SUMMARY

A method for using system identification techniques to improve airframe finite element models using test data has been developed and demonstrated. The method uses linear sensitivity matrices to relate changes in selected physical parameters to changes in the total system matrices. The values for these physical parameters were determined using constrained optimization with singular value decomposition. The method was confirmed using both simple and complex finite element models for which pseudo-experimental data was synthesized directly from the finite element model. The method was then applied to a real airframe model which incorporated all of the complexities and details of a large finite element model and for which extensive test data was available. The method was shown to work, and the differences between the identified model and the measured results were considered satisfactory.

TABLE OF CONTENTS

NOMENCLATURE

$\mathbf{c}$: coefficient matrix
$\mathbf{C}$: damping matrix
$\mathbf{C_A}$: damping matrix for analytical model
$\mathbf{c_i}$: grouped element damping matrix
$\mathbf{f(\lambda)}$: lambda matrix
$\mathbf{K}$: stiffness matrix
$\mathbf{K_A}$: stiffness matrix for analytical model
$\mathbf{k_i}$: grouped element stiffness matrix
$\mathbf{M}$: mass matrix
$\mathbf{M_A}$: mass matrix for analytical model
$\mathbf{m_i}$: grouped element mass matrix
$\mathbf{q(t)}$: displacements at the n degrees of freedom
$\mathbf{Q(t)}$: n independent forces applied at each DOF
$\mathbf{U}$: $\mathbf{Z_1\Lambda}$
$\mathbf{U_I}$: imaginary component of $\mathbf{U}$
$\mathbf{U_R}$: real component of $\mathbf{U}$
$\mathbf{V}$: $\mathbf{Z_2\Lambda}$
$\mathbf{V_I}$: imaginary component of $\mathbf{V}$
$\mathbf{V_R}$: real component of $\mathbf{V}$
$\mathbf{W}$: $\mathbf{Z_2}$
$\mathbf{W_I}$: imaginary component of $\mathbf{W}$
$\mathbf{W_R}$: real component of $\mathbf{W}$
$\mathbf{y(t)}$: redefined displacement vector
$\mathbf{Y(t)}$: redefined applied force vector
$\mathbf{Y_1}$: $-(d\mathbf{U_R}^T\mathbf{M_A}+d\mathbf{V_R}^T\mathbf{C_A}+d\mathbf{W_R}^T\mathbf{K_A})$
$\mathbf{Y_2}$: $-(d\mathbf{U_I}^T\mathbf{M_A}+d\mathbf{V_I}^T\mathbf{C_A}+d\mathbf{W_I}^T\mathbf{K_A})$
$\mathbf{Z_1,Z_2}$: special modal matrices defined in this paper
α : eigenvalue
α_i : adjustable physical mass quantities
β_i : adjustable physical damping quantities
γ_i : adjustable physical stiffness quantities
δ : real component of the complex eigenvalue
λ : eigenvalue
φ : modal matrix
Ω : imaginary component of the complex eigenvalue
$\varphi^{(r)}$: rth modal column
Ψ : n x 2n rectangular modal matrix
η : modal coordinates matrix
Φ : modal matrix
d( ) : differences between experimental data and analytical data

INTRODUCTION

Background

The vast bulk of the work reported to date on identification of structural dynamic systems has focused on identifying mathematical models that reproduce test results, but little consideration has been given to the physical basis for the identified system equations. Typically, the identification procedures make systematic adjustments to the system equation, commonly to the stiffness and/or mass matrices but also to the damping matrix, so that the identified eigenvalues and eigenvectors reproduce as closely as possible the results measured in tests. The result of this process is almost inevitably identified mass, stiffness and damping matrices that are fully populated, that is, which have nonzero values for almost all elements. Such matrices, while capable of producing plausible eigenvalues and eigenvectors, can nonetheless be physically implausible in the sense that the large numbers of nonzero elements throughout the system matrices implies direct connectivity among the degrees of freedom that does not exist physically.

Identified mathematical models that are based on physically implausible system matrices may be quite acceptable if the objective of the study is to develop a *simulation* model. However, such results for analysis purposes are generally unsatisfactory because it is difficult or impossible to relate specific features of the physical system to the analysis results. This problem is particularly troublesome when the objective of the identification of a system model from experimental measurements is an accurate system model that, in turn, will be used to make modifications to or improvements in the original physical system. Such an example might be the modification of an existing aircraft structure to accommodate a new mission. In this case it would be desirable to formulate a structural model for the present structure, verify its accuracy against experimental measurements, and then use it as the basis for the modifications. When the verification process yields identified system matrices that are mathematically acceptable but physically implausible, the resulting model may be useless as the basis for future structural modifications.

The objective of the present work was to develop a method for identifying physically plausible finite element system models of airframe structures from test data. The assumed models were based on linear elastic behavior with general (nonproportional) damping. Physical plausibility of the identified system matrices was insured by restricting the identification process to designated physical parameters only and not simply to the elements of the system matrices themselves. For example, in a large finite element model the identified parameters might be restricted to the moduli for each of the different materials used in the structure. In the case of damping, a restricted set of damping values might be assigned to finite elements based on the material type and on the fabrication processes used. In this case, different damping values might be associated with riveted, bolted and bonded elements.

The method itself is developed first, and several approaches are outlined for computing the identified parameter values. The method is applied first to a simple structure for which the "measured" response is actually synthesized from an assumed model. Both stiffness and damping parameter values are accurately identified. The true test, however, is the application to a full-scale airframe structure. In this case, a NASTRAN model and actual measured modal parameters formed the basis for the identification of a restricted set of physically plausible stiffness and damping parameters.

Review of Previous Pertinent Work

Airframes are generally modelled using powerful finite element analysis packages such as *NASTRAN* that are capable of representing quite detailed aspects of the structural system. The accuracy of such models is determined by comparing the analytical results with flight or ground vibration test results. In the case of helicopter airframes, several recent efforts have focused on the correlation of *NASTRAN* model data with ground vibration test data[1-3]. The conclusions reached in these studies suggest that in cases where there is some degree of correlation, the model frequencies compare favorably with test frequencies, but generally only in the low frequency range

below about 15 Hz [1-2]. The frequency response functions at selected locations also compare reasonably well in this range. Outside this range the comparisons are generally unsatisfactory, and the eigenvectors do not usually compare favorably in either range.

Although there have been numerous contributions to the literature in the area of the identification of structural dynamic systems[4-25], the majority of reported methods are based on simply adjusting the elements of one or more of the **K**, **M**, and **C** matrices. While this approach is capable of yielding a system matrix whose eigenvalues and eigenvectors suitably match measured results, the methods generally lose all physical interpretability inherent in the original **K**, **M** and **C** matrices by not maintaining relationships among elements dictated by the model topology. These difficulties are compounded for large-scale models with thousands of degrees of freedom.

Kuo and Wada[25] used nonlinear sensitivity coefficients (NSC) in the identification procedure. Their sensitivity coefficients are between the system parameters and eigenvalues. In the present work the interest is in the change of system matrices as a function of physical variables of the structure. A different type of sensitivity coefficient between system matrices and physical variables has therefore been developed.

