This supplement is available as NTISUB/141/093 from the National Technical Information Service (NTIS), Springfield, Virginia 22161 at the price of \$5.00 domestic, \$10.00 foreign.

INTRODUCTION

Under the terms of an interagency agreement with the Federal Aviation Administration this publication has been prepared by the National Aeronautics and Space Administration for the joint use of both agencies and the scientific and technical community concerned with the field of aeronautical engineering. The first issue of this bibliography was published in September 1970 and the first supplement in January 1971.

This supplement to *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 466 reports, journal articles, and other documents originally announced in August 1983 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged by the first nine *STAR* specific categories and the remaining *STAR* major categories. This arrangement offers the user the most advantageous breakdown for individual objectives. The citations, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* and *STAR*, including the original accession numbers from the respective announcement journals. The *IAA* items will precede the *STAR* items within each category.

Six indexes -- subject, personal author, corporate source, contract number, report number, and accession number -- are included.

An annual cumulative index will be published.

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A83-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies of accessions are available at \$8.00 per document. Microfiche⁽¹⁾ of documents announced in *IAA* are available at the rate of \$4.00 per microfiche on demand, and at the rate of \$1.35 per microfiche for standing orders for all *IAA* microfiche.

Minimum air-mail postage to foreign countries is \$2.50 and all foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to AIAA Technical Information Service. Please refer to the accession number when requesting publications.

STAR ENTRIES (N83-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26 1 reduction)

- Avail· DOE Depository Libraries Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center
- Avail Univ Microfilms Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation
- Avail USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction
- Avail HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI
- Avail BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown (If none is given, inquiry should be addressed to the BLL)
- Avail: Fachinformationszentrum, Karlsruhe Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM)
- Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document
- Avail U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.
- Other availabilities If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the category sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

AERONAUTICS (GENERAL)

A83-33622

A COMPLETE INTRODUCTION TO THE REVOLUTIONARY NEW WAY TO FLY ULTRALIGHTS

J E MRAZEK, JR and J E MRAZEK, SR New York, St Martin's Press, 1982, 204 p

The various materials, construction and piloting techniques, configurations, and uses of ultralight aircraft, which do not require pilot's license to fly, are explored. Attention is given to the evolution of the ultralight aircraft from hang gliders based on the Rogallo wing, and to the categories of ultralights, including their propulsion systems. The control systems are described, together with the necessary equipment, instrumentation, and maintenance procedures. Flight theory is reviewed, as is flying instruction for ultralights. Meteorological conditions significant to ultralight pilots are examined, as are uses of ultralights as glider tows, for military missions, and as amphibious aircraft. National and international programs, clubs, and other activities involving ultralight aircraft are summarized. M S K

A83-36203

FLIGHT SIMULATION TECHNOLOGIES CONFERENCE, NIAGARA FALLS, NY, JUNE 13-15, 1983, COLLECTION OF TECHNICAL PAPERS

Conference sponsored by the American Institute of Aeronautics and Astronautics New York, American Institute of Aeronautics and Astronautics, 1983, 174 p

The present conference on flight simulation technologies considers the indoctrination of U S Navy test pilots in vectored thrust practices by means of the X-22A in-flight simulator, the improvement of flight performance simulator fidelity in the B-52H WST flight station simulator, advanced display techniques for the training of multimember tactical air crews, a visual cueing model for terrain following applications, and the spectral decontamination of real time helicopter simulations. Also discussed are benchmarks for a computer system for NASA's Space Shuttle Procedures Simulator, error sources in hybrid computer-based flight simulation, simulator performance definition by cue synchronization analysis, NASA's new Man-Vehicle Systems Research Facility, and the application of experimentally derived pilot perceptual angular response transfer functions. A83-36443

AIRCRAFT PRODUCTION TECHNOLOGY (2ND REVISED AND ENLARGED EDITION) [TEKHNOLOGIIA SAMOLETOSTROENIIA /2ND REVISED AND ENLARGED EDITION/]

A L ABIBOV, N M BIRIUKOV, V V BOITSOV, V P GRIGOREV, I A ZERNOV, P F CHUDAREV, and A I IARKOVETS Moscow, Izdatel'stvo Mashinostroenie, 1982, 552 p. In Russian refs

This textbook on aircraft fabrication and production reflects recent technological advances both inside and outside the USSR. The principles underlying aircraft production technology are examined, with particular attention given to quality control, cost

efficiency of fabrication, and techniques of mechanization and automation. Processes for the fabrication of aircraft parts, assembly processes, and the assembly of aircraft control systems and equipment are considered in detail. B J

A83-36457

AIRCRAFT PROTOTYPE AND TECHNOLOGY DEMONSTRATOR SYMPOSIUM, DAYTON, OH, MARCH 23, 24, 1983, PROCEEDINGS

Symposium sponsored by the American Institute of Aeronautics and Astronautics New York, American Institute of Aeronautics and Astronautics, 1983, 196 p

The present conference on aircraft prototype program management and technology demonstrator development considers the course from technology development to operational stages for the B-36, B-58, X and F-111/FB-111 aircraft, the technology advancements incorporated into the XB-70 aircraft's design, the development of variable sweep wing design from the Bell X-5 to the F-14, the application of low cost demonstrators to the evaluation of advanced fighter technology, and gas turbine engine prototype development practices. Also discussed are the YAV-8B flight demonstrator program, the AFTI/F-111 Mission Adaptive Wing development program, Highly Maneuverable Aircraft technology development, the testing of a low altitude 'night-in-weather' attack system, the development history of the Northrop 'Flying Wing' prototypes, and the development history of the F-5 fighter. O C

A83-36458#

PROTOTYPING FOR FUN AND PROFIT

M D MARKS (McDonnell Douglas Corp, St Louis, MO) IN Aircraft Prototype and Technology Demonstrator Symposium, Dayton, OH, March 23, 24, 1983, Proceedings New York, American Institute of Aeronautics and Astronautics, 1983, p 1-7 (AIAA PAPER 83-1045)

Attention is given to the prototype program experiences gained in the course of developing such experimental and military services design competition aircraft as the XP-85 'parasite fighter', the XP-88 supersonic fighter prototype, and the subsequently highly successful F4H-1 Phantom, of which more than 5000 were produced. Prototype development and testing experiences are also related for the cases of the XHJD-1 twin engine/twin rotor helicopter and the HV-1 and HV-3 advanced rotary wind concept demonstrator aircraft. O C

A83-36459#

FROM NEW TECHNOLOGY DEVELOPMENT TO OPERATIONAL USEFULNESS B-36, B-58, F-111/FB-111

F E ARMSTRONG (General Dynamics Corp, Fort Worth, TX) IN Aircraft Prototype and Technology Demonstrator Symposium, Dayton, OH, March 23, 24, 1983, Proceedings New York, American Institute of Aeronautics and Astronautics, 1983, p 9-17 (AIAA PAPER 83-1046)

While the B-36, B-58 and F-111 weapon systems all achieved superior performance through the selective use of advanced technology to meet demanding requirements, a number of retrospectively interesting technologies developed and tested in connection with these programs never reached the operational phase. Cases in point are the track landing gear developed for the B-36 prototype, which could not withstand landing loads, and the use of the B-36 as a mother aircraft for F-84F reconnaissance

01 AERONAUTICS (GENERAL)

fighters and as nuclear reactor test bed Attention is given to the variety of F-111 variants O C

THE NORTHROP FLYING WING PROTOTYPES

L BEGIN (Northrop Corp., Aircraft Div., Hawthorne, CA) IN Aircraft Prototype and Technology Demonstrator Symposium, Dayton, OH, March 23, 24, 1983, Proceedings New York, American Institute of Aeronautics and Astronautics, 1983, p 135-144 (AIAA PAPER 83-1047)

The evolution of the Northrop Flying Wing prototypes is described with attention given to preliminary design work in the 1920's, the evolution through several prototype stages beginning with the N-1M in 1939, the development of the N-9M series as one-third scale prototypes for a projected long-range bomber, the first flight of the XB-35 in June 1946, and the 1947 flight of the YB-49 Consideration is also given to such prototypes as the XP-56 Black Bullet, a fighter/interceptor, the XP-79B Flying Ram, the MX-324/MX-334, prototypes for a rocket-powered interceptor, and the X-4 Skylancer, a Flying Wing research vehicle built to study high subsonic stability and control phenomena The XT-37 Turbodyne engine program, involving the first turboprop qualified for flight in the United States, is also considered B J

THE FUTURE OF THE MANNED AIRCRAFT

M LAMBERT Interavia (ISSN 0020-5168), vol 38, June 1983, p 581-593

After assessing the prospects for manned aircraft system developments from the present to the year 2000 and beyond, with attention to longterm requirements being formulated for payload capacity, fuel consumption and life cycle costs in the various passenger, cargo and military aircraft categories, a series of detailed aircraft system element considerations is presented These concern laminar flow techniques, advanced fighter design, airliner and business aircraft, digital avionics, active control technology, satellite-aided navigation, air traffic control, propfan airliner propulsion system development, and such advanced, low weight/high strength materials and construction techniques as metal matrix composites, all composite primary aircraft structures, and powder metallurgy techniques All present considerations are informed and complicated by the fact that aviation is a highly political industry, constituting an important component of national defence O C

FAA AVIATION FORECASTS. FISCAL YEARS 1983-1994

Feb 1983 80 p

(AD-A124611, FAA-APO-83-1) Avail NTIS HC A05/MF A01 CSCL 01B

This report contains the Fiscal Years 1983-1994 Federal Aviation Administration (FAA) forecasts of aviation activity at FAA facilities These include airports with FAA control towers, air route traffic control centers, and flight service stations Detailed forecasts were made for the four major users of the national aviation system air carriers, air taxi/commuters, general aviation and the military The forecasts have been prepared to meet the budget and planning needs of the constituent units of the FAA and to provide information that can be used by state and local authorities, by the aviation industry and the general public The overall outlook for the forecast period is for moderate economic growth, relatively stable real fuel prices, and decreasing inflation Based upon these assumptions, aviation activity is forecast to increase by Fiscal Year 1994 by 97

percent at towered airports, 50 percent at air route traffic control centers, and 54 percent in flight services performed Hours flown by general aviation is forecast to increase 56 percent and helicopter hours flown 80 percent Scheduled domestic revenue passenger miles (RPM's) are forecast to increase 81 percent, with scheduled international RPM's forecast to increase by 80 percent and commuter RPM's forecast to increase by 220 percent GRA

GENERAL AVIATION ACTIVITY AND AVIONICS SURVEY Annual Report, 1981

J C SCHWENK (Transportation Systems Center) and P W CARTER Dec 1982 110 p refs

(AD-A124595, FAA-MS-82-5) Avail NTIS HC A06/MF A01 CSCL 01B

This report presents the results and a description of the 1981 General Aviation Activity and Avionics Survey The survey was conducted during 1982 by the FAA to obtain information on the activity and avionics of the United States registered general aviation aircraft fleet, the dominant component of civil aviation in the U S The survey was based on a statistically selected sample of about 89 percent of the general aviation fleet and obtained a response rate of 61 percent Survey results are based upon response but are expanded upward to represent the total population Survey results revealed that during 1981 an estimated 407 million hours of flying time were logged by the 213,226 active general aviation aircraft in the U S fleet, yielding a mean annual flight time per aircraft of 1881 hours The active aircraft represented about 83 percent of the registered general aviation fleet The report contains breakdowns of these and other statistics by manufacturer/model group, aircraft type, state and region of based aircraft, and primary use Also included are fuel consumption, lifetime airframe hours, avionics, and engine hours estimates In addition, tables are included for detailed analysis of the avionics capabilities of GA fleet GRA

THE EFFECTS OF THE PRODUCTION ORIENTED MAINTENANCE ORGANIZATION (POMO) CONCEPT ON ADTAC AIRCRAFT MAINTENANCE PRODUCTIVITY AND QUALITY M.S. Thesis

J B AMEND and L E ERIKSEN Sep 1982 139 p refs (AD-A123981, AFIT-LSSR-70-82) Avail NTIS HC A07/MF A01 CSCL 01C

Virtually all USAF tactical fighter and interceptor units work under the AFR 66-5 decentralized POMO concept for aircraft maintenance This thesis used an aggregation of maintenance data from five ADTAC Fighter Interceptor Squadrons spanning periods preceding and following POMO implementation Hypotheses reflecting POMO's intended effects on maintenance productivity and quality were then statistically tested using the Analysis of Variance, Duncan's Multiple Range Test, and the Large Sample Test of Significance The final research results showed that conversion to POMO generally improved aircraft maintenance performance in the ADTAC FISs, but not to any great extent

These findings may possibly be generalizable to other USAF tactical air force operations Author (GRA)

N83-25656# Air Force Inst of Tech, Wright-Patterson AFB, Ohio School of Systems and Logistics
AIRFRAME RDT&E COST ESTIMATING: A JUSTIFICATION FOR AND DEVELOPMENT OF UNIQUE COST ESTIMATING RELATIONSHIPS ACCORDING TO AIRCRAFT TYPE M S Thesis

C L BECK, JR and D L PFEIL Sep 1982 205 p refs
 (AD-A123848, AFIT-LSSR-56-82) Avail NTIS HC A10/MF A01 CSCL 01C

Airframe RDT&E costs are invariably predicted by utilizing one general cost estimating relationship (CER) regardless of aircraft type (fighter, attack, or bomber/cargo). This practice results in inconsistent and often very significant inaccuracies in predicting weapon system development costs which may affect subsequent program funding. This thesis examines the utility of a unique CER for each aircraft type to be used for estimating airframe development costs. The methodology consisted of factor analysis and step-wise multiple regression analysis. Based on the results, the authors concluded that the unique CERs are consistently and significantly more accurate when estimating airframe RDT&E costs than the general CERs developed by former studies. The results of this study should be applicable to those organizations dealing with the procurement of aircraft airframes Author (GRA)

SOME HISTORICAL TRENDS IN THE RESEARCH AND DEVELOPMENT OF AIRCRAFT
 M L SPEARMAN Apr 1983 15 p
 (NASA-TM-84665, NAS 1 15 84665) Avail NTIS HC A02/MF A01 CSCL 01B

A survey of some trends in aircraft design was made in an effort to determine the relation between research, development, test, and evaluation (RDT and E) and aircraft mission capability, requirements, and objectives. Driving forces in the history of aircraft include the quest for speed which involved design concepts incorporating jet propulsion systems and low drag features. The study of high speed design concepts promoted new experimental and analytical research techniques. These research techniques, in turn, have led to concepts offering new performance potential. Design trends were directed toward increased speed, efficiency, productivity, and safety. Generally speaking, the research and development effort has been evolutionary in nature and, with the exception of the transition to supersonic flight, little has occurred since the origin of flight that has drastically changed the basic design fundamentals of aircraft. However, this does not preclude the possibility of dramatic changes in the future since the products of research are frequently unpredictable. Advances should be expected and sought in improved aerodynamics (reduced drag, enhanced lift, flow field exploitation), propulsion (improved engine cycles, multimode engines, alternate fuels, alternate power sources), structures (new materials, manufacturing techniques), all with a view toward increased efficiency and utility Author

OPTIMUM WIRE SCREENS FOR CONTROL OF TURBULENCE IN WIND TUNNELS

G I DERBUNOVICH, A S ZEMSKAIA, E U REPIK, and I U SOSEDKO (TsAGI, Uchenye Zapiski, vol 13, no 1, 1982, p 11-20) Fluid Mechanics - Soviet Research (ISSN 0096-0764), vol 10, Sept-Oct 1981, p 136-147 Translation refs

Recommendations are made for selecting the set of screens that will give the most effective damping of free-stream turbulence for a specified screen drag. Attention is also given to the structure of the turbulence generated by a screen placed in nonturbulent flow. Optimal geometry is sought because the introduction of flow-damping screens significantly increases the pressure drop and the pumping penalty. It is pointed out that the mechanisms of the screen's damping effect involves primarily the reduction of the scale of the turbulence fluctuations, with the smaller fluctuations then being damped more rapidly than large-scale turbulence C R

RECENT STUDIES AT NASA-LANGLEY OF VORTICAL FLOWS INTERACTING WITH NEIGHBORING SURFACES
 J E LAMAR and J F CAMPBELL (NASA, Langley Research Center, Hampton, VA) NATO, AGARD, Symposium on Vortical Type Flows in Three Dimensions, Rotterdam, Netherlands, Apr 25-28, 1983, Paper 33 p refs

The importance of leading-edge vortical flows, which occur near and interact with neighboring surfaces, is stressed. Research in this area conducted or sponsored by the NASA Langley Research Center since 1978 is surveyed. Particular attention is given to the cumulative results of a number of theoretical and experimental studies. It is noted that these studies have been carried out in order to understand and use this kind of flow. Much of the work has been devoted to improving the lift-to-drag ratio and pitch characteristics for wings in this flow, although work has also been done on examining the unsteady and lateral characteristics C R

THE AERODYNAMICS OF HYPOSONIC VELOCITIES (ON FLOWS WITH LOW MACH NUMBERS) [AERODINAMIKA GIPOZVUKOVYKH SKOROSTEI /O TECHENIIAKH S MALYMI CHISLAMI MAKHA/]
 R KH ZEITUNIAN PMTF - Zhurnal Prikladnoi Mekhaniki i Tekhnicheskoi Fiziki (ISSN 0044-4626), Mar-Apr 1983, p 53-61 In Russian refs

The paper introduces the concept of hypersonic flow which describes slow subsonic weakly compressible gas flow. Hypersonic flow is discussed with reference to the phenomena of unsteadiness,

viscosity, and acoustics which are connected with it. Particular consideration is given to the necessity of correctly allowing for weak compressibility in the mathematical modeling of flow phenomena. The discussion is illustrated by several simple problems, and solutions are indicated for some of these problems. Particular attention is given to the case where S is not equal to zero and R is not equal to infinity, the case of hypersonic flow within a limited region, the effect of weak compressibility on viscosity, the theory of small perturbations for hypersonic flows, and the external unsteady problem. CALCULATION OF SUBSONIC FLOW PAST RECTANGULAR WINGS AND THEIR COMBINATIONS ON THE BASIS OF A DISCRETE VORTEX SCHEME [RASCHET OBTEKANIYA PRIAMOUGOL'NYKH KRYE'EV I IKH KOMBINATSII V DOZVUKOVOM POTOKE PO DISKRETOI VIKHREVOI SKHEME]

N F VOROBEV and G N SHASHKINA. PMTF - Zhurnal Prikladnoi Mekhaniki i Tekhnicheskoi Fiziki (ISSN 0044-4626), Mar-Apr 1983, p 91-98. In Russian. refs

The effect of the parameter K on the aerodynamic characteristics of rectangular-planform wings is evaluated, the variation of K from 0 to 1 corresponds to the modeling of the intensity of a vortex sheet in the process of shedding ($K = 0$ corresponds to nonseparated flow while $K = 1$ corresponds to the limiting case of total separation). An analysis is also presented of the effect of individual computational parameters and individual elements of a free vortex sheet on the overall aerodynamic characteristics. Calculations of flow past combinations of rectangular wings of small aspect ratio are presented, and results of calculations of normal force coefficients and pitching moment are compared with available experimental data. A scheme is proposed for modeling the twisting of the vortex sheet into two vortex cores some distance from the wing. B J

THE SWIRL IN AN S-DUCT OF TYPICAL AIR INTAKE PROPORTIONS

R W GUO and J SEDDON. Aeronautical Quarterly (ISSN 0001-9259), vol 34, May 1983, p 99-129. refs

Measurements were made of the static pressure, total pressure, and swirl in an S-shaped duct typical of jet air intakes. Various angles of attack and different flow-through ratios were examined. It was determined that swirl presence in an S-duct is affected by the interaction between pressure gradients caused by bends and by the angle of attack, the flow inertia, the viscous flow condition, and the geometry of the duct cross-sections. The pattern and intensity of the swirl is dependent on the first three factors, as well as the duct geometry. A high mean total pressure at the engine face is present at a low incidence, then decreases with increasing incidence. High values of the distortion parameter at high incidence are lowered through use of spoilers and an auxiliary inflow area. M S K

SEPARATED FLOWS ON A CONCAVE CONICAL WING [OTRYVNYE TECHENIYA NA VOGNUTOM KONICHESKOM KRYLE]

V V KRAVETS and A I SHVETS. Akademiya Nauk SSSR, Izvestiya, Mekhanika Zhidkosti i Gaza (ISSN 0568-5281), Mar-Apr 1983, p 83-91. In Russian. refs

A series of models of concave conical wings were tested in a wind tunnel, along with flat delta wings, at Mach 3 and angles of attack ranging from 0 to 15 deg. In comparison with flat delta wings, the concave configuration makes it possible to achieve higher shock waves, avoid additional pressure losses associated with transverse flows, and prevent flow over the leading edge of the wing at larger angles of attack. Experimental data on pressure distribution, shock waves, and separated flows are discussed in detail, and some of the results are presented in graphical form. V L

APPLICATIONS OF COMPUTATIONAL TECHNIQUES IN THE DESIGN OF RAMJET ENGINES

M D GRIFFIN, F S BILLIG, and M E WHITE (Johns Hopkins University, Laurel, MD). IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers. New York, American Institute of Aeronautics and Astronautics, 1983, p 215-228. refs

A discussion is presented concerning computational fluid dynamics techniques for ramjet engine design and analysis which are sufficiently efficient to allow their routine use as part of the iterative design and optimization process. The applications and limitations noted for purely inviscid analyses of inlet flowfields are complemented by steady state, parabolized Navier-Stokes methods considering the effects of viscosity. Attention is given to modeling techniques, and to a procedure for flow field analysis, in the case of a dual combustor ramjet. O C

NUMERICAL COMPUTATION OF TURBULENT FLOW AROUND THE SPINNER OF A TURBOFAN ENGINE

Y OBIKANE (Ishikawajima-Harima Heavy Industries Co., Ltd., Tokyo, Japan). IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers. New York, American Institute of Aeronautics and Astronautics, 1983, p 304-312. refs

The Reynolds stress in the flow around the spinner of a turbofan engine has been predicted with a second order turbulence modeling equation. It has been shown that the large mean strain rate and the mean shear gradient change significantly the turbulent kinetic energy and the anisotropy. Especially, it is predicted that the turbulent kinetic energy is strongly intensified on the streamline near the spinner. Therefore, one may expect that the intensified turbulence is swallowed into the core region of the turbofan engine. The turbulence model may be applicable for higher intensified turbulent flow such as the blade-to-blade flow in turbine and could be very useful for engine design. Author

AERODYNAMIC OPTIMIZATION THEORY OF A 3-D AXIAL-FLOW ROTOR-BLADING VIA OPTIMAL CONTROL

L GAOLIAN (Shanghai Institute of Mechanical Engineering, Shanghai, People's Republic of China). IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers. New York, American Institute of Aeronautics and Astronautics, 1983, p 313-318. refs

In this paper a theory of optimum aerodynamic design of a whole 3-D rotor-blading with cylindrical hub and casing in compressible flow is put forth. It has been formulated as an optimal control problem with multiple inequality constraints on control- and phase-variables, including also a constraint on centrifugal stress in rotating blades. The essential feature of the present theory consists in its capability of handling a variety of practical design constraints (to account for aerodynamic, cooling, material-strength, vibrational and technological requirements) in a unified manner,

so that the optimal solution thus obtained is surely feasible and can be adopted for practical use

A CONTRIBUTION TO THE CALCULATION OF SECONDARY FLOWS IN AN AXIAL FLOW COMPRESSOR

K D PAPAILIOU (Athens, National Technical University, Athens, Greece) IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers New York, American Institute of Aeronautics and Astronautics, 1983, p 439-446 refs

Modifications are introduced into the theoretical development of flow equations based on a parabolic (boundary layer) formulation in the longitudinal flow direction and an elliptic (secondary vorticity) formulation in the transverse flow direction, introducing a simple approximation technique which accounts for viscous/inviscid interaction effects in the course of viscous flow calculations. The application given for this approach is the case of a compressor cascade, with the theoretical modifications and the approximate viscous/inviscid interaction procedure incorporated

EXPERIMENTAL STUDY OF A HIGH-THROUGH-FLOW TRANSONIC AXIAL COMPRESSOR STAGE

A J WENNERSTROM (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, OH) IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers New York, American Institute of Aeronautics and Astronautics, 1983, p 447-457 refs

Design features and experimental performance data are given for the case of a 195 kg/sec per sq m transonic axial compressor achieving a 1.95 pressure ratio at a tip speed of 457 m/sec. This design incorporates several novel features that are instrumental in the attainment of a design speed peak isentropic efficiency of more than 88 percent. An optimum rotor tip clearance is determined for the design, and it is found that the placing of vortex generators upstream is ineffective in influencing stall margin. The installing of vortex generators on the rotor did, however, improve stall margin, and increased efficiency at speeds above 90 percent of the design speed

