systems Div., Phoenix, AZ) IN: Control and dynamic systems. Vol. 32 - Advances in aerospace systems dynamics and control systems. Pt. 2. San Diego, CA, Academic Press, Inc., 1990, p. 1-21. refs Copyright

Optimization and simulation studies conducted to clarify the more pragmatic aspects of commercial aircraft flight management system (FMS) computations have indicated that the optimum arrival time and cost index can be found with adequate accuracy for cost minimization by means of a three trial pass-based procedure. While precise speed adjustment for required arrival-time predictions can be found by a simple algorithm requiring few passes to converge, wind forecast errors are found to compromise prediction accuracy; a simple method is available, however, for adjusting the flight speed by the forecast error and adjusting the prediction speed limits accordingly. Total flight cost-minimizing speed control is achievable with relatively modest FMS design modifications.

The present generic optimization procedure for a continuous or discrete control law (of arbitrary order), which will be applicable to a multiinput-multioutput system, is upon constraining used to

satisfy conflicting design requirements on the mean-square responses and stability robustness at the plant input and output. The synthesis procedure is especially suitable for flexible airframes and large space structures modeled by a high-order state-space system of equations. Analytical expressions are obtained for the gradients of the cost function, together with design constraints on the mean-square response and minimum singular value.

## A91-38234# THE DEVELOPMENT AND RESEARCH ON CAD FOR EDUCATION ON AIRCRAFT DESIGN

MING CAO Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 39, no. 446, 1991, p. 127-137. In Japanese, with abstract in English. refs

An educational computer-aided aircraft design (ECAAD) system is developed using microcomputers. The constitutive details of the program are presented with some examples. The convergence rate and accuracy of the four different optimization methods are compared and the simplex method is found to have superior characteristics to the other three. The effect of introducing a relaxation factor in optimization of the structural initial design is also discussed.

# A91-39417# ROBUST EIGENSTRUCTURE ASSIGNMENT WITH STRUCTURED STATE SPACE UNCERTAINTY

KENNETH M. SOBEL (City College, New York) and WANGLING YU Journal of Guidance, Control, and Dynamics (ISSN 0731-5090), vol. 14, May-June 1991, p. 621-628. refs (Contract F49620-88-C-0053)

Copyright

Recent sufficient conditions for robust stability and robust performance of linear time-invariant systems subject to structured state-space uncertainty are utilized to obtain a robust eigenstructure assignment design method. This new approach optimizes either the sufficient condition for stability or performance robustness while constraining the dominant eigenvalues to lie within chosen regions in the complex plane. This constrained optimization problem is solved by using the sequential unconstrained minimization technique with a quadratic extended interior penalty function. The use of constraints on certain eigenvector entries and the effect of these constraints on robustness and nominal performance are considered. Conservatism of the robustness conditions is reduced by simultaneously introducing a similarity transformation, a positive real diagonal weighting, and a unitary weighting into the design procedure. An example that illustrates the design of a robust eigenstructure assignment controller for a pitch pointing/vertical translation maneuver of the AFTI F-16 aircraft is presented.

The Northrop criterion (Hoh et al., 1982) used to relate flying qualities characteristics to the amount of dipole cancellation is further validated via a fixed-base simulation. Pilot comments and tracking error data are related to the analytical level boundaries provided by the criterion. A general agreement is found with the left-hand boundaries' limits, whereas the boundary position on the right-hand side of the criterion appears disputable. The validation shows the capability of the method, provided the other parameters involved in the task have level-1 values.

ADVANCED COMPUTATIONAL MODELS FOR ANALYZING HIGH SPEED PROPULSIVE FLOWFIELDS

SANFORD M. DASH *In* Johns Hopkins Univ., The 1990 JANNAF Propulsion Meeting, Volume 1 p 247-283 Oct. 1990 Avail: NTIS HC/MF A20

Recently developed 3-D computational models (SCRINT, PARCH, SCHAFT, CRAFT) which analyze high speed propulsive flowfield problems are described. All the models contain generalized thermochemical capabilities and advanced turbulence models, and all integrate the governing equations using implicit/ strongly-conservative upwind and/or central difference numerics. The models differ with respect to discretization (finite-difference vs finite-volume), solution formulation (spatial marching parabolized Navier-Stokes (PNS), iterative PNS, time asymptotic full Navier-Stokes (FNS), and time accurate FNS), chemistry coupling (matrix-split/loosely-coupled vs largematrix/strongly coupled), and geometric/boundary condition flexibility. The hierarchy of propulsive related problems analyzable by these models is described, with specific model formulations found to be most appropriate for specific classes of propulsive flows. Applications to both air-breathing (scramjet/gas-turbine) and rocket propulsive flowfields are described along with thoughts and experiences related to code validation, turbulence modeling, and the development of problem specific, user-friendly codes. ### VALIDATION OF IN-HOUSE AND EXTERNAL SOFTWARE SYSTEMS AT AEROSPATIALE

J. LOCATELLI and J. C. SOURISSEAU In AGARD, Analytical Qualification of Aircraft Structures 3 p Apr. 1991 Copyright Avail: NTIS HC/MF A08; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

In the aeronautical industry, the concept of numerical simulation is implemented, at first, in the preliminary design stage, and then during the certification activities with respect to the airworthiness regulations. This implies the development and the use of calculation software, of which it is necessary to improve the validation at different levels. The different features of these validation tests are described in the design, use, and evaluation of these software systems. The experience of the engineer then plays a major role in obtaining high quality models in the design of aircraft structures.

### ALDAS USER'S MANUAL

MICHAEL E. WATTS Apr. 1991 49 p (NASA-TM-102831; A-90182; NAS 1.15:102831) Avail: NTIS HC/MF A03 CSCL 09/2

The Acoustic Laboratory Data Acquisition System (ALDAS) is an inexpensive, transportable means to digitize and analyze data. The system is based on the Macintosh 2 family of computers, with internal analog-to-digital boards providing four channels of simultaneous data acquisition at rates up to 50,000 samples/sec. The ALDAS software package, written for use with rotorcraft acoustics, performs automatic acoustic calibration of channels, data display, two types of cycle averaging, and spectral amplitude analysis. The program can use data obtained from internal analog-to-digital conversion, or discrete external data imported in ASCII format. All aspects of ALDAS can be improved as new hardware becomes available and new features are introduced into the code.

NASA-Lewis has committed to a long range goal of creating a numerical test cell for aeropropulsion research and development. Efforts are underway to develop a first generation Numerical Propulsion System Simulation (NPSS). The NPSS will provide a unique capability to numerically simulate advanced propulsion systems from nose to tail. Two essential ingredients to the NPSS are: (1) experimentally validated Computational Fluid Dynamics (CFD) codes; and (2) high performing computing systems (hardware and software) that will permit those codes to be used efficiently. To this end, NASA-Lewis is using high speed, interactive computing as a means for achieving Integrated CFD and Experiments (ICE). The development is described of a prototype ICE system for multistage compressor flow physics research.

### ACOUSTICS OF UNSTEADY TRANSONIC FLOW

A. S. LYRINTZIS and Y. XUE (Minnesota, University, Minneapolis) IN: International Symposium on Nonsteady Fluid Dynamics, Toronto, Canada, June 4-7, 1990, Proceedings. New York, American Society of Mechanical Engineers, 1990, p. 187-199. refs

Copyright

Investigation of noise mechanisms due to unsteady transonic flow is important for aircraft noise reduction. In this work, the near-field impulsive noise due to transonic Blade Vortex Interaction (BVI) and oscillating flap is simulated numerically. These problems are modeled by the two-dimensional high frequency transonic small disturbance equation (VTRAN2 code). The three types of unsteady shock wave motion have been identified. Two different important disturbances exist in the pressure signal. The first disturbance is related to the fluctuating lift and the second is related to the fluctuating drag. Pressure wave signatures, noise frequency spectra, and noise directivity are investigated.

### A NEW TECHNIQUE AND APPLICATION FOR NONLINEAR ACOUSTIC FATIGUE OF STIFFENED COMPOSITE PANELS

M. A. FERMAN and J. H. JACOBS (McDonnell Aircraft Co., Saint Louis, MO) IN: Vibration and behavior of composite structures; Proceedings of the Symposium, ASME Winter Annual Meeting, San Francisco, CA, Dec. 10-15, 1989. New York, American Society

of Mechanical Engineers, 1989, p. 27-33. refs Copyright

A new solution for the prediction of nonlinear acoustic fatigue of aircraft panels is presented, emphasizing both bidirectionally and unidirectionally stiffened panels. The response of integrally stiffened panels has been studied and a prediction methodology for nonlinear bay response and its relation to overall panel response for unimodal systems is developed. Test results indicate the accuracy for composite and metal panels, utilizing both literature and in-house data. Comparison with other prediction methods indicate that significantly more accurate results are achieved by this approach.

THE BREAKDOWN OF THE LINEARIZED THEORY AND THE ROLE OF QUADRUPOLE SOURCES IN TRANSONIC ROTOR ACOUSTICS

H. ARDAVAN (Cambridge, University, England) Journal of Fluid Mechanics (ISSN 0022-1120), vol. 226, May 1991, p. 591-624.

Copyright

The retarded Green function for the linearized version of the equation of the mixed type governing the potential flow around a rotating helicopter blade or a propeller is derived, and the distinction between the various forms of the Ffowcs Williams-Hawkings equations in the supersonic regime is discussed. The singularity structure of the Green function in the supersonic regime is examined in detail. The caustic representing the envelope of the spherical wavefronts emanating from a circularly moving point source is compared and contrasted with the Mach cone of a rectilinearly moving point source, and its role in the calculation of the sound amplitude of an extended source is considered. The radial component of the gradient of the sound amplitude predicted by the Ffowcs Williams-Hawkings equation is shown to diverge as the observation point approaches the sonic cylinder from outside. The practical implications of the findings are noted, and the relationship of the singularity obtained in the study with those already found in literature is discussed.