The most significant achievement in the present work[30] is to preserve the physical interpretability of the **M**, **C**, **K** matrices so that the identification can provide evidence of possible sources of erroneous modeling and point to specific regions of the model that are unduly sensitive and need additional consideration in modeling. The identification procedure developed in this paper is capable of adjusting physical quantities such as boundary conditions, moments of inertia, stiffnesses, damping or other selected physical parameters.

Mathematical Model

Basic Equations

Any linearly elastic structural system with n discrete degrees of freedom and with general viscous damping (either proportional or nonproportional) can be represented by n coupled ordinary differential equations that can be written in the following form[27]:

$$\mathbf{M}\ddot{\mathbf{q}}(t)+\mathbf{C}\dot{\mathbf{q}}(t)+\mathbf{K}\mathbf{q}(t)=\mathbf{Q}(t) \tag{1}$$

where **M**, **C**, and **K** are symmetric n x n inertia, damping, and stiffness matrices, respectively. In this formulation, $\mathbf{q}(t)$ are the displacements at the n degrees of freedom and $\mathbf{Q}(t)$ are the n independent forces applied at each degree of freedom.

In the case of undamped or proportionally damped systems, there are n complex conjugate pairs of eigenvalues and n distinct modes which are orthogonal with respect to **M** and **K**. Using a transformation matrix of the form:

$$\mathbf{q}(t)=\Psi\eta(t)$$

will allow decomposition of the original system equations (Eq. 1) into n decoupled equations that are straightforward to solve.

This transformation cannot be applied to the general nonproportionally damped problem in the same manner because for this case there are 2n complex modes, $\varphi^{(r)}$, and consequently 2n modal coordinates, $\eta_r(t)$, but there are only n physical coordinates, $q_i(t)$.

One can overcome this difficulty by writing Eq. (1) as a set of 2n ordinary differential equations in the form:

$$\begin{bmatrix} \mathbf{0} & \mathbf{M} \\ \mathbf{M} & \mathbf{C} \end{bmatrix}\begin{Bmatrix} \ddot{\mathbf{q}}(t) \\ \dot{\mathbf{q}}(t) \end{Bmatrix}+\begin{bmatrix} -\mathbf{M} & \mathbf{0} \\ \mathbf{0} & \mathbf{K} \end{bmatrix}\begin{Bmatrix} \dot{\mathbf{q}}(t) \\ \mathbf{q}(t) \end{Bmatrix}=\begin{Bmatrix} \mathbf{0} \\ \mathbf{Q}(t) \end{Bmatrix}. \tag{2}$$

If one then defines: $\mathbf{y}(t)=\begin{Bmatrix} \dot{\mathbf{q}}(t) \\ \mathbf{q}(t) \end{Bmatrix}$ and $\mathbf{Y}(t)=\begin{Bmatrix} \mathbf{0} \\ \mathbf{Q}(t) \end{Bmatrix}$, the above equations can be written as a set of 2n first order ordinary differential equations:

$$\begin{bmatrix} 0 & M \\ M & C \end{bmatrix}\dot{y}(t)+\begin{bmatrix} -M & 0 \\ 0 & K \end{bmatrix}y(t)=Y(t). \tag{3}$$

This formulation has the advantage that the modes obtained from the solution of the homogeneous equations, obtained by letting $Y(t)=0$ in Eqs. (3), are orthogonal, and hence can be used in conjunction with the expansion theorem to obtain the solution of the nonhomogeneous problem. The solution of the homogeneous equations is obtained by assuming as before a solution in the form:

$$y(t)=\Phi e^{\alpha t} \tag{4}$$

where Φ represents the spatial component of the solution and is a vector consisting of 2n constant elements. The corresponding eigenvalue problem can be written as:

$$\alpha\begin{bmatrix} 0 & M \\ M & C \end{bmatrix}\Phi+\begin{bmatrix} -M & 0 \\ 0 & K \end{bmatrix}\Phi=\begin{Bmatrix} 0 \\ 0 \end{Bmatrix} \tag{5}$$

The solution of the eigenvalue problem yields 2n eigenvalues, α_r, and 2n eigenvectors

$$\Phi_r^T=\begin{Bmatrix} \alpha_r\phi_r^T \\ \phi_r^T \end{Bmatrix}, \quad r=1,2,...2n. \tag{6}$$

Equations (5) and (6) provide the solution to Eq. (1), but in order to simplify the computational work, it is convenient to formally separate these complex equations into real and imaginary pairs. Following the approach introduced by Cheng[10], the real and imaginary components of the eigenvalues and eigenvectors are defined, respectively, as:

$$\begin{aligned} \lambda_r&=\delta_r+j\Omega_r \\ \Phi_r&=\Phi_{R_r}+j\Phi_{I_r} \end{aligned} \tag{7}$$

and in addition the following modal matrices are defined:

$$\begin{aligned} Z_1 &= (\mathrm{Re}(\alpha_1\phi_1), \mathrm{Im}(\alpha_1\phi_1), \mathrm{Re}(\alpha_2\phi_2), \mathrm{Im}(\alpha_2\phi_2), .. \\ &\quad \mathrm{Re}(\alpha_n\phi_n), \mathrm{Im}(\alpha_n\phi_n)) \\ Z_2 &= (\mathrm{Re}(\phi_1), \mathrm{Im}(\phi_1), \mathrm{Re}(\phi_2), \mathrm{Im}(\phi_2), ... \\ &\quad \mathrm{Re}(\phi_n), \mathrm{Im}(\phi_n)) \end{aligned} \tag{8}$$

Then the new system equation, Eq. (5), can now be rewritten with purely real terms in the form:

$$\Lambda\begin{bmatrix} 0 & M \\ M & C \end{bmatrix}\begin{Bmatrix} Z_1 \\ Z_2 \end{Bmatrix}+\begin{bmatrix} -M & 0 \\ 0 & K \end{bmatrix}\begin{Bmatrix} Z_1 \\ Z_2 \end{Bmatrix}=\begin{Bmatrix} 0 \\ 0 \end{Bmatrix} \tag{9}$$

where the eigenvector matrix, Λ, is a block diagonal matrix with blocks

$$\Lambda_r=\begin{bmatrix} \delta_r & \Omega_r \\ -\Omega_r & \delta_r \end{bmatrix} \tag{10}$$

along the diagonal and zeros elsewhere. Equation (9) can be further simplified by the introduction of U, V, and W as follows:

$$MU+CV+KW=0 \tag{11}$$

where $U = Z_1\Lambda$, $V = Z_2\Lambda$ and $W = Z_2$ or explicitly:

$$\begin{aligned} U &= (\mathrm{Re}(\alpha_1^2\phi_1), \mathrm{Im}(\alpha_1^2\phi_1), \mathrm{Re}(\alpha_2^2\phi_2), \mathrm{Im}(\alpha_2^2\phi_2), \\ &\quad ... \mathrm{Re}(\alpha_n^2\phi_n), \mathrm{Im}(\alpha_n^2\phi_n)) \\ V &= (\mathrm{Re}(\alpha_1\phi_1), \mathrm{Im}(\alpha_1\phi_1), \mathrm{Re}(\alpha_2\phi_2), \mathrm{Im}(\alpha_2\phi_2), ... \end{aligned}$$

$$\mathbf{W} = (\mathrm{Re}(\alpha_1\phi_1), \mathrm{Im}(\alpha_1\phi_1), \mathrm{Re}(\alpha_2\phi_2), \mathrm{Im}(\alpha_2\phi_2), \ldots \mathrm{Re}(\alpha_n\phi_n), \mathrm{Im}(\alpha_n\phi_n)) \quad (12)$$

Finally, Eq. (11) can be separated into explicit real and imaginary equations in the form of the following two equations.

$$\mathbf{M}\mathbf{U}_R+\mathbf{C}\mathbf{V}_R+\mathbf{K}\mathbf{W}_R=\mathbf{0} \quad (13)$$

$$\mathbf{M}\mathbf{U}_I+\mathbf{C}\mathbf{V}_I+\mathbf{K}\mathbf{W}_I=\mathbf{0} \quad (14)$$

These equations are same as Eqs. (5), but they do not include complex variables. For the identification procedure, it is much easier to use these equations than to use Eqs. (5) directly.