EFFECT OF ENTRY BOUNDARY LAYER THICKNESS ON SECONDARY FLOWS IN AN ANNULAR CASCADE OF TURBINE NOZZLE AND ROTOR BLADES

M GOVARDHAN and N VENKATRAYULU (Indian Institute of Technology, Madras, India) IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers New York, American Institute of Aeronautics and Astronautics, 1983, p 585-594

This paper presents the results of some of the initial investigations carried out on a low speed annular cascade of turbine nozzle blades, with a view to study the secondary flows and losses arising out of the three-dimensional nature of the flow and interaction of such parameter like the entry boundary layers. From the results obtained, the spanwise variation of circumferentially averaged total pressure, local loss coefficient, velocity, flow angle and pitch angle downstream of the cascade are presented. Also presented in the paper are the contours of total pressure, velocity, flow direction and local loss coefficient at the downstream for one typical boundary layer thickness. Results from linear cascade by using rotor blades are presented in the form of total pressure contours for two typical entry boundary thicknesses

FLOW IN ROTATING STALL CELLS OF A LOW SPEED AXIAL FLOW COMPRESSOR

F A E BREUGELMANS, K MATHIOUDAKIS, and F CASALINI (Institut von Karman de Dynamique des Fluides, Rhode-Saint-Genese, Belgium) IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers New York, American Institute of Aeronautics and Astronautics, 1983, p 632-642 refs

A high hub-tip ratio single stage compressor is investigated over the entire characteristic, using fast response instrumentation. The flow field is explored in the absolute and relative reference frame. The information is digitized for further analysis of the instantaneous and averaged flow parameters. Two distinct types of perturbations are explored: the small oscillating eight cell and the single or double cell pattern with deep stall. The energy spectra, autocorrelation function and phase locked averaging technique are used in the analysis. The instantaneous traces are used in the description of the cell structure for the deep stall case. Vortices and strong reversed flows are observed during the passage of the large stall cells and large radial drifts occur on the blade surfaces

ENTRAINMENT AND MIXING IN THRUST AUGMENTING EJECTORS

L BERNAL and V SAROHIA (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, CA) American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 21st, Reno, NV, Jan 10-13, 1983 10 p NASA-supported research refs

(Contract N62269-80-MP-00034, AF-AFOSR-ISSA-81-00029)

(AIAA PAPER 83-0172)

An experimental investigation of two-dimensional thrust augmenting ejector flows has been conducted. Measurements of

the shroud surface pressure distribution, mean velocity, turbulent intensities and Reynolds stresses were made in two shroud geometries at various primary nozzle pressure ratios. The effects of shroud geometry and primary nozzle pressure ratio on the shroud surface pressure distribution, mean flow field and turbulent field were determined. From these measurements the evolution of mixing within the shroud of the primary flow and entrained fluid was obtained. The relationship between the mean flow field, the turbulent field and the shroud surface pressure distribution is discussed. Author

NUMERICAL CALCULATIONS OF TIME DEPENDENT
THREE-DIMENSIONAL VISCOUS FLOWS IN A BLADE
PASSAGE WITH TIP CLEARANCE**

A R WADIA (General Motors Corp, Detroit Diesel Allison Div, Indianapolis, IN) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 12 p refs (AIAA PAPER 83-1171)

It is pointed out that significant gains in efficiency are possible by minimizing the aerodynamic losses in various mechanical components of a gas turbine engine. Endwall losses constitute a major portion of the total losses, and a significant portion of the total endwall flow losses is attributed to tip leakage flow. Wadia and Booth (1982) have computed the two-dimensional streamline patterns in the tip region. Several tip configurations were analyzed and the pressure side winglet was found to seal quite effectively. The present investigation is concerned with further improvements in rotor-tip winglet configurations, taking into account the systematic and economical approach developed by Wadia and Booth. It is found that the pressure side winglet is a more effective sealing configuration than a suction side winglet. The obtained numerical

results suggest that a partial shroud is the best performer among all the members of the winglet family. Attention is also given to the development of a full three-dimensional viscous flow model of the tip leakage problem. G R

STOL WIND TUNNEL TEST RESULTS FOR A TACTICAL
SUPERCRUISER**

R A HUTCHISON, M B SUSSMAN (Boeing Military Airplane Co, Seattle, WA), R MAINQUIST (USAF, Eglin AFB, FL), and J W PAULSON, JR (NASA, Langley Research Center, Hampton, VA) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 12 p refs (Contract F33615-80-C-3001) (AIAA PAPER 83-1224)

Attention is given to the NASA Langley Research Center's testing of a 10.5 percent-scale supersonic cruiser (supercruiser) aircraft model in its V/STOL wind tunnel, in order to investigate the low speed aerodynamic characteristics of STOL enhancement devices. The STOL devices employed by the supercruiser configuration are high vector angle ramp nozzles, working in conjunction with a remote augmented lift system (RALS), in addition to a canard trim system. Also investigated were thrust reverser/ground plane interaction effects, for the evaluation of landing characteristics. It is noted that STOL approach thrust management requires the use of a partially reversing RALS nozzle which develops approximately 31 percent of main nozzle thrust, and that strong nose-up interactions during ground roll, with reverser operation, may limit dry power engine thrust for braking assistance to about 50 percent of maximum dry power. (Contract F33615-79-C-3009)
(AIAA PAPER 83-1225)

Recent studies concerned with advanced exhaust nozzle concepts have identified numerous potential benefits for advanced tactical aircraft. These benefits are related to increased maneuverability through vectored thrust, increased range through reduced cruise drag, and enhanced aircraft survivability through reduced observables. The present investigation is concerned with a significant contribution to enlarging the advanced exhaust nozzle data base available for aircraft preliminary design. Four advanced exhaust nozzle configurations have been studied over a Mach number range from 0.6 to 1.45. The exhaust nozzle configurations considered include an advanced, lightweight, vectoring, convergent-divergent axisymmetric nozzle, and a low aspect ratio Axisymmetric Load balanced Exhaust Nozzle. Each nozzle was examined at representative nonafterburning (dry cruise) and afterburning (combat maneuver) power settings and thrust vector angles up to 20 deg. G R

A STATIC INVESTIGATION OF YAW VECTORING CONCEPTS ON TWO-DIMENSIONAL CONVERGENT-DIVERGENT NOZZLES

B L BERRIER and M L MASON (NASA, Langley Research Center, Transonic Aerodynamics Div., Hampton, VA) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 13 p refs

(AIAA PAPER 83-1288)

The flow-turning capability and nozzle internal performance of yaw-vectoring nozzle geometries were tested in the NASA Langley 16-ft Transonic wind tunnel. The concept was investigated as a means of enhancing fighter jet performance. Five two-dimensional convergent-divergent nozzles were equipped for yaw-vectoring and examined. The configurations included a translating left sidewall, left and right sidewall flaps downstream of the nozzle throat, left sidewall flaps or port located upstream of the nozzle throat, and a powered rudder. Trials were also run with 20 deg of pitch thrust vectoring added. The feasibility of providing yaw-thrust vectoring was demonstrated, with the largest yaw vector angles being obtained with sidewall flaps downstream of the nozzle primary throat. It was concluded that yaw vector designs that scoop or capture internal nozzle flow provide the largest yaw-vector capability, but decrease the thrust the most. M S K

J LEPICOVSKY and W A BELL (Lockheed-Georgia Co., Marietta, GA) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 12 p. Research supported by the Lockheed-Georgia Co. refs

(AIAA PAPER 83-1354)

Data treatment and analysis techniques, as well as test results with the flowfield around propeller blades, are reported for a laser velocimetry system. Triggering pulses are initiated in synchronization with the propeller speed and data is acquired at a rate down to 8 microsec between samples. Data processing involves dividing the propeller revolution into 360 time slots with a velocity for each time slot. The rms value for all corresponding time slots for a series of propeller revolutions, when compared with the mean values, yields the local turbulence intensity at a given propeller angular position. Experimental data from examination of a two-bladed propeller are presented, including derivation of the mean, axial, radial, and tangential velocity and

turbulence components. A blade to blade turbulence distribution was also generated. M S K

(AIAA PAPER 83-1367)

A trend toward replacement of parametric model testing with parametric analysis for the design of aircraft is driven by the rapidly escalating cost of wind tunnel testing, the increasing availability of large fast computers, and powerful numerical flow algorithms. In connection with the complex flow phenomena characteristic of propulsion installations, it is now necessary to employ both parametric analysis and testing for design procedures. Powerful flow analysis techniques are available to predict local flow phenomena. However, the employment of these techniques is very expensive. It is, therefore, necessary to link these analyses with less powerful and less expensive procedures for an accurate analysis of propulsion installation flowfields. However, the interfacing and coupling processes needed are not available. The present investigation is concerned with progress made regarding the development of suitable linking methods. Attention is given to methods of analysis for predicting the flow around a nacelle coupled to a highly swept wing. G R

A83-36364#**PAN AIR APPLICATIONS TO AERO-PROPULSION INTEGRATION**

A W CHEN and E N TINOCO (Boeing Commercial Airplane Co., Seattle, WA) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 11 p refs

(AIAA PAPER 83-1368)

Several diverse applications of the PAN AIR system to aeropropulsion problems are presented in order to demonstrate the versatility of the method. These illustrative examples involve the coupling of PAN AIR to a three-dimensional boundary layer analysis for obtaining iterative solutions, and include a study of the internal flow losses through a calibration nozzle, the calculation of surface pressures about an isolated nacelle, the modeling of exhaust flows, and the analysis of nacelle blowing effects on a complete wing-body strut nacelle configuration. A83-36365#**PAN AIR PILOT CODE APPLICATION TO SUBSONIC NACELLE TYPE INTERIOR FLOWS**

W D SIDDONS, JR (United Technologies Corp., Pratt and Whitney Group, East Hartford, CT) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 7 p refs

(AIAA PAPER 83-1369)

This paper reports results from an investigation into the applicability of the PAN AIR Pilot Code to the calculation of nacelle-type interior flows. A flow model proposed for use in such calculations is found to permit the adjustment of interior flow leakage. The doublet matching at network edges imposed by the Pilot Code is found to be the cause of this unusual capability. A leakage parameter is defined which permits an assessment of the quality of interior flow solutions as well as providing a guide to the calculation of low leakage solutions. Pilot Code predictions are compared to exterior and interior solutions for nacelle flows from alternative calculations and to measurements of internal nacelle pressures for low speed flow at angle of attack. THREE-DIMENSIONAL COMPRESSIBLE VISCOUS ANALYSIS OF MIXER NOZZLES

R K GOYAL, W L BLACKMORE (Garrett Turbine Engine Co., Phoenix, AZ), V HEAD, and L POVINELLI (NASA, Lewis Research Center, Cleveland, OH) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 13 p refs (AIAA PAPER 83-1401)

An analysis-based design procedure for compound-mixer exhaust nozzles is presented and compared to test data. The design approach is based on two numerical solutions to the 3-D viscous compressible Navier-Stokes equations: an equation splitting technique used for the analysis of the core and bypass flow, and a parabolic marching scheme used in the analysis of the mixing duct. The selection of the analytical methods through test data comparisons and their coupling into an integrated design system are discussed. NASA test data is used to demonstrate the validity of the computations from the exhaust system rating station, upstream of the mixer lobe, to the nozzle throat. An estimate is made of the savings in development time and cost utilizing the new procedure. Author

RESPONSE OF A SUPERSONIC INLET TO DOWNSTREAM PERTURBATIONS

T J BOGAR, M SAJBEN, and J C KROUTIL (McDonnell Douglas Research Laboratories, St Louis, MO) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 12 p refs (Contract N00014-80-C-0481) (AIAA PAPER 83-2017)

Experimental results are reported for flows in a ramp-type, external compression inlet with a large-aspect-ratio, rectangular cross-section, operated at a freestream Mach number of 1.84 under the influence of a mechanically generated downstream perturbation. High-speed schlieren and time dependent pressure measurements were employed extensively. In supercritical operation, pressure fluctuations throughout the inlet caused by the excitation varied linearly with the fluctuations at the exit station, even for large exit station amplitudes. In subcritical operation (buzz), the excitation interacted nonlinearly with the naturally present, highly periodic oscillations by either modifying the natural frequency, if the excitation was near a natural harmonic, or by having the excitation modulate the naturally occurring oscillation. In addition, the conditions at the two criticality boundaries were determined as a function of excitation amplitude and frequency. Author

NATURAL LAMINAR FLOW DATA FROM FULL-SCALE FLIGHT AND WIND-TUNNEL EXPERIMENTS

B J HOLMES, P F COY, L P YIP, P W BROWN (NASA, Langley Research Center, Hampton, VA), and C J OBARA (George Washington University, Hampton, VA) American Institute of Aeronautics and Astronautics, Annual General Aviation Technology Fest, 8th, Wichita, KS, Nov 13, 14, 1981, Paper 22 p

Experimental results obtained at NASA Langley during studies of natural laminar flow (NLF) over commercially produced aircraft surfaces are reported. The general aviation aircraft examined were light aircraft, yet displayed NLF extents close to the maximum available and equivalent to high performance business aircraft flying envelopes. Sublimating chemicals and acoustic detection techniques were employed to measure the boundary layer transition. Theoretical predictions of boundary layer stability were found to match well with the experimental data, with consideration given to both swept wings and the amplitudes of allowable waves on the airfoil surfaces. The presence of the NLF on the airfoil surfaces confirmed the benefits available from use of composite materials for airfoil surfaces. M S K

FRICITION DRAG MEASUREMENTS OF ACOUSTIC SURFACES
 T-M LIU and J S MOUNT (Rohr Industries, Inc., Chula Vista, CA) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 10 p refs (AIAA PAPER 83-1356)

Drag measurements have been made for several acoustic panels from 25 ft/sec up to Mach 0.75, using both direct and indirect methods, at two different facilities. Testing was conducted with and without an augmented noise source. It was found that, because of the intercoupling of the normal turbulent intensity near the surface and the acoustic attenuation through the face sheet and honeycomb cavity, all panels tested resulted in higher drag in comparison to a flat plate, though differently for different structures. With the augmented noise source turned on with a spectrum typical of that in a turbo-fan engine exhaust duct, it was found that drag was higher than that encountered without augmented noise. Estimates of the equivalent sand-grain roughness for these surfaces at the condition tested have been made. Skin-friction coefficients measured have been presented as a function of Reynolds number based on momentum thickness. Author

THE MOTION DYNAMICS OF PARACHUTE SYSTEMS [DINAMIKA DVIZHENIYA PARASHIUTNYKH SISTEM]

A I ANTONENKO, O V RYSEV, F F FATYKHOV, V M CHURKIN, and I U N IURTSEV Moscow, Izdatel'stvo Mashinostroenie, 1982, 152 p. In Russian refs

The present work considers the analysis of the dynamic and aerodynamic characteristics of load-parachute systems at the stage of their motion from the moment of full opening of the canopy to the moment of landing. Results are presented of linear and nonlinear analyses of the equations of motion of a load-parachute system corresponding to various mathematical models: a geometrically invariant system, a rigid parachute with a freely suspended load, and an inertialess parachute. IMPROVED NUMERICAL METHOD FOR UNSTEADY LIFTING SURFACES IN INCOMPRESSIBLE FLOW

A ICHIKAWA and S ANDO (Nagoya University, Nagoya, Japan) Journal of Aircraft (ISSN 0021-8669), vol 20, July 1983, p 612-616 refs

An improved numerical method has been developed for unsteady thin rectangular wings in incompressible flow. To satisfy the wing boundary conditions, the spanwise pressure distribution is assumed to be stepwise constant, while the chordwise integral is reduced to a finite sum using several kinds of quadratures. Cauchy and logarithmic singularities are treated appropriately. The present method gives excellent results over a wide range of reduced frequency k ($k = 0.0-5.0$) within reasonable computer time. Extension to compressible flow and to swept tapered wings applications is discussed briefly. Author

CORRECTION TO THE WING SOURCE VELOCITY ERROR IN WOODWARD'S USSAERO CODE

G J VAN DEN BROEK (National Institute for Aeronautics and Systems Technology, Pretoria, Republic of South Africa) Journal of Aircraft (ISSN 0021-8669), vol 20, July 1983, p 628-632 refs

An analytical error present in the USSAERO computer code used to compute the subsonic and supersonic potential-flow aerodynamic characteristics of aircraft configurations is described, and a correction is proposed. The expressions of the USSAERO model for the vertical-perturbation-velocity component induced by the linear source distribution on a wing panel (WL) is shown to be incorrect, resulting in erroneous values of the vertical flowfield below a tapered wing, regardless of the chordwise paneling scheme employed. Correct expressions for the velocity components are derived, it is shown that function G(2) in the USSAERO WL expression must be replaced by the quantity G(2)-G(3). A further refinement involves the removal of the undesirable effects of the residual source sheet on the vertical perturbation velocities by applying the USSAERO treatment of wing-panel linear vortex distribution to the linear source distribution. The validity of the corrections is demonstrated for a typical case. T K

EXPERIMENTAL INVESTIGATION OF THE EFFECTS OF WALL SUCTION AND BLOWING ON THE PERFORMANCE OF HIGHLY OFFSET DIFFUSERS

W H BALL (Boeing Military Airplane Co., Seattle, WA) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983, 14 p (AIAA PAPER 83-1169)

Tests were conducted in the Boeing Diffuser Test Facility to investigate the effect on diffuser performance of centerline offset, wall suction and blowing. Effects of offset were studied using a family of two-dimensional diffusers. Effectiveness of wall suction and blowing in controlling the diffuser boundary layer was investigated initially with the highest offset two-dimensional diffuser. This was followed by a more detailed investigation of wall suction and blowing using a three-dimensional offset diffuser model. Configuration variables included center-line offset, hole area for distributed suction, and blowing slot height. Diffuser exit total pressure profiles and longitudinal wall static pressure distributions were measured to determine diffuser overall performance and to obtain an indication of local flow behavior. Test results indicate that good performance can be achieved for diffusers with large offset by using small amounts of wall suction or blowing upstream of the separation point. Author

DEFINITION OF VECTORED NONAXISYMMETRIC NOZZLE PLUMES

M COMPTON and D L BOWERS (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983, 14 p refs (AIAA PAPER 83-1290)

In approximately 1971, the nonaxisymmetric exhaust nozzle emerged as a large contributor to tactical aircraft mission performance. These nozzles, especially if equipped with the functions of thrust vectoring and thrust reversing, can increase aircraft maneuverability, agility, provide STOL capability, and increase aircraft survivability. Many advanced aircraft concepts are being configured with this nozzle type. In connection with the importance of this technology, it was determined that a need existed for a comprehensive investigation of nonvectored and vectored nonaxisymmetric exhaust plumes issuing from highly integrated nozzles in a general advanced aircraft configuration. An experimental investigation was initiated with the objective to define, with a very fine survey grid, the characteristics of an integrated nonaxisymmetric exhaust nozzle plume to establish an empirical data base and to update analytical aircraft performance prediction

techniques. A description is provided of the approach taken and the apparatus utilized in the study. G R

EXPERIMENTAL RESULTS OF A DEFLECTED THRUST V/STOL NOZZLE RESEARCH PROGRAM

P L BURSTADT and A L JOHNS Mar 1983 26 p refs
Presented at the 21st Aerospace Sci Conf., Reno, Nev., 10-13 Jan 1983, sponsored by AIAA. Original contains color illustrations.
(NASA-TM-83069, E-1539, NAS 1 15 83069) Avail NTIS HC A03/MF A01 CSCL 01A

Four deflected thrust nozzle concepts, designed to operate at the low pressure ratio typical of high bypass-ratio turbofan engines for medium speed (subsonic) V/STOL aircraft, were studied. Maps of overall performance characteristics and exit velocity distributions are used to highlight similarities and differences between the four concepts. Analytically determined secondary flows at the exit of a 90 deg circular pipe bend are compared with the experimental results from the more complex three dimensional geometries. The relative impact of total-pressure losses and secondary flows on nozzle thrust coefficient is addressed by numerical integration of exit velocity measurements. Author

HELICOPTER ROTOR LOADS USING DISCRETIZED MATCHED ASYMPTOTIC EXPANSIONS Final Report

G A PIERCE and A R VAIDYANATHAN May 1983 76 p refs
(Contract NAS1-16817)
(NASA-CR-166092, NAS 1 26 166092) Avail NTIS HC A05/MF A01 CSCL 01A

The numerical practicality of a matched asymptotic expansion approach for the computation of unsteady three dimensional airloads on a helicopter rotor was improved. This effort utilizes a discretized representation of the doublet strength distribution and helical streamlines to decrease the computational requirements of the original analysis. The continuous variation of the doublet strength was approximated by piecewise constant or piecewise quadratic distributions, and the helical trajectory of a fluid particle was approximated by connected straight line segments. As a direct result of these simplified representations the computational time required for the execution of a typical flight condition was reduced by an order of magnitude with respect to the requirements of the original analysis. Airloads which were computed using the discretized method for a two bladed model rotor and a full scale four bladed rotor are in close agreement with measured results and airloads from the original asymptotic analysis. For conditions characterized by significant rotor/wake interaction the piecewise constant representation requires a reduced azimuth spacing to maintain acceptable accuracy. S L

A wind tunnel investigation of an advanced technology airfoil, the CAST 10-2/DOA 2, was conducted in the Langley 0.3 meter Transonic Cryogenic Tunnel (0.3 m TCT). This was the first of a series of tests conducted in a cooperative National Aeronautics and Space Administration (NASA) and the Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt e V (DFVLR) airfoil research program. Test temperature was varied from 280 K to 100 K to pressures from slightly above 1 to 5.8 atmospheres. Mach number was varied from 0.60 to 0.80, and the Reynolds number (based on airfoil chord) was varied from 4×10^6 to the 8th power to 45×10^6 to the 6th power. This report presents the experimental aerodynamic data obtained for the airfoil and includes descriptions of the airfoil model, the 0.3 m TCT, the test instrumentation, and the testing procedures. A centrifugal compressor facility being built by the NASA Lewis Research Center is described; its purpose is to obtain benchmark experimental data for internal flow code verification and modeling. The facility will be heavily instrumented with standard pressure and temperature probes and have provisions for flow visualization and laser Doppler velocimetry. The facility will accommodate rotational speeds to 2400 rpm and will be rated at pressures to 1.25 atm. The initial compressor stage for testing is geometrically and dynamically representative of modern high-performance stages with the exception of Mach number levels. Design exit tip speed for the initial stage is 500 ft/sec with a pressure ratio of 1.17. The rotor exit backsweep is 55 deg from radial. M G

 (NASA-TP-2017, H-1161, NAS 1 60 2017) Avail NTIS HC A05/MF A01 CSCL 01A

Fuselage, boundary layer, and nozzle pressures were measured in flight for a twin jet fighter over a Mach number range from 0.60 to 2.00 at test altitudes of 6100, 10,700, and 13,700 meters for angles of attack ranging from 0 deg to 7 deg. Test data were analyzed to find the effects of the propulsion system geometry. The flight variables, and flow interference. The aft fuselage flow field was complex and showed the influence of the vertical tail, nacelle contour, and the wing. Changes in the boattail angle of either engine affected upper fuselage and lower fuselage pressure coefficients upstream of the nozzle. Boundary layer profiles at the forward and aft locations on the upper nacelles were relatively insensitive to Mach number and altitude. Boundary layer thickness decreased at both stations as angle of attack increased above 4 deg. Nozzle pressure coefficient was influenced by the vertical tail, horizontal tail boom, and nozzle interfairing; the last two tended to separate flow over the top of the nozzle from flow over the bottom of the nozzle. The left nozzle axial force coefficient was

most affected by Mach number and left nozzle boattail angle. At Mach 0.90, the nozzle axial force coefficient was 0.0013. Author

ANALYSIS OF NONPLANAR WING-TIP-MOUNTED LIFTING SURFACES ON LOW-SPEED AIRPLANES Final Report

C P VANDAM and J ROSKAM Washington NASA Jun 1983 175 p refs
 (Contract NSG-1633)
 (NASA-CR-3684, NAS 1 26 3684, KU-FRL-427-1) Avail NTIS HC A08/MF A01 CSCL 01A

Nonplanar wing tip mounted lifting surfaces reduce lift induced drag substantially. Winglets, which are small, nearly vertical, winglike surfaces, are an example of these devices. To achieve reduction in lift induced drag, winglets produce significant side forces. Consequently, these surfaces can seriously affect airplane lateral directional aerodynamic characteristics. Therefore, the effects of nonplanar wing tip mounted surfaces on the lateral directional stability and control of low speed general aviation airplanes were studied. The study consists of a theoretical and an experimental, in flight investigation. The experimental investigation involves flight tests of winglets on an agricultural airplane. Results of these tests demonstrate the significant influence of winglets on airplane lateral directional aerodynamic characteristics. It is shown that good correlations exist between experimental data and theoretically predicted results. In addition, a lifting surface method was used to perform a parametric study of the effects of various winglet parameters on lateral directional stability derivatives of general aviation type wings.  (AD-A124663, AFIT/GAE/AA/82D-34) Avail NTIS HC A05/MF A01 CSCL 14B

A transient maneuver testing technique has been developed by the Air Force Flight Test Center (AFFTC) for aerothermodynamic evaluation of the Space Shuttle Orbiter Thermal Protection System.