UNIFIED AEROACOUSTICS ANALYSIS FOR HIGH SPEED TURBOPROP AERODYNAMICS AND NOISE. VOLUME 2: DEVELOPMENT OF THEORY FOR WING SHIELDING Final Report

R. K. AMIET May 1991 41 p (Contract NAS3-23720)

(NASA-CR-185192; NAS 1.26:185192) Avail: NTIS HC/MF A03 CSCL 20/1

A unified theory for aerodynamics and noise of advanced turboprops is presented. The theory and a computer code developed for evaluation at the shielding benefits that might be expected by an aircraft wing in a wing-mounted propeller installation are presented. Several computed directivity patterns are presented to demonstrate the theory. Recently with the advent of the concept of using the wing of an aircraft for noise shielding, the case of diffraction by a surface in a flow has been given attention. The present analysis is based on the case of diffraction of no flow. By combining a Galilean and a Lorentz transform, the wave equation with a mean flow can be reduced to the ordinary equation. Allowance is also made in the analysis for the case of a swept wing. The same combination of Galilean and Lorentz transforms lead to a problem with no flow but a different sweep. The solution procedures for the cases of leading and trailing edges are basically the same. Two normalizations of the solution are given by the computer program. FORTRAN computer programs are presented with detailed documentation. The output from these programs compares favorably with the results of other investigators.

Results of the program for the generation of a computer prediction code for noise of advanced single rotation, turboprops (prop-fans) such as the SR3 model are presented. The code is based on a linearized theory developed at Hamilton Standard in which aerodynamics and acoustics are treated as a unified process. Both steady and unsteady blade loading are treated. Capabilities include prediction of steady airload distributions and associated aerodynamic performance, unsteady blade pressure response to gust interaction or blade vibration, noise fields associated with thickness and steady and unsteady loading, and wake velocity fields associated with steady loading. The code was developed on the Hamilton Standard IBM computer and has now been installed on the Cray XMP at NASA-Lewis. The work had its genesis in the frequency domain acoustic theory developed at Hamilton Standard in the late 1970s. It was found that the method used for near field noise predictions could be adapted as a lifting surface theory for aerodynamic work via the pressure potential technique that was used for both wings and ducted turbomachinery. In the first realization of the theory for propellers, the blade loading was represented in a quasi-vortex lattice form. This was upgraded to true lifting surface loading. Originally, it was believed that a purely linear approach for both aerodynamics and noise would be adequate. However, two sources of nonlinearity in the steady aerodynamics became apparent and were found to be a significant factor at takeoff conditions. The first is related to the fact that the steady axial induced velocity may be of the same order of magnitude as the flight speed and the second is the formation of leading edge vortices which increases lift and redistribute loading. Discovery and properties of prop-fan leading edge vortices were reported in two papers. The Unified AeroAcoustic Program (UAAP) capabilites are demonstrated and the theory verified by comparison with the predictions with data from tests at NASA-Lewis. Steady aerodyanmic performance, unsteady blade loading, wakes, noise, Author and wing and boundary layer shielding are examined.

the shirt

The Unified AeroAcoustic Program (UAAP) code calculates the airloads on a single rotation prop-fan, or propeller, and couples these airloads with an acoustic radiation theory, to provide estimates of near-field or far-field noise levels. The steady airloads can also be used to calculate the nonuniform velocity components in the propeller wake. The airloads are calculated using a three dimensional compressible panel method which considers the effects of thin, cambered, multiple blades which may be highly swept. These airloads may be either steady or unsteady. The acoustic model uses the blade thickness distribution and the steady or unsteady aerodynamic loads to calculate the acoustic radiation. The users manual for the UAAP code is divided into five sections: general code description; input description; output description; system description; and error codes. The user must have access to IMSL10 libraries (MATH and SFUN) for numerous calls made for Bessel functions and matrix inversion. For plotted output users must modify the dummy calls to plotting routines included in the code to system-specific calls appropriate to the user's installation.

PROPAGATION OF PROPELLER TONE NOISE THROUGH A
FUSELAGE BOUNDARY LAYER Final Report

B. MAGLIOZZI and D. B. HANSON May 1991 71 p (Contract NAS3-23720)

(NASA-CR-185195; NAS 1.26:185195) Avail: NTIS HC/MF A04 CSCL 20/1

An analysis of tone noise propagation through a boundary layer and fuselage scattering effects was derived. This analysis is a three dimensional and the complete wave field is solved by matching analytical expressions for the incident and scattered waves in the outer flow to a numerical solution in the boundary layer flow. The outer wave field is constructed analytically from an incident wave appropriate to the source and a scattered wave in the standard Hankel function form. For the incident wave, an existing function - domain propeller noise radiation theory is used. In the boundary layer region, the wave equation is solved by numerical methods. The theoretical analysis is embodied in a computer program which allows the calculation of correction factors for the fuselage scattering and boundary layer refraction effects. The effects are dependent on boundary layer profile, flight speed, and frequency. Corrections can be derived for any point on the fuselage, including those on the opposite side from the source. The theory was verified using limited cases and by comparing calculations with available measurements from JetStar tests of model prop-fans. For the JetStar model scale, the boundary layer refraction effects produce moderate fuselage pressure reinforcements aft of and near the plane of rotation and significant attenuation forward of the plane of rotation at high flight speeds. At lower flight speeds, the calculated boundary layer effects result in moderate amplification over the fuselage area of interest. Apparent amplification forward of the plane of rotation is a result of effective changes in the source directivity due to boundary layer refraction effects. Full scale effects are calculated to be moderate, providing fuselage pressure amplification of about 5 dB at the peak noise location. Evaluation using available noise measurements was made under high-speed, high-altitude flight conditions. Comparisons of calculations made of free field noise, using a current frequency-domain propeller noise prediction method, and fuselage effects using this new procedure show good agreement with fuselage measurements over a wide range of flight speeds and frequencies. Correction factors for the JetStar measurements made on the fuselage are provided in an Author Appendix.

# N91-23853# Aerospatiale, Toulouse (France). NOISE INSIDE AIRCRAFT FUSELAGES SUBJECTED TO AIRBORNE EXCITATIONS

M. GOULAIN 1991 26 p Presented at Internoise 90, 13-15 Aug. 1990

(REPT-911-111-104; ETN-91-99268) Avail: NTIS HC/MF A03

Noises inside a cockpit and a cabin and airborne and structureborne noise are summarized with the use of graphics. The necessity of having a model of acoustic and vibration transmission is outlined. The history and complexity of models, fuselage test in laboratory and a comparison of theory and experiment are discussed. The modal method is concluded to give a good understanding of the transmission phenomena through an aircraft fuselage in a 0.15 to 2.3 frequency range. The ease of use of these methods allow parametrical studies for preliminary design for noise reduction purpose.

Republic of Germany, HC 53.50 Deutschs marks

The propagation of small disturbances in the vicinity of transonic wings with a mixture of subsonic and supersonic regions is theoretically investigated on the basis of the geometrical acoustics approximation. Waves, beams, and the spatial density distribution of the dissipated disturbance energy are numerically calculated using a system of eighteen differential equations. The effects of various two dimensional and three dimensional fields, of the location of the source and of reflections on the wing surface are investigated. The results of the acoustic theory are used to derive a general influence function for sources of disturbance in arbitrary transonic fields. This function represents a first step towards a new surface panel method for calculating unsteady transonic flows. The acoustic results are compared with measured unsteady pressure distributions on oscillating transonic wings and with the results of a numerical field panel method.

### A FIELD-DEPLOYABLE DIGITAL ACOUSTIC MEASUREMENT SYSTEM

DAVID L. GRAY, KENNETH D. WRIGHT, II, and WAYNE D. ROWLAND *In* NASA, Washington, Technology 2000, Volume 2 p 325-332 1991

Avail: NTIS HC/MF A16 CSCL 20/1

A field deployable digital acoustic measurement system was developed to support acoustic research programs at the Langley Research Center. The system digitizes the acoustic inputs at the microphone, which can be located up to 1000 feet from the van which houses the acquisition, storage, and analysis equipment. Digitized data from up to 12 microphones is recorded on high density 8mm tape and is analyzed post-test by a microcomputer system. Synchronous and nonsynchronous sampling is available with maximum sample rates of 12,500 and 40,000 samples per second respectively. The high density tape storage system is capable of storing 5 gigabytes of data at transfer rates up to 1 megabyte per second. System overall dynamic range exceeds 83 dB.

### AGARD FLIGHT TEST TECHNIQUES SERIES. VOLUME 9: AIRCRAFT EXTERIOR NOISE MEASUREMENT AND ANALYSIS TECHNIQUES

H. HELLER (Deutsche Forschungs- und Versuchsanstalt fuer Luftund Raumfahrt, Brunswick, Germany, F.R.) Apr. 1991 201 p (AGARD-AG-300-VOL-9; ISBN-92-835-0612-X) Copyright Avail: NTIS HC/MF A10; Non-NATO Nationals requests available only from AGARD/Scientific Publications Executive

Testing and analysis techniques to measure aircraft noise primarily for purposes of noise certification as specified by the 'International Civil Aviation Organization', ICAO are described. The relevant aircraft noise certification standards and recommended practices are presented in detail for subsonic jet aircraft, for heavy and light propeller-driven aircraft, and for helicopters. The practical execution of conducting noise certification tests is treated in depth. The characteristics and requirements of the acoustic and non-acoustic instrumentation for data acquisition and data processing are discussed, as are the procedures to determine the special noise measures - effective perceived noise level (EPNL) and maximum overall A-weighted noise level (L sub pA,max) that are required for the noise certification of different types of aircraft. The AGARDograph also contains an extensive, although selective, discussion of test and analysis techniques for more detailed aircraft noise studies by means of either flight experiments or full-scale and model-scale wind tunnel experiments. Appendices provide supplementary information.