Identification Procedure

To begin, suppose that the mass, damping and stiffness matrices for the initial analytical model are given by $\mathbf{M}_A$ $\mathbf{C}_A$ and $\mathbf{K}_A$, respectively, and the identified mass, damping and stiffness matrices are given by **M**, **C** and **K**. In a similar manner, the eigenvectors and eigenvalues for the analytical model are given by $\mathbf{U}_A$, $\mathbf{V}_A$ and $\mathbf{W}_A$, while $\mathbf{U}_E$, $\mathbf{V}_E$ and $\mathbf{W}_E$ are the eigenvectors and eigenvalues determined from test data. From these definitions it follows that the relationship between the identified model (based on the test data) and the analytical model can be written as:

$$\mathbf{M}=\mathbf{M}_A+d\mathbf{M}, \quad \mathbf{C}=\mathbf{C}_A+d\mathbf{C}, \quad \mathbf{K}=\mathbf{K}_A+d\mathbf{K} \quad (15)$$

$$\mathbf{U}_E=\mathbf{U}_A+d\mathbf{U}, \quad \mathbf{V}_E=\mathbf{V}_A+d\mathbf{V}, \quad \mathbf{W}_E=\mathbf{W}_A+d\mathbf{W} \quad (16)$$

where d**M**, d**C**, d**K**, d**U**, d**V** and d**W** are the changes. The identified model satisfies equations (13) and (14), so substituting equations (15) and (16) into equation (13) and (14), yields:

$$d\mathbf{U}_R^T\mathbf{M}_A+d\mathbf{V}_R^T\mathbf{C}_A+d\mathbf{W}_R^T\mathbf{K}_A= -(\mathbf{U}_{ER}^T,\mathbf{V}_{ER}^T,\mathbf{W}_{ER}^T)(d\mathbf{M},d\mathbf{C},d\mathbf{K})^T \quad (17)$$

$$d\mathbf{U}_I^T\mathbf{M}_A+d\mathbf{V}_I^T\mathbf{C}_A+d\mathbf{W}_I^T\mathbf{K}_A= -(\mathbf{U}_{EI}^T,\mathbf{V}_{EI}^T,\mathbf{W}_{EI}^T)(d\mathbf{M},d\mathbf{C},d\mathbf{K})^T \quad (18)$$

These equations can be combined into the following form:

$$\begin{bmatrix} \mathbf{U}_{ER}^T & \mathbf{V}_{ER}^T & \mathbf{W}_{ER}^T \\ \mathbf{U}_{EI}^T & \mathbf{V}_{EI}^T & \mathbf{W}_{EI}^T \end{bmatrix} \begin{Bmatrix} d\mathbf{M} \\ d\mathbf{C} \\ d\mathbf{K} \end{Bmatrix} = \begin{Bmatrix} \mathbf{Y}_1 \\ \mathbf{Y}_2 \end{Bmatrix}, \quad (19)$$

where

$$\mathbf{Y}_1=-(d\mathbf{U}_R^T\mathbf{M}_A+d\mathbf{V}_R^T\mathbf{C}_A+d\mathbf{W}_R^T\mathbf{K}_A)$$
$$\mathbf{Y}_2=-(d\mathbf{U}_I^T\mathbf{M}_A+d\mathbf{V}_I^T\mathbf{C}_A+d\mathbf{W}_I^T\mathbf{K}_A). \quad (20)$$

The right side of these equations is known, since $\mathbf{M}_A$, $\mathbf{C}_A$, and $\mathbf{K}_A$ are given by the analytical model and $d\mathbf{U}_R^T$, $d\mathbf{V}_R^T$, $d\mathbf{W}_R^T$, $d\mathbf{U}_I^T$, $d\mathbf{V}_I^T$, and $d\mathbf{W}_I^T$, which are the differences of the eigenvalues and eigenvectors between the analytical model and the experimental data, are known. Finally, the matrix

$$\begin{bmatrix} \mathbf{U}_{ER}^T & \mathbf{V}_{ER}^T & \mathbf{W}_{ER}^T \\ \mathbf{U}_{EI}^T & \mathbf{V}_{EI}^T & \mathbf{W}_{EI}^T \end{bmatrix}$$

contains only experiment data.

The solution to these equations are the changes of d**M**, d**C** and d**K**. Because of matrix symmetry, the number of unknowns in Eq. (19) is 3 $n(n+1)/2$. The number of equations depends on the number of known experimental modes. Suppose this number is m, then the number of

equations are m x n. If the number of the equations is larger than or equal to the number of unknowns and the rank of this matrix is equal to 3 $n(n+1)/2$, normal least square methods can be used to solve these equations. Otherwise, singular value decomposition, or constrained optimization can be used to solve Eq. (19) for the changes dM, dC and dK, and these results can then be substituted into Eq. (15) to determine the identified **M**, **C** and **K** matrices. It should be noted that this approach is capable of handling nonproportional damping and underdetermined problems in which fewer modes are measured than are computed from the analytical model.

At this stage the usual identification procedure can be performed. The values of **M**, **C** and **K** can be put into the system equation, Eq. (1), and the experimental data can then be reproduced. However the identified **M**, **C** and **K** cannot be related to particular physical quantities in the actual airframe, because the changes occur throughout the entire **M**, **C** and **K** matrices . In order to preserve the physical interpretability of the identified system, it is necessary to develop a relationship between dM, dC and dK and adjustable physical quantities such as boundary conditions, moments of inertia, stiffnesses or other selected physical parameters. To this end, assume that each of the system matrices can be decomposed into the form:

$$\mathbf{M}=\sum_{i=1}^{N_m}\mathbf{m}_i\alpha_i, \quad \mathbf{C}=\sum_{i=1}^{N_c}\mathbf{c}_i\beta_i, \text{ and } \mathbf{K}=\sum_{i=1}^{N_k}\mathbf{k}_i\gamma_i \tag{21}$$

where α_i, β_i and γ_i are adjustable physical quantities and $\mathbf{m}_i$, $\mathbf{c}_i$ and $\mathbf{k}_i$ are grouped element matrices with common physical quantities.

