| 16. ABSTRACT <p>This report presents a summary of selected atmospheric conditions observed near Space Shuttle STS-41G launch time on October 5, 1984, at Kennedy Space Center Florida. Values of ambient pressure, temperature, moisture, ground winds, visual observations (cloud), and winds aloft are included. The sequence of pre-launch Jimsphere measured vertical wind profiles is given in this report. The final atmospheric tape, which consists of wind and thermodynamic parameters versus altitude, for STS-41G vehicle ascent has been constructed. The STS-41G ascent atmospheric data tape has been constructed by Marshall Space Flight Center's Atmospheric Sciences Division to provide an internally consistent data set for use in post flight performance assessments.</p> | | | | | |

ACKNOWLEDGMENTS

The authors wish to thank the personnel at NASA Kennedy Space Center, along with those at the Cape Canaveral Air Force Station and their Pan American World Airways contractors, for the acquisition and distribution of all related atmospheric data received at MSFC.

Thanks are due to James Arnold and David Keller of the Atmospheric Effects Branch, MSFC, for their help in extracting atmospheric data and satellite cloud photographs that are used in this report. Also, special thanks to Messrs. Bill Jeffries and Bobby Vayda of Computer Sciences Corporation for their assistance in processing all the upper air data used in producing the STS-41G final atmospheric data tapes. Finally, appreciation is expressed to Rhonda Blocker and Sherry Anderson of Boeing Computer Support Services for the GRA model and ESDB computer support, respectively.

TECHNICAL MEMORANDUM

ATMOSPHERIC ENVIRONMENT FOR SPACE SHUTTLE (STS-41G) LAUNCH

I. INTRODUCTION

This report presents an evaluation of the atmospheric environmental data taken during the launch of the Space Shuttle/STS-41G vehicle. This Space Shuttle vehicle was launched from Pad 39A at Kennedy Space Center (KSC), Florida, on a bearing of 39 deg east of north at 1103 UT (0703 EDT) on October 5, 1984.

This report presents a summary of the atmospheric environment at launch time (L+0) of the STS-41G, together with the sequence of prelaunch Jimsphere measured winds aloft profiles from L-12 hr through liftoff. The general atmospheric situation for the launch and flight area is described, and surface and upper level wind/thermodynamic observations near launch time are given. Since the ship Redstone was unavailable for STS-41G duty, the SRB descent/impact atmospheric data were not taken. However, one can use the STS-41G ascent data for SRB studies, as the best substitute.

Previous MSFC-related launch vehicle atmospheric environmental conditions have been published as Appendix A of individual MSFC Saturn Flight Evaluation Working Group reports [1]. Office memorandums have been issued for previous flights giving launch pad wind information. A report has also been published [2] which summarizes most launch atmospheric conditions observed for the past 155 MSFC/ABMA-related vehicle launches through SA-208 (Skylab 4). Reports summarizing ASTP, STS-1 through STS-41D launch conditions are presented in References 3 through 15, respectively. Table 1 gives the atmospheric L+0 launch conditions for all the Space Shuttle missions.

II. SOURCES OF DATA

Atmospheric observational data used in this report were taken from synoptic maps made by the National Weather Service, plus all available surface observations and measurements from around the launch area. Upper air observations were taken from balloon-released instruments sent aloft from Cape Canaveral Air Force Station (CCAFS). High-altitude winds and thermodynamic data were measured by the Super-Loki rocketsondes launched from the CCAFS. Table 2 presents a listing of systems used to obtain the upper level wind profiles used in compiling the final ascent atmospheric data tape. Data cutoff altitudes are also given in Table 2.

III. GENERAL SYNOPTIC SITUATION AT LAUNCH TIME

An area of high pressure, located in the Atlantic just off the Virginia coast, prevailed over the southeastern states just prior to STS-41G liftoff. This air mass brought warm and less humid conditions to the KSC area throughout the countdown period. Light to moderate northeast to easterly surface winds were the rule during

countdown. Figure 1 presents the surface map conditions approximately 57 minutes after launch. Figure 2 depicts the winds aloft conditions at the 500 mb pressure level approximately 57 minutes after launch. Westerly winds dominated the flow aloft over the KSC Florida area. Skies were mostly scattered to broken throughout the early morning of October 5, 1984. Figure 3 presents the GOES-5 visible picture taken at 1100 UT (3 minutes before liftoff). Figure 4 shows an up-close visible shot of the Florida peninsula as recorded by GOES-5, taken also at 1100 UT.