LABORATORY TEST AND ACOUSTIC ANALYSIS OF CABIN TREATMENT FOR PROPFAN TEST ASSESSMENT AIRCRAFT Interim Report

H. L. KUNTZ and R. J. GATINEAU May 1991 144 p (Contract NAS1-18036)

(NASA-CR-182075; LF-31879; NAS 1.26:182075) Avail: NTIS HC/MF A07 CSCL 20/1

An aircraft cabin acoustic enclosure, built in support of the Propfan Test Assessment (PTA) program, is described. Helmholtz resonators were attached to the cabin trim panels to increase the sidewall transmission loss (TL). Resonators (448) were located between the trim panels and fuselage shell. In addition, 152 resonators were placed between the enclosure and aircraft floors. The 600 resonators were each tuned to a 235 Hz resonance frequency. After flight testing on the PTA aircraft, the enclosure was tested in the Kelly Johnson R and D Center Acoustics Lab. Laboratory noise reduction (NR) test results are discussed. The enclosure was placed in a Gulfstream 2 fuselage section. Broadband (138 dB overall SPL) and tonal (149 dB overall SPL) excitations were used in the lab. Tonal excitation simulated the propfan flight test excitation. The fundamental tone was stepped in 2 Hz intervals from 225 through 245 Hz. The resonators increase the NR of the cabin walls around the resonance frequency of the resonator array. The effects of flanking, sidewall absorption, cabin adsorption, resonator loading of trim panels, and panel vibrations are presented. Increases in NR of up to 11 dB were measured.

SIGNAL PROCESSING OF AIRCRAFT FLYOVER NOISE

JEFFREY J. KELLY May 1991 86 p (Contract NAS1-19000)

(NASA-CR-187546; NÁS 1.26:187546) Avail: NTIS HC/MF A05 CSCL 20/1

A detailed analysis of signal processing concerns for measuring aircraft flyover noise is presented. Development of a de-Dopplerization scheme for both corrected time history and spectral data is discussed along with an analysis of motion effects on measured spectra. A computer code was written to implement the de-Dopplerization scheme. Input to the code is the aircraft position data and the pressure time histories. To facilitate ensemble averaging, a uniform level flyover is considered but the code can accept more general flight profiles. The effects of spectral smearing and its removal is discussed. Using data acquired from XV-15 tilt rotor flyover test comparisons are made showing the measured and corrected spectra. Frequency shifts are accurately accounted for by the method. It is shown that correcting for spherical spreading, Doppler amplitude, and frequency can give some idea about source directivity. The analysis indicated that smearing increases with frequency and is more severe on approach than Author recession.

SURFACE ACTIVATION OF CONCORDE BY BE-7 Abstract

P. Ř. TRUSCOTT, C. S. DYER, and J. C. FLATMAN In NASA, Langley Research Center, First LDEF Post-Retrieval Symposium Abstracts p 14 Jun. 1991

Avail: NTIS HC/MF A07 CSCL 20/8

Activation analysis of two airframe parts from Concorde aircraft has identified the presence of Be-7, a nuclide which was found by other investigators to have been collected on the forward edge of the Long Duration Exposure Facility (LDEF) structure. The results of the Concorde analysis indicate that this phenomenon is very much a surface effect, and that the areal densities of the Be-7 are comparable to those found for LDEF. The collection of Be-7

by the aircraft must be greater than in the case of LDEF (since the duration for which Concorde is accumulating the nuclide is shorter) and is of the order of 1.9 to 40 nuclei sq cm/s, depending upon assumptions made regarding the efficiency of the process which removes the radionuclide.

### THE ENGLISH SUMMER OF 1990 - FURTHER PROGRESS TOWARDS DEREGULATION OF THE AVIATION AND TRAVEL INDUSTRY

MARTIN BRIGGS (Aviation and Travel Services, Ltd., Coventry, England) Air Law (ISSN 0165-2079), vol. 16, April 1991, p. 50-62. refs Copyright

A summary is presented of the most significant events concerning the legal and regulatory developments involving England and the EEC that occurred during 1990. Also addressed are the results of further negotiations between the governments of the U.K. and the U.S.A. on services between the two countries, and the increased security measures implemented during this period. Some of the proposals put forth by the European Commission include: a regulation on the operation of air cargo services, a draft for common rules for denied boarding compensation in scheduled air transport, and mutual acceptance of licenses for civil aviation personnel.

# THE ROLE OF ORGANIZATIONS IN PROFESSIONAL DEVELOPMENT [EL PAPEL DE LAS ASOCIACIONES EN EL DESARROLLO PROFESIONAL]

CORT DUROCHER (AIAA, Washington, DC) IN: Space Conference of the Americas, San Jose, Costa Rica, Mar. 12-16, 1990, Proceedings. Vol. 1 - Reports. San Jose, Costa Rica, Ministerio de Ciencia y Tecnologia, 1990, p. 436-440. In Spanish.

An evaluation is made of the potential contribution of such professional organizations as the American Institute of Aeronautics and Astronautics (AIAA) to the growth and dissemination of expertise in the space sciences and the aerospace industries. An account is given of the illustrative roles of AIAA in furnishing expert testimony to legislative bodies on matters pertaining to space research and development, and in the convening of conferences and exhibitions whose proceedings are subsequently published for wide circulation. AIAA's focus on the ongoing education of its members, and on the recognition of their professional achievements, is stressed.

AN OVERVIEW OF INFORMATION RESOURCES IN AVIATION
THOMAS G. DEPETRO In its Kansas Aviation Review p 21-29
1991

Avail: NTIS HC/MF A03

Information resources in aviation are produced by many sources, including publishing companies, government agencies, professional associations, research organizations, and colleges and universities. Aspects of aviation covered include: management, government regulations, air transport, engineering, technology, research and development, and applied sciences. Information is available in a number of formats including books, periodicals (magazines, journals, newspapers, newsletters), maps and charts, government documents, technical reports, professional papers, microfiche, and more recently, audio and video cassette tapes and CD/ROM and

Ĭ

online computer databases. This overview serves an an introduction to what information is available from key organizations and how it is distributed and organized.

The activities of the five research centers of the German research organization for air and space transportation during the year 1989/90 are described. Air flight, spaceceflight, and energy techniques are discussed. With regard to air flight the following research work was carried out: aerodynamic efficiency improvement, flight dynamical simulation, new helicopter technology, new propulsion unit development, air traffic, and personnel selection. Under the topic of space flight the follwing areas of research were addressed: space vehicles, rocket launchers, operating tasks for space missions, and research in space. Weightlessness research in the field of materials and bioscience, multi-axis vibration simulator development for satellites, and ozone measuring aircraft is presented. Energy techniques in the field of fossil fuel combustion, solar and hydrogen energy, and high energy lasers are discussed.

AERONAUTICAL ENGINEERING / A Continuing Bibliography (Supplement 269)

### Typical Subject Index Listing

The subject heading is a key to the subject content of the document. The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of document content, a title extension is added, separated from the title by three hyphens. The accession number and the page number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document. Under any one subject heading, the accession numbers are arranged in sequence.

 [ISSN-0720-78081
                                         p 643 N91-23103
AIR TRAFFIC CONTROL
    Evolution of clutter suppression techniques for air traffic
  control and surveillance radar
                                  p 641 A91-37101
weather radars used for
    Clutter rejection in Doppler
 airport wind shear detection p 685 A91-37104
Track initiation using MHT in dense environments —
Multiple Hypotesis Tracking p 674 A91-37141
   Evaluation of the performance of a RISC based real
 time data processor in air traffic control radar applications p 642 A91-37145
   Practical considerations in optimal and 4-dimensional
 flight management computations
                                        p 686 A91-37585
   Air traffic control today and tomorrow
                                        p 642 A91-38215
    European studies to investigate the feasibility of using
 1000 ft vertical separation minima above FL 290. I
                                        p 642 A91-38217
   Current status and future prospects of air traffic
   ontrol p 642 A91-38322
Flight tests show potential benefits of data link as primary
 control
 communication medium
                                        p 643 A91-38577
   Near midair collisions as an indicator of general aviation
 collision risk
                                        p 635 N91-23096
   Microwave landing system modeling with application to
 air traffic control
 [NASA-TM-102832]
                                        p 636 N91-23099
   Flight mechanics/air navigation research field. A 1990
 Scientific report of the German Air and Space Research
 Organization
 (ISSN-0720-7808)
                                        p 643 N91-23103
 Airborne Collision Avoidance System (ACAS) in controlled air traffic. Aspects of reciprocal influence in Secondary Surveillance Radar (SSR) radio loads
 [ETN-91-99253]
                                        p 644 N91-23105
   Differential GPS terminal area test results
 [AD-A232668]
                                        p 644 N91-23106
   The limits of the landing process of aircraft
 [DLR-FB-90-49]
                                        p 653 N91-23137
   Precision runw
                     monitor demonstration report
p 669 N91-23198
 [AD-A232671]
   National airspace system. Communications operational
concept NAS-SR-136
[DOT/FAA/SE-91/1]
                                        p 640 N91-24185