For example, in the finite element model of actual airframe, there is an ej-th element , (see Fig. 1). The portion of the stiffness matrix that describes bending in the xz plane of an element, assumed to be a principal plane (Fig. 2), in NASTRAN, is given by

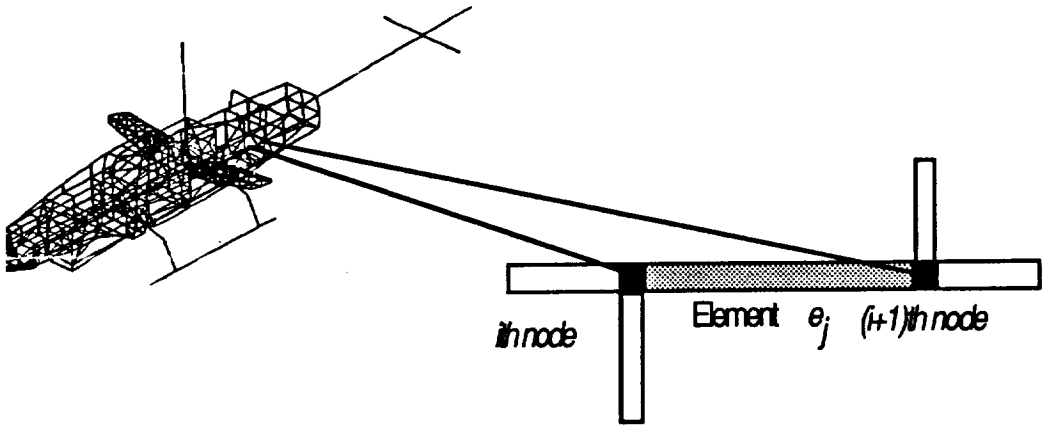

Fig. 1 Typical Bar Element, e_j, in Airframe Model

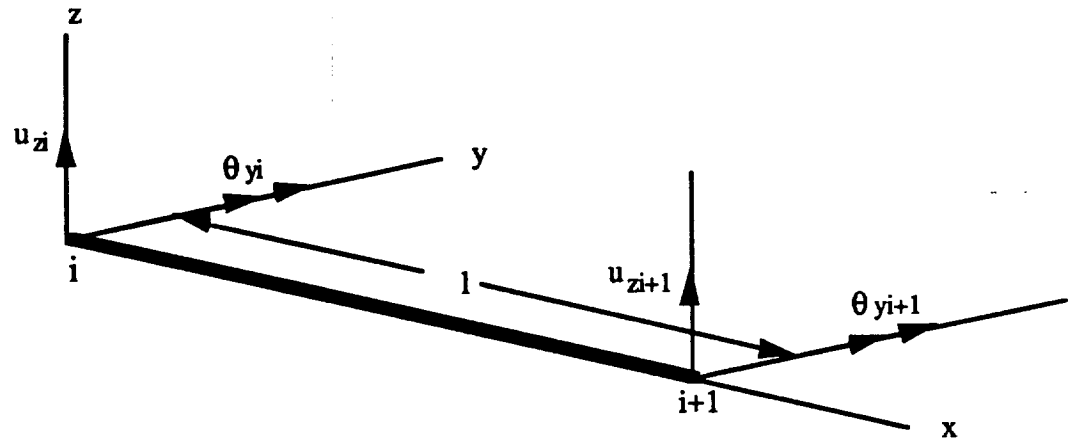

Fig. 2. Degrees of Freedom for Bending in the xz Plane

$$\begin{Bmatrix} F_{zi} \\ M_{zi} \\ F_{zi+1} \\ M_{zi+1} \end{Bmatrix} = \begin{bmatrix} R & -\frac{l}{2}R & -R & -\frac{l}{2}R \\ & \frac{l^2}{4}R+\frac{EI_y}{l} & \frac{l}{2}R & \frac{l^2}{2}R-\frac{EI_y}{l} \\ & \text{sym} & R & \frac{l}{2}R \\ & & & \frac{l^2}{4}R+\frac{EI_y}{l} \end{bmatrix} \begin{Bmatrix} u_{zi} \\ \theta_{zi} \\ u_{zi+1} \\ \theta_{zi+1} \end{Bmatrix}$$

where $R = \left(\frac{l}{k_z AG}+\frac{l^3}{12EI_y}\right)^{-1}$. If the modulus of elasticity, E, is taken here as an adjustable physical quantity, γ_k, then

$$K_{ej} = \begin{bmatrix} R & -\frac{l}{2}R & -R & -\frac{l}{2}R \\ & \frac{l^2}{4}R+\frac{EI_y}{l} & \frac{l}{2}R & \frac{l^2}{2}R-\frac{EI_y}{l} \\ & & R & \frac{l}{2}R \\ \text{sym} & & & \frac{l^2}{4}R+\frac{EI_y}{l} \end{bmatrix}$$

$$= \begin{bmatrix} r & -\frac{l}{2^r} & -r & -\frac{l}{2^r} \\ & \frac{l^2}{4^r}+\frac{I_y}{l} & \frac{l}{2^r} & \frac{l^2}{2^r}-\frac{I_y}{l} \\ & & r & \frac{l}{2^r} \\ \text{sym} & & & \frac{l^2}{4^r}+\frac{I_y}{l} \end{bmatrix} \gamma_k = k_{ej}\gamma_k \qquad (23)$$

where $\gamma_k = E$ and $r = \left(\frac{2(1+\nu)l}{k_z A} + \frac{l^3}{12 I_y}\right)^{-1}$. Suppose there are n elements which have the same E so that it is possible to express the stiffness as:

$$\mathbf{k}_k = \sum_{e_j=1}^{n} \mathbf{k}_{ej}$$

When the modulus changes from E to E+dE, the corresponding change in γ_k is to $\gamma_k + d\gamma_k$. Considering all different γ_k, **K** changes from **K** to **K**+d**K** where

$$d\mathbf{K} = \sum_{k=1}^{N_k} \mathbf{k}_k d\gamma_k$$

Similar procedures can be generalized to include the damping, other stiffness parameters, and mass.

$$d\mathbf{M} = \sum_{i=1}^{N_m} \frac{\partial \mathbf{M}}{\partial \alpha_i} d\alpha_i = \sum_{i=1}^{N_m} \mathbf{m}_i d\alpha_i$$

$$d\mathbf{C} = \sum_{i=1}^{N_c} \frac{\partial \mathbf{C}}{\partial \beta_i} d\beta_i = \sum_{i=1}^{N_c} \mathbf{c}_i d\beta_i \tag{24}$$

$$d\mathbf{K} = \sum_{i=1}^{N_k} \frac{\partial \mathbf{K}}{\partial \gamma_i} d\gamma_i = \sum_{i=1}^{N_k} \mathbf{k}_i d\gamma_i$$

Substituting these into Eq. (19) yields a set of linear algebra equations with unknowns $d\alpha_i$, $d\beta_i$ and $d\gamma_i$:

$$\begin{bmatrix} \mathbf{U}_R^T \frac{\partial \mathbf{M}}{\partial \alpha_1} \cdots \mathbf{V}_R^T \frac{\partial \mathbf{C}}{\partial \beta_1} \cdots \mathbf{W}_R^T \frac{\partial \mathbf{K}}{\partial \gamma_1} \cdots \\ \mathbf{U}_I^T \frac{\partial \mathbf{M}}{\partial \alpha_1} \cdots \mathbf{V}_I^T \frac{\partial \mathbf{C}}{\partial \beta_1} \cdots \mathbf{W}_I^T \frac{\partial \mathbf{K}}{\partial \gamma_1} \cdots \end{bmatrix} \begin{Bmatrix} d\alpha_1 \\ \vdots \\ d\alpha_{N_m} \\ d\beta_1 \\ \vdots \\ d\beta_{N_c} \\ d\gamma_1 \\ \vdots \\ d\gamma_{N_k} \end{Bmatrix} = \begin{Bmatrix} \mathbf{Y}_1 \\ \mathbf{Y}_2 \end{Bmatrix} \tag{25}$$

The number of unknowns in this equation is much less than the number of unknowns in Eq. (19), and also all the unknowns in this equation have physical meaning in the real structure.

