THEORETICAL STUDIES OF SOLAR LASERS AND CONVERTERS

By

John H. Heinbockel*

Research for the period consisted of developing and refining the continuous flow laser model program. In addition, a working model for a two pass continuous wave amplifier was developed. The following is a summary of the mathematical development of a two pass amplifier for the n-C₃F₇I iodine laser. The geometry of the amplifier is illustrated in Figure 1. In this figure

P_{in} - power density into the amplifier (watts/cm²),
W - transmission coefficient,
 ϵ - radiation energy from I* (watt-sec),
C - speed of light,
P_{out} - output power density,
R_L - reflection coefficient for mirror,
 $\rho+(Z)$ - photon density for wave motion in positive direction (cm⁻³),
 $\rho-(Z)$ - photon density for wave motion in negative direction (cm⁻³).

The input power density P_{in} is assumed to be known. The photon density satisfies for all values Z

$$\rho+(Z) \rho-(Z) = K_0 \quad (1)$$

*Professor, Department of Mathematical Sciences, Old Dominion University, Norfolk, Virginia 23529.

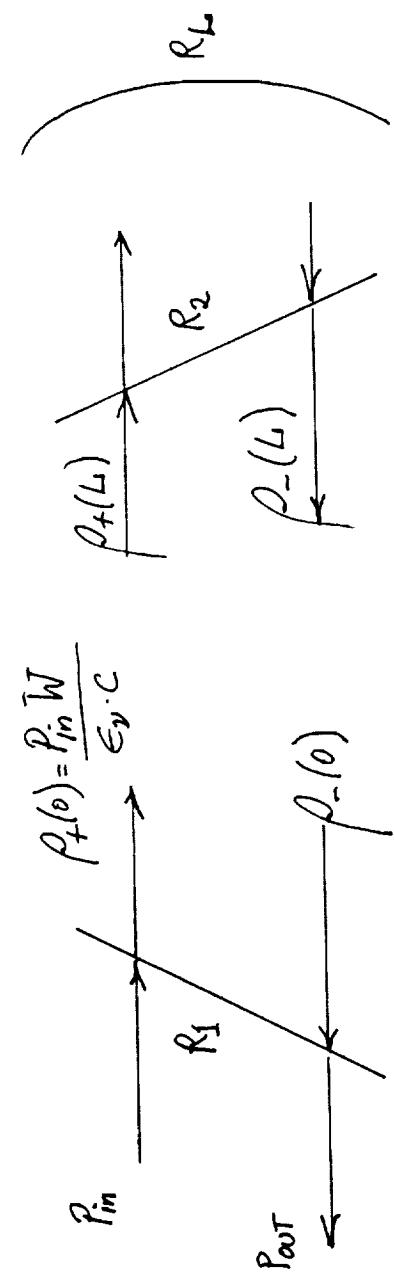

Figure 1. Geometry for Two Pass Amplifier.

where K_0 is a constant. At $Z = 0$ we have

$$\rho+(0)\rho-(0) = K_0 \quad (2)$$

and at $Z = L$ we have

$$\rho+(L)\rho-(L) = K_0. \quad (3)$$

The value of $\rho+(0)$ is determined from the assumed value for the input power density P_{in} and from this we calculate

$$\rho+(0) = \frac{P_{in}W}{\epsilon C} \quad (4)$$

and consequently from the relation (2) we have

$$\rho-(0) = \frac{K_0}{\rho+(0)}.$$

In the above relations W is the transmission coefficient of the Brewster windows and K_0 is an assumed initial value. At $Z = L$ we have $R_2 = W^2 R_L$ as the reflection coefficient from the Brewster window. We then are able to calculate the return photon density from the Brewster window at $Z = L$. We find that this density should have the value

$$\rho_-(L) = R_2 \rho_+(L). \quad (5)$$

Combining the equations (2) (3) and (5) we determine that

$$R_2 \rho_+^2(L) = K_0 \quad \text{or} \quad \rho_+(L) = \sqrt{\frac{K_0}{R_2}} = \sqrt{\frac{\rho_+(0)\rho_-(0)}{R_2}} \quad (6)$$

Using the value (6) as the theoretical value for $\rho_+(L)$ at $Z = L$ we can compare this value with the calculate value for $\rho_+(L)$ obtained from an integration of the differential equations defining the chemical reactions occurring in the amplifier. We adjust the value for $\rho_-(0)$ until

$$\left| \rho_+(L)_{\text{theoretical}} - \rho_+(L)_{\text{calculated}} \right| < E \quad (7)$$

where E is an error criteria.