(TPS) during reentry. The objectives are to determine the feasibility of the testing technique and the feasibility of using the transient maneuver technique for wind tunnel heat transfer measurements. The transient maneuver technique can enhance the capability of wind tunnel testing by reducing the overall required testing time, and in turn lower the cost of testing significantly. Wind tunnel data were obtained using the TPS materials of the Orbiter as wind tunnel test articles. The principle finding indicates the heating estimates are significantly lower for the TPS test articles than the thin skin test article and Eckert theory. The discrepancy is believed to be caused mainly by the non-isothermal wall effect. Finally, the transient maneuver testing technique has been proven since the transient maneuvers agree well with the steady state results.

(AD-A124722, AFIT/GAE/AA/82D-30) Avail NTIS HC A11/MF

A01 CSCL 01C

Low speed wind tunnel tests and a boundary layer flow visualization study were conducted in the Air Force Institute of Technology fourteen inch wind tunnel to determine the differences in the aerodynamic characteristics among a forward-swept wing and several forward-swept wing/canard configurations. Both the wing and canard were constructed with an NACA 0006 airfoil section and had quarter chord sweeps of -30 and +40 deg, respectively. All tests were conducted at a dynamic pressure of 25.6 lbf/sq ft and a Reynolds number of 1.9×10^6 based on the wing mean aerodynamic chord. The results show that the changes in the aerodynamic characteristics are dependent upon canard location relative to the wing, canard incidence, and model angle of attack. The largest increases in CL were observed for the two canard positions above and closest to the wing. A decrease

in CM was noted as the canard location changed vertically from the upper to the lower test positions. An increase in CD occurred as the canard location approached the wing horizontally. Comparison of the force and moment data with the flow study photographs suggests that the canard wake/vortex system is responsible for the changes in the wing/canard aerodynamic characteristics.

APPLICATION OF A FINITE DIFFERENCE METHOD TO THE TRANSONIC AIRFOIL PROBLEM M.S. Thesis

M P BURKE Dec 1982 52 p refs

(AD-A124720, AFIT/GAE/AA/79D-4) Avail NTIS HC A04/MF

A01 CSCL 20D

This study presents the development and evaluation of a numerical solution technique used to analyze the two dimensional transonic airfoil problem. The full potential equation of motion and the irrotationality condition are used for the governing equations. A coordinate transformation is applied to the governing equations to limit the domain of the problem and for easier application of the boundary conditions. The method of lines is then used to reduce the equations from partial to ordinary differential equations. Solutions obtained using this numerical solution technique are compared to published data for both incompressible and compressible flowfield cases. It is concluded that the solution technique developed in this study is accurate and efficient when analyzing subcritical flowfields around circular airfoil shapes.

A05/MF A01 CSCL 01C

Wind tunnel investigations were conducted to probe the wake of a C-141 aircraft in an airdrop configuration. A rake with twelve 5-hole yaw head probes measured velocities at various positions in the wake, and these measurements were used to compute the vorticity of the wake. In addition, motion pictures and force measurements were taken with three differently sized extraction parachute models attached to the model aircraft by three extraction lines of different lengths. Correlation of parachute behavior with the airflow data indicates that the vortex shed by the inboard flaps and the fuselage-wing junction causes an instability in the performance of the smallest parachute models while the performance of the larger parachute models is relatively unaffected.

FINITE DIFFERENCE CALCULATION OF AN INVISCID TRANSONIC FLOW OVER OSCILLATING AIRFOILS

T ISHIGURO Oct 1980 45 p refs Transl into ENGLISH from Japan Natl Aerospace Lab (Japan), no TR-632, Oct 1980 (AD-A123982, RAE-LIBRARY-TRANS-2087, DRIC-BR-86199) Avail NTIS HC A03/MF A01 CSCL 20D

A procedure is presented to calculate the compressible inviscid pitch. In order to treat precisely boundary conditions on the oscillating airfoil surface and at infinity, the exterior of the airfoil shaped contour in the physical plane is mapped onto a rectangle in a computational plane. The two dimensional unsteady Euler equations are solved there by the Lax-Wendroff finite difference scheme with artificial viscosity. Test calculations were made for the unsteady flows over the Joukowski airfoil and the NACA 0012 airfoil oscillating in pitch, in order to obtain several individual flow patterns. The resulting unsteady pressure distributions, shock wave locations, etc, are presented. Furthermore, the unsteady numerical results obtained by this procedure for the NLP 7301 airfoil and the NACA 64A010 airfoil are compared with the experimental ones. Author (GRA)

HIGHER-ORDER COMPUTATIONAL METHODS FOR TRANSONIC WING/BODY FLOWFIELDS Final Report, 16 Mar. 1981 - 30 Sep. 1982

L T CHEN 30 Sep 1982 54 p refs (Contract N00167-81-C-0057) (AD-A124079, DTNSRDC/ASED-CR-03-82, MDC-Q0773) Avail NTIS HC A04/MF A01 CSCL 01C

This report presents the development of high-order finite-difference schemes for application to transonic wing-body flow calculations. These schemes treat supersonic flows and shocks more accurately than most existing schemes. A transformed full potential equation in a general curvilinear coordinate system is derived, and higher-order operators are introduced. A new shock-point operator produces Mach number jumps at a shock that agree reasonably well with Rankine-Hugoniot values. Second- and third-order, quasi-conservative, and fully conservative schemes are thereby developed for general geometries where flow directions can be approximately aligned with coordinate lines in supersonic regions. The fully conservative schemes are developed by modifying an existing finite-volume algorithm, while the quasi-conservative schemes are developed by solving the transformed full potential equation directly with the addition of the second- and third-order artificial viscosities at supersonic points, and the corresponding first- and second-order shock-point operators at shock points. TECHNICAL EVALUATION REPORT ON THE FLUID DYNAMICS PANEL SPECIALISTS' MEETING ON PREDICTION OF AERODYNAMIC LOADS ON ROTORCRAFT

H R VELKOFF (Ohio State Univ, Columbus) Feb 1983 14 p refs Meeting held in London, 17-18 May 1982 (AGARD-AR-189, ISBN-92-835-1445-9) Avail NTIS HC A02/MF A01

While a broad overview of work being done on (1) rotor blade aerodynamic characteristics, (2) wakes and aerodynamic effects of rotorcraft and wind turbines, and (3) rotor airloads predictions programs was presented, a serious concern remains that the intent of the conference was not fully met. Few papers evidenced experimental correlations of the aerodynamic forcing functions that were at a level similar to the extensive models and codes discussed. Most of the data used for evaluations were structural response data or were dependent on that response. Codes and analysis were not adequately verified. Adequate data bases for

verification are not generally available and usually lack important such as flow velocities, pressures, or other measurements taken simultaneously. Experimental efforts were often run independently of the analytical programs and often do not meet the needs of the programs. Author (A R H)

SOME RECENT APPLICATIONS OF XTRAN3S

D A SEIDEL, R M BENNETT, and R H RICKETTS May 1983 12 p refs Proposed for presentation at the AIAA Appl Aerodyn Conf, Danvers, Mass, 13-15 Jul 1983 (NASA-TM-85641, NAS 1 15 85641) Avail NTIS HC A02/MF A01 CSCL 01A

A time marching finite difference code, XTRAN3S that solves the three dimensional transonic small perturbation equation for flow over isolated wings was developed. During initial applications of the program, problems were encountered in the prediction of unsteady forces. The use of a revised grid and force calculation scheme improved those predictions. Comparisons are made between predicted and experimental pressure data for a rectangular supercritical wing. Comparisons of steady and unsteady data at $M_{\infty} = 0.700$ show good agreement between calculated and experimental values. A comparison of steady data at $M_{\infty} = 0.825$ shows poor agreement between calculations and experiment. Program difficulties were encountered with swept and tapered configurations. MODEL AERODYNAMIC TEST RESULTS FOR A REFINED ACTUATED INLET EJECTOR NOZZLE AT SIMULATED TAKEOFF AND CRUISE CONDITIONS Final Report

D P NELSON Jun 1983 80 p refs (Contract NAS3-22738) (NASA-CR-168051, NAS 1 26 168051, PWA-5768-29) Avail NTIS HC A05/MF A01 CSCL 01A

Wind tunnel model tests were conducted to demonstrate the aerodynamic performance improvements of a refined actuated inlet ejector nozzle. Models of approximately one-tenth scale were configured to simulate nozzle operation at takeoff, subsonic cruise, transonic cruise and supersonic cruise. Variations of model components provided a performance evaluation of ejector inlet and exit area, forebody boattail angle and ejector inlet operation in the open and closed mode. Approximately 700 data points were acquired at Mach numbers of 0, 0.36, 0.9, 1.2, and 2.0 for a wide range of nozzle flow conditions. Results show that relative to two ejector nozzles previously tested performance was improved significantly at takeoff and subsonic cruise performance, a C_{sub} of 0.982, was attained equal to the high performance of the previous tests. The established advanced supersonic transport propulsion study performance goals were met or closely approached at takeoff and supersonic cruise. Author

This review indicates the possible future directions for research on endwall flows in axial flow compressors. Theoretical investigations on the rotor blade endwall flows in axial flow compressors reported here include the secondary flow calculation and the development of the momentum integral equations for the prediction of the annulus wall boundary layer. The equations for secondary vorticity at the rotor exit are solved analytically. The solution includes the effects of rotation and the viscosity. The momentum integral equations derived include the effect of the blade boundary layers. The axial flow compressor facility of the Department of Aerospace Engineering at The Pennsylvania State University, which is used for the experimental investigations of the endwall flows, is described in some detail. The overall performance and other preliminary experimental results are presented. Extensive radial flow surveys are carried out at the design and various off design conditions. These are presented and interpreted in this report. The following experimental investigations of the blade endwall flows are carried out: (1) Rotor blade endwall flows. The following measurements are carried out at four flow coefficients: (a) The rotor blade static pressures at various axial and radial stations (with special emphasis near the blade tips); (b) The hub wall static pressures inside the rotor blade passage at various axial and tangential stations; (2) IGV endwall flows. The following measurements are carried out at the design flow coefficient: (a) The boundary layer profiles at various axial and tangential stations inside the blade passage and at the blade exit; (b) Casing static pressures and limiting streamline angles inside the blade passage. To assist in identifying and quantifying the relevant parameters associated with the complex topic of main rotor/fuselage/tail rotor interference, a model scale hover test was conducted in the Model Rotor Hover Facility. The test was conducted using the basic model test rig, fuselage skins to represent a UH-60A BLACK HAWK helicopter, 4 sets of rotor blades of varying geometry (i.e., twist, airfoils and solidity) and a model tail rotor that could be relocated to give changes in rotor clearance (axially, laterally, and vertically), can't angle and operating model (pusher or tractor). The description of the models and the tests, data analysis and summary (including plots) are included. The customary system of units gas used for principal measurements and calculations. Expressions in both SI units and customary units are used with the SI units stated first and the customary units afterwards, in parenthesis. S L

The aeropropulsive characteristics of an advanced twin engine fighter designed for supersonic cruise was investigated in the 16 foot Transonic Tunnel. The performance characteristics of advanced nonaxisymmetric nozzles installed in various nacelle locations, the effects of thrust induced forces on overall aircraft aerodynamics, the trim characteristics, and the thrust reverser performance were evaluated. The major model variables included nozzle power setting, nozzle duct aspect ratio, forward, mid, and aft nacelle axial locations, inboard and outboard underwing nacelle locations, and underwing and overwing nacelle locations. Thrust vectoring exhaust nozzle configurations included a wedge nozzle, a two dimensional convergent divergent nozzle, and a single expansion ramp nozzle, each with deflection angles up to 30 deg. In addition to the nonaxisymmetric nozzles, an axisymmetric nozzle installation was also tested. The use of a canard for trim was also assessed. S L

Test descriptions and results are documented from an experimental, low speed study of the separating confluent boundary layer on a NASA GAW-1 (General Aviation) high lift airfoil. The airfoil was tested in a variety of high lift configurations comprised of leading edge slat and trailing edge flap combinations. The primary test instrumentation was a two dimensional, laser velocimeter (LV) system operating in a backscatter mode. Surface pressures and corresponding LV-derived, boundary layer profiles are given in terms of velocity components, turbulence intensities and Reynolds shear stresses as characterizing confluent boundary layer behavior up to and beyond stall. Comparisons are given between LV-derived profiles and associated boundary layer parameters and those obtained from more conventional instrumentation such as pitot static traverses, Preston tube measurements and hot wire surveys. A descriptive summary of the experimental set up along with limited test results are presented. Pertinent comparisons of the results are made where possible with those from other sources. Author

COMPUTATION OF INCOMPRESSIBLE POTENTIAL FLOW OVER AN AIRFOIL USING A HIGH ORDER AERODYNAMIC PANEL METHOD BASED ON CIRCULAR ARC PANELS Ph.D. Thesis

J DEJONG Aug 1982 269 p refs
(AD-A124896, AFIT/DS/AA/82-1) Avail NTIS HC A12/MF A01 CSCI 12A

A new two dimensional panel method has been developed. This method uses a new approximating element, the circular arc, and a new singularity representation, the sine series, and all integrations are performed analytically for maximum computational efficiency. The method was applied to a circular cylinder and to several different types of airfoils, and a number of characteristics which define the method were varied to determine their effects on the solution. Major conclusions from this study were that the method produced very accurate solutions over the major part of the airfoil, error reduction occurred as both the number of panels and the number of terms in the series were increased, the effect of point source location was large but was local and could be controlled, the method was generally insensitive to minor variations in paneling, and the accuracy of the solution increased as panel curvature was increased from relatively flat to circular. ADVANCED NAVIGATION SYSTEMS AND FUEL CONSERVATION

C H SIMPSON (Air Canada, Montreal, Canada) Canadian Aeronautics and Space Journal (ISSN 0008-2821), vol 29, March 1983, p 14-16

Attention is confined to the savings that can be realized from improvements in operating procedures and navigation procedures, including advanced navigation systems. The Flight Management System is linked to the avionics flight control system on the L-1011-500 Tristar. The computer receives information from the engines, the central air data system, and the navigation receivers. It processes the information in accordance with a predetermined program and sends control signals to the autopilot and auto-throttle system. The way in which the Inertial Navigation System (Omega) works to ensure direct routings is discussed. The importance of air traffic controllers understanding that speed control is far more important than vectors in conserving fuel is stressed. CR

IMPACT DAMPING AND AIRPLANE TOWING

C MATUK Lulea, Hogskola, Doctoral Thesis, 1982, 179 p. Research supported by the Forsvaret Materielverk refs

Three problems are treated. The first concerns the impact of a linearly elastic hammer on a linearly viscoelastic plate. The Laplace transform method is used, and the results are seen as having application to the design of impact protection devices. The second problem has to do with the towing of targets by wires during aircraft accelerations in a straight path. Again the Laplace transform method is used, and the results can serve as conservative estimates to avoid failure of the wire. The third problem concerns the towing of targets by wires during semicircular aircraft turns. The results here are obtained by means of the finite difference method and are checked through full-scale tests. These results can be used in predicting the target path and avoiding wire failure during semicircular turn maneuvers. CR

FLIGHT OPERATIONS: A STUDY OF FLIGHT DECK MANAGEMENT

C A OWENS New York, Van Nostrand Reinhold Co., 1982, 200 p

After presenting a development history of cockpit design, including pilot tasks, control devices, instrumentation, and avionics, for aircraft employing flight crews of two or more, attention is given to topics associated with the flight operations of modern commercial aircraft. These include pilot activities and responsibilities (especially with respect to air traffic control, weather conditions, and fuel and cargo loads), the distribution of flight tasks among pilot, copilot, navigator and flight engineer, and crew selection and training criteria. Consideration is also given to the variety of documents relating to aircraft operation and navigation, typical management practices in the takeoff, climb, cruise, descent and landing portions of a flight, and the unique requirements of critical phases of flight with respect to unfavorable weather conditions and emergencies due to malfunction. NUMERICAL SIMULATION OF AIRFOIL ICE ACCRETION

C D MACARTHUR (Dayton, University, Dayton, OH) American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 21st, Reno, NV, Jan 10-13, 1983 40 p refs (Contract NAG3-65)

(AIAA PAPER 83-0112)

A mathematical model of glaze and rime ice accretion on a two-dimensional airfoil is presented. The model employs standard methods for calculating the flow field and cloud droplet trajectories. This data is used as input to a thermodynamic analysis of the ice accretion process which includes liquid runback. The structure of the model allows for dynamic updating of the droplet collection efficiency and heat and mass transfer processes as the accreted ice shape changes. This results in the improved shape prediction over previously described methods. Simulations made with the model are compared to experimental results obtained for a NACA 0012 airfoil in the NASA/Lewis Icing Research Tunnel. The agreement with experiment is found to be generally satisfactory for some cases, but a need for improvements is indicated by others. Suggestions for improvements are made. Author

NUMERICAL SIMULATION OF ELECTROTHERMAL DE-ICING SYSTEMS

K J DE WITT, T G KEITH, D F CHAO, and K C MASIULANIEC (Toledo, University, Toledo, OH) American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 21st, Reno, NV, Jan 10-13, 1983 7 p. NASA-supported research refs (AIAA PAPER 83-0114)

Transient simulations of de-icing of composite aircraft components by electrothermal heating have been computed for both one and two-dimensional rectangular geometries. The implicit Crank-Nicolson formulation is used to insure stability of the finite-differenced heat conduction equations and the phase change in the ice layer is simulated using the Enthalpy method. Numerical solutions illustrating de-icer performance for various composite aircraft blades and environmental conditions are presented. Comparisons are made with previous studies and with available experimental data. Initial results using a coordinate mapping technique to describe the actual blade geometry are discussed. Author

CONCEPTS FOR A FUTURE JOINT AIRLIFT DEVELOPMENT PROGRAM

W G MOORE, JR and J F SHEA AIAA, ASCE, TRB, ATRIF, and CASI, International Air Transportation Conference, Montreal, Canada, June 1-3, 1983 4 p
(AIAA PAPER 83-1591)

It is pointed out that since World War II the U S has had the most effective airlift capability in the world in both peace and war. There are, however, signs of deterioration with respect to this capability. The U S military has had great difficulty in gaining congressional acceptance of a timely program to modernize and improve the U S airlift force. The U S civil airlines are faced with an apparent inability to assure continued preeminence of the U S civil airlift structure. Almost 25 years have passed since the current U S airlift policy was approved by the President of the U S, and it is felt that a new statement of Presidential policy is needed. It is believed to be necessary for the President, with congressional approval, to initiate a joint civil-military program for the development of an efficient and effective airlift system able to serve both the nation's civil needs and the military emergency requirements.

GUIDANCE CONTROL SYSTEMS FOR AIRCRAFT ON AIRPORT SURFACES

D M ARNTZEN (Chicago Bureau of Engineering, Chicago, IL) and M E WILFERT (Douglas Aircraft Co., Long Beach, CA) AIAA, ASCE, TRB, ATRIF, and CASI, International Air Transportation Conference, Montreal, Canada, June 1-3, 1983 9 p refs
(AIAA PAPER 83-1579)

Since the conduction of the first flights, aviation has been concerned with overcoming the effects of poor visibility. Suitable approaches for doing this during flights have been developed on the basis of a utilization of electronic systems, such as the Automated Radar Terminal System (ARTS-3). However, corresponding solutions have not been implemented to assist the pilot on the ground in maneuvering from the runway to the terminal. In the U S visual aids such as edge lights and center line lights are all that are provided for the pilot. Such a system cannot warn the pilot of other aircraft in the area. A ground movement control system used at Heathrow is considered, along with a Surface Traffic Control System (STRACS) studied by the Port Authority of NY and NJ. Attention is given to surface movement guidance needs and recommendations for a surface guidance system. The FAA is currently deploying Airport Surface Detection Equipment (ASDE-3) to replace visual observations with an electronic picture.

A STRATEGY IS NEEDED TO DEAL WITH PEAKING PROBLEMS AT INTERNATIONAL AIRPORTS

24 Mar 1983 66 p

(GAO/GGD-83-4, B-208444) Avail NTIS HC A04/MF A01

The role that controlling the timing of flight arrivals could play in coping with the problem of peaking--multiple arrivals of international flights within a limited time period--which causes traveler delays in clearing the Federal inspection process is examined. It was concluded that because of competition, international relations, and other implications of controlling the timing of flight arrivals this course of action should only be considered when all else fails in coping with peaking problems. There is a need to establish criteria for identifying current and anticipated peaking problems affecting international travelers and a concomitant need to gauge the current and potentially enhanced capacity of the Federal inspection operations to overcome these problems. Only then will there be a logical basis for determining the need to control flight arrivals as part of an overall strategy to speed the entry of international travelers.

VERIFICATION TESTING OF AN AH-1S WIRE STRIKE PROTECTION SYSTEM (WSPS)

L T BURROWS Dec 1982 38 p

(AD-A123188, USAAVRADCOM-TR-82-D-36) Avail NTIS HC A03/MF A01 CSCL 131

The Applied Technology Laboratory conducted developmental and performance verification tests to determine the suitability for AH-1S application of a Wire Strike Protection System (WSPS) designed and fabricated by Bristol Aerospace Limited and Bell Helicopter Textron, Inc. The WSPS tested consisted of an upper cutter, a telescopic sight unit deflector, a chin cutter above the 20mm gun, a lower cutter, and a forward windshield deflector. Using the NASA-Langley Research Center's Impact Dynamics Research Facility, an AH-1S helicopter fitted with the WSPS was subjected to pendulum swing tests into the objective wire, which is a steel, seven-strand, 3/8-inch-diameter cable having an 11,500-pound tensile strength. The WSPS successfully demonstrated its capability to sever the objective wire in all tests, during which impact velocity, impact angle, aircraft pitch attitude, and aircraft impact area were varied. During the WSPS installation it was determined that some WSPS components were not necessary, and these were not necessary, and these were excluded from the system tested. During the test program it was concluded that a small cutter should be added to the system to prevent a wire from hanging up on the air data sensor boom, however, timing did not permit the fabrication and test of such a component.