i

Calculation of steady and unsteady pressures on wings

p 617 A91-38544

at supersonic speeds with a transonic small-disturbance

**AIRCRAFT INDUSTRY** SUBJECT INDEX

SUBJECT INDEX		AIRCRAFT INDUSTRY
Aviation system capital investment plan	Integration of handling quality aspects into the	IAI hypersonic wind tunnel
[PB91-150268] p 644 N91-24189	aerodynamic design of modern unstable fighters	[IAITIC-87-1006] p 668 N91-23194
AIR TRANSPORTATION	p 667 N91-23125	Nonlinear Aerodynamics and the Design of Wing Tips
The English summer of 1990 - Further progress towards	A review of high angle of attack requirements for combat aircraft p 651 N91-23130	[NASA-CR-188044] p 630 N91-24105
deregulation of the aviation and travel industry	aircraft p 651 N91-23130 X-31A at first flight p 651 N91-23131	A general multiblock Euler code for propulsion integration. Volume 1: Theory document
p 690 A91-37801	Navigation, guidance, and trajectory optimization for	[NASA-CR-187484-VOL-1] p 632 N91-24120
Aeronautical research in the United States - Challenges for the 1990's p 612 A91-38580	hypersonic vehicles p 644 N91-23150	A general multiblock Euler code for propulsion
Engine technology challenges for a 21st century high	Calculation of high angle of attack aerodynamics of	integration. Volume 3: User guide for the Euler code
speed civil transport	fighter configurations. Volume 1: Steady	[NASA-CR-187484-VOL-3] p 632 N91-24122
[NASA-TM-104363] p 636 N91-23098	[AD-A233482] p 631 N91-24113 Calculation of high angle of attack aerodynamics of	Transonic Symposium: Theory, Application and
Activities report of the DLR	fighter configurations. Volume 2: User manual for	Experiment, volume 2 [NASA-CP-3020-VOL-2] p 634 N91-24132
[ISSN-0938-2194] p 691 N91-24086	VORSTAB-2	Laminar-flow flight experiments p 634 N91-24135
An overview of information resources in aviation	[AD-A233483] p 631 N91-24114	Computational support of the X-29A Advanced
p 690 N91-24091	AIRCRAFT CONSTRUCTION MATERIALS	Technology Demonstrator flight experiment
AIRBORNE EQUIPMENT  Functional-adaptive data processing in airborne radio	Metal matrix composite vertical tail fabrication [SME PAPER EM90-438] p 611 A91-36875	p 653 N91-24137 Results of correlations for transition location on a
navigation and landing systems p 643 A91-39187	Modal analysis for fibre-carbon composite parts of an	clean-up glove installed on an F-14 aircraft and design
Advanced airborne oxygen sensors	airplane p 679 A91-40157	studies for a laminar glove for the X-29 aircraft accounting
p 655 A91-39387	Calculation and experimental study on sonic fatigue life	for spanwise pressure gradient p 654 N91-24138
Airborne Collision Avoidance System (ACAS) in	of aircraft structural panels p 648 A91-40162	Variable Sweep Transition Flight Experiment (VSTFE):
controlled air traffic. Aspects of reciprocal influence in	NKK premium quality titanium master alloy p 672 A91-40425	Unified Stability System (USS). Description and users' manual
Secondary Surveillance Radar (SSR) radio loads [ETN-91-99253] p 644 N91-23105	Observatory of new materials. Evolution perspectives	[NASA-CR-181918] p 634 N91-24139
Airborne Wind Shear Detection and Warning Systems:	for the materials used in civil transportation aircraft	Lightning protection requirements for aircraft: A
Third Combined Manufacturers' and Technologists'	[REPT-911-111-107] p 672 N91-23248	proposed specification
Conference, part 2	AIRCRAFT CONTROL	[RAE-TM-FS(F)-632-ISSUE-1-R] p 641 N91-24186
[NASA-CP-10060-PT-2] p 636 N91-24140	Normalized predictive deconvolution - Multichannel time-series applications to human dynamics	A system approach to aircraft optimization [NASA-TM-104074] p 654 N91-24196
CLASS: Coherent Lidar Airborne Shear Sensor. Windshear avoidance	p 686 A91-37584	The effects on aerodynamic performance of designing
[LMSC-F-415048] p 636 N91-24141	Methodology for the analytical assessment of aircraft	supersonic wings for laminar flow control
Clutter modeling of the Denver Airport and surrounding	handling qualities p 664 A91-37597	[AD-A233040] p 654 N91-24197
areas p 638 N91-24152	ACT wind-tunnel experiments of a transport-type wing	Evaluation of cloud detection instruments and
Radar simulation program upgrade and algorithm	p 615 A91-37772 Effects of horizontal tail ice on longitudinal aerodynamic	performance of laminar-flow leading-edge test articles during NASA Leading-Edge Flight-Test Program
development p 638 N91-24153 Airborne radar simulation studies of the Denver July 11,	derivatives p 665 A91-38547	[NASA-TP-2888] p 655 N91-24199
1988 microburst p 638 N91-24155	Evolution of airplane stability and control - A designer's	Analytical Qualification of Aircraft Structures
Description, characteristics and testing of the NASA	viewpoint p 665 A91-39401	[AGARD-R-772] p 683 N91-24638
airborne radar p 638 N91-24156	Real time estimation of aircraft angular attitude	Validation of in-house and external software systems
Integration of weather sensing devices	[IAITIC-87-1004] p 649 N91-23107 Flying Qualities	at Aerospatiale p 687 N91-24640 Analytical certification of alreraft structures
p 639 N91-24174 NASA Langley flight test program p 639 N91-24175	[AGARD-CP-508] p 649 N91-23108	p 684 N91-24641
TDWR information on the flight deck	MIL-STD-1797 is not a cookbook p 650 N91-23111	AIRCRAFT ENGINES
p 640 N91-24176	Handling qualities guidelines for the design of fly-by-wire	Automated CAD design for sculptured airfoil surfaces
Orlando experiment p 640 N91-24177	flight control systems for transport aircraft p 667 N91-23119	[SME PAPER MS90-744] p 673 A91-36943
AIRBORNE SURVEILLANCE RADAR	Determination of decision-height windows for	On digital electronic control system of aircraft engine p 657 A91-38209
Adaptive airborne track while scan p 642 A91-37139	decelerating IMC approaches in helicopters	Water droplet impingement on airfoils and aircraft engine
AIRBORNE/SPACEBORNE COMPUTERS	p 667 N91-23124	inlets for icing analysis p 634 A91-38543
A320 - First of the computer-age aircraft	The electrical flight control system of A320 Airbus: A	Design and development of aviation gas turbine engines
p 645 A91-36354	fault tolerant system [REPT-911-111-103] p 667 N91-23192	Russian book p 657 A91-39201
Along for the ride? computer-automated aviation overview p 656 A91-40550	[REPT-911-111-103] p 667 N91-23192 AIRCRAFT DESIGN	Modification meets Chapter 3 standards re-engined Boeing 727 p 612 A91-40181
overview p 656 A91-40550  The electrical flight control system of A320 Airbus: A	Identification of pilot-vehicle dynamics from simulation	Vectored propulsion, supermaneuverability and robot
fault tolerant system	and flight test p 664 A91-37598	aircraft Book p 649 A91-40501
[REPT-911-111-103] p 667 N91-23192	Design of aircraft wings subjected to gust loads - A safety	NASA aeropropulsion research in support of propulsion
AIRCRAFT ACCIDENTS	index based approach p 675 A91-37851 Advanced aircraft secondary power system design	systems of the 21st century [NASA-TM-104403] p 627 N91-23083
Aeronautical meteorology - Safety and economics of commercial air transports p 685 A91-38323	p 656 A91-38007	[NASA-TM-104403] p 627 N91-23083 Engine technology challenges for a 21st century high
Orientation measurements and transmission via Mode	The development and research on CAD for education	speed civil transport
S at airports p 643 A91-38526	on aircraft design p 686 A91-38234	[NASA-TM-104363] p 636 N91-23098
Near midair collisions as an indicator of general aviation	Aircraft design for maintainability p 612 A91-38546	Fuel-rich, catalytic reaction experimental results
collision risk p 635 N91-23096  The airbag as a supplement to standard restraint	Optimization of rotor performance in hover using a free wake analysis p 646 A91-38548	[NASA-TM-104423] p 662 N91-24203 Small Engine Component Technology (SECT)
systems in the AH-1 and AH-64 attack helicopters and	Vibration problems in an aircraft design	[NASA-CR-175078] p 662 N91-24205
its role in reducing head strikes of the copilot/gunner,	p 648 A91-40165	Small Engine Component Technology (SECT) study
volume 2	Tiltrotor developments p 612 A91-40180	[NASA-CR-175081] p 663 N91-24207
[AD-A232907] p 641 N91-24187	Effects of canard position on the aerodynamic characteristics of a close-coupled canard configuration at	AIRCRAFT FUELS  Detection of traces of water in aviation kerosenes by
AIRCRAFT ANTENNAS  Characteristics of the reception by the antenna systems	low speed p 649 A91-40495	gas chromatography p 670 A91-37182
of a descending aircraft of signals from radio-beacon	Safety of aging aircraft - Boeing programs for the	Commercial aircraft fuel efficiency potential through
landing systems p 642 A91-37200	1990's	2010 p 645 A91-38127
Development of B-1 antenna measurement test bed	[AIAA PAPER 91-0909] p 612 A91-40563 The art of flying qualities testing p 649 N91-23109	Methanol - An environmentally attractive alternative
p 668 A91-37881	The art of flying qualities testing p 649 N91-23109 Integration of handling quality aspects into the	commercial aviation fuel p 670 A91-38129 AIRCRAFT GUIDANCE
AIRCRAFT COMMUNICATION  Current status and future prospects of air traffic	aerodynamic design of modern unstable lighters	Navigation, guidance, and trajectory optimization for
control p 642 A91-38322	p 667 N91-23125	hypersonic vehicles p 644 N91-23150
Flight tests show potential benefits of data link as primary	Agility: A rational development of fundamental metrics	AIRCRAFT HAZARDS
communication medium p 643 A91-38577	and their relationship to flying qualities	loing simulation: A survey of computer models and experimental facilities
National airspace system. Communications operational concept NAS-SR-136	p 651 N91-23129	[NASA-TM-104366] p 628 N91-23087
[DOT/FAA/SE-91/1] p 640 N91-24185	A review of high angle of attack requirements for combat aircraft p 651 N91-23130	Near midair collisions as an indicator of general aviation
AIRCRAFT COMPARTMENTS	aircraft p 651 N91-23130 X-31A at first flight p 651 N91-23131	collision risk p 635 N91-23096
Full-scale demonstration tests of cabin noise reduction	A new architecture and expert system for aircraft design	Signal processing techniques for clutter filtering and wind
using active vibration control p 646 A91-38549	synthesis p 652 N91-23132	shear detection p 638 N91-24154
Canopy breaking system for non-delay pilot rescue p 647 A91-39398	Application of multidisciplinary optimization methods to	Lightning protection requirements for aircraft: A proposed specification
Application of acoustically treated honeycomb sandwich	the design of a supersonic transport	[RAE-TM-FS(F)-632-ISSUE-1-R] p 641 N91-24186
panels in noise control of aircraft cabin	[NASA-TM-104073] p 652 N91-23135	AIRCRAFT INDUSTRY
p 648 A91-40160	Design and construction of a composite airframe for UAV research	Estimating fixed and variable costs of airframe
AIRCRAFT CONFIGURATIONS  A study on sonic load of the vertical tail of F-7 aircraft	[AD-A232422] p 653 N91-23143	manufacturers [AD-A232661] p 613 N91-23077
A study on sonic load of the vertical tall of F-7 aircraft p 648 A91-40171	A computer aided multivariable control systems design	Integration of propulsive systems: Selection and
Aerodynamic characteristics of scissor-wing	technique with application to aircraft flying qualities	compromise
geometries p 624 A91-40216	[AD-A232549] p 653 N91-23144	[REPT-911-111-101] p 661 N91-23187