However, neither Eq. (19) or Eq. (25) can be solved directly since the numbers of unknowns and equations are not equal in most of the cases. There exists a number of techniques for dealing with sets of equations that are under or over-determined or with matrices that are either singular or else poorly conditioned. The singular value decomposition, or SVD method[26], is one of the most

powerful ways to handle these problems. In the present study it was employed to compute solutions to Eq's. (19) and (25) which are highly under-determined for most practical situations. In this case the SVD method provides a least square type of solution to the problem.

In most cases, the selected physical parameters must also be restricted to positive values in order to make sense physically. However, the identification procedure outlined above cannot guarantee that the identified values will all be positive. This is of particular concern when the parameters are proportional to mass, an elastic modulus or a damping coefficient, all of which must be positive for the systems typically considered. Using a constrained optimization method, this problem can be eliminated. The present problem can be posed as one of minimizing

$$f=d\alpha_1+d\alpha_2+\cdots+d\alpha_{N_m}+d\beta_1+..+d\beta_{N_c}+d\gamma_1+..+d\gamma_{N_k} \tag{26}$$

subject to the constraints

$$\begin{bmatrix} \mathbf{U}_R^T\frac{\partial \mathbf{M}}{\partial \alpha_1}\cdots \mathbf{V}_R^T\frac{\partial \mathbf{C}}{\partial \beta_1}\cdots \mathbf{W}_R^T\frac{\partial \mathbf{K}}{\partial \gamma_1}\cdots \\ \mathbf{U}_I^T\frac{\partial \mathbf{M}}{\partial \alpha_1}\cdots \mathbf{V}_I^T\frac{\partial \mathbf{C}}{\partial \beta_1}\cdots \mathbf{W}_I^T\frac{\partial \mathbf{K}}{\partial \gamma_1}\cdots \end{bmatrix} \begin{Bmatrix} d\alpha_1 \\ \cdot \\ \cdot \\ \cdot \\ d\alpha_{N_m} \\ d\beta_1 \\ \cdot \\ \cdot \\ \cdot \\ d\beta_{N_c} \\ d\gamma_1 \\ \cdot \\ \cdot \\ \cdot \\ d\gamma_{N_k} \end{Bmatrix} = \begin{Bmatrix} \mathbf{Y}_1 \\ \mathbf{Y}_2 \end{Bmatrix}$$

and

$$d\alpha_1\geq 0,\ d\alpha_2\geq 0,\ ..d\alpha_{N_m}\geq 0,\ d\beta_1\geq 0,..d\beta_{N_c}\geq 0,\ d\gamma_1\geq 0,\ ..d\gamma_{N_k}\geq 0$$

The feasible solution ($d\alpha_1$, $d\alpha_2$, ..., $d\alpha_{N_m}$, $d\beta_1$, ..., $d\beta_{N_c}$, $d\gamma_1$, ..., $d\gamma_{N_k}$) to this problem yields the identified selected physical parameters.

APPLICATIONS

System Identification Procedures

The method described above was applied to several practical examples. For these cases, the analytical finite element model for the structures was assumed correct and was developed using the NASTRAN finite element analysis package[28]. Then, values for selected physical parameters in the model were identified on the basis of measured experimental data (eigenvalues and eigenvectors) so that the analytical model more accurately represented the real structure. The assumption for this procedure was that the identification process could be applied in an iterative fashion by making successive small modifications to the selected physical parameters until satisfactory agreement with experimental results was obtained. For the i-th iteration, there are the following relationships:

$$M^i = M^{i-1} + dM,\ C^i = C^{i-1} + dC,\ K^i = K^{i-1} + dK$$

$$U^i = U^{i-1} + dU,\ V^i = V^{i-1} + dV,\ W^i = W^{i-1} + dW, \tag{27}$$

Substitute these into equation (25), we can obtain

$$\begin{bmatrix} U_R{}^T\frac{\partial M^{i-1}}{\partial \alpha_1} \cdots V_R{}^T\frac{\partial C^{i-1}}{\partial \beta_1} \cdots W_R{}^T\frac{\partial K^{i-1}}{\partial \gamma_1} \cdots \\ U_I{}^T\frac{\partial M^{i-1}}{\partial \alpha_1} \cdots V_I{}^T\frac{\partial C^{i-1}}{\partial \beta_1} \cdots W_I{}^T\frac{\partial K^{i-1}}{\partial \gamma_1} \cdots \end{bmatrix} \begin{Bmatrix} d\alpha_1{}^i \\ \cdot \\ \cdot \\ \cdot \\ d\alpha_{N_m}{}^i \\ d\beta_1{}^i \\ \cdot \\ \cdot \\ \cdot \\ d\beta_{N_c}{}^i \\ d\gamma_1{}^i \\ \cdot \\ \cdot \\ \cdot \\ d\gamma_{N_k}{}^i \end{Bmatrix} = \begin{Bmatrix} Y_1' \\ Y_2' \end{Bmatrix} \tag{28}$$

where

$$Y_1' = -(dU_R^T M^{i-1} + dV_R^T C^{i-1} + dW_R^T K^{i-1})$$

$$Y_2' = -(dU_I^T M^{i-1} + dV_I^T C^{i-1} + dW_I^T K^{i-1}) \tag{29}$$

The convergence criteria was formulated as follows:

(1) Check the physical parameter differences $d\alpha_1, d\alpha_2, .., d\alpha_{N_m}, d\beta_1, .., d\beta_{N_C}, d\gamma_1, .., d\gamma_{N_k}$ either manually or programmatically. If these physical parameter differences are smaller than a tolerance value, the identified physical parameters are obtained.

(2) Check the differences of the experimental eigenvalues and the i-th iteration analytical results which are obtained after running NASTRAN. If the differences are smaller than a tolerance value, the identified system is obtained.

Simple Numerical Example

In order to verify the proposed approach, the identification procedure developed above was applied first to a very simple finite element model with only a few degrees of freedom. It is a simple variable cross section straight rod with fixed ends, and it contains all the desired parameters

to be identified such as mass, stiffness and damping. It was modeled using 9 rod elements with lumped masses at each node as shown in Fig. 3, and representative values were assumed for all elements and mass properties. For the purpose of defining the damping, the elements were segregated into 4 groups and a different damping coefficient was specified for each group.