8 Apr 1983 58 p refs
 (PB83-910401, NTSB-AAR-83-01) Avail NTIS HC A04/MF A01 CSDL 01C

On May 6, 1982, at 1155 28 eastern daylight time (edt), while in cruise flight on Airway J79-121 en route to Orlando, Florida, from Teterboro, New Jersey, the flightcrew of N100TA, an IBEX Corporation Gates Learjet 23, was cleared by the Jacksonville Air Route Traffic Control Center to descend from its altitude of Flight Level 410 to Flight Level 390. The flightcrew acknowledged the clearance, and air traffic control observed the radar target descend. About 2 minutes later, the airplane crashed into the Atlantic Ocean, from a steep, high speed descent about 12 miles from Savannah, Georgia. The air traffic controller made several unsuccessful attempts to contact the airplane. The pilots had reported no difficulties in any of their radio transmissions. The pilot, copilot, and the two passengers on board were killed. The National Transportation Safety Board determines that the probable cause of the accident was an uncontrolled descent from cruise altitude for undetermined reasons, from which a recovery was not or could not be effected. NEW ADVANCES IN WIDE BAND DUAL POLARIZATION ANTENNA ELEMENTS FOR EW APPLICATIONS

G MONSER (Raytheon Co., Electromagnetic Systems Div., Goleta, CA) IN Antenna Applications Symposium, Monticello, IL, September 23-25, 1981, Proceedings Urbana, IL, University of Illinois, 1982, 10 p

The present investigation is concerned with the results of a project which was conducted to achieve multioctave integrated, dual-polarized, array elements for EW array applications. A need existed for wideband, dual-polarized arrays with a number of properties. These properties are related to a bandwidth which is greater than 2 octaves, certain amplitude and phase tracking specifications, array coverage, an element efficiency of 75 percent (minimum), and an element power handling capacity of 100 watts. The array developed to satisfy the requirements is shown in a photograph. Eight elements were used for developing polarization parallel to the array, and nine elements were employed for developing polarization orthogonal to the array. G R

A RAPID-TUNING HIGH-POWER POD-MOUNTED VHF ANTENNA SYSTEM

B HODGSON (American Electronic Laboratories, Inc., Montgomeryville, PA) IN Antenna Applications Symposium, Monticello, IL, September 23-25, 1981, Proceedings Urbana, IL, University of Illinois, 1982, 16 p

This paper describes a high-power jamming antenna system. The incorporation of a microprocessor in the RF coupler gives the system a very rapid frequency-hopping capability, enabling it to be time-shared between a number of threats. The antenna is electrically very small (approaching one-twentieth of a wavelength at the lowest operating frequency), but gives good omni-directional patterns up to 70 MHz. The system has an instantaneous bandwidth of approximately 1 percent, and a maximum efficiency of 40 percent. Author

MULTIMODE PLANAR SPIRAL FOR DF APPLICATIONS

D D CONNELL and B J LAMBERTY (Boeing Aerospace Co., Seattle, WA) IN Antenna Applications Symposium, Monticello, IL, September 23-25, 1981, Proceedings Urbana, IL, University of Illinois, 1982, 15 p. Research supported by the Boeing Aerospace Co. refs

It is pointed out that the several modes available in multiarm log-spiral antennas can be useful in wide-angle direction-finding applications. The research undertaken in connection with the present investigation was conducted because the available data base on multiarm spirals is sparse. The computations presented were performed by using the Wirant computer code. Wirant is a moment-method code which uses constant-current basis functions with point marching. Input impedance and radiation patterns have been computed and compared to measured data for a 6-arm planar spiral antenna. The discussed study showed that the Wirant moments code can be used to accurately predict patterns and impedance of all possible modes in multiarm spirals. G R

A NETWORK FORMULATION FOR PHASED ARRAYS - APPLICATION TO LOG-PERIODIC ARRAYS OF MONOPOLES ON CURVED SURFACES

R J COE and D E YOUNG (Boeing Aerospace Co., Seattle, WA) IN Antenna Applications Symposium, Monticello, IL, September 23-25, 1981, Proceedings Urbana, IL, University of Illinois, 1982, 27 p refs

In the present investigation, a combination of electromagnetic modelling techniques and network theory are used to calculate the performance of a log-periodic monopole array containing driven elements as well as parasitic elements. The performance of several log-periodic monopole arrays on a conducting conical surface are also obtained by representing the conical surface as a wire mesh. An impedance matrix formulation of combined antenna and feed network is illustrated. Both antenna and feed are represented by multiport Thevenin equivalent networks. The application of network techniques to antenna-feed system modelling is illustrated. Attention is given to array geometry, the impedance matrix of an log-periodic monopole array (LPMA), the impedance matrix of feed LPMA with parasitic elements, the radiation pattern, the performance function, and the input impedance. COMPARATIVE ANALYSIS OF A PHASE AND AN AMPLITUDE PROCESSOR FOR AMPLITUDE MONOPULSE SYSTEMS

A I SINSKY and E A LEW (Bendix Corp., Communications Div., Baltimore, MD) IEEE Transactions on Antennas and Propagation (ISSN 0018-926X), vol AP-31, May 1983, p 519-522 Sponsorship U S Department of Transportation (Contract DOT-FA01-81-C-10041)

The theoretical performance of an amplitude monopulse processor is compared with that of a phase monopulse processor in the presence of thermal noise. Both processors use the sum and difference beam antenna model. Both processors exhibit a bias error at signal-to-noise ratios below 20 dB. The phase processor demonstrates a smaller standard deviation in the angle estimate for target angles in the vicinity of the monopulse boresight. Author

A THEORETICAL FRAMEWORK FOR ANALYSIS OF LATERAL POSITION ERRORS IN VOR JET-ROUTE SYSTEMS

D A HSU (Wisconsin, University, Milwaukee, WI) Journal of Navigation (ISSN 0020-3009), vol 36, May 1983, p 262-268

The applicability of a second-order differential equation in the physics of mechanical vibration is investigated as a model for aircraft lateral position errors obtained from the VOR environment. Navigational interpretations of the parameters in the model analogous to a vibrating mechanical system are constructed. Solutions to the second-order differential equation are described, and the properties and phenomena implied by the model are discussed. In extending the theoretical reasoning, phenomena embedded in the aggregated data are discovered. Ways are also found to explain the most salient features of VOR position errors based on the suggested model. The steps required for the future empirical confirmation, clarification, and calibration of parameter values are outlined. C R

ON THE USE OF HEIGHT RULES IN OFF-ROUTE AIRSPACE

R L FORD (Royal Signals and Radar Establishment, Malvern, Worcs., England) Journal of Navigation (ISSN 0020-3009), vol 36, May 1983, p 269-287 Research supported by the Civil Aviation Authority

The standard height rules applied in off-route airspace are considered in order to assess the degree of intrinsic safety they provide, that is, the reduction of conflicts without action being taken by pilots or ATC. The standard employed is the conflict rate that would obtain if the aircraft were uniformly randomly distributed in the height dimension and flying straight and level on tracks distributed uniformly and randomly. It is shown that, unless significant height-keeping errors are present, the application of

the standard rules can lead to a reduction in the intrinsic safety. An alternative height rule ostensibly having more desirable characteristics is examined on the same basis. C R

COMPUTER MODEL OF A COLLISION-AVOIDANCE SYSTEM FOR AIR TRAFFIC CONTROL

S MORLEIGH Journal of Navigation (ISSN 0020-3009), vol 36, May 1983, p 288-301

The investigation presented here assumes that the airborne system is provided with accurate information concerning the relative position and velocity of any other aircraft within a range of 25 n mi. Attention is restricted to aircraft flying in controlled airspace, within which it is mandatory for a flight plan to be approved by ATC before an aircraft is allowed to take off. The computer model is found to operate satisfactorily over a wide range of potential conflict situations. The results obtained for 'converging' conflict situations are improved if the aircraft involved both participate in the maneuver. C R

OMEGA APPLICATION IN THE INDONESIAN REGION [UTILISATION DE L'OMEGA DANS LA REGION INDONESIENNE]

P GUILLARD, A RENARD, and H ALZIAL (Crouzet, Valence, Drome, France) Navigation (Paris) (ISSN 0028-1530), vol 31, April 1983, p 172-182 In French

The equipment, capabilities, and performance of the Omega navigation system for the A 300 aircraft newly delivered to the Indonesian region are detailed. Complete digital control was installed to be compatible with the A 300 avionics and to enhance the otherwise bad propagation characteristics of the area. The on-board system consists of the receiver/processor, the command and display post, and an antenna. The processor contains five programmable maps and one block processor, and can handle ground links furnishing heading, airspeed, wind velocity, and links with the autopilot. The memory stores 29 waypoints in the Indonesian region, safekeeping them between two flights. A control unit allows the pilot to retrieve and program information and commands into the processor. Details of the data processing program are reviewed, noting the shift to real time analysis of all available Omega data to improve accuracy. With activation of an Australian station in 1982, good signals were received from Reunion and Japan, a medium level from Liberia, and a weak signal from Norway, with a listening position near Djakarta being considered. PERFORMANCE CAPABILITIES OF PHOTOGRAPHIC FLIGHT NAVIGATION AND SENSOR ORIENTATION SYSTEMS [DAS LEISTUNGSVERMOEGEN VON BILDFLUGNAVIGATIONS- UND SENSORORIENTIERUNGSSYSTEMEN]

F L J H CORTEN (International Institute for Aerial Survey and Earth Sciences, Enschede, Netherlands) Bildmessung und Luftbildwesen (ISSN 0006-2421), vol 51, May 1983, p 82-102 In German Translation refs

Advanced methods and instruments for navigation and inflight determination of the elements of exterior orientation of a sensor are reviewed. Basic principles and characteristics are addressed, including the physics of coupled navigation systems, of systems for determining positions, and of moving objects. The performance parameters of various systems are compared, including VLF Omega, microwave reflection systems, and Doppler radar. Methods of determining height above ground and sea level and of measuring differences in height are examined, as are methods for orientation under a variety of external conditions. Finally, issues of cost effectiveness and applicability are addressed. C D

DESIGN FOR TESTING OF A LOW ALTITUDE NIGHT-IN-WEATHER ATTACK SYSTEM

K M MARCROFT (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) IN Aircraft Prototype and Technology Demonstrator Symposium, Dayton, OH, March 23, 24, 1983, Proceedings New York, American Institute of Aeronautics and Astronautics, 1983, p 131-133 (AIAA PAPER 83-1061)

The need for system integration in the task of designing the next generation night-in-weather (NIW) attack system for the US Air Force is examined. This integration will be needed to preprocess the large amount of diverse information necessary to carry out a low-altitude NIW attack mission in a high-threat environment and to manage the compressed time lines associated with low-altitude attack. It is noted that, if an integrated system includes flight critical elements, it must be designed and tested to ensure that it is fail-safe through the third failure (fail op/fail op/fail safe). It is concluded that current design criteria and testing procedures are not sufficient to field successfully an integrated system of this type, and that new designs that include testability from inception and allow for retesting through the aircraft's operational life as system changes are made will be required. GE'S APG-67 - FIGHTER RADAR WITH A FUTURE

G WARWICK Flight International (ISSN 0015-3710), vol 123, June 11, 1983, p 1797, 1800-1802

The GE APG-67 fighter aircraft radar system is described. The radar is being installed in the F-20 fighter, and uses the X-band and a side-looking phased-array antenna. The digital pulse Doppler radar consists of four line-replaceable units that weigh a total of 270 lb and fill 3.28 cu ft of space. The four units comprise the flat-plate, slotted-array antenna, the X-band travelling wave tube transmitter, a radar data computer, and the radar target data processor. Operating in the 9.7-9.9 GHz interval, the transmitter produces a 3.5 kW peak power and 2.0 kW average power beam and requires only forced-air cooling. The coherence of the look-down pulse permits signal processing to discern moving targets on the ground due to Doppler shifts of the returning signal. Ground test requirements for the first production radars include 200 hr MBTF in the laboratory. M S K

FAA'S PLAN TO IMPROVE THE AIR TRAFFIC CONTROL SYSTEM. A STEP IN THE RIGHT DIRECTION BUT IMPROVEMENTS AND BETTER COORDINATION ARE NEEDED

GAO 16 Feb 1983 63 p (GAO/AFMD-83-34, B-206887) Avail NTIS HC A04/MF A01

A modernization plan that describes specific improvements in facilities and equipment needed in the air traffic control system was developed. It was recommended that an integrated long range plan addressing all aspects of the National Airspace System including use of the Nation's airspace and airports be developed. Preliminary findings from ongoing airport and airspace reviews should be coordinated with equipment and facility decisions in the modernization plan. The modernization plan should be updated to identify priorities, subsystem costs, and interdependency of projects. Other recommendations are aimed at reducing acquisition costs of the enroute replacement computers and strengthening the management and development of automation and communications systems to alleviate problems identified and satisfy the increased management demands of the system. PRECISION NAVIGATIONAL FILMSTRIPS FOR USE IN DOD AIRCRAFT

R BOZICH Sep 1982 15 p (AD-A124761) Avail NTIS HC A02/MF A01 CSCL 17G

The Defense Mapping Agency Aerospace Center (DMAAC) has been producing high resolution precision aircraft navigation filmstrips since 1969. These filmstrips are used in various type projection systems within Department of Defense (DoD) aircraft to provide the pilot/flight crew with a screen display of position and progress relative to the real world in real time. Superimposed on the projected chart image is an aircraft position symbol that appears to move across the display screen in the direction and at a speed proportionate to that being flown over the ground. DMAAC has produced numerous filmstrips for several operational aircraft today and is currently producing filmstrips for test and evaluation in new aircraft systems which will require support well into the 1980s.

SH-3 HELICOPTER/GLOBAL POSITIONING SYSTEM INTEGRATION ANALYSIS M.S. Thesis

R H HART Oct 1982 60 p refs (AD-A125005) Avail NTIS HC A04/MF A01 CSCL 17G

The Global Positioning System (GPS), the transmitted navigational signal, and the overall acquisition approach are explained. Navigational receiver components are functionally described and the hierarchy of platform integration and capability is discussed. Specifically explored is the integration of GPS into the Sikorsky SH-3 Helicopter. Performance comparisons of the medium versus high dynamic receiver, based solely on preliminary simulation data, indicate that at this time the medium dynamic receiver is the optimum configuration. Elimination of the Doppler radar in lieu of the five channel receiver would only be possible after thorough over-water testing of the high dynamic set. The actual velocity accuracy of GPS receivers in a hovering helicopter is the main question yet to be answered. The overall mission effectiveness of the GPS equipped SH-3 Helicopter should be significantly improved because of an accurate, stand-alone navigation system. Author (GRA)

INVESTIGATION OF A THIRD ORDER BARO-DAMPED VERTICAL CHANNEL OF INS M.S. Thesis

A RIAZ Dec 1982 157 p refs (AD-A124882, AFIT/GE/EE/82D-55) Avail NTIS HC A08/MF A01 CSCL 17G

The optimization of the three gains of a third-order baro-inertial vertical channel has been formulated as a stochastic optimal control problem, with the objective of minimizing the mean squared altitude error due to the noise induced altitude error and a disturbance of known magnitude. For a vehicle carrying out a TERCOM-update immediately following a vertical descent, and being subjected to a disturbance input to the vertical channel, optimum gains are presented and the performance is analyzed through a simulated flight in a Monte Carlo analysis. Performance comparisons between the optimized gains and the classical gains are also presented. The results show a significant performance improvement over the classical gains for a vehicle carrying out the TERCOM-update.

COUPLED FLAP-LAG-TORSIONAL DYNAMICS OF HINGELESS ROTOR BLADES IN FORWARD FLIGHT

P P FRIEDMANN and S B R KOTTAPALLI (California, University, Los Angeles, CA) American Helicopter Society, Journal (ISSN 0002-8711), vol 27, Oct 1982, p 28-36 Army-supported research refs
 (Contract NSG-1578)

The aeroelastic stability and response problem of the coupled flap-lag-torsional dynamics of an isolated hingeless rotor blade in forward flight is considered. Linear, quasi-steady aerodynamics below stall is included. The spatial dependence of the partial differential nonlinear equations of motion is discretized using a multimodal Galerkin method. The nonlinear time dependent equilibrium position (steady state response) about which the equations are linearized is obtained by solving a sequence of linear periodic response problems (quasilinearization). Results illustrating blade behavior in forward flight for both soft-in-plane and stiff-in-plane designs are presented. Quasilinearization provides a clear indication of the cases when nonlinear terms due to moderate deflections are important. The results indicate that nonlinearities affect system stability much more than system response. This implies that for obtaining blade vibrations and loads, approximate analytical models based on linearized formulations could be employed, whereas for determining blade stability a more accurate nonlinear analysis would be required. THE DASH 8 DEVELOPMENT PROGRAM

C J AUSTIN (Havilland Aircraft of Canada, Ltd, Downsview, Ontario, Canada) (Flight Test Symposium, Dorval, Quebec, Canada, Mar 17, 1982) Canadian Aeronautics and Space Journal (ISSN 0008-2821), vol 29, March 1983, p 17-24

In describing the interior arrangements, it is pointed out that a standard movable bulkhead will make it possible to alter the ratio of passengers to freight. The engine, the PW120 turboprop engine, was chosen with fuel efficiency a prime consideration. An account is given of the steps taken to ensure aerodynamic cleanliness for high cruise efficiency. Strict controls on weight have held the increase in this area to 30 lb over one year of design development. Kevlar/nomex structures are employed through most of the interior furnishings and floors. A number of topics from this test are discussed. A description is given of the software system used for load command and system safety. The selection of the test load spectrum using fleet counting accelerometer data as a basis is reviewed, with attention given to the data rejection criteria. A simple whiffletree and contour board load application system employing only four command channels for six servo-hydraulic actuators is discussed. It is noted that this system has proved to be very successful from the viewpoint of both reliability and load distribution. Large high wing aircraft present certain problems when tested using the 'pivoted fuselage'

configuration adopted for this test. Some of these difficulties are described, and recommendations are made for future tests. A status report on the test is provided which includes details of the failures to date and plans for the post-test analysis and tear-down inspection. C R

PERFORMANCE FLIGHT TESTING

H SMITH, ED (Pennsylvania State University, University Park, PA) Blue Ridge Summit, PA, Tab Books, Inc., 1982, 143 p

In the early stages of flight testing, the aircraft is very gently maneuvered to determine its degree of stability and control. Once the aircraft is proved to perform safely, it is carefully tested to see if it meets the performance that was expected of it when it was designed. This procedure is, therefore, appropriately termed, 'performance flight testing'. This book describes a series of tests by which most of the performance information normally required for aircraft operation can be obtained. The tests are designed to be carried out by the average light aircraft pilot or someone with equal aviation background. No special equipment is required other than a stopwatch and a basic electronic calculator. Attention is given to the effects of the atmosphere, general flight test procedures, airspeed calibration, stall speed, takeoff performance, climb performance, cruise performance, and descent and landing performance. G R

TECHNOLOGY STATUS FOR AN ADVANCED SUPERSONIC TRANSPORT

W T ROWE (Douglas Aircraft Co., Long Beach, CA) Society of Automotive Engineers, West Coast International Meeting, San Francisco, CA, Aug 16-19, 1982, 9 p refs
 (SAE PAPER 820955)

An assessment is undertaken of the development status of a proprietary SST propulsion, structural design, materials, and aerodynamics research program. The Mach 2.2-cruise speed SST design considered incorporates a novel wing planform which results in a 45 percent lift-to-drag ratio improvement over the Concorde SST, and employs superplastic forming and diffusion bonding methods in the fabrication of a 78 percent Ti alloy structure. Composites are used in all secondary structures. A reoptimization of the engine cycle, which includes variable features, improves fuel efficiencies in the subsonic cruise regime. It is noted that jet noise suppression techniques are able to keep noise levels down to those of wide-bodied subsonic transports. O C

APPLICATIONS OF ADVANCED UPPER SURFACE BLOWING PROPULSIVE-LIFT TECHNOLOGY

J A COCHRANE, D W RIDDLE (NASA, Ames Research Center, Quiet Short-Haul Aircraft Office, Moffett Field, CA), and S YOUTH (Boeing Commercial Airplane Co., Preliminary Design Dept., Seattle, WA) Society of Automotive Engineers, West Coast International Meeting, San Francisco, CA, Aug 16-19, 1982, 13 p
 (SAE PAPER 820956)

The success of the Quiet Short-Haul Research Aircraft led to studies of this technology for a business jet and a Short-Haul Transport. The studies showed that the Short-Haul Transport could operate from a 762.0-m runway with 95 passengers at low noise levels. Design range was 500 n mi but with maximum fuel load the runway length is only increased to 883.9 m while the range is increased to more than 1000 n mi. Two business jet designs were studied, one design was based on a 457.2-m field length and the other was designed for a 760.0-m field length. The business jet designed for a 457.2-m field length can also be loaded to maximum fuel capacity. In this case the range increases from 500 n mi to 1400 n mi while the runway length increases from 457.2 m to 632.5 m. The business jet studies showed that the application of advanced propulsive-lift technology to this class aircraft can result in payload-range-speed performance comparable to current aircraft with about one-half the runway length requirement. THE RESPONSE OF AIRCRAFT TO PULSE EXCITATION

P K R BHARGOV and H R SRIRANGARAJAN (Aeronautical Development Establishment, Structures and Materials Div., Bangalore, India) Computers and Structures (ISSN 0045-7949), vol 17, no 3, 1983, p 335-338.

The response of aircraft and landing gear, idealized as a two-degree of freedom nonlinear system, to pulse excitation is analyzed using the Runge-Kutta algorithm. In addition, the application of a microcomputer for analyzing nonlinear vibration problems is evaluated. Results show that the response decreases as the value of epsilon increases, where epsilon is a nonlinear-spring parameter. It is demonstrated that a microcomputer is useful in analyzing these types of problems, even though it is slow, since it eliminates turn around time. N B

CF34 UPGRADES CHALLENGER CAPABILITIES

D M NORTH Aviation Week and Space Technology (ISSN 0005-2175), vol 118, May 16, 1983, p 63-65, 69.

The evaluation of flight performance presented here is based on a comparison between the new Challenger CL-601 and the Challenger CL-600. It is noted that the drawback to the 600 had to do with range, not with overall handling characteristics, which are considered excellent. Flying at a long-range cruise of Mach 0.74 and its higher 42,250-lb gross weight, the range of the Challenger 601 is approximately 3500 n mi. The Challenger 601s all have the fuselage fuel tank installed during production. With this tank, the fuel capacity is increased from 14,900 lb to 16,725 lb. The most obvious difference between the two models is the installation of 4-ft winglets on the newer aircraft. These winglets afford a cruise efficiency increase of 3-4 percent. Another important change is the engine nacelles on the 601. The interior dimensions of the two models are identical. It is pointed out that the 601's auxiliary power unit was moved forward to counter some of the additional weight of the CF34 engines. C R

SAAB-FAIRCHILD 340 - TRANSATLANTIC FRONTRUNNER

Air International (ISSN 0306-5634), vol 24, June 1983, p 267-271, 272, 274, 295.

A discussion is presented concerning the aircraft design and construction program management arrangements devised by two aircraft manufacturers, Saab-Scania of Sweden and Fairchild Industries of the U.S., in order to produce the Saab-Fairchild 340 regional airliner. This aircraft employs two 1630-shp turboprop engines and seats 30-40 passengers. Significant use is made of metal-to-metal and aluminum honeycomb bonding, together with sandwich composite materials. Use is also made of a fully digital, fail-passive Flight Guidance and Autopilot system which employs dual microprocessor computations. The low wing, which has an aspect ratio of 11, is based on a novel NASA airfoil profile which yields improved lift/drag ratios in takeoff and climb together with reduced cruise drag. O C

AIRCRAFT DESIGN PHILOSOPHY. I - LEE BEGIN OF NORTHBROOK

R BRAYBROOK Air International (ISSN 0306-5634), vol 24, June 1983, p 296-302.

Contemporary tactical aircraft designers must be able to consider not only novel design possibilities in their work, but also performance requirements that include, in addition to performance demands, reliability and maintenance manpower figures. In addition, attention must be given to pricing policy regarding the recovery of development funds, and to offset programs that restrict the impact of a given system's purchase on the balance of payments of the recipient nation. The F-5/F-20 and F-18 development programs are taken as exemplary cases of these rules. Consideration is given to trends in such fighter aircraft performance factors as rate of climb, thrust/weight ratio, maximum instantaneous turn rate, and maximum payload as a ratio of takeoff weight. The most impressive current aircraft in these respects are the F-16, F-18, F-20, and Mirage 2000. O C

BRING COHESION TO HANDLING-QUALITIES ENGINEERING

R H HOH (Systems Technology, Inc., Hawthorne, CA) Astronautics and Aeronautics (ISSN 0004-6213), vol 21, June 1983, p 64-69. refs.