Development of MIL-8785C into a handling qualities Some analysis of decision-making in the test **AIRCRAFT STRUCTURES** manufacture of military aircraft specification for a new European fighter aircraft Automatic aircraft paint stripping [SME PAPER MS90-280] [AD-A233111] p 666 N91-23114 p 613 N91-24093 p 611 A91-36895 Robotic sensors for aircraft paint stripping AIRCRAFT INSTRUMENTS Do civil flying qualities requirements address military [SME PAPER MS90-282] p 673 A91-36896 Radiation transmission in adverse weather missions for off-the-shelf procurement p 675 A91-37880 p 650 N91-23115 The introduction of off-line programming techniques for Aircraft Command in Emergency Situations (ACES). Airborne Wind Shear Detection and Warning Systems: the robotic assembly of aircraft structures Phase 1: Concept development SME PAPER MS90-2761 p 611 A91-36898 Third Combined Manufacturers' and Technologists' p 636 N91-23097 [DOT/FAA/CT-90/21] A new technique and application for nonlinear acoustic Conference, part 1 An engineering study of altitude determination fatigue of stiffened composite panels [NASA-CP-10060-PT-1] p 639 N91-24166 deficiencies of the Service Aircraft Instrumentation p 687 A91-38863 Estimate of heavy rain performance effect Package (SAIP) [AD-A232055] Sensitivity analysis, optimization, and data support in p 640 N91-24182 p 656 N91-23145 finite element systems p 677 A91-39230 AIRCRAFT PILOTS AIRCRAFT LANDING Identification of nacelle modes from airplane GVT Identification of pilot-vehicle dynamics from simulation p 64B A91-40170 Characteristics of the reception by the antenna systems results and flight test p 664 A91-37598 of a descending aircraft of signals from radio-beacon Computerized system for static and fatigue targe scale Canopy breaking system for non-delay pilot rescue p 642 A91-37200 structural tests: A case study [IAITIC-87-1007] landing systems p 647 A91-39398 The limits of the landing process of aircraft p 681 N91-23522 [DLR-FB-90-49] p 653 N91-23137 AIRCRAFT POWER SUPPLIES Quantitative nondestructive evaluation: Requirements p 639 N91-24167 Advanced aircraft secondary power system design for tomorrow's reliability p 681 N91-24074 LIDAR studies on microbursts p 656 A91-38007 AIRCRAFT MAINTENANCE Evaluation of automation for inspection of aging Aircraft repair/general aviation quick tooling
[SME PAPER EM90-178] p 611 A91-36944
Aircraft design for maintainability p 612 A91-38546 simulation p 613 N91-24088 Aircraft electrical system compute p 657 A91-38037 Program plans for aviation safety research p 638 N91-24157 [NIAR-90-32] AIRCRAFT PRODUCTION AIRCRAFT MANEUVERS Feasibility study in crack detection in aircraft stiffened CAPP imitative system of aircraft assembly --- Computer The influence of altitude and speed variations over the Aided Process Planning p 611 A91-37061 panels by pulse probing and deconvolution aircraft flight control response during the longitudinal D 654 N91-24158 AIRCRAFT RELIABILITY p 664 A91-36722 p 671 A91-39389 nonlinear manoeuvres Bonded/fusion repair of aircraft structures Flexure vibration test method of aviation tube Helicopter in-flight stores lettison p 613 N91-24160 p 648 A91-40172 Vectored propulsion, supermaneuverability and robot Mechanical paint removal techniques for composite The certification of the aircraft integrated propulsive p 613 N91-24163 aircraft --- Book p 649 A91-40501 aircraft Agility: A rational development of fundamental metrics Analytical Qualification of Aircraft Structures [REPT-911-111-102] p 661 N91-23188 and their relationship to flying qualities [AGARD-R-772] p 683 N91-24638 p 651 N91-23129 The role of structural analysis in airworthiness Validation of in-house and external software systems Aerospatiale p 687 N91-24640 p 684 N91-24647 at Aerospatiale p 687 Status of Sundstrand research p 640 N91-241B3 Analytical methods for the qualific cation of helicopter AIRCRAFT MODELS Analytical certification of aircraft structures p 684 N91-24650 Safety of aging aircraft - Boeing programs for the structures p 684 N91-24641 Nonlinear analysis of composite shear webs with holes AIRCRAFT SAFETY 1990's [AIAA PAPER 91-0909] Aeronautical meteorology - Safety and economics of p 612 A91-40563 and correlation with tests p 684 N91-24642 commercial air transports p 685 A91-38323 The costs and benefits of aircraft availability Evaluation of the qualification of the structure of a p 613 N91-23076 [AD-A232660] passenger aircraft by analysis and full-scale testing Orientation measurements and transmission via Mode Navigation, guidance, and trajectory optimization for p 684 N91-24645 S at airports p 643 A91-38526 p 644 N91-23150 hypersonic vehicles The role of analysis in the design and qualification of Air travel - System relating flight safety, aircraft, and p 684 N91-24648 Model rotor icing tests in the NASA Lewis icing research p 634 A91-38527 composite aircraft structures Probability approach for strength calculations Safety of aging aircraft - Boeing programs for the NASA-TM-104351] p 661 N91-23184 p 685 N91-24652 1990's [AIAA PAPER 91-0909] AIRCRAFT SURVIVABILITY AIRCRAFT NOISE p 612 A91-40563 Full-scale demonstration tests of cabin noise reduction Toward enhanced fighter combat effectiveness Near midair collisions as an indicator of general aviation p 646 A91-38549 using active vibration control p 635 N91-23096 p 645 A91-37050 A study of the noise mechanisms of transonic blade-vortex interactions AIRCRAFT WAKES Aircraft Command in Emergency Situations (ACES). A vortex panel method for calculating aircraft downwash Phase 1: Concept development (NASA-CR-1881991 p 627 N91-23084 [DOT/FAA/CT-90/21] on parachute trajectories p 636 N91-23097 Unified aeroacoustics analysis for high speed turboprop p 649 N91-23109 [AIAA PAPER 91-0875] p 626 A91-40557 The art of flying qualities testing p 649 Program plans for aviation safety research erodynamics and noise. Volume 2: Development of theory An experimental study of an axisymmetric turbulent p 638 N91-24157 for wing shielding [NIAR-90-32] boundary layer disturbed by a periodic freestream (NASA-CR-1851921 p 626 N91-23078 NASA Langley flight test program p 639 N91-24175 Unified aeroacoustics analysis for high speed turboprop aerodynamics and noise. Volume 3: Application of theory The airbag as a supplement to standard restraint Aircraft wake vortices: An assessment of the current situation systems in the AH-1 and AH-64 attack helicopters and for blade loading, wakes, noise, and wing shielding [AD-A231658] p 626 N91-23079 its role in reducing head strikes of the copilot/gunner. [NASA-CR-185193] p 688 N91-23850 A vortex panel method for calculating aircraft downwash on parachute trajectories volume 2 Unified aeroacoustics analysis for high speed turboprop p 641 N91-24187 [AD-A232907] aerodynamics and noise. Volume 4: Computer user's p 627 N91-23085 [DE91-009764] AIRCRAFT SPECIFICATIONS Aircraft wake vortices: An annotated bibliography manual for UAAP turboprop aeroacoustic code Flying Qualities [AGARD-CP-508] p 688 N91-23851 [NASA-CR-185194] p 649 N91-23108 Unified aeroacoustics analysis for high speed turboprop AD-A2331611 p 631 N91-24111 MIL-STD-1797 is not a cookbook p 650 N91-23111 **AIRFOIL FENCES** aerodynamics and noise. Volume 5: Propagation of Flying qualities experience on the AMX aircraft Tip vortex/airfoil interaction for a low Reynolds numb propeller tone noise through a fuselage boundary layer p 650 N91-23112 p 689 N91-23852 canard/wing configuration AIRFOIL OSCILLATIONS [NASA-CR-185195] The development of alternate criteria for FBW handling p 617 A91 38545 Noise inside aircraft fuselages subjected to airborne p 666 N91-23113 Simplification of nonlinear indicial response models -Development of MIL-8785C into a handling qualities (REPT-911-111-1041 p 689 N91-23853 specification for a new European fighter aircraft Assessment for the two-dimensional airfoil case field-deployable digital acoustic p 666 N91-23114 p 664 A91-37771 measurement p 689 N91-24078 Do civil flying qualities requirements address military On some physical aspects of airfoil dynamic stall p 618 A91-38686 AGARD flight test techniques series. Description and users' manual [NASA-CR-181918] BOUNDARY LAYER TRANSITION A model for the experimental study of curvature effects on transition of the boundary layer on a swept wing - Preliminar-turbulent transition; Proceedings of the IUTAM	CALIBRATING  ALDAS user's manual [NASA-TM-102831] p 687 N91-24757  CANARD CONFIGURATIONS  Tip vortex/airfoll interaction for a low Reynolds number canard/wing configuration p 617 A91-38545  Effects of canard position on the aerodynamic characteristics of a close-coupled canard configuration at low speed p 649 A91-40495  Computational support of the X-29A Advanced Technology Demonstrator flight experiment p 653 N91-24137  CANOPIES  Canopy breaking system for non-delay pilot rescue p 647 A91-39398  CARBON DIOXIDE LASERS  Continuous wave laser for wind shear detection p 637 N91-24142  CARGO  Low Altitude High Speed Cargo Parachute system development - A status report [AIAA PAPER 91-0880] p 635 A91-40558  CARGO AIRCRAFT  Fire detection system for alroraft cargo bays p 655 A91-36755