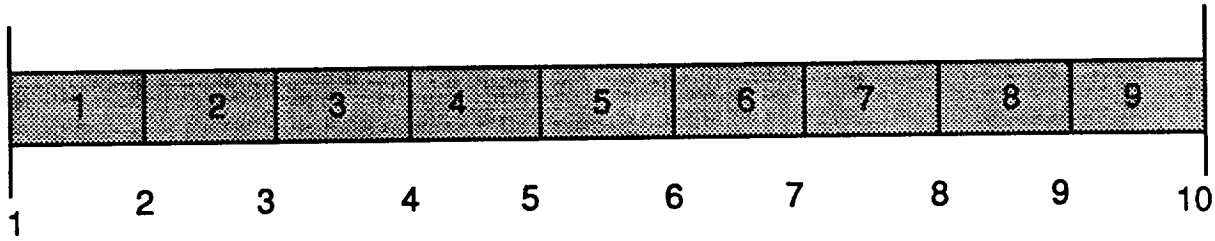

Figure 3. Simple Numerical Example

The assumed physical properties were defined to be typical of an aluminum rod. The length was 228.6 mm (9") and the modulus E =68.9 GPa (10e6 psi). The concentrated masses at each node were those given in Table 1. This model was then employed to generate eigenvalues and eigenvectors which were used to represent "measured" test results. In all the cases presented in this report, the calculations were done in US customary units and the results converted to SI units. As a result, some of the percentage figures may be slightly in error due to numerical roundoff in the conversion of units.

TABLE 1.
ASSUMED PHYSICAL PROPERTIES FOR SIMPLE NUMERICAL EXAMPLE

Index	Mass at Node (kg)	Element Stiffness (MN/m)	Element Damping Coefficient (kN s/m)
1	21.89	367.7	28.34
2	22.76	369.5	28.34
3	23.64	371.3	28.34
4	24.51	373.0	27.58
5	25.39	374.8	27.58
6	26.26	376.5	27.14
7	27.14	378.3	27.14
8	28.01	380.0	26.27
9	28.89	381.8	26.27
10	29.76		

The objective of the identification was to determine the physical parameters such as damping constants (c or ζ) and the cross section area for each rod element. There are three different cases to start to consider with this system. In the first case, the mass and the stiffness matrices were assumed to be accurate, and four damping parameters were identified assuming zero as initial analytical values of the damping matrix. The identified damping parameters are listed in Table 2 .

TABLE 2.
CASE I: IDENTIFYING THE DAMPING PARAMETERS

Damping Parameter	Exact Value	Initial Value	Identified Value	Error (%)
c_1	28.34	0.	28.3420	-0.0029
c_2	28.34	0.	28.3420	-0.0029
c_3	28.34	0.	28.3420	-0.0029
c_4	27.58	0.	27.5805	-0.0022
c_5	27.58	0.	27.5805	-0.0022
c_6	27.14	0.	27.1431	-0.0006
c_7	27.14	0.	27.1431	-0.0006
c_8	26.27	0.	26.2676	-0.0005
c_9	26.27	0.	26.2676	-0.0005

The second case was to identify the stiffness parameters assuming accurate values of mass and damping parameters which were the same for all elements k_i = 376.5 MN/m. The identified stiffness parameters are listed below.

TABLE 3.
CASE II: IDENTIFYING STIFFNESS PARAMETERS

Stiffness Parameter	Exact (MN/m)	Initial (MN/m)	Identified (MN/m)	Error (%)
k_1	367.7	376.5	367.7	0.0000
k_2	369.5	376.5	369.5	-0.0005
k_3	371.3	376.5	371.3	0.0000
k_4	373.0	376.5	373.0	0.0000
k_5	374.8	376.5	374.8	0.0000
k_6	376.5	376.5	376.5	0.0000
k_7	378.3	376.5	378.3	0.0000
k_8	380.0	376.5	380.0	0.0000
k_9	381.8	376.5	381.8	0.0000

In the third case, both the damping and the stiffness parameters were identified under the assumption of accurate mass value alone. The elements of the initial damping matrix were assumed to be zero, and the stiffness parameters were assumed to be the same for all elements (k_i= 376.5 MN/m). The identified damping and stiffness parameters are listed in Tables 4 and 5.

TABLE 4.
CASE III(A): DAMPING PARAMETERS

Damping Parameter	Exact	Initial	Identified	Error (%)
c_1	28.34	0.	28.34	0.0000
c_2	28.34	0.	28.34	0.0000
c_3	28.34	0.	28.34	0.0000
c_4	27.58	0.	27.5812	0.0004
c_5	27.58	0.	27.5812	0.0004
c_6	27.14	0.	27.1437	0.0015
c_7	27.14	0.	27.1437	0.0015
c_8	26.27	0.	26.2679	0.0008
c_9	26.27	0.	26.2679	0.0008

TABLE 5.
CASE III(B): STIFFNESS PARAMETERS

Stiffness Parameter	Exact (MN/m	Initial (MN/m)	Identified (MN/m)	Error (%)
k_1	367.7	376.5	367.700	0.0000
k_2	369.5	376.5	369.492	-0.0019
k_3	371.3	376.5	371.285	0.0094
k_4	373.0	376.5	373.044	0.0112
k_5	374.8	376.5	374.763	0.0028
k_6	376.5	376.5	376.521	0.0047
k_7	378.3	376.5	378.290	0.0093
k_8	380.0	376.5	379.964	-0.0111
k_9	381.8	376.5	381.908	0.0394

All the results were obtained after only one iteration. For these simple cases the method accurately identified the selected physical parameter values (damping and cross section areas).

Application to AH-1G Model

A NASTRAN finite element model (FEM) for the AH-1G helicopter airframe has existed for a long time and was originally developed by Bell Helicopter Textron Inc. It is basically composed of two parts, one is stiffness modeling for idealizing the structures and the other is weight modeling for distributing weights to grid points. There are 4405 different elements with a total of 2764 degrees of freedom in the basic full model. A reduced model, based on Guyan reduction, contains only a total of 63 physical degrees of freedom.

Normally, the input and output data files from NASTRAN dynamic analyses are specially formatted and are quite large for a large finite element model such as the full AH-1G model. For convenience and accuracy, the present system identification programs were designed to automatically read NASTRAN output files and create NASTRAN input data deck files. At each step in the iterative identification procedure, the new modified physical parameters were put into the NASTRAN model bulk data in order to generate the required analytical results, such as eigenvalues, eigenvectors and other parameters, for the next iteration.

The mass, stiffness and damping matrices defined with respect to the internal degrees of freedom are not normal NASTRAN output data. However, such results can be developed by

using appropriate Direct Matrix Abstraction Programming (DMAP) utilities so that the identification program can automatically get this NASTRAN output data (see Appendix B).

Results Using Simulated Test Data

The NASTRAN model of an AH-1G airframe includes 4405 different elements with a total of 2764 degrees of freedom. In order to make sure that the identification procedure was appropriate to a such big model, the use simulation has been chosen to begin with. For this identification, the mass and stiffness properties of the analytical model were considered to be accurate, and nonproportional damping properties were identified. The physical damping parameters were associated with 8 distinctly different types of materials and structural fabrication techniques used in the airframe (e.g., aluminum, steel, riveted, welded, bolted, etc.) and one of these damping values was associated with each of the model elements using Eq. (11).