Handling-quality deficiencies afflicting aircraft represent problems which are difficult to deal with. This difficulty is largely related to the dependence of handling-quality evaluations on an interpretation of pilot rating data. The present investigation provides an interpretation of the process of developing flying-quality criteria.

and its problems 'Handling qualities' are defined as 'characteristics of a vehicle which make it satisfactory, adequate, or inadequate in terms of its response to control by a human operator in the presence of varying levels of atmospheric disturbances and outside visual cues' Pilot opinion is quantified from a decision-tree type of rating scale. The relations of this scale, called the Cooper-Harper pilot rating, to the considered definition are examined. It is found that the assurance of good handling qualities for modern aircraft requires a combination of unified analysis and experimental techniques combined with excellent communication among flight test engineers, pilots, and other persons involved. A83-35947**FULL-SCALE MEASUREMENTS OF BLADE-VORTEX INTERACTION NOISE**

D A BOXWELL and F H SCHMITZ (U.S. Army, Aeromechanics Laboratory, Moffett Field, CA) American Helicopter Society, Journal (ISSN 0002-8711), vol 27, Oct 1982, p 11-27 refs

Full-scale far-field acoustic data on four different two-bladed rotors encountering blade-vortex interaction are compared. The UH-1H helicopter was tested with its standard NACA 0012 airfoil rotor. Data are also presented for the AH-1S helicopter configured with its standard 540 rotor, the Kaman K747 rotor, and the OGEE tip rotor. The data were reduced using 'time-windowing' of the impulsive noise event, thus enhancing the signal-to-noise ratio of the in-flight data. Strong pressure gradients, isolated in the UH-1H and AH-1S 540 rotor signatures, strongly influenced the subjective annoyance of the rotor. The peak amplitudes and power spectrum of the K747 and OGEE rotors were about equal and generated less annoyance than the standard AH-1S or UH-1H rotors. Author

A83-35948* California Univ., Los Angeles**COUPLED FLAP-LAG-TORSIONAL DYNAMICS OF HINGELESS ROTOR BLADES IN FORWARD FLIGHT**

P P FRIEDMANN and S B R KOTTAPALLI (California, University, Los Angeles, CA) American Helicopter Society, Journal (ISSN 0002-8711), vol 27, Oct 1982, p 28-36 Army-supported research refs (Contract NSG-1578)

The results presented in connection with the current investigation are based on a relatively comprehensive analysis of the coupled flap-lag-torsion dynamics of an isolated hingeless rotor blade in forward flight. Two elastic modes for each of the flap, lag, and torsion degrees of freedom were used. A convenient numerical method is implemented for obtaining the nonlinear periodic blade response. It is concluded that the presented numerical methods provide a very effective means for determining both aeroelastic stability and response. Quasi-linearization gives a clear indication of the cases when nonlinear terms due to moderate deflections are important. It is found that these terms can be both stabilizing and destabilizing. Forward flight seems to be stabilizing the blade for a considerable number of cases considered, particularly when the blade is soft-in-plane. G R

A83-35949**A TUBULAR BRAIDED COMPOSITE MAIN ROTOR BLADE SPAR**

M L WHITE (Kaman Aerospace Corp., Bloomfield, CT) American Helicopter Society, Journal (ISSN 0002-8711), vol 27, Oct 1982, p 45-48 refs

In connection with efforts to enhance helicopter blade operational characteristics and to reduce manufacturing costs, the preliminary design and process development was undertaken of a composite improved main rotor blade for the OH-58 helicopter. This design is unique in that the blade spar is fabricated by mechanical tubular braiding. Mechanical braiding is an established textile process for weaving a tubular fabric which has been employed for more than a century in fabricating products such as rope, hose, and cable assembly overlays. Recently, it has been adapted to composite fabrication, predominantly in light duty or nonstructural applications such as aircraft ducting. Attention is given to the technical approach, the blade configuration, development

testing, and costs. It is concluded that mechanical braiding is a viable manufacturing technology for helicopter main rotor blade spars. This technology will permit significant manufacturing cost reduction. G R

A83-35950**EVALUATION OF THE EFFECT OF VOIDS IN COMPOSITE MAIN ROTOR BLADES**

D G ORLINO (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA), R J SHUFORD, and W W HOUGHTON (U.S. Army, Army Materials and Mechanics Research Center, Watertown, MA) American Helicopter Society, Journal (ISSN 0002-8711), vol 27, Oct 1982, p 49-56

The design and fabrication of the Improved Main Rotor Blade, designated K-747, as a replacement for the Bell Model AH-1S Cobra, was undertaken in connection with mission requirements necessitating higher armament payloads, and, thus, a need to improve rotor lifting capacity. The required 6-percent increase in hover gross weight appeared to be obtainable by replacing the main rotor blades with new blades having increased aerodynamic efficiency. In order to assess void growth in composite main rotor blades, it was thought desirable to subject one K-747 main rotor blade to 28 million cycles (1440 flight hours) of spectrum testing. If no sign of degradation or void growth occurred, a reasonable level of confidence in the structural integrity of the blade could be established. Attention is given to a specimen description, the application of fatigue loads, the conducted fatigue test, and the employed nondestructive inspection techniques. G R

A83-36065**LIGHT AIRCRAFT AND SAILPLANE STRUCTURES IN REINFORCED PLASTICS**

R TETLOW (Materials and Design (ISSN 0261-3069), vol 4, Feb-Mar 1983, p 657-662 refs

Newer materials for the aircraft designer include those utilizing carbon fiber in its various forms and, to a lesser extent, Kevlar. These materials, with high specific strength (ultimate strength/density) and high specific stiffness (modulus/density) offer special possibilities for the aircraft designer. However, the cheaper, less structurally attractive glass is the material which has been most widely used. This is particularly true in the case of sailplanes. Unidirectional reinforced plastic structural materials are compared with Sitka Spruce and an aluminum alloy. Wing structures, fuselage structures, and control surfaces are considered. Attention is given to the shear moduli for various materials, the optimum stress levels for simply supported compression panels, the optimum stress levels for a wide column compression panel, and wing loading levels. G R

A83-36074**THE HISTORY OF V/STOL AIRCRAFT**

J J SCHNEIDER (Boeing Vertol Co., Philadelphia, PA) Vertiflite (ISSN 0042-4455), vol 29, Mar-Apr 1983, p 22-29

The development of VTOL and STOL aircraft, excluding helicopters, is traced from its beginnings through the early 1950's. The general classification of these aircraft in terms of thrust generation and of conversion from lift to cruising mode is presented, and the capabilities desired in a V/STOL aircraft are considered. The evolution of V/STOL concepts, designs, and prototypes from antiquity through the infancy of powered flight to the 1940's and 1950's is recounted, including discussion of the work of Sikorsky and of Focke-Wulf in the late 1930's and early 1940's, the U.S. Navy POGO-VTOL program in the 1950's, the Army XV-1, 2, and 3 and Air Force X-13 and 14 aircraft, and the British Short SC 1. SPECTRAL DECONTAMINATION OF A REAL-TIME HELICOPTER SIMULATION

R E MCFARLAND (NASA, Ames Research Center, Moffett Field, CA) IN Flight Simulation Technologies Conference, Niagara Falls, NY, June 13-15, 1983, Collection of Technical Papers New York, American Institute of Aeronautics and Astronautics, 1983, p 64-70 (AIAA PAPER 83-1087)

Nonlinear mathematical models of a rotor system, referred to as rotating blade-element models, produce steady-state, high-frequency harmonics of significant magnitude In a discrete simulation model, certain of these harmonics may be incompatible with realistic real-time computational constraints because of their aliasing into the operational low-pass region However, the energy is an aliased harmonic may be suppressed by increasing the computation rate of an isolated, causal nonlinearity and using an appropriate filter This decontamination technique is applied to Sikorsky's real-time model of the Black Hawk helicopter, as supplied to NASA for handling-qualities investigations Author

ERROR SOURCES IN HYBRID COMPUTER BASED FLIGHT SIMULATION

R A WEEKS (Northrop Corp., Pico Rivera, CA) IN Flight Simulation Technologies Conference, Niagara Falls, NY, June 13-15, 1983, Collection of Technical Papers New York, American Institute of Aeronautics and Astronautics, 1983, p 84-91 (Contract F33615-78-C-3608) (AIAA PAPER 83-1090)

Man-in-the-loop real time simulation, with a sophisticated simulator, requires a large computation facility to provide the capability for effective and detailed mathematical modeling of the air vehicle and its subsystems Analog and digital computers can be employed for the performance of the required calculations Each computer type has certain advantages and drawbacks Many large simulation mechanizations run, therefore, in a hybrid fashion, where both analog and digital computing methods are employed The present investigation is concerned with errors and problems associated with both types of computation, taking into account also the communication link between analog and digital computations Typical errors encountered in analog, digital, and hybrid computation are listed in a table A linear airframe model was utilized for the study of the effects of error sources on solution accuracy G R

A83-36215#**USE OF FLIGHT TEST RESULTS TO IMPROVE THE FLYING QUALITIES SIMULATION OF THE B-52H WEAPON SYSTEM TRAINER**

J WEISS (Singer Co., Link Flight Simulation Div., Binghamton, NY) IN Flight Simulation Technologies Conference, Niagara Falls, NY, June 13-15, 1983, Collection of Technical Papers New York, American Institute of Aeronautics and Astronautics, 1983, p 92-113 refs
(AIAA PAPER 83-1091)

Correlating simulation results to flight test results proved to be a useful tool in assuring high-fidelity flight simulation for the B-52H Weapon System Trainer. The particular correlation described in this paper was limited to the longitudinal flying qualities. Analyses pertaining to the simulation of the engine, aircraft performance, and lateral-directional flying qualities were performed prior to the correlation. The correlation demonstrated the significance of fuel loading and fuel slosh on certain flight test maneuvers. It resulted in modifications to the design data pitching moment coefficient equation and stabilizer angle design. These modifications improved the simulation results to the point where they closely matched with the flight test results. Author

A83-36225#**FLIGHT FIDELITY TESTING OF THE F/A-18 SIMULATORS**

T C SANTANGELO (U.S. Navy, Naval Air Test Center, Patuxent River, MD) and R T GALLOWAY (U.S. Navy, Naval Training Equipment Center, Orlando, FL) American Institute of Aeronautics and Astronautics, Flight Simulation Technologies Conference, Niagara Falls, NY, June 13-15, 1983 7 p refs
(AIAA 83-1094)

The development program for the first operational flight trainer (OFT) for the Navy F/A-18 aircraft is described, with a focus on flight-fidelity testing. The problems inherent in constructing specifications and beginning development before the configuration and flight characteristics of the F/A-18 were finalized are discussed. The OFT design includes actual cockpit controls, a 3-window, 120x30-deg visual display driven by 3-channel VITAL-IV CGI system, a g-seat/g-suit/seat-shaker motion-cueing system, an instructor/operator station, and a host computer consisting of four SEL 32/77 CPU incorporating real-time input/output capability. The techniques used to test the flight fidelity of the OFT are outlined, and the importance of quick access to flight-test results, pilot input, comprehensive database construction, and the use of defined test parameters is emphasized. Future improvements such as automatic fidelity-testing functions built into the OFT and automatic data recording are proposed. The designs of the weapons-tactics trainer and part-task trainer for the F/A-18 are also considered. T K

PROGRESS IN PROPULSION SYSTEM/AIRFRAME
STRUCTURAL INTEGRATION**

J L WHITE, T L JANSSEN, and T F YANTIS (Boeing Commercial Airplane Co., Seattle, CA) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 9 p
NASA-sponsored program refs
(AIAA PAPER 83-1123)

Attention is given to the improvements in mathematical modeling, and the emerging role of computer-related technology, in airframe structural technology advancements related to the engine/airframe integration requirements of such recent designs as the 747 airliner's JT9D turbofan engine nacelle. Also noted are investigation results concerning propulsion system flight loads and their influence on thrust-specific fuel consumption deterioration, which has been addressed through the development of the novel structural concept of the 'load-carrying core cowl' engine nacelle structure. Analytical studies on integrated system vibration include low frequency, nonsynchronous vibration analyses of large, high bypass turbofan engines that have been conducted by means of three-dimensional integrated finite element models. LARGE JET AIRCRAFT VALIDATION AND DEMONSTRATIONS - AN OVERVIEW OF BOEING EXPERIENCE

J E STEINER and L K MONTLE (Boeing Co., Seattle, WA) IN Aircraft Prototype and Technology Demonstrator Symposium, Dayton, OH, March 23, 24, 1983, Proceedings New York, American Institute of Aeronautics and Astronautics, 1983, p 145, 147-166 (AIAA PAPER 83-1049)

Boeing experience with large jet aircraft validation and demonstrations is examined with particular attention given to the trend toward the use of simulation as a design and validation tool. It is noted that the XB-47 integrated a new set of technology, while the X and YB-52s were used to refine details before entering a large production program. The Dash 80 vehicle was intended to demonstrate Boeing convictions to the airlines and Wright Field. The 727 could have used a prototype but time did not permit it, while the 737 could have benefitted from more component technology demonstration. The first 747 was not a prototype (nor was one needed), the YC-14 integrated a new set of technology, the 757 and 767 were 'prototyped' by flying them on the ground in a complex digital simulation facility. It is concluded that the circumstances were different in each case and general rules are not feasible. Future challenges are identified, including the rise in program costs as a justification for a more accurate technological knowledge. B J

AFTI/F-16 TECHNOLOGY DEMONSTRATOR

M E WADDUPS (General Dynamics Corp., Fort Worth, TX) IN Aircraft Prototype and Technology Demonstrator Symposium, Dayton, OH, March 23, 24, 1983, Proceedings New York, American Institute of Aeronautics and Astronautics, 1983, p 173-179 (AIAA PAPER 83-1059)

AFTI/F-16 is the first aircraft to begin flight testing out of a planned AFTI series of technology demonstrators sponsored by the Air Force Flight Dynamics Laboratory. Four technology areas are being developed and integrated in the AFTI/F-16 testbed: direct force and weapon line pointing, digital flight control system, integrated flight and fire control, and pilot-vehicle interface advances. These are two program phases: Phase I, Digital Flight Control System (DFCS), and Phase II, Automated Maneuvering Attack System (AMAS). More than 45 test flights have been carried out in the DFCS phase to demonstrate the triplex DFCS and its integration into the aircraft. It is noted that AMAS is being prepared for critical design review, and that a series of experiments is planned for the Phase II demonstrator to identify the role of automation in making single-seat attack feasible. GENERALIZED MAXIMUM SPECIFIC RANGE PERFORMANCE

E TORENBEEK and H WITTENBERG (Delft, Technische Hogeschool, Delft, Netherlands) Journal of Aircraft (ISSN 0021-8669), vol 20, July 1983, p 617-622 refs

The conditions for maximum specific range are examined for a given aircraft/engine combination. The optimum flight conditions are derived, taking into account the effects of compressibility on the airplane drag and the effects of engine rating, altitude, and speed on the engine characteristics. Approximations for the drag and/or engine characteristics are introduced to obtain results for special cases. It is shown that the optimum cruise condition is either a fixed point in the generalized drag polars (for the unconstrained case) or a combination of a fixed curve in this polar plot with constraints on T/δ or W/δ , where T is the net propulsive thrust, W is the aircraft all-up-weight, and δ is the relative atmospheric pressure. For turbojet and turbofan aircraft the unconstrained and optimum cruise condition is essentially located in the drag rise, and the classical criteria are not accurate enough for this class of high-subsonic aircraft. It is concluded that this method gives a useful tool for performance optimization in the preliminary design stage, particularly if a reliable estimate of the compressibility drag is available. N B

FLIGHT TESTS OF TOW WIRE FORCES WHILE FLYING A RACETRACK PATTERN

C MATUK (Lulea, Högskola, Lulea, Sweden) Journal of Aircraft (ISSN 0021-8669), vol 20, July 1983, p 623-627. Research supported by the Forsvarets Materielverk

Airplane towing of a target with a long wire in a racetrack pattern has been investigated. First the theoretical background is presented and then the experiments are treated. Twelve flights with different airplane speeds and turn radii are studied. The force at the airplane end of the wire, and the airplane and the target paths are plotted. The maximum force in the wire occurs after the airplane turn is finished. This maximum value is due to whip effect. The occurrence of maximum and minimum values for the vertical distance between airplane and target is demonstrated. The experimental results are compared with theoretical results for the conditions of the experiments. The overall agreement is considered satisfactory. Therefore theoretical graphs on the maximum force in the wire as a function of airplane speed and turn radius can be used to avoid wire failure while flying a racetrack pattern. Author

Work continued toward the development of tooling and processing concepts required for a cocured hat/skin cover assembly. A plan was developed and implemented to develop the process for using preimpregnated T300/5208 with a resin content of 34 + or - 2 percent by weight. Use of this material results in a simplified laminating process because removal by bleeding or prebleeding is no longer required. The approach to this task basically consists of fabricating and testing flat laminated panels and simulated structural panels to verify known processing techniques relative to end-laminate quality. The flat panels were used to determine air bleeding arrangement and required cure cycle. Single and multihat-stiffened panels were fabricated using the established air bleeding arrangement and cure cycle with the resulting cured parts yielding excellent correlation of ply thickness with all surfaces clear of porosity and voids. Work on process verification and tooling development continued. The cover process development was completed with the decision to proceed with low resin content prepreg material (34 + or - 3% by weight) in the fabrication of production readiness verification test (PRVT) specimens and the full-scale covers. The structural integrity of the cover/joint design was verified with the successful test of the cover attachment to fuselage ancillary test specimen (H25). Failure occurred, as predicted, in the skin panel away from the fuselage joint at 141 percent of the design ultimate load. With the successful completion of the H25 test, the PRVT cover specimens, which are identical to the H25 ancillary test specimen, were cleared for production. Eight of the twenty cover specimens were fabricated and are in preparation for test. All twenty of the PRVT spar specimens were fabricated and also were prepared for test. The environmental chambers used in the durability test of ten cover and ten spar PRVT specimens were completed and installed in the load reaction frames. Author

Work in process verification and tooling development continued. The decision was made to redesign the ribs to a more producible design. The bead was eliminated and the truss ribs changed to plain C sections. The solid web rib stiffeners were eliminated as well as the beads and the webs are now reinforced with a syntactic core. Syntectic is an epoxy containing glass microballoons. Two cover specimens were successfully tested. The first specimen (H27) was designed to verify the stability and compression strength of the cover when it is hot and wet. Failure occurred at 120 percent of design ultimate load. As the failure appeared to be fixture induced and was limited to one end of the panel, the remainder of the panel will be tested. The second specimen (H28) was designed to verify the failsafe aspects of the design. The test verified the design. Preparation of the PRVT test facility is nearing completion.

and all ten spar durability specimens were installed in the test chambers. S L

CORRELATION AND EVALUATION OF INPLANE STABILITY CHARACTERISTICS FOR AN ADVANCED BEARINGLESS MAIN ROTOR Final Report
W H WELLER May 1983 85 p refs
(Contract NAS2-11269)
(NASA-CR-166448, NAS 1 26 166448) Avail NTIS HC A05/MF A01 CSCL 01C

A program of experimental and analytical research was performed to demonstrate the degree of correlation achieved between measured and computed rotor inplane stability characteristics. The experimental data were obtained from hover and wind tunnel tests of a scaled bearingless main rotor model. Both isolated rotor and free-hub conditions were tested. Test parameters included blade built-in cone and sweep angles, rotor inplane structural stiffness and damping, pitch link stiffness and location, and fuselage damping, inertia, and natural frequency. Analytical results for many test conditions were obtained. In addition, the analytical and experimental results were examined to ascertain the effects of the test parameters on rotor ground and air resonance stability. The results from this program are presented herein in tabular and graphical form. Author

AIRCRAFT EQUIPMENT RANDOM VIBRATION TEST CRITERIA BASED ON VIBRATIONS INDUCED BY TURBULENT AIRFLOW ACROSS AIRCRAFT EXTERNAL SURFACES
J F DREHER 1983 13 p refs
(AD-A123281) Avail NTIS HC A02/MF A01 CSCL 01C

Vibrations within jet aircraft are caused by a number of phenomena. The principal sources, generally, are jet engine noise and turbulent airflow (pseudo-noise) which impinge on aircraft external surfaces, gust, landing, and takeoff loads, and on-board mechanical equipment such as engines and pumps. This paper describes the structural vibrations induced by turbulent airflow and generalizes the findings to develop pertinent, adaptable random vibration test criteria for aircraft equipment. These criteria are those recently proposed for inclusion in Method 514 of MIL-STD-810C, Environmental Test Methods. Author (GRA)

(AD-A124670, USAAEFA-80-07) Avail NTIS HC A12/MF A01 CSCL 01C

Environmental testing of the YAH-64 helicopter was conducted in the McKinley Climatic Laboratory, Eglin Air Force Base, Florida. The US Army Aviation Engineering Flight Activity was responsible for the evaluation of aircraft systems and the US Army Aviation Development Test Activity was responsible for the mission equipment evaluation. The test consisted of 14.4 hours of aircraft

operating time between 2 November and 16 December 1981. Testing was accomplished at 125, 70, -25, and -50 F with the aircraft attached to the hangar floor. At each temperature, testing consisted of preflight inspections, APU and engine starts, simulated mission profiles, engine shut down, and maintenance inspections. Nine deficiencies were found which would preclude mission accomplishment: (1) the fire control computer was unreliable, (2) the symbol generator required an excessive warm-up time at cold temperatures, (3) the heading and attitude reference system was unreliable, (4) the environmental control unit failed to provide adequate heating or cooling to the cockpit and avionics bays at -25 F, -50 F, and 125 F, (5) the TADS/PNVS and weapons systems did not function adequately at 125 F, (6) the APU aborted its start sequence because it could not accelerate the accessory gearbox to operating speed at -25 F and -50 F, (7) the hydraulic hand pump was ineffective at -25 F and -50 F, (8) the utility hydraulic manifold allowed the accumulator to bleed off at -25 F and -50 F, and (9) failure of the hydraulic flex lines at cold ambient temperatures. CSCL 01C

A three-dimensional parabolic Navier-Stokes numerical solution algorithm has been analyzed for prediction of the nearfield flow development of a VSTOL jet in subsonic crossflow. The essential aspects of algorithm definition, with regards to initial and boundary condition specifications, has been summarized. A momentum conserving pressure gradient computation has been developed to complete the problem definition and facilitate problem initialization. A sequence of overlapping interaction solutions has been evaluated for prediction of a circular jet at $\gamma = 8.0$. The results of the 3DPNS predictions have been compared qualitatively with the sparse available experimental data. It is crucial that quality data be acquired to permit quantitative assessment of the results of this analysis procedure. Author (GRA)

AN EXPERIMENTAL/ANALYTICAL INVESTIGATION INTO THE PERFORMANCE OF A 20-PERCENT THICK, 8.5-PERCENT CAMBERED, CIRCULATION CONTROLLED AIRFOIL M.S. Thesis

J K HARVELL Dec 1982 84 p refs
(AD-A124732, AFIT/GAE/AA/82D-13) Avail NTIS HC A05/MF A01
CSCL 01C

This study was conducted to investigate the effect of two tangentially blown slots on the performance of a 20-percent thick, 8.5-percent cambered elliptical airfoil. Lift, drag, and moment coefficients were obtained at a test Reynolds number of $9.5 \times$

100,000 for secondary slot locations of 73.5 and 83.5 deg. Results show that the use of two tangentially blown slots enables the generation of higher lift coefficients at lower blowing rates. This feature enables the test airfoil to equal the performance of single slotted blown airfoils at lower blowing rates, therefore reducing the parasitic losses and resulting in higher lift/drag ratios. A limited study of the ability of the (TRACON) program to predict circulation controlled airfoil performance was conducted. The program failed to provide accurate predictions for the pressure distribution or force coefficients for the airfoil configuration of this study. This study also found that using different geometry smoothing techniques in the region of the slot resulted in large variations in TRACON's performance predictions. GRA

DESIGN AND ANALYSIS OF A SUBCRITICAL AIRFOIL FOR HIGH ALTITUDE, LONG ENDURANCE MISSIONS M.S. Thesis

I AHMAD Dec 1982 132 p refs
(AD-A124757, AFIT/GAE/AA/82D-1) Avail NTIS HC A07/MF A01
CSCL 01C

An airfoil was designed using the 'inverse design' method. The airfoil was tailored to meet the requirements of high altitude, long endurance missions. The cruise Mach number was 0.65 so compressibility effects were included. In the procedure used, a basic airfoil was generated to meet the thickness and moment requirements. It was then refined to ensure desired behavior of the boundary layer at the operating angles of attack. Computer codes designed by Richard Eppler were used for this study. The airfoil was analyzed by using a viscous effects analysis program designed by Shang et al and a comparison was made with results obtained through Eppler's code. GRA

MIL-F-8785C, Military Specification -- Flying Qualities of Piloted Airplanes, has been reformatted into a MIL Standard and a supporting MIL Handbook. This report is a draft of the proposed MIL Standard, which has been developed by Systems Technology, Inc., with the McDonnell Aircraft Company acting in a consulting role. It is presented to industry and the United States armed forces for comments and proposed revisions. The responsibility for the legal MIL Standard and Handbook rests within the armed forces. This draft will be considered and form the basis for revisions, industry and government comments and a tri-service review in the process of developing the MIL Standard and Handbook. Suggested values and background information are contained in this volume MIL-F-8785C and the backup documents to both it and its predecessor, MIL-F-8785B, were reviewed extensively. Much of the material contained therein is still considered to be valid and relevant and has been retained in this document. Author (GRA)

The Airworthiness and Flight Characteristics (A&FC) Evaluation Part 2, of the prototype YAH-64 helicopter (S/N 77-23258) was conducted at Palomar Airport, Carlsbad, California (elevation 328 ft) A total of 12 flights were conducted between 8 December and 17 December 1981 and 143 productive hours were flown Prior to this test significant design changes were incorporated in the flight control system, the digital automatic stabilization equipment (DASE) and the stabilator system to correct objectionable characteristics determined during the airworthiness qualification program Significant improvements in handling qualities were noted since the previous evaluation Uncommanded control inputs, caused by recentering of the SAS actuators, upon failure or disengagement of the DASE may cause a potentially hazardous situation The instrument flight characteristics of the YAH-64 are satisfactory in smooth air but have yet to be evaluated in turbulent conditions Manual programming of the stabilator in rearward flight did not significantly reduce objectional vibration at the pilot's station Results of this test have shown that both previously reported deficiencies and 14 shortcomings have been corrected One deficiency not previously observed, was identified the possibility of a false indication of dual engine failure following a single engine failure Two previously unreported shortcomings were also identified GRA