**COMPRESSOR BLADES** SUBJECT INDEX

SUBJECT INDEX		COMPRESSOR BLADES
Computation of three-dimensional flow fields through	The 1989 high-speed civil transport studies	COMBUSTION STABILITY
compressor blade rows p 625 A91-40375	[NASA-CR-4375] p 654 N91-24195	The effects of controlling vortex formation on the
Euler calculations of unsteady transonic flow in	AGARD flight test techniques series. Volume 9: Aircraft	performance of a dump combustor p 672 N91-23270
cascades	exterior noise measurement and analysis techniques [AGARD-AG-300-VOL-9] p 689 N91-24843	COMMERCIAL AIRCRAFT  Long-range aircraft are in demand
[AIAA PAPER 91-1104] p 626 A91-40562	CLEARANCES	p 611 A91-36353
Aero-thermal investigation of a highly loaded transonic linear turbine guide vane cascade. A test case for inviscid	Research on aerodynamic control of blade tip clearance	Practical considerations in optimal and 4-dimensional
and viscous flow computations	flow in air-cooled turbine	flight management computations p 686 A91-37585
[VKI-TN-174] p 680 N91-23437	[DE91-764223] p 660 N91-23182 CLIMBING FLIGHT	Commercial aircraft fuel efficiency potential through
Viscous design and analysis methods for transonic	Aircraft performance p 649 A91-40511	2010 p 645 A91-38127
compressor blading [AD-A232902] p 682 N91-24530	CLIPS	Tiltrotor developments p 612 A91-40180 Engine technology challenges for a 21st century high
CATALYSTS	Airborne rescue system	speed civil transport
Fuel-rich, catalytic reaction experimental results	[NASA-CASE-ARC-11909-1] p 635 N91-23095 CLOUD COVER	[NASA-TM-104363] p 636 N91-23098
[NASA-TM-104423] p 662 N91-24203	RADAR performance experiments	COMMUNICATION NETWORKS
CAVITIES	p 639 N91-24168	National airspace system. Communications operational
Steady flow in a three-dimensional rectangular cavity yawed from the freestream turbulent boundary layer	CLOUDS	concept NAS-SR-136 [DOT/FAA/SE-91/1] p 640 N91-24185
p 619 A91-38742	Evaluation of cloud detection instruments and performance of laminar-flow leading-edge test articles	COMPONENT RELIABILITY
CENTRIFUGAL PUMPS	during NASA Leading-Edge Flight-Test Program	Probability approach for strength calculations
Fluid Machinery Forum - 1990; ASME Spring Meeting,	[NASA-TP-2888] p 655 N91-24199	p 685 N91-24652
University of Toronto, Canada, June 4-7, 1990,	CLUTTER	COMPOSITE MATERIALS
Proceedings p 676 A91-38869  Toward automating the design of centrifugal impellers	Evolution of clutter suppression techniques for air traffic control and surveillance radar p 641 A91-37101	Designing with composites - A study of design process p 646 A91-38752
p 676 A91-38874	Saberliner flight test for airborne wind shear forward	Composites for a widebody p 612 A91-39852
CERAMIC MATRIX COMPOSITES	looking detection and avoidance radar systems	Moulded Mustang p 612 A91-39854
Oxidation resistant carbon/carbon materials	p 637 N91-24149	Design and construction of a composite airframe for
[REPT-911-430-105] p 672 N91-23251	Clutter modeling of the Denver Airport and surrounding areas p 638 N91-24152	UAV research [AD-A232422] p 653 N91-23143
How to know CMC [REPT-911-430-130] p 672 N91-23262	areas p 638 N91-24152  Radar simulation program upgrade and algorithm	[AD-A232422] p 653 N91-23143 Integration of propulsive systems: Selection and
[REPT-911-430-130] p 672 N91-23262 CERAMICS	development p 638 N91-24153	compromise
Fabrication of engineering ceramics by injection	Signal processing techniques for clutter filtering and wind	[REPT-911-111-101] p 661 N91-23187
molding p 674 A91-37375	shear detection p 638 N91-24154	Observatory of new materials. Evolution perspectives
Improved silicon carbide for advanced heat engines	Description, characteristics and testing of the NASA	for the materials used in civil transportation aircraft
[NASA-CR-182289] p 672 N91-24451	airborne radar p 638 N91-24156 COCKPITS	[REPT-911-111-107] p 672 N91-23248  The role of analysis in the design and qualification of
CERTIFICATION  The certification of the aircraft integrated propulsive	Kansas Aviation Review	composite aircraft structures p 684 N91-24648
system	[NIAR-91-3] p 613 N91-24087	COMPOSITE STRUCTURES
[REPT-911-111-102] p 661 N91-23188	COHERENT RADAR	Spot welded thermoplastic composite access door
Kansas Aviation Review	Radar simulation program upgrade and algorithm development p 638 N91-24153	[SME PAPER EM90-489] p 645 A91-36942
[NIAR-91-3] p 613 N91-24087	development p 638 N91-24153  Description, characteristics and testing of the NASA	Analytical studies on static aeroelastic behavior of forward-swept composite wing structures
Analytical certification of aircraft structures  p 684 N91-24641	airborne radar p 638 N91-24156	p 674 A91-37774
Beechcraft starship strength certification	COLLISION AVOIDANCE	Designing with composites - A study of design
p 684 N91-24643	Air traffic control today and tomorrow	process p 646 A91-38752
The role of structural analysis in airworthiness	p 642 A91-38215 Airborne Collision Avoidance System (ACAS) in	Flexural waves induced by electro-impulse deicing forces p 676 A91-38776
certification p 684 N91-24647 Probability approach for strength calculations	controlled air traffic. Aspects of reciprocal influence in	A new technique and application for nonlinear acoustic
p 685 N91-24652	Secondary Surveillance Radar (SSR) radio loads	fatigue of stiffened composite panels
AGARD flight test techniques series. Volume 9: Aircraft	[ETN-91-99253] p 644 N91-23105	p 687 A91-38863
exterior noise measurement and analysis techniques	COMBAT Toward onbanced Eabter combat effectiveness	Design and construction of a composite airframe for
[AGARD-AG-300-VOL-9] p 689 N91-24843	Toward enhanced fighter combat effectiveness p 645 A91-37050	UAV research [AD-A232422] p 653 N91-23143
CHANNEL FLOW  Mixing of multiple jets with a confined subsonic	One-on-one helicopter combat simulated by chess-type	Bonded/fusion repair of aircraft structures
crossflow. Summary of NASA-supported experiments and	lookahead p 668 A91-37775	p 613 N91-24160
modeling	COMBUSTIBLE FLOW	Mechanical paint removal techniques for composite
[NASA-TM-104412] p 662 N91-24202	Subsonic and supersonic combustion using noncircular	aircraft p 613 N91-24163 Soft hub for bearingless rotors
CIRCULAR CYLINDERS  Rotary oscillation control of a cylinder wake	injectors p 674 A91-37414	[NASA-CR-177586] p 654 N91-24198
p 620 A91-39708	COMBUSTION Aerodynamics and stabilization of combustion of	The role of analysis in the design and qualification of
Secondary frequencies in the wake of a circular cylinder	hydrogen jets injected into subsonic airflow	composite aircraft structures p 684 N91-24648
with vortex shedding p 620 A91-39736	p 629 N91-23164	COMPRESSED GAS
CIRCULATION Simulation of the flow past an impulsively started cylinder	Fuel-rich, catalytic reaction experimental results	An isentropic compression-heated Ludweig tube transient wind tunnel p 673 A91-36450
using a discrete vortex method	[NASA-TM-104423] p 662 N91-24203	COMPRESSIBILITY EFFECTS
[AD-A233066] p 683 N91-24533	COMBUSTION CHAMBERS	An efficient hybrid scheme for the solution of rotational
CIRCULATION CONTROL AIRFOILS	Design and development of aviation gas turbine engines Russian book p 657 A91-39201	flow around advanced propellers p 629 N91-24104
Aerodynamic calculation of tandem wings in supersonic flow by means of SLLT p 614 A91-36724	Design techniques for dual mode ram-scramjet	On the instability of hypersonic flow past a wedge
flow by means of SLLT p 614 A91-36724  Dynamic stall of an oscillating circulation control airfoil	combustors p 659 N91-23166	p 621 A91-39922
p 617 A91-38677	Analytical and experimental investigations of the oblique	COMPRESSIBLE FLOW
CIVIL AVIATION	detonation wave engine concept p 660 N91-23169	Structure of the compressible turbulent shear layer
The English summer of 1990 - Further progress towards	A CFD study of jet mixing in reduced flow areas for	p 616 A91-37830 Block multigrid implicit solution of the Euler equations
deregulation of the aviation and travel industry p 690 A91-37801	lower combustor emissions [NASA-TM-104411] p 661 N91-23185	of compressible fluid flow p 616 A91-37836
Air travel - System relating flight safety, aircraft, and	The effects of controlling vortex formation on the	Unsteady wave structure near separation in a Mach 5
airports p 634 A91-38527	performance of a dump combustor p 672 N91-23270	compression ramp interaction p 616 A91-37838
Aeronautical research in the United States - Challenges	Mixing of multiple jets with a confined subsonic	Theoretical study of Goertler vortices - Linear stability approach p 623 A91-39950
for the 1990's p 612 A91-38580 Euler analysis of a High-Speed Civil Transport concept	crossflow. Summary of NASA-supported experiments and	approach p 623 A91-39950 Second mode interactions in supersonic boundary
at Mach 3 p 624 A91-40217	modeling [NASA-TM-104412] p 662 N91-24202	layers p 623 A91-39957
Engine technology challenges for a 21st century high	An experimental evaluation of combustor liner materials	Procedure for determination of three-dimensional wind
speed civil transport	for solid fuel ramjet testing p 670 N91-24289	tunnel wall interferences and wall adaptation in
[NASA-TM-104363] p 636 N91-23098	COMBUSTION EFFICIENCY	compressible subsonic flow using measured wall pressures
Do civil flying qualities requirements address military missions for off-the-shelf procurement	A CFD study of jet mixing in reduced flow areas for	[DLR-FB-90-46] p 628 N91-23088
p 650 N91-23115	lower combustor emissions	Block implicit multigrid solution of the Euler equations
An investigation into the use of side-arm control for civil	[NASA-TM-104411] p 661 N91-23185	p 680 N91-23413
rotorcraft applications p 667 N91-23123	Fuel-rich, catalytic reaction experimental results [NASA-TM-104423] p 662 N91-24203	Euler flow predictions for an oscillating cascade using
Integration of propulsive systems: Selection and	An experimental evaluation of combustor liner materials	a high resolution wave-split scheme [NASA-TM-104377] p 630 N91-24107
compromise [REPT-911-111-101] p 661 N91-23187	for solid fuel ramjet testing p 670 N91-24289	COMPRESSOR BLADES
Observatory of new materials. Evolution perspectives	COMBUSTION PHYSICS	Residual stress control in developing processes for the
for the materials used in civil transportation aircraft	Kinetic study of a homogeneous propellant primary	manufacture of compressor blades for gas turbine
[REPT-911-111-107] p 672 N91-23248	flame, with and without additive p 671 A91-39690	engines p 674 A91-37269