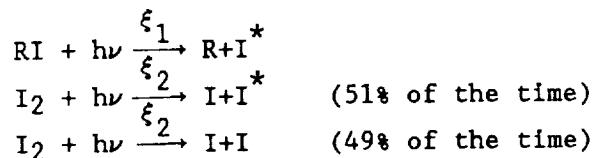

The above procedure is a shooting method for the determination of $\rho_-(0)$. When the error criteria is satisfied, the output power is obtainable from the relation

$$P_{\text{out}} = \rho_-(0) W \epsilon C \quad (8)$$

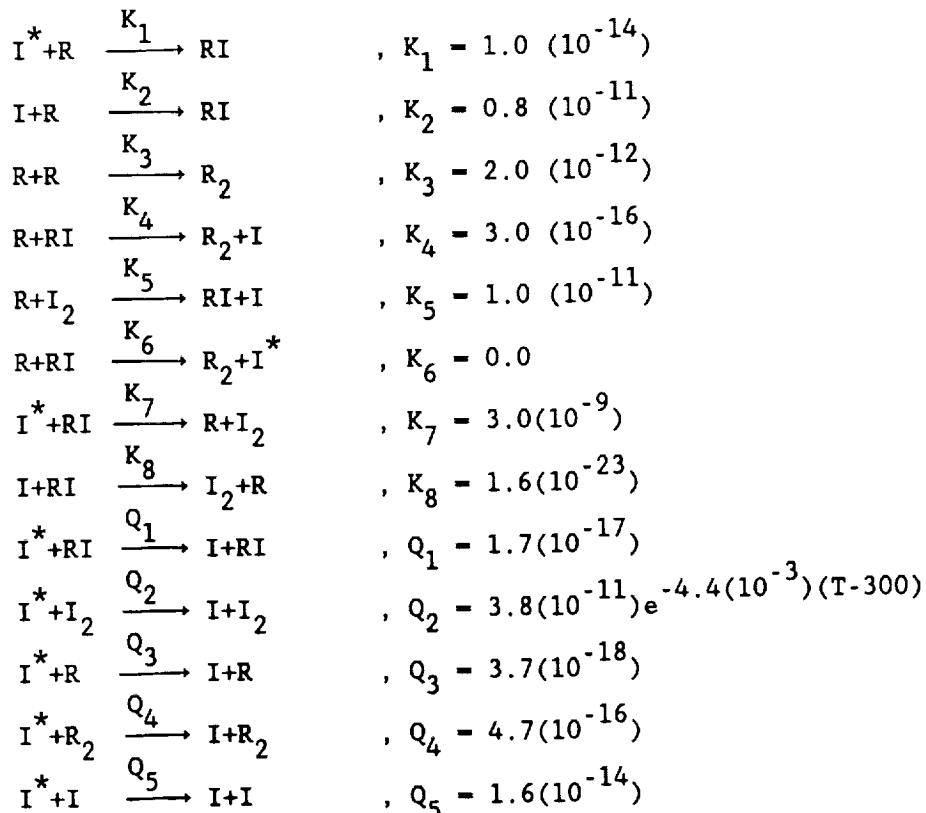

and the gain is calculated from the relation

$$\text{gain} = 10 \log_{10} \left(\frac{P_{\text{out}}}{P_{\text{in}}} \right) \text{ (decibels).} \quad (9)$$