For this case, the test data were synthesized from the original NASTRAN model assuming small values for the extension and rotation viscous damping coefficients (kN-s/m and N-s/rad units):

TABLE 6. ASSUMED INITIAL PHYSICAL DAMPING VALUES

Extension	Rotation
$C_1 = 5.253$	$C_5 = 93.4$
$C_2 = 8.756$	$C_6 = 155.7$
$C_3 = 1.751$	$C_7 = 31.14$
$C_4 = 1.226$	$C_8 = 21.80$

The synthesized data included 24 modes of which 6 were rigid body modes, and the frequency range was from 0.0 to 30.2 Hz. The dimension of the mass, stiffness and damping matrices was 2764 x 2764. The initial values of the physical damping parameters for the analytical NASTRAN model were taken to be zero, and the results for the identified values are shown below:

TABLE 7. IDENTIFIED PHYSICAL DAMPING PARAMETERS

Parameter	Initial	Identified
C_1	5.253	5.429
C_2	8.756	10.490
C_3	1.751	1.746
C_4	1.226	6.069
C_5	93.4	55.91
C_6	155.7	160.35
C_7	31.14	65.96
C_8	21.80	55.91

The error in the identified damping parameters as a function of the number of matrix elements for each of the 8 damping types is shown in Fig. 4. The error for those element types with more than 100 elements present is quite low, but it is much larger for those types with only a few elements present in the complete finite element model. The largest error was associated with what appeared to be elastomeric materials.

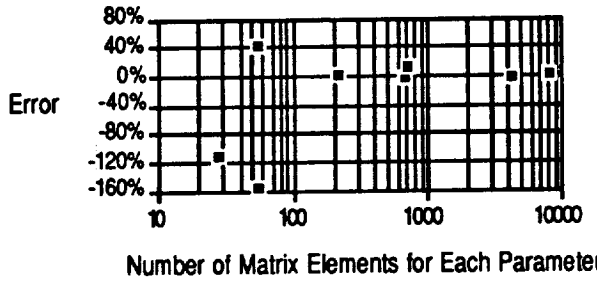

Fig. 4. Error in Damping Estimate as a Function of Number of Matrix Elements in Model

This simulation confirms the identification procedure for a complicated but yet well-defined example. If the assumptions such as nonproportional damping are correct for the airframe and if the experimental data are of high quality, the physical damping parameters can be identified from the test data.

Actual AH-1G Data

Actual test data for an AH-1G airframe were provided by Bell Helicopter Textron Inc. based on ground vibration tests and included both resonance dwell and FRF (frequency response function) data. The experimental data were available for 8 different configurations of the AH-1G that were tested. The principal difference between the tests concerned the degree of complexity of the actual airframe tested. At one extreme, the bare airframe without most attachments was tested while at the other extreme the complete airframe with all attached mechanical components was tested. The test data from the most complex airframe configuration (with all difficult components present) showed the poorest agreement with the corresponding analytical model, while the data from the simplest test airframe showed the best agreement.

For this study, the test data from the most complex airframe configuration was used. Only the FRF data were employed, and the complex eigenvalues and eigenvectors for some 7 triaxial modes were obtained from the FRF data by using the TDAS® curvefitting program[29]. The experimental data were provided as FRF's in TDAS universal file format, and the results generated by TDAS were complex eigenvalues and eigenvectors.

Before use in the identification program, the eigenvectors were normalized. Two options were used to normalize both experimental and analytical eigenvectors. One was to normalize the eigenvectors to the same point, and the other was to normalize based on the minimum deviation between the analytical and experimental eigenvectors.

The full finite element model for AH-1G airframe, as mentioned in the previous section, has a total of 2764 degrees of freedom which is very large for the identification procedure. In order to keep the problem tractable, a Guyan reduction was used in the present application to reduce the analytical model to a total of 63 degrees of freedom, which corresponded to the 23 distinct locations on the airframe at which experimental measurement were made. The error due to the reduction in degrees of freedom from 2764 to 63 is shown in Table 8.

® TDAS (Test Data Analysis) is a part of I-DEAS which is a computer-aided engineering product of Structural Dynamical Research Corporation (SDRC).

TABLE 8.
EIGENVALUES (FREQUENCY) (WITHOUT ANY DAMPING)

Test	Full Model	Error (%)	Reduced Model	Error (%)
7.2475	7.6734	5.877	7.6932	6.150
8.0458	8.3467	3.740	8.4026	4.435
15.9539	14.6722	-8.034	15.825	-0.810
17.2174	17.3701	0.887	17.784	3.294
23.7396	20.7955	-12.392	22.881	-3.606
24.6675	25.7955	4.573	28.238	14.475
32.6848	31.7526	-2.852	33.786	3.369

Initially, both the full and the reduced models were used as analytical models. Using the actual experimental data, the physical parameters in the analytical models were obtained using the iterative procedure outlined earlier. The initial results for both the full model and the reduced model included several negative identified damping parameters which were obtained using the singular value decomposition method when either zero or positive initial guess values were assumed for the analytical model. Physically of course, the damping parameters should be greater than zero, but mathematically, the identification procedure is oblivious to this constraint. The constrained optimization procedure outlined earlier was therefore used in order to overcome this problem. In addition, the reduced model was used in most of the identification cases, expect when otherwise stated, because of the small error and big savings in computational time.

The complete system identification was carried out in two steps. The first step was to identify the stiffness, and for this process the initial damping values were assumed to be zero. The second step was to use the stiffness values obtained from the first step to identify the damping values. This was done under the assumption that the greatest change in natural frequency can be obtained by changing the stiffness parameter, while changes in the damping parameters will only fine-tune the eigenvalues but will obtain accurate modal damping estimates for the structure.

At the first step, four stiffness parameters associated with elastic moduli for four principal materials used in the airframe were selected to be identified. After two iterations, the differences between the identified and the initial moduli and the analytical and experimental eigenvalues were those shown in the following tables:

TABLE 9.
IDENTIFIED MODULUS VALUES

	Initial (GPa)	After first iteration (GPa)	Change from initial value (%)	After second iteration (GPa)	Change from initial value(%)
mat.-1	22.1	21.7	-1.81	3.937	23.03
mat.-2	72.4	72.5	0.19	9.417	-10.41
mat.-3	200.0	190.5	-4.75	28.435	-1.95
mat.-4	120.7	112.2	-7.01	19.396	10.83

TABLE 10.
IDENTIFIED EIGENVALUES (FREQUENCY)

Test	Original	Error (%)	After first iteration	Error (%)	After second iteration	Error (%)
7.247	7.693	6.15	7.686	6.05	7.426	2.47
8.046	8.403	4.43	8.394	4.33	8.064	0.22
15.95	15.82	-0.81	15.795	-0.99	15.302	-4.09
17.22	17.78	3.29	17.762	3.16	17.180	-0.22
23.74	22.88	-3.61	22.899	-3.53	21.819	-8.08
24.67	28.24	14.5	28.195	14.3	27.544	11.6
32.68	33.79	3.37	33.805	3.43	32.481	-0.62

As the second step, the damping parameters were identified for the previously identified stiffness conditions. Initial estimates for the damping parameters were developed by assuming a nominal damping ratio, ζ=5%. For the extensional elements, it was therefore assumed that the initial viscous damping values would be c_E=17.5 for all extensional viscous damping, and that for the rotational elements (assuming the cross section area to be a circle) it would be c_R=222 for all rotational damping.