EVALUATION OF AERODYNAMIC DERIVATIVES FROM DO-28-TNT FREE-FLIGHT MODEL TESTS

M MARCHAND Apr 1983 40 p refs Transl into ENGLISH of 'Bestimmung der Derivate eines Do-28-TNT Modells aus Freiflugversuchen', DFVLR, Brunswick Report DFVLR-FB-82-17, May 1982 Original report in GERMAN previously announced as N83-18711

(ESA-TT-784, DFVLR-FB-82-17) Avail NTIS HC A03/MF A01, original German version available from DFVLR, Cologne DM 16 50

Free flight tests were conducted on a Do-28-TNT model to determine the derivatives of longitudinal motion Preprogrammed control inputs were given to the elevator or the flaps during the free flight phase The mathematical model which included the frequency dependent effects of rapid flap deflection and the pitch rate measuring system is described Analysis reveals that the dynamics of the measuring circuitry must be considered in the mathematical model Changes in the resulting derivatives if the time constant of a filter located in the pitch rate channel was not known exactly, or was neglected were examined In order to determine pitching moment derivatives, a fast combined step input signal is best For the normal force derivatives a slower input with additional trimming by mass changes is preferable Comparison of the identifications performed with different mathematical models shows that for an investigation into the influence of nonstationary effects a significantly higher frequency excitation, in the range of 5 to 10 Hz, is necessary Author (ESA)

 (AD-A124949, AFWAL-TR-82-3043) Avail NTIS HC A03/MF A01 CSCL 01C

Two annular peripheral jet air cushion models were designed, fabricated and tested in-house at the Mobility Development Laboratory (AFWAL/FIEMB) at Wright-Patterson AFB, OH. The vehicles were designed to attain maximum hover height at a fixed level of available power based on Barratt Theory, and achieve maximum static hover stability. The assumptions and analytic development of Barratt Theory are discussed, as well as some design aspects to achieve vehicle cushionborn stability. Test results indicated Barratt lift predictions to be slightly conservative. Both vehicles were unstable at high hover power heights in their basic configurations. The addition of several configurations of vertical strakes compartmenting the cushion area achieved varying improvements to vehicle stability. The addition of full cushion depth cruciform strakes completely stabilized the vehicles. Vehicle instability was concluded to be caused by aerodynamic activity in the cushion area induced by shear from high momentum jet airflow. GRA

SURVIVABILITY OF INTERDICTION AIRCRAFT: SENSITIVITY TO TERRAIN FOLLOWING, COMMAND ALTITUDE, VELOCITY AND ELECTRONIC COUNTER MEASURES M.S. Thesis
 M D REID Dec 1982 230 p refs
 (AD-A124870, AFIT/GOR/MA/82D-2) Avail NTIS HC A11/MF A01 CSCL 01C

The FORTRAN program TERRAIN is a deterministic model of a tactical aircraft penetrating a Surface-to-Air (SAM) and Anti-Aircraft Artillery (AAA) threat. TERRAIN generates a terrain following flight path profile based on specified flight parameters and then assesses the aircraft vulnerability in terms of exposure time and shots taken by individual threat site and the total defense. Modifications were made to assess aircraft survivability (the probability of kill of the aircraft) and to calculate the effect on the probability of kill of electronic countermeasures. The TERRAIN model is particularly sensitive to the selection of beddown, rate of fire for AAA, aircraft velocity, and aircraft commanded clearance altitude. A comparison of the strengths and weaknesses of the original TERRAIN model, the modified TERRAIN model, and six other SAM/AAA models has been compiled. A user's guide for the modified TERRAIN model is provided. Author (GRA)

LATERAL FLYING QUALITIES OF HIGHLY AUGMENTED FIGHTER AIRCRAFT, VOLUME 1 Final Report, Mar. 1980 - May 1982
 S J MONAGAN, R E SMITH, and R E BAILEY Wright-Patterson AFB, Ohio AFWAL Jun 1982 85 p refs
 (Contract F33615-79-C-3618)
 (AD-A118070, CALSPAN-6645-F-8-VOL-1, AFWAL-TR-81-3171-VOL-1) Avail NTIS HC A05/MF A01 CSCL 01C

This in-flight simulation experiment, using the USAF NT-33 variable stability aircraft operated by Calspan, was undertaken to generate lateral-directional flying qualities data applicable to highly augmented fighter aircraft. In particular, the effects of time delay and prefilter lag in the lateral flight control system were studied for representative Flight Phase Category A and C tasks. The combined effects of those elements as well as the effects of nonlinear command gain and high Dutch roll damping were also evaluated. Tasks included were actual target tracking, air refueling and precision landing as well as special Head-Up Display (HUD) tracking tasks. Results indicated that a properly designed HUD bank angle tracking task is a valid flying qualities evaluation task. Data show that lateral flying qualities are very sensitive to control system time delay and very short values of roll mode time constant typically result in poor lateral flying qualities. Excellent separation of the data into flying qualities level is achieved for the Category A task data using time domain equivalent indicated by the data, sensitivity to equivalent time delay is a minimum at this value. Volume I contains the body of the report, while Volume II consists of the Appendices. GRA

In connection with a continuing improvement regarding the performance of new gas turbine designs, both gas and metal temperature measurements for the next generation of engines will have to be performed at increasingly higher temperature levels in regions where heat fluxes, g-loads, erosion rates, and sensitivity of measurement requirements to instrument installation perturbations will all increase The present investigation is concerned with the status of a number of advanced techniques for high temperature measurement currently in various stages of development and acceptance The devices considered for the measurement of metal temperatures include thin film thermocouples, pyrometers, and IR scanning cameras Approaches for determining gas temperatures are also discussed, taking into account Coherent Anti-Stokes Raman spectroscopy (CARS) and dynamic temperature sensors

A83-36326# APPLICATION OF THIN FILM STRAIN GAGES AND THERMOCOUPLES FOR MEASUREMENT ON AIRCRAFT ENGINE PARTS

W R STOWELL and R A WEISE (General Electric Co., Cincinnati, OH) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 6 p
(AIAA PAPER 83-1292)

In connection with aerodynamic disturbances caused by wire strain gages on compressor blade air foils, a program was initiated to develop measurement techniques which could provide dynamic strain information from blades in an operating test engine without affecting the response of the blades to their environment and without changing significantly the airflow Reliable gages could be developed for measurements at temperatures up to 1000 F (540 C) Attention is given to the development of gages which are reliable at metal temperatures of 1200 F (approximately 650 C) Reliable thermocouples for measurements on operating turbine buckets are also being developed It is intended to apply thin film thermocouples to turbine buckets in connection with a study involving the mapping of temperature profiles in the vicinity of air cooling holes on advanced bucket designs Attention is given to a

thin film insulator, quality control, and aspects of thin film thermocouple development

A83-36327# INSTRUMENTAL PROBLEMS IN SMALL GAS TURBINE ENGINES

J ALLAN, III (Garrett Turbine Engine Co., Phoenix, AZ) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 12 p
(AIAA PAPER 83-1293)

The small size, high rotational speeds, and unusual flowpath configurations associated with small gas turbine engine development programs make it necessary to develop instrumentation techniques and systems compatible with the special problems encountered in connection with the smaller engines Typical measurement techniques include blade tip clearance measurement systems, slip-ring systems, telemetry systems, and torque measurement systems A description is provided of the 'single-point probe' survey system This system represents a computer-controlled preprogrammed traversing actuator and data acquisition system which allows vane wake mapping and rotor performance mapping without the use of traditional wake rakes This method of performance mapping reduces flow blockage and flow disturbances and eliminates measurement inaccuracies associated with sensor-to-sensor variations

(AD-A124681, AFIT/GE/EE/82D-24) Avail NTIS HC A10/MF A01 CSCL 17G

This report describes the development of an error model for the Helmet-Mounted Sight System This model is designed to generate the HMS aiming errors that are encountered when the

sight is used in the Navigation Update role. This report details the research performed to identify, categorize, and model the Helmet-Mounted Sight (HMS) errors. The HMS error model includes error generated by the human operator, the HMS equipment, the vibration environment, canopy refraction, and the system boresighting procedure. The final portion of this report demonstrates the performance of this model in a Monte Carlo simulation program. Author (GRA)

THEORY UNDERLYING THE PERIPHERAL VISION HORIZON DEVICE

K E MONEY Dec 1982 13 p refs
(AD-A124426, DCIEM-TC-82-C-57) Avail NTIS HC A02/MF
A01 CSCL 01D

A simple statement of the Peripheral Vision Horizon Device (PVHD) theory is that the likelihood of pilot disorientation in flight can be much reduced by providing a new kind of artificial horizon that will provide orientation information to peripheral vision. In considering the validity of this theory, three questions which are crucial are discussed: (1) Why was the artificial horizon chosen, instead of some other flight instrument? (2) Why is peripheral vision used instead of foveal vision? (3) Is there convincing evidence that peripheral vision is particularly well suited to the processing of orientation information? GRA

THERMAL CYCLING IN COMPACT PLATE-FIN HEAT EXCHANGERS

T D EASTOP and G SINGH (Wolverhampton Polytechnic, Wolverhampton, England) IN Numerical methods in thermal problems. Volume 2. Proceedings of the Second International Conference, Venice, Italy, July 7-10, 1981. Swansea, Wales, Pineridge Press, 1981, p 723-736 refs

Compact plate-fin heat exchangers of the considered type are used in the aircraft industry because of their small volume and weight. The heat exchanger consists of a series of flat plates, sandwiching corrugated plates, and separated by spacer bars. The heat exchanger considered in the present investigation is subjected to a sudden flow of hot air on one side of the exchanger with the air coolant side inlet temperature remaining constant. Since this sudden increase in temperature occurs every time the aircraft takes off, the heat exchanger is subjected to a thermal cycle with a long time period. A cross-flow plate-fin type heat exchanger with both fluids unmixed is analyzed numerically, taking into account the thermal storage of the fluids and the metal, but assuming that the fluid properties are constant. GR

AR.318 - ITALY'S LOW-COST GA TURBOPROP

J MOXON Flight International (ISSN 0015-3710), vol 123, May 21, 1983, p 1398, 1399

Design and performance features of the AR 318 600 shp turboprop, targeted for production in 1985, are detailed. The AR 318, the first turbine engine to be wholly built in Italy, has been designed for simplicity and low-cost manufacture. It has a single shaft, a single-stage centrifugal compressor at one end driven by a two-stage turbine at the other, and a reverse flow annular combustion chamber. An epicyclic gearbox transfers power to the propeller, and drives the oil pump, fuel control unit, the starter/generator, and the propeller control unit. The dry weight is 310 lb and fuel consumption is 0.578 lb/hr per shp. Further increases of power to 850 shp are projected with a new centrifugal compressor. There is no provision for turbine blade cooling. Overhaul life is expected to be 500 hr at first, and 3500 hr with experience. M S K

TEMPERATURE AND COMPOSITION MEASUREMENTS IN A RESEARCH GAS TURBINE COMBUSTION CHAMBER

W P JONES and H TORAL (Imperial College of Science and Technology, London, England) Combustion Science and Technology (ISSN 0010-2202), vol 31, no 5-6, 1983, p 249-275. Research sponsored by Rolls-Royce, Ltd refs

Motivation regarding an improvement in the design of gas turbine combustion chambers is related to the need to achieve improved combustor exit temperature profiles, longer combustor life, and reduced combustion generated pollutant emission levels. Better understanding of combustor operation is required to achieve these objectives and this in turn requires sufficiently detailed experimental data. The present investigation is concerned with measurements in a model can-type combustion chamber intended to be representative of aircraft gas turbine combustors. The fuel employed was gaseous propane. Measurements are presented of O₂, CO, CO₂, H₂, unburnt hydrocarbons, NO_x, and temperature, taking into account the exit plane and various planes within the combustor at different air inlet temperatures. NEW TRENDS IN COMBUSTION RESEARCH FOR GAS TURBINE ENGINES

E J MULARZ (NASA, Lewis Research Center, Combustion Fundamentals Section, U.S. Army, Propulsion Laboratory, Cleveland, OH) IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers New York, American Institute of Aeronautics and Astronautics, 1983, p 37-44 Army-supported research refs

Research on combustion is being conducted to provide improved analytical models of the complex flow and chemical reaction processes which occur in the combustor of gas turbine engines, in order to enable engine manufacturers to reduce the development time of these concepts. The elements of the combustion fundamentals program is briefly discussed with examples of research projects described more fully. Combustion research will continue to emphasize the development of analytical models and the support of these models with fundamental flow experiments to assess the models accuracy and shortcomings. THE EFFECT OF FUEL ATOMIZATION ON SOOT-FREE COMBUSTION IN A PREVAPORIZING COMBUSTOR

W BUSCHULTE (Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Institut fuer chemische Antriebe und Verfahrenstechnik, Hardthausen, West Germany) IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers New York, American Institute of Aeronautics and Astronautics, 1983, p 79-89 refs

A combustor system with combustion gas recirculation for soot-free combustion of hydrocarbon fuels with air is described. The system itself contains - besides means for air supply and distribution and for fuel supply, atomization and distribution - a mixing tube for the introduction of recirculating combustion gas into the air-fuel-mixture stream promoting fuel evaporation and a flame tube for defining a properly sized reactor space. Certain interrelationships between certain measures of the combustor elements are to be obeyed to achieve proper and stable operation. Special importance for proper functioning was predicted by theory for the maximum droplet size in the fuel spray. Experimental studies have been carried out to evaluate the influence of the droplet size in the spray on sootfreeness of combustion. As well droplet size, fuel-air mixture ratio and fuel viscosity has been varied. The results show a clearly defined influence of fuel droplet size. As a subsidiary result viscosity effects on nozzle flow parameters and maximum droplet size development are described Author

SEMI IMPLICIT CALCULATION METHOD OF THE FLOW FIELD IN A DUCT WITH THE FLAME STABILIZED BY A STEP

P MAGRE (ONERA, Chatillon-sous-Bagneux, Hauts-de-Seine, France) IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers New York, American Institute of Aeronautics and Astronautics, 1983, p 147-153 refs

A finite volume semiimplicit and fast numerical method for combustion flow prediction is applied to a problem involving the coupling of equations, with a view to ensuring computational stability. After performing tests for the validation of computations without combustion for the cases of various geometrical configurations, the method's suitability for combustion flow phenomena is tested in the case of a premixed flame that is stabilized by a step. It is found that, despite the turbulent combustion model's simplicity, the numerical method is able to provide a realistic simulation of combustion flow O C

INLET, ENGINE, AIRFRAME CONTROLS INTEGRATION DEVELOPMENT FOR SUPERCRUISING AIRCRAFT

J H HOUCARD, C M CARLIN, and E TJONNELAND (Boeing Military Airplane Co., Seattle, WA) IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers New York, American Institute of Aeronautics and Astronautics, 1983, p 342-356 refs (Contract NAS1-16150)

In connection with a consideration of advanced military aircraft systems, attention is given to research for improving the technology of the design of supersonic cruise aircraft. Syberg et al (1981) have shown that an analytic design method is now available to accurately predict the flow characteristics of axisymmetric supersonic inlets, including off-design angle of attack operation. On the basis of information regarding the inlet flow characteristics, the control system designer can begin the inlet design and development, before wind tunnel testing has begun. The present investigation is concerned with details and status of inlet control technology. A detailed representation of a supersonic propulsion system is developed. This development demonstrates the feasibility of the selected hybrid computational concept. G R

THE TRANSIENT PERFORMANCE OF TURBOJET ENGINES AND AXIAL COMPRESSORS

S M RAMACHANDRA, F I ABDELMALIK, and M A MUNTASSER (Alfateh University, Tripoli, Libya) IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers New York, American Institute of Aeronautics and Astronautics, 1983, p 394-398

Slam acceleration characteristics of turbojet engines determine the maneuvering performance of military aircraft and the emergency handling characteristics of civil aircraft. A pair of coupled differential equations for the rotational speed and the mass flow rate of the turbojet engine is presented together with an algebraic equation for the compression pressure ratio, giving the overall system performance in terms of the component performance. The differential equations have been solved analytically assuming an overall linear performance of the exit jet velocity, the exhaust plane pressure and the thrust. It is found that the mass flow rate variation lags/leads in phase the rotational speed acceleration/deceleration for a non-stationary engine while for the case of the stationary engine, this phase reverses. The thrust variation follows the mass flow rate variation in a similar manner. An expression for the characteristic relaxation time of the engine mass flow rate response is given which is also nearly equal to that of the thrust relaxation time. Author

THE EFFECT OF VARIATION OF DIFFUSER DESIGN ON THE PERFORMANCE OF CENTRIFUGAL COMPRESSORS

A M EL SIBAIE (Ain Shams University, Cairo, Egypt) and M H NASSAR (Egyptian Air Force, Cairo, Egypt) IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers New York, American Institute of Aeronautics and Astronautics, 1983, p 571-578 refs

Attention is given to the effect of the number of diffuser vanes, vane curvature, and diffuser rotation, on the performance of a

centrifugal compressor applied to an aviation piston engine. Diffuser vane number and curvature have direct effects on compressor stage performance and diffuser efficiency, where the controlling factor is the ratio of overlap area between two successive vanes and the number of diffuser vanes. Diffuser efficiency and compressor pressure ratio increase with this ratio. By rotating the diffuser with the same angular velocity as the impeller, a higher pressure ratio was obtained for the compressor, together with a wider mass flow rate range. O C

COMPONENT LIFE REDUCTION DUE TO USE OF AVGAS IN GAS TURBINE ENGINES

M L SIDANA and K SRINIVASA (Ministry of Defence, Directorate of Aeronautics, Bangalore, India) IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers. New York, American Institute of Aeronautics and Astronautics, 1983, p 597-602

Attention is given to the effects of the use of AVGAS fuel engines designed for operation on AVTUR fuels, with the intention of assessing the effects of the fuel change on fuel pump and hot section component service lives. Erosion rate, crack growth rate, and burn areas were monitored, and the effect of erosion on turbine blade fatigue and creep life was analyzed and found to be life-limiting. Low lubricity and higher vapor pressure also adversely affected fuel pump life. O C

LIFE ESTIMATION METHODS OF GAS TURBINE ROTATING COMPONENTS

J S RAO (Bharat Heavy Electricals, Ltd., Hyderabad, India) IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers. New York, American Institute of Aeronautics and Astronautics, 1983, p 603-610 refs

An expression is derived for the computation of the equivalent cyclic damage rate of compressor and turbine disk spacers and shafts subjected to low cycle fatigue, where the fatigue is due to the cyclic loading which arises with engine speed changes. The expression allows gas turbine designers to predict the low cycle fatigue life of rotating components in light of the assumed flight envelope of an aircraft. A method is also given for the assessment of compressor blade life, which is based on a residual strength plot derived from the rig fatigue testing of blades. O C

CONTAINMENT OF TURBINE ENGINE FAN BLADES

J M PAYEN (SNECMA, Departement Mecanique Avancee, Moissy-Cramayel, Seine-et-Marne, France) IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers. New York, American Institute of Aeronautics and Astronautics, 1983, p 611-616

Presented are an analysis of the gas turbine engine fan blade fragmentation process, an evaluation of blade fragment energy, an investigation of the fan casing performance mode, and the development of a stressing method applicable to metal containment casings which makes use of Kevlar fabric. The metal casing stressing model employed is based on the theory of dynamic shearing perforation. Tests simulating blade fragment impacts on Kevlar fabric strips were used to investigate fabric behavior and to define a method for the computation of the number of fabric layers required to achieve containment. A CONTRIBUTION TO AIRWORTHINESS CERTIFICATION OF GAS TURBINE DISKS

J DREXLER and J STATECNY (Vyzkumny a Zkusebni Letecky Ustav, Prague, Czechoslovakia) IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers. New York, American Institute of Aeronautics and Astronautics, 1983, p 617-622

Airworthiness proof of gas turbine disks involves some specific problems connected with the experimental verification of the admissible probability of a hazardous effect due to an individual

failure. The authors' attempt is to present a simple method how to meet the airworthiness requirements in case that the disk blade fir-tree attachment number exceeds some tenths, the dominating damage mechanism being low cycle fatigue. The structure of the method consists in taking the disk operation or test as an experiment being run simultaneously on a group of identical test specimens up to appearances of the cracked attachment. Cumulative numbers describing achievement of the disk limit state. Author

INVESTIGATION METHODS ON RESIDUAL STRESSES IN AERO ENGINES COMPONENTS

J KAFKA, F NECKAR (Ceske Vysoke Ucení Technické, Prague, Czechoslovakia), D SMETANA, and P VOSTATEK (Motorlet, Prague, Czechoslovakia) IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers. New York, American Institute of Aeronautics and Astronautics, 1983, p 677-683 refs

Methods and obtained results are presented for the measurements of residual stresses in surface layers of chromium steel and titanium alloy materials used in the fabrication of axial compressor vanes and impellers for a small turboprop engine. The measurements were conducted in order to increase both service life and reliability and fabrication process productivity. In the case of compressor vanes, the connection between residual stress magnitude and fatigue limit is established. Surface layer residual stress magnitude and character, after titanium alloy milling and finishing operations, were measured through the destructive method of electrochemical removal from the specimen surface while recording deformation. STRESS ANALYSIS OF CRITICAL AREAS OF LOW-PRESSURE COMPRESSOR-DISC ASSEMBLY OF A DEVELOPMENTAL AERO-ENGINE

R PADMANABHAN, K RAMACHANDRA, B J RAGHUNATH, and V MARUTHI (Gas Turbine Research Establishment, Bangalore, India) IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers. New York, American Institute of Aeronautics and Astronautics, 1983, p 684-691

A series of three-dimensional photoelastic investigations has been conducted in order to estimate the strength reserve factors of compressor blades and disks which employ lugs for attachment. Attention is given to the influence of untwisting torque of wide chord and large twist blades on the stresses at the concave and convex profile fillets of blade aerofoil roots, together with the combined effect of large axial loads, rim-bending loads, and hoop loads, on stress concentration factors around the cutouts in the compressor disk rims. Concave profile stresses as high as 5.8 times greater than those theoretically obtained for the root fillets of first stage blades are noted. It is also confirmed that the influence of lug axial loads on disk stress concentration factors, under normal operating conditions, is not as significant as the radial rim loads. O C

VARIATION OF ROTOR BLADE VIBRATION DUE TO INTERACTION OF INLET AND OUTLET DISTORTION

S YOKOI, S NAGANO (Ishikawajima-Harima Heavy Industries Co., Ltd., Aero-Engine and Space Development Group, Tokyo, Japan), and T ABE (Japan Defense Agency, Technical Research and Development Institute, Tokyo, Japan). IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers. New York, American Institute of Aeronautics and Astronautics, 1983, p 700-707.