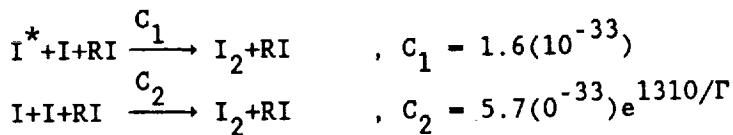

The chemical reactions occurring in the laser tube are listed along with the values used for the rate constant. The assumed reactions are:

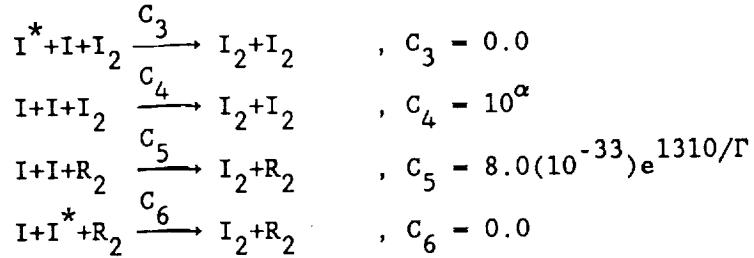

Two Body Reactions

Three Body Reactions

where

$$\alpha = -29.439 - 5.844 \log_{10} \left(\frac{T}{300} \right) - 2.163 \left[\log_{10} \frac{T}{300} \right]^2$$

Let B denote a scale factor and let y_i , $i=1,7$ denote the normalized values of concentration. Define the quantities:

$$\begin{aligned}
 X_1 &= By_1 = [RI] \\
 X_2 &= By_2 = [R] \\
 X_3 &= By_3 = [R_2] \\
 X_4 &= By_4 = [I_2] \\
 X_5 &= By_5 = [I^*] \\
 X_6 &= By_6 = [I] \\
 X_7 &= By_7 = \rho + (Z) \\
 X_8 &= \rho - (Z) = K_0/X_7 \\
 \rho &= \rho(Z) = X_7 + X_8
 \end{aligned}$$

where $[]$ denotes concentration of substance, R is the iodide perflouride radical $n\text{-C}_3\text{F}_7$, I is iodine and I^* denotes the excited state of iodine. For ω the flow rate of $n\text{-C}_3\text{F}_7\text{I}$ in the Z direction (cm/sec) and ρ the total photon density, the differential equations defining the chemical kinetics of the amplifier are given by:

$$\omega \frac{dy_1}{dz} = K_1 By_2 y_5 + K_2 By_2 y_6 - \xi_1 y_1 - K_4 By_1 y_2 + K_5 By_2 y_4 - K_7 By_5 y_1 - K_6 By_2 y_1 - K_8 By_1 y_6 - y_1 \frac{dw}{dz}$$

$$\begin{aligned}\omega \frac{dy_2}{dz} = & \xi_1 y_1 - K_1 By_2 y_5 - K_2 By_2 y_6 - 2K_3 By_2^2 - K_4 By_1 y_2 - K_6 By_1 y_2 - K_5 By_2 y_4 \\ & + K_7 By_1 y_5 + K_8 By_1 y_6 - y_2 \frac{dw}{dz} - y_2 / \tau_2\end{aligned}$$

$$\omega \frac{dy_3}{dz} = K_3 By_2^2 + K_6 By_1 y_2 + K_4 By_1 y_2 - y_3 \frac{dw}{dz} - y_3 / \tau_3$$

$$\begin{aligned}\omega \frac{dy_4}{dz} = & C_1 B^2 y_1 y_5 y_6 + C_2 B^2 y_1 y_6^2 + C_3 B^2 y_4 y_5 y_6 + C_4 B^2 y_4 y_6^2 - \xi_2 y_4 + K_7 By_1 y_5 \\ & - K_5 By_2 y_4 + C_5 B^2 y_6^2 y_3 + K_8 By_6 y_1 + C_6 B^2 y_6 y_5 y_3 - y_4 \frac{dw}{dz} - y_4 / \tau_4\end{aligned}$$