### F

Unified Stability System (USS). Description and users' manual p 634 N91-24139

NASA-CR-1819181 F-16 AIRCRAFT

Demonstration of a Laser Ordnance Initiation System in an F-16 sled --- for flight crew escape system p 646 A91-39377

**FABRICATION** 

Fabrication of engineering ceramics by injection planting p 674 A91-37375

**FACTORIZATION** 

Implicit solvers for unstructured meshes

p 633 N91-24125 FAILURE ANALYSIS

Sensor failure detection for jet engines

p 656 A91-37593 Nonlinear analysis of composite shear webs with holes p 684 N91-24642 and correlation with tests Influence of the refinement of structural calculation on p 684 N91-24649 aircraft qualification procedures

**FALSE ALARMS** 

Track initiation using MHT in dense environments Multiple Hypotesis Tracking p 674 A91-37141 Saberliner flight test for airborne wind shear forward looking detection and avoidance radar systems p 637 N91-24149

FATIGUE (MATERIALS)

Application of cyclic damage accumulation life prediction model to high temperature components

p 681 N91-24309 Notched fatigue of single crystal PWA 1480 at turbine p 682 N91-24310 attachment temperatures **FATIGUE LIFE** 

Modeling of creep-fatigue interaction effects on crack p 670 A91-38802 p 612 A91-39852 growth Composites for a widebody Calculation and experimental study on sonic fatigue life of aircraft structural panels Analytical methods for the qualification of helicopte p 684 N91-24650

**FATIGUE TESTS** 

Computerized system for static and fatigue large scale structural tests: A case study

[IAITIC-87-1007] p 681 N91-23522

**FAULT TOLERANCE** 

The electrical flight control system of A320 Airbus: A fault tolerant system REPT-911-111-1031 p 667 N91-23192

FEEDBACK CONTROL

Automatic aircraft paint stripping p 611 A91-36895 [SME PAPER MS90-280]

FIBER COMPOSITES

Supersonic flutter analysis of clamped symmetric composite panels using shear deformable finite p 675 A91-37847 elements Modal analysis for fibre-carbon composite parts of an p 679 A91-40157 airplana Integrated multidisciplinary optimization of actively p 667 N91-23190 controlled fiber composite wings

FIGHTER AIRCRAFT

Toward enhanced fighter combat effectiveness

p 645 A91-37050 Northrop advanced fighter crew protection system. I Engineering development. II - System development, test p 647 A91-39395 and evaluation A study on sonic load of the vertical tail of F-7 aircraft

p 648 A91-40171 Development of MIL-8785C into a handling qualities specification for a new European fighter aircraft

p 666 N91-23114 The flying qualities influence of delay in the fighter pilot's p 650 N91-23120 cuing environment Agility: A rational development of fundamental metrics and their relationship to flying qualities

p 651 N91-23129 p 651 N91-23131 X-31A at first flight structural/flight-control system Buffet induced interaction of the X-29A aircraft

p 652 N91-23133 [NASA-TM-101735] Calculation of high angle of attack aerodynamics of fighter configurations. Volume 1: Steady

p 631 N91-24113 [AD-A233482] Calculation of high angle of attack aerodynamics of fighter configurations. Volume 2: User manual for VORSTAB-2

p 631 N91-24114 [AD-A233483]

Calculation of high angle of attack aerodynamics of fighter configurations. Volume 3: Unsteady

p 631 N91-24115 [AD-A233569]

FINANCIAL MANAGEMENT Aviation system capital investment plan

[PB91-150268] p 644 N91-24189

FINITE DIFFERENCE THEORY

Calculation of low Reynolds number flows at high angles p 624 A91-40218 of attack

FINITE ELEMENT METHOD

Three-dimensional finite element method analysis of turbulent flow over self-propelled slender bodies p 615 A91-37419

Sensitivity analysis, optimization, and data support in p 677 A91-39230 finite element systems Modal analysis of multistage gear systems coupled with

searbox vibrations [NASA-TM-103797] p 681 N91-23513

FINITE VOLUME METHOD

Cell contered and cell vertex multigrid schemes for the avier-Stokes equations p 674 A91-37834 Navier-Stokes equations Transonic analysis and design using an improved grid p 624 A91-40137

FINNED BODIES

Inception length to a fully developed, fin-generated, shock-wave, boundary-layer interaction p 617 A91-37842

FIRE PREVENTION

Fire detection system for aircraft cargo bays p 655 A91-36755

Aircraft Command in Emergency Situations (ACES). Phase 1: Concept development

IDOT/FAA/CT-90/211 p 636 N91-23097

FIRES

Aircraft Command in Emergency Situations (ACES). Phase 1: Concept development [DOT/FAA/CT-90/21] p 636 N91-23097

FLAME PROPAGATION

Subsonic and supersonic combustion using noncircular injectors D 674 A91-37414

**FLAME TEMPERATURE** 

Kinetic study of a homogeneous propellant primary p 671 A91-39690 flame, with and without additive A CFD study of jet mixing in reduced flow areas for lower combustor emissions [NASA-TM-104411] p 661 N91-23185

FLAMES

Aerodynamics and stabilization of combustion of hydrogen jets injected into subsonic airflow

p 629 N91-23164

FLAPS (CONTROL SURFACES)

A comparison between computation and experiment for flows around airfoil with slat and flap

p 616 A91-37780 Blunt-nosed swept supercritical LFC wings without nos p 622 A91-39936

FLAT PLATES

Cross-flow instability of 3-D boundary layers on a flat p 622 A91-39931 Visual study of boundary layer transition on rotating flat p 623 A91-39941 The experimental investigation of stability and receptivity

of a swept-wing flow p 623 A91-39944 The effect of isolated roughness elements on transition p 678 A91-39959 in attachment-line flows Breaking down the delta wing vortex: The role of vorticity

in the breakdown process [NASA-CR-188235]

p 630 N91-24109 An experimental analysis of critical factors involved in the breakdown process of leading edge vortex flows [NASA-CR-188231] p 631 N91-24110 FLEXIBILITY

Microwave landing system modeling with application to ir traffic control

[NASA-TM-102832] p 636 N91-23099

**FLEXIBLE BODIES** 

The transient dynamic performances of a rotor-SFDB

system during passage through resonance p 678 A91-40130

**FLEXIBLE WINGS** 

Analysis of circular elastic membrane wings p 625 A91-40472

FLEXING

Flexural waves induced by electro-impulse deicing p 676 A91-38776 Flexure vibration test method of aviation tube

p 648 A91-40172 FLIGHT ALTITUDE

The influence of altitude and speed variations over the aircraft flight control response during the longitudinal

onlinear manoeuvres p 664 A91-36722 European studies to investigate the feasibility of using nonlinear manoeuvres 1000 ft vertical separation minima above FL 290. I

p 642 A91-38217

A test of the American Safety Flight Systems, Inc. prebreather/portable oxygen system p 636 N91-23100

AD-A2327231 FLIGHT CHARACTERISTICS

Improvement of atmospheric flight performance of a space vehicle through sensitivity minimization

p 664 A91-37779

Flying Qualities [AGARD-CP-508] p 649 N91-23108 The art of flying qualities testing p 649 N91-23109 ADFCS and NOTAR (trademark): Two ways to fix flying p 650 N91-23110

MIL-STD-1797 is not a cookbook p 650 N91-23111 Flying qualities experience on the AMX aircraft

p 650 N91-23112 The development of alternate criteria for FBW handling p 666 N91-23113 qualities Development of MIL-8785C into a handling qualities specification for a new European fighter aircraft

p 666 N91-23114 Do civil flying qualities requirements address military missions for off-the-shelf procurement

p 650 N91-23115 Handling qualities of highly augmented unstable aircraft summary of an AGARD-FMP working group effort

p 666 N91-23116 The handling qualities of the STOL and maneuver technology demonstrator from specification to flight test p 666 N91-23117