The variation of rotor blade vibration due to the interaction of inlet and outlet distortion is experimentally investigated by means of a two-stage fan with a typical circumferential distortion screen. The vibration level of the first and second stage rotor blades, and the pressure distributions upstream and downstream of the second stage, were investigated and compared for various screen circumferential positions. In the case of combined inlet distortions, the distortion levels significantly changed according to screen circumferential position. In the case of combined inlet and outlet distortions, inherent inlet distortion was nearly compensated for by outlet distortion for any screen position, and also yielded a constant blade vibration level. DESIGN OF DRY-FRICTION DAMPERS FOR TURBINE BLADES

W ANCONA and E H DOWELL (Princeton University, Princeton, NJ). IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers. New York, American Institute of Aeronautics and Astronautics, 1983, p 708-722. refs. (Contract NAG3-221)

A study is conducted of turbine blade forced response, where the blade has been modeled as a cantilever beam with a generally dry friction damper attached, and where the minimization of blade root strain as the excitation frequency is varied over a given range is the criterion for the evaluation of the effectiveness of the dry friction damper. Attempts are made to determine the location of the damper configuration best satisfying the design criterion, together with the best damping force (assuming that the damper location has been fixed). Results suggest that there need not be an optimal value for the damping force, or an optimal location for the dry friction damper, although there is a range of values which should be avoided. O C

CRITERIA FOR OPTIMIZING STARTING CYCLES FOR HIGH PERFORMANCE FIGHTER ENGINES

J B DAVIS and R R POLLAK (United Technologies Corp., Government Products Div., West Palm Beach, CA). AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983. 12 p. (AIAA PAPER 83-1127)

This paper summarizes some of the criteria that must be considered to optimize starting cycles for modern fighter aircraft engines. Due to high performance compression system designs, the ability to start successfully has become more challenging. The effects of major variables that influence starting ability are discussed together with a description of improved techniques that are now available to quantify these variables. As a result of these development efforts and the advent of fully electronic control systems, a unique, closed-loop starting system that has been designed and developed to provide consistency to the starting cycle regardless of external or internal conditions of the engine are discussed. SIMULATION OF ADVANCED ENGINE LUBRICATION AND ROTOR DYNAMICS SYSTEMS - RIG DESIGN AND FABRICATION

A PEDUZZI (United Technologies Corp., Government Products Div., West Palm Beach, FL). AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983. 9 p. (AIAA PAPER 83-1133)

Advanced technology dual rotor turbofan and turbojet engines will incorporate rotor support system features to increase rotor speed capability and engine thrust-to-weight ratio while reducing cost. These features may include straddle-mounted rotors, high strain energy low pressure rotors and counter-rotating shafts with a load-carrying intershaft bearing. A 'bladeless engine' rig incorporating the above features has been designed and fabricated, and test plans formulated. The rig will be utilized to evaluate counter rotating intershaft bearing lubrication and breather system operation, low leakage intershaft seals, and dynamic operation of counter-rotating rotors including identification of critical speed modes, shaft deflection and bearing load sensitivity to rotor imbalance, as well as oil film damper operation. Pre-test calibrations of damper springrate and high and low rotor resonant frequencies were conducted. System endurance will be evaluated in a 150-hour cyclic endurance test. Author

EFFECT OF FUEL COMPOSITION ON NAVY AIRCRAFT ENGINE HOT SECTION COMPONENTS

R E VOGEL, S B REIDER (General Motors Corp., Detroit Diesel Allison Div., Indianapolis, IN), and P A KARPOVICH (U S Naval Air Propulsion Center, Trenton, NJ). AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983. 8 p. Navy-supported research. (AIAA PAPER 83-1147)

Fuel composition is examined with a view to relaxing fuel specifications and thus increasing the supply of gas turbine fuel. The tests are carried out on the T56 aircraft engine, whose combustion system is described. The effect of variation in fuel properties is evaluated by testing 10 experimental fuels in a single-can combustion rig. The rig simulates a 60-deg sector of the T56 engine combustion system from diffuser inlet to turbine inlet; this includes the compressor discharge passage, the diffuser air passage, the inner and outer cases, and the turbine inlet passage. The T56-A-14 combustion system is found in general to be highly tolerant of broadened fuel specifications. It is believed that the limitations imposed on the ignition/lean blowout capability could be removed or reduced by modifications to the fuel injector design. The incidence of a strong statistical correlation between fuel properties and combustor performance is found to be much higher at low power (idle, altitude cruise) than that at high power (climbout, takeoff). Another finding is that low-power gaseous emissions are influenced by physical fuel properties (distillation, viscosity, freeze point, pour point). No significant fuel property-emission correlations are found at high power. C R

THE PERFORMANCE OF SINGLE-SHAFT GAS TURBINE LOAD COMPRESSOR AUXILIARY POWER UNITS

C RODGERS (Solar Turbines, Inc., Turbomach Div., San Diego, CA) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 8 p refs (AIAA PAPER 83-1159)

Military and commercial aircraft operating from remote airfields can attain self-sufficiency with small onboard auxiliary power units (APU). When large amounts of pneumatic ground power are required for aircraft systems cooling at hot day conditions in addition to self-start capability, the optimum APU is that which can provide air for the environmental control system and to an air turbine starter. Three gas turbine APU configurations are used to supply essentially 100 percent pneumatic power output. They include the single-shaft gas turbine integral bleed (SSGTIB), the single-shaft gas turbine load compressor (SSGTLC), and the two-shaft gas turbine load compressor. The SSGTIB has dominated the pneumatic APU field for two decades. Recently, the SSGTLC has entered the U.S. pneumatic power APU market. The SSGTLC has operational characteristics which are different from those of the SSGTIB. Attention is given to relevant information on the SSGTLC APU characteristics. This information can be used for secondary power tradeoff studies by the aircraft-user G R

A83-36252*# General Electric Co., Cincinnati, Ohio THE AERODYNAMIC DESIGN AND PERFORMANCE OF THE GENERAL ELECTRIC/NASA EEE FAN

T J SULLIVAN (General Electric Co., Cincinnati, OH) and R D HAGER (NASA, Lewis Research Center, Cleveland, OH) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 11 p refs (AIAA PAPER 83-1160)

The aerodynamic design and test results of the fan and quarter-stage component for the GE/NASA Energy Efficient Engine (EEE) are presented. The fan is a high bypass ratio, single-stage design having 32 part-span shrouded rotor blades, coupled with a unique quarter-stage arrangement that provides additional core-stream pressure ratio and particle separation. The fan produces a bypass pressure ratio of 1.65 at the exit of the low aspect ratio vane/frame and a core-stream pressure ratio of 1.67 at the entrance to the core frame struts. The full-scale fan vehicle was instrumented, assembled and tested as a component in November 1981. Performance mapping was conducted over a range of speeds and bypass ratios using individually-controlled bypass and core-stream discharge valves. The fan bypass and core-stream test data showed excellent results, with the fan exceeding all performance goals at the important engine operating conditions Author

DESIGN AND PERFORMANCE OF A LOW ASPECT RATIO, HIGH TIP SPEED MULTI-STAGE COMPRESSOR

W A TESCH and R L PASE (United Technologies Corp., Government Products Div., West Palm Beach, FL) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 8 p (AIAA PAPER 83-1161)

The aerodynamic design and performance of a low aspect ratio, high tip speed multi-stage axial compressor for application in turboshaft engines is presented. The axial compressor has been designed to be used in conjunction with a centrifugal stage to produce the required cycle pressure ratio. Designed to produce above 7 to 1 pressure ratio, the compressor is comprised of five axial stages and features variable geometry to meet the off-design stability requirements. The average aspect ratio and solidity are 1.2 and 1.6, respectively. Considerations as a result of the presence of a centrifugal stage and the mechanical arrangement of the engine are discussed. The compressor has been evaluated experimentally as a component rig powered by a 6000 hp electric

motor. Testing encompassed 153 hours of running over the entire anticipated operational regime. At design speed, the compressor has demonstrated a peak adiabatic efficiency above 85 percent and a stall margin above 20 percent Author

MAXIMUM LOADING CAPABILITY OF AXIAL FLOW COMPRESSORS

J K SCHWEITZER and J E GARBEROGLIO (United Technologies Corp., Government Products Div., West Palm Beach, FL) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 10 p refs (Contract F33615-76-C-2091) (AIAA PAPER 83-1163)

A maximum loading prediction system for determining the design speed stall margin capability of axial flow compressors is presented. The formulation of the primary correlations for this system is based on the analogy between a compressor cascade and a diffuser passage. Semi-empirical corrections are applied to relate the initial cascade-derived maximum loading values to the real compressor environment. Good agreement is demonstrated between the predicted and test stall margins for a wide range of both single- and multi-stage compressor geometries. As the system is formulated on the basis of meanline parameters, a useful tool has resulted capable of guiding the selection of the primary compressor design variables early in the design phase Author

A SURVEY OF TRENDS IN MODERN TURBINE TECHNOLOGY

K D MACH and D W ZABIEREK (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, OH) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 3 p (AIAA PAPER 83-1174)

In connection with the development of component technology, there exists a potential for dramatic increases in turbine performance. Advances are needed with respect to materials, heat transfer, and aerodynamics. An important contribution to the improvement of material characteristics can be provided by suitable coatings. To survive in an environment of high-temperature gas, a material will need protection against oxidation, corrosion, and erosion. Extensive development work with respect to coatings is, therefore, expected through the end of the century. Except for coatings, turbine vanes and blades will continue to be made of metal for the next several years. The most serious drawback of ceramics, brittleness, has not yet been overcome. Of the metals, the refractories are the least developed for turbine applications with respect to conventional superalloys, very little room remains for further development. Extensive studies and development work during the next decade will be concerned with heat transfer, cooling, and aerodynamic design G R

CRUISE MISSILE PROPULSION VERSUS COMMERCIAL AIRLINER PROPULSION - DIFFERENT CHALLENGES CAN PRODUCE SIMILAR ENGINE CYCLES

L CRUZEN (Williams International, Walled Lake, MI) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 6 p refs (AIAA PAPER 83-1176)

A commercial turbofan engine, the JT8D, which is employed to power a number of airliners, is compared with F107 engines, which power the Air Force and Navy cruise missiles. The design requirements for aircraft and cruise missile propulsion systems are examined. It is found that a cruise missile and a commercial airliner engine do not share many of the major parameters which influence cycle selection. The airliner application tends to call for higher bypass ratio and, consequently, for higher turbine inlet temperatures. However, an inspection of relevant design data shows that JT8D and F107 cycle parameters are notably similar, although the JT8D-17 engine is about 24 times the size of the F107-WR-101. In this connection, questions arise regarding the reasons for the low bypass ratio employed by the JT8D-17 cycle

07 AIRCRAFT PROPULSION AND POWER

It is shown that the JT8D-17 characteristics are the results of evolutionary changes G R

ADVANCED TURBOPROP AND DUAL CYCLE ENGINE PERFORMANCE BENEFITS AND INSTALLATION OPTIONS ON A MACH 0.7 SHORTHAIL TRANSPORT AIRCRAFT

H W BENNETT (Rolls-Royce, Ltd., Derby, England), A P HAYS, and G L HERSTINE (Lockheed-California Co., Burbank, CA) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 12 p refs (AIAA PAPER 83-1212)

The block fuel and direct operating costs of a 100 passenger aircraft powered by an advanced turbofan, turboprop, and a dual cycle engine were evaluated. The locations of the turboprop engines were also evaluated based on aircraft weight, drag, and inlet recovery penalties. Results show that the underwing mounted turboprop engine with offset gearbox and chin inlet was the optimum configuration. The turboprop is found to have a block fuel advantage of 27 percent over the turbofan at the average stage length of 300 n mi and a 26 percent advantage at the design range of 1000 n mi. The direct operating cost benefit was determined to be 16 percent at the average stage length. The dual cycle engine exhibited a block fuel benefit of only 22 percent at the average stage length and 21 percent at the design range, while the direct operating cost benefit was 12 percent at the average stage length. THRUST REVERSER EXHAUST PLUME REINGESTION TESTS FOR A STOL FIGHTER MODEL

N F AMIN and C J RICHARDS (Northrop Corp., Hawthorne, CA) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 11 p (AIAA PAPER 83-1229)

The development of advanced tactical fighter aircraft requiring short takeoff and landing capability in order to operate from bomb damaged runways is being considered. A STOL aircraft with a reversing nozzle may be needed to satisfy this requirement. Thrust reversing represents an effective approach for decelerating an aircraft, both in-flight and during ground roll. A potential problem associated with reversing thrust during aircraft ground roll is related to the ingestion of hot exhaust gases into the engine inlet. The reingested gases can generate pressure and temperature distortion levels at the engine compressor face substantially above the engine distortion tolerance limits, resulting in possible engine damage. It is found that for an effective thrust reverser design, it is necessary to develop a detailed exhaust plume reingestion test data base. Attention is given to a novel flow visualization water and wind tunnel test program which was conducted to develop the required data base. G R

A MONTE CARLO SIMULATION OF THE ENGINE DEVELOPMENT PROCESS

W R ALLEY, JR and H D STETSON (United Technologies Corp., Government Products Div., West Palm Beach, FL) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 8 p (AIAA PAPER 83-1230)

A mathematical model of the engine development process has been formulated. The model quantifies the elements that affect engine development, such as test vehicles, severity and length of tests and test schedule. Problem occurrences, based on historic experience, are introduced at random by the model and the impact of these problems on the development program is assessed. By iterating a given development plan, a statistical distribution of probable program results, including such information as program duration, problems found, and engine maturity at fleet introduction is obtained. Modifying the development plan input and re-running the program generates a new set of probable program results which can be compared with the original results to evaluate the advantages and disadvantages of each plan. A typical engine development program was modeled and several perturbations of the development plan were made and evaluated. Author

A83-36296#**AIRCRAFT ENGINE INLET PRESSURE DISTORTION TESTING IN A GROUND TEST FACILITY**

R E ANDERSON (U S Naval Air Propulsion Test Center, Trenton, NJ) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 12 p refs
(AIAA PAPER 83-1233)

At first, the problem of inlet distortion as it affected the stability of a jet engine in a high performance aircraft was either underestimated or not understood. Inlet pressure distortion phenomena can be divided into steady-state and time-variant categories. A review is provided of various methods for producing each type. Steady-state pressure distortion is the relatively constant pressure variation from the average pressure of the measurement plane. A variation from the center to the outside diameter is called radial distortion, while circumferential distortion represents variation on any concentric circle. Steady-state total pressure distortion for test purposes is generally produced by screens. Attention is given to a distortion valve, distortion screens for steady-state pressure patterns, aspects of screen design, design revisions, the measurement of steady-state distortion, time-variant distortion, and random frequency generators. G R

A83-36297#**DETERIORATION TRENDING ENHANCES JET ENGINE HARDWARE DURABILITY ASSESSMENT AND PART MANAGEMENT**

R J BARRETT (United Technologies Corp., Government Products Div., West Palm Beach, FL) and W R HARRIS, JR (U S Naval Air Systems Command, Propulsion Div., Washington, DC) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 6 p
(AIAA PAPER 83-1234)

The exposure of a new aircraft engine to the service environment can reveal engine hardware durability limitations not evident during the development or model acceptance phase of an engine program. In connection with the recognition by the Navy of the need for an improved full-scale engine test to assure the long-range durability characteristics of the engine, a new approach for assessing engine hardware durability improvements was initiated in 1978. The approach included Accelerated Simulated Mission Endurance Test (ASMET) and fleet engine hot section hardware deterioration comparisons. Part deterioration 'trending' was initiated during ASMET engine hot section inspections in order to establish a baseline of trending data for comparison with fleet hardware. It is pointed out that jet engine hardware deterioration trending is now a proven method for enhancing long-term durability evaluation of new and improved hardware designs. G R

A83-36298#**ACCELERATED MISSION TESTING OF THE F110 ENGINE**

O T CASTELLS (General Electric Co., Evendale, OH) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 7 p
(AIAA PAPER 83-1235)

A summary of the new use of Accelerated Mission Testing (AMT), in the development of the F110 Engine (formerly F101 DFE), is presented. A comparison of the AMT to previous qualification tests and to actual field service is presented. This test approach has been now adopted as the official endurance qualification test for the USAF. Author

A83-36299#**INTEGRATED PROPULSION-AIRCRAFT CONTROL EVALUATION FOR A CURRENT NAVY FIGHTER**

R W VIZZINI (U S Naval Air Propulsion Test Center, Advanced Development Div., Trenton, NJ) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 12 p refs
(AIAA PAPER 83-1236)

It is pointed out that the Navy is actively engaged in the development of engine-mounted, fault tolerant Full Authority Digital Electronic Controls (FADEC). This technology base will lead to

advanced propulsion control systems integrated with aircraft control systems to provide a wider range of aircraft-engine optimization than is available today. The present investigation is concerned with the major benefits of an advanced control system integrated with the F-14 aircraft. A TF30 engine with a dual-channel, fault tolerant FADEC has been interfaced to an Advanced Fuel Management (AFM) system. It is shown that overall F-14 propulsion system reliability would be improved by at least a factor of two due to the integration of the FADEC/AFM configuration with the F-14 control system. Other benefits included improved aircraft-engine performance and significant reductions in aircraft system weight, cost, and fuel consumption. G R

A83-36300#**F/A-18A INFLIGHT ENGINE CONDITION MONITORING SYSTEM (IECMS)**

P M DOANE (McDonnell Aircraft Co., St. Louis, MO) and W R KINLEY (General Electric Co., Lynn, MA) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 10 p
(AIAA PAPER 83-1237)

An Inflight Engine Condition Monitoring System (IECMS) has been developed by General Electric and McDonnell Aircraft and is currently operational in all F/A-18 aircraft. It is fully integrated with other systems on the aircraft, minimizing cost and weight. The system activates cockpit cautions and sets maintenance codes whenever an engine exceedance is detected. Engine data is automatically recorded up to 5 seconds before the exceedance and 35 seconds after. In addition, engine life usage parameters, used for tracking remaining engine life, are calculated in flight. Operational experience has shown benefits in reduced maintenance, lower support costs and accelerated maturing of the engine. Specific cases illustrating these benefits are described. A list of design considerations, based on IECMS experience, is presented for application to future systems. Author

L D EMERSON and W J DAVIES (United Technologies Corp., Pratt and Whitney Group, West Palm Beach, FL) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 6 p
(AIAA PAPER 83-1238)

In connection with the introduction of redundant digital electronic systems to accomplish flight and propulsion control in modern military aircraft, opportunities arise for complete weapons systems integration. Attention is given to system intercommunication, the communication of thrust request to the engine control on the electronic data bus, the engine condition monitoring system (ECMS), the electrical power system, and the design of hydraulic power systems on advanced aircraft and propulsion systems. It is shown that integrated aircraft and propulsion control systems provide the key to many benefits for future aircraft. Integrated communications lead to improved weapon system performance, increased reliability, ease of maintenance, and cost and weight benefits. Shared electric and hydraulic power can provide similar benefits. G R

COMPARISON OF AN EXPERIENCE WITH FULL AUTHORITY DIGITAL ENGINE CONTROLS IN ROTARY WING AND JET-LIFT VSTOL AIRCRAFT

E S ECCLES (Dowty and Smiths Industries Controls, Ltd, Cheltenham, Glos, England) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 9 p Research supported by the Ministry of Defence of England refs (AIAA PAPER 83-1241)

The design differences and common features of the full authority digital engine control demonstrator systems mounted on the Gem engines in a Lynx helicopter and on the Pegasus engines in a Harrier aircraft are surveyed The Gem system contained its own power supply, while the Pegasus system was connected to the aircraft power supplies The Gem system, being on a helicopter, had lower static and dynamic pressures to contend with, but was required to be able to disconnect the engine from the rotor when a rapid onset of autorotation was encountered The loss of power from one engine was immediately followed by a drop in rotor speed and increased power demand on the other engine The engine power and the nozzle setting were controlled with the Harrier system, which has only one engine Limiters in both systems protected against overspeed and overtemperature It was concluded that a fully redundant system is necessary in the fixed-wing aircraft, while a single system or a system-and-a-half may be used in a helicopter due to life-cycle cost considerations M S K

A C ECKBRETH, G M DOBBS, J H STUFFLEBEAM (United Technologies Research Center, East Hartford, CT), and P A TELLEX (United Technologies Corp., Government Products Div., West Palm Beach, FL) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 14 p refs (AIAA PAPER 83-1294)

Coherent anti-Stokes Raman spectroscopy (CARS) is a nonintrusive laser diagnostic technique for spatially- and temporally-precise measurements of temperature and species in practical combustion systems. Over the last several years, the development of CARS has progressed from simple flames of increasing complexity to practical application in internal combustion engines and simulations of gas turbine combustors. Here, the first application of CARS to an actual jet engine is described. The CARS instrument constructed is capable of completely remote operation and permits instantaneous thermometry at a 20 Hz rate. Its design and operation, as well as sample exhaust measurements, are presented Author

A83-36329#**DEVELOPMENT TRENDS IN ENGINE DURABILITY**

W D COWIE and T A STEIN (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 8 p refs

(AIAA PAPER 83-1297)

The Air Force has approximately 38,000 aircraft propulsion units in the active inventory. A 1977 study reports that over two thirds of an engine's 15-year life cycle cost is 'ownership costs' and that the ownership portion is rising. It is believed that this situation is driven in large part by modern engines which lack desired structural durability. In this connection, the Air Force is concerned with an identification and an understanding of design factors, which influence engine durability. It has been found that operational engines resulting from past development programs have not had the durability characteristics necessary for efficient and cost effective operations. It is now believed that an organized and systematic structural development process can help minimize service related surprises. This realization led to the formulation of the Engine Structural Integrity Program (ENSIP). Attention is given to accelerated mission testing, an engine structural maintenance plan, and an implementation/rationale G R

A83-36339#**A JT8D LOW EMISSIONS COMBUSTOR BY RADIAL ZONING**

M H ZEISSER and T G FOX (United Technologies Corp., Pratt and Whitney Group, East Hartford, CT) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 8 p refs

(AIAA PAPER 83-1324)

A radially zoned, low emissions, can-annular combustion system, which has been developed for the JT8D-200 series engines, is examined. This combustion system utilizes significantly different internal air and fuel flow patterns than previous combustors and attains very low levels of both emissions and smoke with relatively simple combustor and fuel injection hardware. The improvements in performance are accomplished through the use of two distinct concentric combustion zones (radial zoning) which are formed by controlling airflow and fuel injector/combustor geometry. A hybrid fuel injector is used to inject the fuel into each zone. At low power, combustion occurs in the central core zone, while at high power both zones are utilized with the majority of the fuel being injected into the outer zone N B

(Contract NAS3-74)

(AIAA PAPER 83-1326)

In connection with the desirability of optimizing the design of a gas turbine combustion chamber, there exists a need for a more complete understanding of the fluid dynamics of the flow in such chambers. In order to satisfy this need, experimental and theoretical research is being conducted with the objective to study two-dimensional axisymmetric geometries under low speed, nonreacting, turbulent, swirling flow conditions. The flow enters the test section and proceeds into a larger chamber. Inlet swirl vanes are adjustable to a variety of vane angles. The present investigation concentrates on the time-mean flow characteristics which are generated by the upstream annular swirler. The investigation makes use of a five-hole pitot probe technique. A theoretical analysis of swirl numbers associated with several idealized exit velocity profiles is included, and values of the ratio of maximum swirl velocity to maximum axial velocity at different swirl strengths are given for each case G R

KC-135/CFM56 RE-ENGINE - THE BEST SOLUTION

S B KAZIN (General Electric Co., Cincinnati, OH) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 6 p
(AIAA PAPER 83-1374)

The KC-135A fleet of tankers was originally established to support the bomber force. Since that time changes in force structure and basing have greatly increased the need for aerial refueling. According to conservative estimates, there is a need for 1200 tankers with the capability of the current KC-135A. The current KC-135A inventory is only 642. The least cost method of gaining the required additional capacity involves an improvement of the capability of existing aircraft. This means that the same number of aircraft is to be employed, but each aircraft is to be more effective. As the current engine of the aircraft limits aircraft utility, a new engine, the CFM56, is to be employed. Since the engines comprise the largest flyaway cost element in the KC-135A modernization program, the program is often referred to as 'The KC-135 Reengine Program'. However, the aircraft will also receive additional configuration modifications for enhanced capability.

INTRODUCING THE ROLLS-ROYCE TAY

P J ASHMOLE (Rolls-Royce, Ltd., East Kilbride, Scotland) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 13 p
(AIAA PAPER 83-1377)

This paper covers the background to the launch of the Rolls-Royce Tay Turbofan emphasizing the use of a well proven core with the latest fan technology. The basic design of the engine is described and the main performance parameters discussed. This new development provides a thrust increase of the order of 25 percent, fuel burn reduction of 15 percent and reduction in noise of the order of 7 PNdB compared with existing Spey installations. It is therefore an ideal powerplant to provide development potential for existing Spey powered aircraft offering also good re-engining possibilities on existing airframes. The application of this engine to three different aircraft and the successful adoption of a common powerplant is covered, together with a brief review of aircraft performance improvements associated with this engine.

A COMPREHENSIVE METHOD FOR PRELIMINARY DESIGN OPTIMIZATION OF AXIAL GAS TURBINE STAGES. II - CODE VERIFICATION

R M JENKINS (Tuskegee Institute, Tuskegee, AL) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 10 p refs
(Contract NSG-3295)
(AIAA PAPER 83-1403)

The present effort represents an extension of previous work wherein a calculation model for performing rapid pitchline optimization of axial gas turbine geometry, including blade profiles, is developed. The model requires no specification of geometric constraints. Output includes aerodynamic performance (adiabatic efficiency), hub-tip flow-path geometry, blade chords, and estimates of blade shape. Presented herein is a verification of the aerodynamic performance portion of the model, whereby detailed turbine test-rig data, including rig geometry, is input to the model to determine whether tested performance can be predicted. An array of seven (7) NASA single-stage axial gas turbine configurations is investigated, ranging in size from 0.6 kg/s to 63.8 kg/s mass flow and in specific work output from 153 J/g to 558 J/g at design (hot) conditions, stage loading factor ranges from 1.15 to 4.66.