After one iteration, the results shown in Table 11 were obtained.

TABLE 11.
FINAL RESULTS FOR AH-1G MODEL

Mode	Test		NASTRAN (original)	NASTRAN (final)	
	ω_n (Hz)	ζ (%)	ω_n (Hz)	ω_n (Hz)	ζ (%)

Third Lat Bending	32.685	1.95	33.74	32.498	0.97

CONCLUSIONS AND RECOMMENDATIONS

A structural dynamic system identification procedure that is capable of identifying physical parameter changes has been developed. The changes in physical parameters of the system can therefore be related to observed experimental data. In the examples considered, physical parameters, such as the damping constant of a material that will result in a nonproportionally damped system, the modulus of elasticity of a material, and the dynamic stiffness of a beam element have been identified by using the experimentally obtained frequency response functions, modes and eigenvalues.

Following the validation of the developed procedures by using synthesized data on a small model, the method was applied to a large-scale NASTRAN finite element model of a helicopter airframe. Both synthesized data and observed experimentally identified modal data were used. Again, modulus of elasticity, stiffness and damping constants were the parameters considered for the four representative materials used in the airframe. With the exception of one material that had been used to construct a very small number of components, other material constants were identified reasonably accurately where synthesized data were used. When experimental modal data were used, the modal parameters calculated from the identified model did not yield the experimentally observed modes only in cases where the initial *a priori* finite element model output and the experimental model output differed considerably. When experimental output and the *a priori* model output were reasonably close, the results of the identification were satisfactory.

Even though the method was shown to work and the difference between the identified model and the experimental observations were considered satisfactory in some cases, there are some other cases that need improvement to make the procedure applicable to a structural dynamic design process:

(1) While the numerical processes were improved and refined, no similar improvements in the quality of the test data could be realized. One result of this problem was that it was relatively difficult to match measured eigenvalues and eigenvectors with corresponding analytical values. Quite often, the measured and initial eigenvalues matched closely while the eigenvectors differed considerably, and the identified eigenvectors were not significantly closer in agreement. For this reason it is necessary to consider other experimental data, such as the AH-1G dwell data, which have been acquired by other means.

(2) In cases where selected portions of experimental data and *a priori* analytical data differ significantly while a large amount of experimental and analytical data are close together, it is necessary to minimize first the large errors by using H_∞ type of identification before using the least square analysis with singular value decomposition.

(3) It is important that a larger group of identifiable parameters be considered.

(4) It is necessary that we examine the convergence and accuracy of the complete process.

(5) We have used linear sensitivity coefficients. Accuracy and convergence may require nonlinear sensitivity coefficients.

(6) The real damping in a structural dynamic system may not be linear viscous damping with a nonproportional behavior. It is necessary to include other types of damping mechanisms.

(7) As pointed out by Bell's DAMVIBS conclusions[1], nonlinearity is important in considering selected components of the airframe.

(8) We should also examine the experimental parameter estimation processes used to determine modal parameters used as inputs to the identification process.

The authors gratefully acknowledge the support provided for this work.

APPENDIX A

SYSTEM IDENTIFICATION PROGRAM LISTING

The following pages contain a listing of the current version of the program used to carry out the structural system identification described in this report. The program is written in the CDC version of Fortran 77 and was run on a CDC Cyber 180-990 running under the NOS/VE operating system. The program requires the use of the IMSL Scientific Library (Version 11) in order to carry out the singular value decomposition and the constrained optimization procedures.

The program was used with Version 66C of MSC/NASTRAN which was also run on the same computer system and was used to solve the structural dynamic eigenvalue problems. MSC/NASTRAN was used to run the initial eigenvalue problem and all subsequent iterative solutions. As a result, the program listing also includes the necessary I/O calls needed to operate directly with MSC/NASTRAN input and output data files. The program also requires the experimentally determined eigenvalues and eigenvectors to be present is separate input files for each eigenvalue.

A. Summary of Parameters Used by the Program

Parameter	Dimension	Definition
LAMBDR, LAMBDI	MD	real and imaginary parts of analytical eigenvalues λ_A
LAMBDTR, LAMBDTI	MD	real and imaginary parts of test eigenvalues λ
WAR, WAI	ND×MD	real and imaginary parts of analytical eigenvectors W_A
WTR, WTI	ND×MD	real and imaginary parts of test eigenvectors W
VTR,VTI	ND×MD	real and imaginary parts of V_A
DUR, DUI	ND×MD	real and imaginary parts of $U-U_A$
DVR, DVI	ND×MD	real and imaginary parts of $V-V_A$
DWR, DWI	ND×MD	real and imaginary parts of $W-W_A$
MASS	NV	mass matrix
STIFF	NV	stiffness matrix
DAMP	NV	damping matrix
DC, D^k	NV	$\mathbf{c}_i$ matrix
DK	NV	$\mathbf{k}_i$ matrix
COEFF	NM×ID	coefficient matrix
Y	NM	vector of the right hand side of the equations
WK	ID2	work vector
BETA	ID	damping parameters
GAMMA	ID	stiffness parameters
MODES	22×2	test eigenvector
NTESTk (k=1,2,5)	20×4	test measurement location definitions
NT	7	numbers of test eigenvectors corresponding to the eigenvectors of NASTRAN model
IRTYPE simple	12	vector indicating the type of constraints exclusive of bounds, where IRTYPE(I)=0,1,2,3 indicates .EQ., .LE., .GE., and range constraints respectively
BL,BU general	12	vectors containing the lower and upper limits of the constraints
A	12×12	matrix containing the coefficients of the constraints
C	12	vector containing the coefficients of the objective function

OBJ		value of the objective function
XLB, XUB	12	vectors containing the lower and upper bounds on the variables
XSOL, DSOL	12	vectors containing the primal and the dual solutions
ND		order of the system, default = 63
N		order of the system, (input)
MD		modes used in the identification, default = 25
NMODES		modes used in the identification, (input)
ID		number of physical parameters, default = 12
NUNK		number of unknowns to be identified (input)
NNK		number of stiffness unknowns
NNC		number of damping unknowns
NMR		number of rigid body motion modes
NMT		number of test modes
LP		choice of solving techniques LP=0, singular value decomposition LP=1, constrained optimization

B. Definition of Input and Output Files

File Name	Definition
TEST1, TEST2, TEST5	files containing 3 different test measurement location definitions
GUYAN_DAMP_F06	NASTRAN output data file including analytical mass, stiffness, damping matrices, eigenvalues and eigenvectors
GUYAN_KCOUT	output file including results
GUYAN_ELECDAT	NASTRAN output data file including the grouped element matrices $\mathbf{c}_i$
GUYAN_ELEKDAT	NASTRAN output data file including the grouped element matrices $\mathbf{k}_i$
TEST_EIGENV1, ..., TEST_EIGENV7	files containing the test eigenvectors
TEST_EIGENVAL	file containing the test eigenvalues

C. Program Organization

C
C ---------------------------------------------------------------------
C ---------------------------------------------------------------------
C
C     ------------------------------------------------------------
C     This program is to identify the stiffness or damping parameters
C     by using AHIG NASTRAN finite element models.  The solution can
C     be accomplished using singular value decomposition or constrained
C     optimization.