Metrics for roll response flying qualities

p 650 N91-23118 The flying qualities influence of delay in the fighter pilot's cuing environment p 650 N91-23120

An initial study into the influence of control stick characteristics on the handling qualities of a fly-by-wire heticopter p 651 N91-23122

Flying qualities of the X-29 forward swept wing aircraft p 651 N91-23127

Agility: A rational development of fundamental metrics and their relationship to flying qualities

p 651 N91-23129 Evaluation techniques for highly augmented aircraft IDLR-FB-90-351 p 667 N91-23191

FLIGHT CONDITIONS Effects of canard position on the aerodynamic characteristics of a close-coupled canard configuration at p 649 A91-40495

low speed Theoretical and experimental performance of a solid fuel ramjet combustion cycle for hypersonic flight conditions p 660 N91-23170

FLIGHT CONTROL

The influence of altitude and speed variations over the aircraft flight control response during the longitudinal nonlinear manoeuvres p 664 A91-36722 nonlinear manoeuvres A new method for estimating airspeed, attack angle and

ideslip angle p 664 A91-37051 Practical considerations in optimal and 4-dimensional flight management computations p 686 A91-37585 Decoupled flight control via a model-following technique sing the Euler operator p 664 A91-37595 using the Euler operator

Re-entry flight control of space plane using approximate perfect servo p 664 A91-37778 Lateral-direction tracking requirements from simulation p 686 A91-39436

Testing the tiltrotor flight control system p 666 A91-40202

Flying Qualities [AGARD-CP-508] p 649 N91-23108 p 649 N91-23109 The art of flying qualities testing p 649 N91-23109 ADFCS and NOTAR (trademark): Two ways to fix flying p 650 N91-23110 p 650 N91-23111

MIL-STD-1797 is not a cookbook p 650 N91-23111 Development of MIL-8785C into a handling qualities specification for a new European fighter aircraft p 666 N91-23114

Handling qualities of highly augmented unstable aircraft summary of an AGARD-FMP working group effort p 666 N91-23116

The flying qualities influence of delay in the fighter pilot's p 650 N91-23120 cuing environment Determination of decision-height windows for

decelerating IMC approaches in helicopters p 667 N91-23124

Flying qualities of the X-29 forward swept wing aircraft p 651 N91-23127

Handling qualities evaluation for highly augmented elicopters p 651 N91-23128

## Typical Personal Author Index Listing

Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title. Under any one author's name the accession numbers are arranged in sequence

ABARBANEL, SAUL S. vith vortex shedding ACKVA, JOHANNES ADAMCZYK, JOHN J. ADAMSON, PAT ADELMAN, HENRY G. AHMED, S.

Secondary frequencies in the wake of a circular cylinder p 620 A91-39736

Preference for an inertial degree of freedom describing the teeter motion of windturbine and helicopter rotors p 679 A91-40239

Average-passage flow model development p 682 N91-24338

Status of turbulence Prediction System's AWAS 3 p 637 N91-24146

Analytical and experimental investigations of the oblique detonation wave engine concept p 660 N91-23169

High subsonic flow about a moving spoiler identifying a novel problem of wind tunnel interle

p 619 A91-38710

AIBA, TOSHIKI Track initiation using MHT in dense environments p 674 A91-37141

# **Typical Corporate Source** index Listing

Listings in this index are arranged alphabetically by corporate source. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

#### Typical Foreign Technology Index Listing

Listings in this index are arranged alphabetically by country of intellectual origin. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the citation in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

Discontinuous solutions for a three-dimensional hypersonic boundary layer with interaction p 614 A91-37176 Entropy effects of hypersonic flow past blunt delta wings p 615 A91-37181
Detection of traces of water in aviation kerosenes by gas chromatography p 670 A91-37182 Characteristics of the reception by the antenna systems

of a descending aircraft of signals from radio-beacon landing systems p 642 A91-37200 Residual stress control in developing processes for the manufacture of compressor blades for gas turbine engines p 674 A91-37269 Evaluation of the phase distortions of the input signal of a synthetic-aperture radar p 677 A91-39144
Functional-adaptive data processing in airborne radio

p 643 A91-39187 navigation and landing systems Design and development of aviation gas turbine ngines p 657 A91-39201 

nite element systems p 677 A91-39230
Boundary layer control by a local heating of the wall p 678 A91-39909 The experimental investigation of stability and receptivity of a swept-wing flow p 623 A91-39944

Receptivity and stability of the boundary layer at a high urbulence level p 678 A91-39945 turbulence level UNITED KINGDOM Accent on hypersonic p 669 A91-36625

The introduction of off-line programming techniques for the robotic assembly of aircraft structures [SME PAPER MS90-276] p 6 p 611 A91-36898 FOREIGN TECHNOLOGY INDEX

UNITED KINGDOM

US industry enters the green maze	
p 685 A91-3704	19
Fabrication of engineering ceramics by injection	n
molding p 674 A91-373	
The English summer of 1990 - Further progress toward	İs
deregulation of the aviation and travel industry	
p 690 A91-3780	1
Air traffic control today and tomorrow	
p 642 A91-382	15
High subsonic flow about a moving spoiler identifying	
a novel problem of wind tunnel interference	.8
p 619 A91-387	10
Fighter escape system - The next step forward p 646 A91-3938	22
F	2
Advanced airborne oxygen sensors	
p 655 A91-393	
The control of rotor vibration using squeeze-fit	
dampers p 677 A91-3959	
The breakdown of the linearized theory and the role	of
quadrupole sources in transonic rotor acoustics	
p 688 A91-397	49
Composites for a widebody p 612 A91-398	52
Moulded Mustang p 612 A91-398	54
Aerodynamics at the speed of sound	
p 621 A91-399	00
On the instability of hypersonic flow past a wedge	
p 621 A91-399	22
F	at
The effect of isolated roughness elements on transition attachment-line flows p. 678 A91-399	
In actaonine in the incident	9
Visualisation of boundary layer transition	
p 623 A91-399	
Balancing of rotating machinery p 679 A91-402	
The performance of 60 deg delta wings: The effect	is
of leading edge radius on vortex flaps and the wing	
[CRANFIELD-AERO-9004] p 628 N91-230	
The development of alternate criteria for FBW handling	ng
qualities p 666 N91-231	
Handling qualities guidelines for the design of fly-by-wi	re
flight control systems for transport aircraft	
p 667 N91-231	19
A review of high angle of attack requirements for comb	at
aircraft p 651 N91-231	30
The performance of 60 deg delta wings: The effect	
of leading edge radius and vortex flaps	
[CRANFIELD-AERO-9002] p 653 N91-231	ΔN
Some aspects of shock-wave boundary layer interacti	
	A
Eight and protection of the control	^
proposed specification	
[RAE-TM-FS(F)-632-ISSUE-1-R] p 641 N91-241	
The role of structural analysis in airworthine	
certification p 684 N91-246	47
Surface activation of Concorde by Be-7

# Typical Contract Number Index Listing

Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under the contract are shown. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

# Typical Report Number Index Listing

Listings in this index are arranged alphanumerically by report number. The page number indicates the page on which the citation is located. The accession number denotes the number by which the citation is identified. An asterisk (\*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

### Typical Accession Number **Index Listing**

Listings in this index are arranged alphanumerically by accession number. The page number listed to the right indicates the page on which the citation is located. An asterisk (\*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

# AVAILABILITY OF CITED PUBLICATIONS

### IAA ENTRIES (A91-10000 Series)

Publications announced in *IAA* are available from the AIAA Technical Information Service as follows: Paper copies of accessions are available at \$10.00 per document (up to 50 pages), additional pages \$0.25 each. Standing order microfiche are available at the rate of \$1.45 per microfiche for *IAA* source documents and \$1.75 per microfiche for AIAA meeting papers.

Minimum air-mail postage to foreign countries is \$2.50. All foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to: Technical Information Service, American Institute of Aeronautics and Astronautics, 555 West 57th Street, New York, NY 10019. Please refer to the accession number when requesting publications.

## STAR ENTRIES (N91-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the STAR citation. Current values for the price codes are given in the tables on NTIS PRICE SCHEDULES.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, VA 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the \* symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report number* shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

- Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)
- Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.
- Avail: ESDU. Pricing information on specific data, computer programs, and details on Engineering Sciences Data Unit (ESDU) topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address, both of which are on the page titled ADDRESSES OF ORGANIZATIONS.
- Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).
- Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, CA. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.
- Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, DC 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.
- Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.
- Avail: US Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of \$1.50 each, postage free.
- Avail: (US Sales Only). These foreign documents are available to users within the United States from the National Technical Information Service (NTIS). They are available to users outside the United States through the International Nuclear Information Service (INIS) representative in their country, or by applying directly to the issuing organization.
- Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.
- Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

# FEDERAL DEPOSITORY LIBRARY PROGRAM

In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 52 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. At least one copy of nearly every NASA and NASA-sponsored publication, either in printed or microfiche format, is received and retained by the 52 regional depositories. A list of the regional GPO libraries, arranged alphabetically by state, appears on the inside back cover. These libraries are *not* sales outlets. A local library can contact a Regional Depository to help locate specific reports, or direct contact may be made by an individual.

# **PUBLIC COLLECTION OF NASA DOCUMENTS**

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and \* from ESA — Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 CEDEX 15, France.

### STANDING ORDER SUBSCRIPTIONS

NASA SP-7037 supplements and annual index are available from the National Technical Information Service (NTIS) on standing order subscription as PB91-914100, at price code A04. Current values for the price codes are listed on page APP-5. Standing order subscriptions do not terminate at the end of a year, as do regular subscriptions, but continue indefinitely unless specifically terminated by the subscriber.
