He (Solar Energetic Particles) of an SEP event

Intershock started observations on April 26, 1985, during the tail of SEP increase from the 3B flare of April 24. The following period of observation was quiet with only a few weak increases of low energy protons with several days duration.

Two prominent SEP events occurred on July 9 (start 01:33 UT, position S13, W25) and July 17 (no optical data, type II radio burst 03:33 - 03:48 UT).

episodic We study these mass ejections and particles propagation using X-ray, radio and energetic particle emissions. *(were studied on the basis of)*

On 26 Apr. 1985,
Intershock began observation of a solar energetic particle (SEP) event, ~~24 Apr 1985,~~
during the tail of the increase resulting from the ^{3B} solar flare of 24 April. *(which began on 24 April)*