$$\begin{aligned}\omega \frac{dy_5}{dz} = & \xi_1 y_1 + 0.51 \xi_2 y_4 - K_1 By_2 y_5 - C_1 B^2 y_1 y_5 y_6 - C_3 B^2 y_4 y_5 y_6 - Q_1 By_1 y_5 - Q_2 By_4 y_5 \\ & - C\sigma \cdot \rho \cdot (y_5 - \frac{1}{2} y_6) + K_6 By_2 y_1 - Q_3 By_5 y_2 - Q_4 By_5 y_3 - Q_5 By_5 y_6 \\ & - K_7 By_5 y_1 - C_6 B^2 y_6 y_5 y_3 - y_5 \frac{dw}{dz} - y_5 / \tau_5\end{aligned}$$

$$\begin{aligned}\omega \frac{dy_6}{dz} = & 1.49 \xi_2 y_4 + Q_1 y_1 y_5 + Q_2 By_4 y_5 - 2C_5 B^2 y_6^2 y_3 - K_8 By_6 y_1 + C\sigma\rho (y_5 - \frac{1}{2} y_6) \\ & - C_1 B^2 y_1 y_5 y_6 - 2C_2 B^2 y_1 y_6^2 - C_3 B^2 y_4 y_5 y_6 - 2C_4 B^2 y_4 y_6^2 - K_2 By_2 y_6 + K_4 By_1 y_2 \\ & + Q_3 By_5 y_2 + Q_4 By_5 y_3 + Q_5 By_5 y_6 + K_5 By_2 y_4 - C_6 B^2 y_6 y_5 y_3 - y_6 \frac{dw}{dz} - y_6 / \tau_6\end{aligned}$$

$$\frac{dy_7}{dz} = L_c y_7 (y_5 - \frac{1}{2} y_6)^B \sigma$$

Normalizing the length of the amplifier by using the substitution $Z = SL$, $0 < S < 1$ the differential equations are solved numerically using a Runge-Kutta integration scheme. Appendix A contains the computer code for the simulation of a two pass continuous wave amplifier. Appendix B contains a representation of the output from the code. This Appendix contains figures illustrating how concentrations change with distance. Current research is directed toward the refining of this program and performing a systems study with the parameters involved in the code construction.

APPENDIX A

COMPUTER PROGRAM FOR SIMULATION OF TWO PASS CONTINUOUS WAVE AMPLIFIER

PROGRAM TPAMP2(INPUT,OUTPUT,TAPES=INPUT,TAPE6=OUTPUT,TAPE8)

MAIN PROGRAM
TWO PASS CONTINUOUS WAVE AMPLIFIER

AMPPAR IS THE DATA FILE WITH NAMELIST VARIABLES DEFINED

COMPRESSIBLE FLOW LASER MODEL WHICH INCLUDES
EQUATION OF STATE
CONTINUITY EQUATION
MOMENTUM EQUATION
ENERGY EQUATION

TAPE8 IS FOR OUTPUT DATA---RENAME AND SAVE TAPE8 IF YOU WANT
TO SAVE THE OUTPUT DATA

PROBLEM IS SCALED IN THE AXIAL DIRECTION---LENGTH IS LC
SCALED LENGTH IS ZERO TO ONE

SPECIFIC HEAT AT CONSTANT VOLUME IS FUNCTION OF TEMPERATURE
OBTAINED FROM LEAST SQUARES FIT OF EMPIRICAL DATA
FOR N-C3F7I IODINE LASER

USED IN PREDICTION MODE---GIVEN CONDITIONS AT Z=0.

THIS VERSION CONTAINS AN AUTOMATICALLY CHOSEN VARIABLE STEP
SIZE. IT ALSO CONTAINS WALL EFFECT REACTIONS. (NOT USED THOUGH)

EFFECTS OF TEMPERATURE, FLOWRATE, DENSITY AND PRESSURE VARIATIONS
ARE CONSIDERED IN SUBROUTINES ARREN, PFLOW AND FLOW