IV. SURFACE OBSERVATIONS AT LAUNCH TIME

Surface observations at launch time for selected KSC locations are given in Table 3. Included are pad 39A, shuttle runway, and CCAFS balloon release station observations. Neither precipitation nor lightning was observed at launch time.

Table 4 presents Pad 39A wind data along with other standard hourly atmospheric measurements and sky observations for the 6-hr period prior to launch of STS-41G. Values for wind speed and direction are given for the 84 m (275 ft) FSS reference level and 18 m (60 ft) pad light pole level.

V. UPPER AIR MEASUREMENTS DURING LAUNCH

The FPS-16 Jimsphere (1118 UT), MSS Rawinsonde (1106 UT), Super-Loki Rocketsonde (1403 UT), and Super-Loki Robin (1207 UT) systems were used to measure the upper level wind and thermodynamic parameters for STS-41G launch. At altitudes above the rocket-measured data, the Global Reference Atmosphere (GRA) [16] parameters for October KSC conditions were used. A tabulation of the STS-41G final atmospheric data for ascent is presented in Table 5 which lists the wind and thermodynamic parameters versus altitude. A brief summary of parameters is given in the following paragraphs.

A. Wind Speed

At launch time, wind speeds were 16.5 ft/sec (9.8 kn) at 60 ft and increased to a maximum of 78 ft/sec (46 kn) flowing from 303 deg. This maximum occurred at an altitude of 40,600 ft (12,375 m). The winds decreased above this level as shown in Figure 5. The overall maximum measured speed was 133 ft/sec (79 kn) at 247,000 ft (75,286 m) altitude.

B. Wind Direction

At launch time, the 60-ft wind direction was from the east northeast (73 deg) and shifted through east and south into a west northwesterly component above 32,000 ft (9754 m). Winds remained westerly through 66,000 ft (20,117 m) altitude. Winds above this level shifted into an easterly component, but oscillated enormously above 132,000 ft (40,234 m) as shown in Figure 5. Figure 5 shows the complete wind direction versus altitude profile, which indicates the wind direction became quite variable at altitudes with low wind speeds.

C. Prelaunch/Launch Wind Profiles

Prelaunch/launch wind profiles presented in Figures 6 through 9 were measured by the Jimsphere FPS-16 system. Data are shown for four measurement periods beginning at L-12 hr and extending through L+0.

The wind speed and direction profiles for the 12-hr period prior to and including L+0 are shown in Figures 6 and 7. The in-plane (head-tail wind) and out-of-plane (left-right crosswind) profiles are given on Figures 8 and 9. There were no calculated vehicle load exceedances produced by the wind data presented. The pre-launch atmospheric conditions are discussed in more detail in Section III.

D. Thermodynamic Data

The thermodynamic data taken at STS-41G launch time, consisting of atmospheric temperature, dew-point temperature, pressure, and density have been compiled as the STS-41G ascent atmospheric data and are presented in Table 4. The vertical structure of temperature and dew-point temperature for the STS-41G ascent are shown graphically versus altitude in Figure 10.

The atmospheric thermodynamic parameters of temperature, pressure, and density, measured during STS-41G launch below 102,000 ft (31,090 m) were all within 2 percent of their respective PRA-63 [17] annual values. All these parameters stayed within 20 percent of their respective PRA-63 values, at all levels of measurement.

E. SRB Upper Air and Surface Measurements

As has been mentioned in the introduction, since there was no ship available, an SRB descent atmospheric data tape has not been constructed. The tabular values for the ascent atmospheric tape as presented in Table 5 should be used for SRB descent/impact studies since it is the closest measured data source.

Surface Synoptic Map at 1200 UT October 5, 1984 — Isobaric, Frontal, and Precipitation Patterns are Shown in Standard Symbolic Form.

Figure 1. Surface synoptic chart 57 min after launch of STS-41G.

500 Millibar Height
 Contours at 1200 UT
 October 5, 1984.
 Continuous Lines Indicate Height Contours in Feet Above
 Sea Level. Dashed Lines are Isotherms in Degrees Centi-
 grade. Arrows Show Wind Direction and Speed at the
 500 MB Level.

Figure 2. 500 mb map 57 min after launch of STS-41G.

APPROVAL

ATMOSPHERIC ENVIRONMENT FOR SPACE SHUTTLE (STS-41G) LAUNCH

By D. L. Johnson, C. K. Hill, G. Jasper, and G. W. Batts

The information in this report has been reviewed for technical content. Review of any information concerning Department of Defense or nuclear energy activities or programs has been made by the MSFC Security Classification Officer. This report, in its entirety, has been determined to be unclassified.