MONTE CARLO SIMULATION OF THE ENGINE DEVELOPMENT PROCESS

D G CULY and J J GOSSEN (Garrett Turbine Engine Co., Phoenix, AZ) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 11 p Navy-sponsored research
(AIAA PAPER 83-1405)

The DEVSIM simulation program for generating a Monte Carlo simulation for predicting changes in an engine in its mature development as a result of unforeseen changes during the developmental process is described. The model was formulated on the bases of a chronological sequence of events and on resource usage. The Monte Carlo aspect of the program indicates if a problem has occurred, identifies the component responsible for the problem, and relates the engine maturity to the developmental effort. The model accounts for reduced failure incidence for each engine component after redesign. Input includes parts costs, test hours and equipment, and the number of engines put through each type of test. A Weibull distribution was employed to describe the lifetime of specific parts. DEVSIM was used in conjunction with a life cycle cost model in the cases of a new jet fighter engine at 70 pct of the power and at 70 pct of the scale of an existing design, and an engine that was a 30 pct derate of an already-developed engine.

THE IMPACT OF ENGINE USAGE ON LIFE CYCLE COST

W S WILLIS and T R SEWALL (General Electric Co., Evendale, OH) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 9 p
(AIAA PAPER 83-1406)

The impact of in-service usage of two types of military aircraft, a long-range subsonic bomber and a mixed mission supersonic fighter, on the life-cycle costs (LCC) are evaluated. The critical factor examined was the time at intermediate power or above, and the total failure rates were projected based on the severity of the missions. It was found that actual missions in peacetime training can exceed the design expectancies by a factor of two or three. The LCC analyses were performed with computer programs including the operational severity model, the engine acquisition cost routine, the engine development cost model, an operating and support cost analysis program, and an LCC summation routine. The tactical system had a more severe service life, although the stresses during training missions mandates that higher fatigue lifetimes be designed into both types of aircraft. Component wear-out was identified as a more important LCC driver than part reliability, and it is suggested that spare engines and modules be provided to upgrade aircraft availability.

LCC EVALUATION OF ADVANCED ENGINE DAMAGE TOLERANCE GOALS FOR A HOT-SECTION DISK

R J REED, D T HUNTER (United Technologies Corp., Pratt and Whitney Group, West Palm Beach, FL), and R J HILL (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, OH) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 7 p USAF-sponsored research refs
(AIAA PAPER 83-1407)

Developments related to Air Force gas turbine engines are considered, taking into account the importance of reaching the lowest overall life cycle cost (LCC) by finding an optimum combination between the high strength capability of a critical material and its resistance to fatigue crack growth. An important factor is a component design which includes consideration of crack growth characteristics and critical crack size. Such a design is termed Damage Tolerant Design (DTD). Attention is given to the results of a life cycle cost evaluation to quantify the benefits of designing hot-section disks for damage tolerance. The work reported was conducted under the Life Cycle Cost/Damage Tolerance Assessment program on hot-section damage tolerance, which is currently underway as an evolutionary outgrowth of several programs involving the Air Force and a U.S. aerospace company.

The guidelines of the Retirement for Cause (RFC) system are also taken into account G R

DEVELOPMENT OF SIMULATED MISSION ENDURANCE TEST ACCELERATION FACTORS IN DETERMINING ENGINE COMPONENT SERVICEABILITY AND FAILURE MODE CRITICALITY

T R METZ and P J ZIMMERMAN (U.S. Naval Air Propulsion Test Center, Trenton, NJ) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 6 p (AIAA PAPER 83-1409)

The use of Accelerated Simulated Mission Endurance Testing (ASMET) is a cost effective method of verifying engine durability in projected aircraft weapon system application. ASMET is a gas turbine engine durability test which simulates the aircraft mission in a test environment. A test acceleration methodology has been developed utilizing mission profiles and mission mix to define composite profiles which do not lose mission orientation and still accelerate the damage processes. Identifying the damage processes is critical since failure mode damage acceleration rates will differ with each failure mode. These failure mode conditions are identified from the mission profile/mission mix and retained in the composite profile, while non-damaging mission aspects are deleted. The composite profiles are then used as the ASMET cycle. The ASMET acceleration factors are then determined as a ratio of mission profile/mission mix time to test composite time. Author

ADVANCED PROPULSION CONTROLS - A TOTAL SYSTEM VIEW

P H YOUNG (Rolls-Royce, Ltd., London, England) Aeronautical Journal (ISSN 0001-9240), vol 87, May 1983, p 165-172

The necessity of designing engine control systems integrally with the total propulsion control system is explored, with attention given to the effectiveness of electronic control systems. The control system links the pilot to the propulsion system, airframe systems, and the cockpit displays. The use of electronic controls with their inherent high defect rates requires built-in test capabilities in order to assure flight safety as well as the ability to continue to a main base for repairs. Each function of the digital control system must be designed in consideration of its effect on the other functions controlled. Additionally, safeguards must be included to prohibit

the engine from malfunctioning if a pilot command is received which exceeds the operational envelope. Further discussions are presented on a typical airframe/engine interface, the full authority with no mechanical reversion FADEC system, the minimum requirements of the FADEC system, and system design principles M S K

ELECTROHYDRAULIC FUEL-FLOW REGULATOR FOR GAS-TURBINE-ENGINE CONTROL SYSTEMS [ELEKTROHYDRAULICZNY STEROWNIK PRZEPLYWU DO UKLADOW REGULACJI SILNIKOW TURBINOWYCH]

W BALICKI Instytut Lotnictwa, Prace (ISSN 0509-6669), no 91, 1982, p 63-72 In Polish refs

An experimental electrohydraulic fuel-flow control device is described which operates according to the principle of constant pressure head across a metering orifice of variable area. The area of this orifice is regulated by a mechanism the input quantities of which are signals of the position angle of the control lever and of the stagnation pressure of air at the inlet, and the signal generated by the electronic unit controlling the driving motor of the mechanism. The signal of pressure-head variation across the metering orifice produces a variation in the discharge of the piston pump supplying the control device. In the case of manual (emergency) control, the measured flow rate is a function of the position angle of the control lever and the air pressure head. In the case of automatic control, this flow rate is a function determined by the operation of the electronic unit and its output signal B J

AN UPDATE ON HIGH OUTPUT LIGHTWEIGHT DIESEL ENGINES FOR AIRCRAFT APPLICATIONS

M E MOYNIHAN, S G BERENYI, and A P BROUWERS (Teledyne Continental Motors, General Products Div, Muskegon, MI) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 18 p refs (AIAA PAPER 83-1339)

In connection with fuel-related developments, there is renewed interest within the aviation industry for new, fuel efficient, multifuel

power plants. NASA funded several engine manufacturers to conceptually design new aircraft engines using projected advanced technologies. One company elected to evaluate the diesel engine cycle with respect to its capability to satisfy a number of specified minimum requirements. Using past engines as guidelines, an extensive parametric study was made to first determine the basic overall engine type and next to apply new technologies to achieve a truly advanced engine. The five engines designs which ultimately evolved share a number of common features. These features are partly related to the use of a radial engine configuration, a two-stroke cycle, a low effective compression ratio, minimum cylinder cooling, a high-pressure fuel injection system, and a high-pressure ratio, high efficiency turbocharger. Questions regarding the market acceptance of the diesel engine are also explored G R

DESIGN ANALYSIS OF A SELF-ACTING SPIRAL-GROOVE RING SEAL FOR COUNTER-ROTATING SHAFTS

E DIRUSSO May 1983 12 p refs (NASA-TP-2142, E-1253, NAS 1 60 2142) Avail NTIS HC A02/MF A01 CSCL 11A

A self-acting spiral groove inter-shaft ring seal of nominal 16.33 cm (6.43 in) diameter for sealing fan bleed air between counter-rotating shafts in advanced turbofan engines was analyzed. The analysis focused on the lift force characteristics of the spiral grooves. A NASA Lewis developed computer program for predicting the performance of gas lubricated face seals was used to optimize the spiral groove geometry to produce maximum lift force. Load capacity curves (lift force as function of film thickness) were generated for four advanced turbofan engine operating conditions at relative seal speeds ranging from 17,850 to 29,800 rpm, sealed air pressures from 6 to 42 N/sq cm (9 to 60 psi) absolute and temperatures from 95 deg to 327 C (203 deg to 620 F). The relative seal sliding speed range was 152 to 255 m/sec (500 to 836 ft/sec). The analysis showed that the spiral grooves are capable of producing sufficient lift force such that the ring seal will operate in a noncontacting mode over the operating range of typical advanced turbofan engines Author

HIGH FREQUENCY FATIGUE OF TURBINE BLADE MATERIAL Final Technical Report, Oct. 1979 - Jul. 1982

R C GOODMAN and A M BROWN Wright-Patterson AFB, Ohio AFWAL Oct 1982 119 p refs (Contract F33615-79-C-5108, AF PROJ 2418) (AD-A124585, UDR-TR-82-104, AFWAL-TR-82-4151) Avail NTIS HC A06/MF A01 CSCL 21E

This increased fatigue crack growth rate at elevated temperature due to high frequency loading is examined. The crack growth rate is found to depend upon major cycle stress intensity factor, hold-time and minor cycle frequency, and amplitude for a given temperature. The elevated tests also demonstrate a transition from

creep crack growth dominant to fatigue crack growth dominant at values of minor cycle amplitude above a threshold value A model for determining the crack growth rate is developed GRA

APPLICATION OF THE VORTEX-LATTICE METHOD TO PROPELLER PERFORMANCE ANALYSIS M.S. Thesis

M I MASQUELIER Jul 1982 115 p refs (AD-A124837, AFIT/GAE/AA/81D-19) Avail NTIS HC A06/MF A01 CSCL 12A

The objective of this thesis is to examine the feasibility of applying a vortex lattice method to propeller performance analysis This method allows the calculation of spanwise and chordwise pressure distributions on thin propeller blades of arbitrary planform

07 AIRCRAFT PROPULSION AND POWER

The research for this project involves the application of a vortex lattice method to a propeller with twisted, non-cambered, constant chord blades. The analysis assumes incompressible, inviscid flow over thin sections. The helical wake is modeled as a series of straight vortex filament segments. A computer code has been developed which uses a vortex lattice method to predict performance for propellers. Results are shown for several operating conditions, using various angle of attack distributions, numbers of blades on the propeller, and advance ratios. Similar results are shown using the blade-element theory for comparison. Results indicate that this vortex lattice method is applicable to initial propeller performance analysis. Author (GRA)

A method for obtaining the temperature of gas turbine aircraft engines using two bulb-thermometers with different thermal inertia characteristics is presented. The thermal balance equations for a bulb inside a protective shield are developed. Temperature of the gas outside the shield is calculated by allowing for convective heat transfer with the gas and radiant heat exchange with the shield, and for the inertia of one of the thermometers. Maximum relative error is 8%, compared with 34% for single thermometer methods. Author (ESA)

USING ADAPTIVE CONTROL TO SYNTHESIZE INVARIANT AND PARTIALLY AUTONOMOUS AUTOMATIC STABILIZATION SYSTEMS

B N PETROV, B V VIKTOROV, F A MIKHAILOV, and V L POKHVALENSKII Automation and Remote Control (ISSN 0005-1179), vol 43, no 11, Apr 20, 1983, pt 2, p 1448-1459 Translation refs

A method is developed for increasing the operating accuracy of a multivariable automatic stabilization system, which utilizes special compensating signals that adaptively implement the two-channel design. This adaptive compensation procedure can also be used to ensure the autonomy of the state vector of some relevant subsystems when applied to the control of multivariable systems. The operation of this adaptive algorithm only requires controlling the forced component of the total motion of the system and therefore assumes fast decay of the natural modes. This approach to the construction of the adaptation procedure is found to substantially reduce the number of parameters that need to be adjusted. The compensation procedure is applied to the automatic angular stabilization of an aircraft in the longitudinal plane. Results of experimental studies show that these invariance-generating methods are sufficiently effective in practice when real effector devices are used. NB

AIRCRAFT ACTIVE CONTROLS - NEW ERA IN DESIGN

C HWANG and D F KESLER (Northrop Corp., Aircraft Div., Hawthorne, CA) Astronautics and Aeronautics (ISSN 0004-6213), vol 21, June 1983, p 70-79, 85 refs

The control systems of the modern aircraft accept, in addition to pilot's commands, also sensor information reflecting flight condition and dynamic response. The response may include rigid-body rates, accelerations, and control-surface positions. Sensor information feeds back through a number of networks to effect positive control. This 'active control' of structural dynamic behavior and its effect upon the flight-control system has been relatively new to the structural community. In connection with these and other modern developments, many new requirements are being imposed upon aircraft control-system designers. An overview is provided concerning the new developments affecting aircraft control-system design. Attention is given to a classification of active-control systems, a flutter-suppression model, a Nyquist analysis for a forward-swept-wing aircraft, the organization of a digital adaptive control system, the integration of active control into the flight control system, and a wing load alleviation system.

INVESTIGATION OF AN IMPROVED FINITE ELEMENT MODEL FOR A REPAIRED T-38 HORIZONTAL STABILIZER FLUTTER ANALYSIS USING NASTRAN M.S. Thesis

G G LONDON, JR Dec 1982 47 p refs

(AD-A124741, AFIT/GAE/AA/82D-19) Avail NTIS HC A03/MF A01 CSCL 20D

This thesis investigated the use of an improved finite element model of a T-38 horizontal stabilizer for flutter analysis using NASTRAN. The procedure for evaluating the effect of repairs on the flutter speed is developed and its sensitivity to several modeling assumptions and practices is presented. The procedure is to be used by Air Force engineers to evaluate repair limits of T-38 stabs. The results show that the current repair limits have little or no effects on the flutter conditions, therefore, the procedures presented in this investigation should be used to establish new repair limitations.

The roots are then plotted and the flutter or divergence speeds determined. It was found that flutter speed increased and divergence speed decreased with increasing forward sweep as expected. Also, quasi-steady aerodynamics do not accurately predict flutter and the approximation to unsteady aerodynamics does not accurately predict divergence. It is necessary to combine these two methods in order to obtain a complete analysis of the wing's aeroelastic instabilities.

A FLIGHT-TEST AND SIMULATION EVALUATION OF THE LONGITUDINAL FINAL APPROACH AND LANDING PERFORMANCE OF AN AUTOMATIC SYSTEM FOR A LIGHT WING LOADING STOL AIRCRAFT

S C BROWN, G H HARDY, and W S HINDSON Jun 1983 59 p refs

(NASA-TM-84270, A-8993, NAS 1 15 84270) Avail NTIS HC A04/MF A01 CSCL 01C

As part of a comprehensive flight-test program of STOL operating systems for the terminal area, an automatic landing system was developed and evaluated for a light wing loading turboprop aircraft. The aircraft utilized an onboard advanced digital avionics system. Flight tests were conducted at a facility that included a STOL runway site with a microwave landing system. Longitudinal flight-test results were presented and compared with available (basically CTOL) criteria. These comparisons were augmented by results from a comprehensive simulation of the controlled aircraft which included representations of navigation errors that were encountered in flight and atmospheric disturbances. Acceptable performance on final approach and at touchdown was achieved by the autoland (automatic landing) system for the moderate winds and turbulence conditions encountered in flight. However, some touchdown performance goals were marginally achieved, and simulation results suggested that difficulties could be encountered in the presence of more extreme atmospheric conditions. Suggestions were made for improving performance under those more extreme conditions.

PILOT HUMAN FACTORS IN STALL/SPIN ACCIDENTS OF SUPERSONIC FIGHTER AIRCRAFT

S B ANDERSON, E K ENEVOLDSON, and L T NGUYEN May 1983 12 p refs Presented at the AGARD Conf Flight Mech Sys Design Lessons from Operational Exper, Athens, 10-13 May 1983

(NASA-TM-84348, A-9297, NAS 1 15 84348) Avail NTIS HC A02/MF A01 CSCL 01C

A study has been made of pilot human factors related to stall/spin accidents of supersonic fighter aircraft. The military specifications for flight at high angles of attack are examined. Several pilot human factors problems related to stall/spin are discussed. These problems include (1) unsatisfactory nonvisual warning cues, (2) the inability of the pilot to quickly determine if the aircraft is spinning out of control, or to recognize the type of spin, (3) the inability of the pilot to decide on and implement the correct spin recovery technique, (4) the inability of the pilot to move, caused by high angular rotation, and (5) the tendency of pilots to wait too long in deciding to abandon the irrecoverable aircraft. Psycho-physiological phenomena influencing pilot's behavior in stall/spin situations include (1) channelization of sensory inputs, (2) limitations in precisely controlling several muscular inputs, (3) inaccurate judgment of elapsed time, and (4) disorientation of vestibulo-ocular inputs. Results are given of pilot responses to all these problems in the F14A, F16/AB, and F/A-18A aircraft. The use of departure spin resistance and automatic spin prevention systems incorporated on recent supersonic fighters are discussed. These systems should help to improve the stall/spin accident record with some compromise in maneuverability.

DIGITAL FLIGHT CONTROL SYSTEM VALIDATION

D ELDREDGE, J E REED, E HITT (Battelle Columbus Labs, Ohio), J WEBB (Battelle Columbus Labs, Ohio), and D MULCARE (Lockheed-Georgia Co) Jun 1982 19 p refs Presented at the 1982 Am Control Conf, Arlington, Va, Jun 1982

(AD-A124506, FAA-CT-82-54) Avail NTIS HC A02/MF A01 CSCL 01C

The introduction of advanced technologies, new design concepts, and sophisticated high integrity integrated software-based digital flight control and avionics systems has confronted the FAA with the task of reviewing, revising, and updating its airworthiness assessment criteria in these areas. The FAA needs to establish and maintain systems engineering expertise as well as a capability to establish/evaluate validation/verification procedures for software-based digital systems. In order to accomplish this objective, the FAA must have expertise in fault-insertion techniques, emulation, automated reliability analyses, failure modes and effects analyses, fault-tree graphics, and other analytical tools. In addition, these skills are needed in order to interpret and evaluate data and information submitted, during the certification, process, in compliance with RTCA DO-178 and FAA Advisory Circular 25 1309-XX. This paper discusses techniques, methodologies, data, and information required for digital flight control and avionics systems validation.

HIGH-GAIN ERROR ACTUATED FLIGHT CONTROL SYSTEMS FOR CONTINUOUS LINEAR MULTIVARIABLE PLANTS M.S. Thesis

L THOMAS Dec 1982 151 p refs

(AD-A124871, AFIT/GAE/EE/82D-1) Avail NTIS HC A08/MF A01 CSCL 01C

The theory of high-gain error actuated feedback control, developed by Porter and Bradshaw, is applied to the design of various lateral-directional decoupling flight control systems for an advanced aircraft. The controllers developed in this report utilize output feedback with proportional plus integral control to produce desirable closed-loop responses with minimal interactions between

outputs. Because of the structure of the system, measurement variables in addition to the outputs are necessary to apply this method. The report examines controller design robustness by varying the flight conditions or maneuver commands from the ones the controller is specifically designed for, and then judges system performance. The results show that the controller is robust with respect to varying flight conditions, but is not robust with respect to varying maneuver commands. This report also examines the effect of first-order actuator dynamics in the system model. Actuator dynamics are shown to significantly effect the control system response, indicating that a simplified model, without actuators, is not desirable in one's control design scheme. Also a computer program to determine transmission zeros and decoupling zeros is developed.

AN ALGORITHM OF FLIGHT SIMULATION ON A DYNAMIC STAND OF SUPPORT TYPE [ALGORITM IMITATSII POLETA NA DINAMICHESKOM STENDE OPORNOGO TIPA]

V V ALEKSANDROV, I V DYLEVSKII, V D ZIMENKOV, I G TIKHANINA, and O D CHUGUNOV Akademiia Nauk SSSR, Izvestiia, Mekhanika Tverdogo Tela (ISSN 0572-3299), Mar-Apr 1983, p 30-37. In Russian refs.

The problem of flight simulation is formulated for an operator in the cockpit of a dynamic simulator. A composition method for solving this problem is proposed for a stand of support type with six degrees of freedom, and an algorithm implementing this method is described. As an example, consideration is given to a digital system for the control of a dynamic simulator, and a block diagram of this system is presented. It is noted that the simulation depends significantly on the kinematic scheme of the stand.

The French automated aircraft information service (AISA) capabilities, equipment, and products are described. The system provides on-line access to a computer which holds notices to airmen, cartographic information, and cargo information. The cartographics subsection provides automated map generation of aeronautical maps for pilot use. The maps can be dimensioned to request, identify air routes, ground waypoints and landmarks, hold both typography and graphics and approach paths, and be amenable to interactive processing. Notices to airmen are dispatched by teletype, through hard copy printed with a daisy wheel, or by transmission to a CRT display in the cockpit. Weekly notices can also be issued and stored for inquiry. Finally, the contract subroutine contains samples of up to 7000 bills of lading, procedures for contracting services, postal rates, etc., as well as daily shipment records. The system will eventually be modified to allow interrogation/response from external consoles.

U.S. SETS OWN STANDARDS FOR AIRPORT LIGHTING

A C SCHWARTZ Airport Forum (ISSN 0002-2802), vol 13, April 1983, p 65, 67-69

FAA regulations, the types of equipment, and the acceptance procedures for airport runway lighting systems are outlined. Although several types of equipment installed on federally controlled runways are specified precisely with regards materials and dimensions, local airports are generally permitted to use equipment of their own choice so long as performance specifications are met. Advisory circulars are distributed by the FAA to provide installers of runway lighting equipment with guides as to spacing, radio control, operation, and maintenance. Additionally, the FAA issues a list of U S manufactured equipment which it certifies as meeting performance specifications, although it is noted that FAA officials attend only 15-20 pct of the actual tests of the equipment by manufacturers. PROPULSION SYSTEM SIMULATION TECHNIQUE FOR SCALED WIND TUNNEL MODEL TESTING

C C CASSMEYER (McDonnell Aircraft Co., St Louis, MO) IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers New York, American Institute of Aeronautics and Astronautics, 1983, p 416-421 refs

Propulsion simulators have been developed which allow propulsion system and airframe flowfields to be simultaneously simulated in a single wind tunnel model, thereby improving the accuracy of aircraft performance prediction. It is observed that the most effective use of such propulsion simulator-equipped models will be on configurations having highly integrated and closely coupled propulsion systems. The matching of the maximum propulsion simulator airflow with the maximum engine airflow is found to generally result in an 8-11 percent-scale model. Testing with such models should not be used in an aircraft development cycle prior to the selection of such fundamental design features as engine cycle, airframe configuration, and propulsion system integration. GROUND SIMULATION OF ENGINE OPERATION AT ALTITUDE

B A REESE (Arnold Engineering Development Center, Arnold Air Force Station, TN) IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers New York, American Institute of Aeronautics and Astronautics, 1983, p 537-552 refs

A discussion is presented concerning the contributions obtainable through ground-simulated high altitude testing of turbojet and turbofan aircraft engine operation, with attention to such criteria for test program success as the early involvement of test personnel in the engine development process, the justification of ground testing over flight testing, and adequate funding of the ground test effort. Development status reports are given for the Aeropropulsion System Test Facility, which will begin its check-out operations in the Fall of 1984, and the Turbine Engine Load Simulator which has not yet received funding. Detailed descriptions are given of the experimental facilities covered. O C

ALL WEATHER HELIPORTS AND AIRWAY SYSTEM - THE FUTURE NEED

W F PAUL (United Technologies Corp., Sikorsky Aircraft, Stratford, CT) Vertiflite (ISSN 0042-4455), vol 29, Mar-Apr 1983, p 16-21

A plan for the development of a national system of heliports and helicopter airways to accommodate the growth foreseen in the U S civil helicopter fleet by 1990 is discussed. The elements of the proposed system include allweather heliports located near the center of cities, realistic acoustic guidelines, noninterfering airways for helicopter use only, a navigation, communication, and air-traffic-control network based on NAVSTAR or a similar satellite system, improved forecasting of icing and thunderstorm conditions,

helicopters capable of precision steep instrument approaches and takeoffs at very low speeds, and advanced ice protection for blades, windshields, and propulsion systems. The strategy being pursued by the HAI Heliports and Airways Committee for the implementation of this plan is reviewed. T K

SIMULATOR PERFORMANCE DEFINITION BY CUE SYNCHRONIZATION ANALYSIS

S K BUTRIMAS and G B BROWDER (U S Navy, Naval Training Equipment Center, Orlando, FL) IN Flight Simulation Technologies Conference, Niagara Falls, NY, June 13-15, 1983, Collection of Technical Papers New York, American Institute of Aeronautics and Astronautics, 1983, p 114-122 (AIAA PAPER 83-1092)

This paper describes by experimental example how a cue synchronization study should be performed on a major flight simulator system. It presents dynamic performance measurements made at the Navy's Visual Technology Research Simulator (VTRS) facility, and shows timing interactions between critical subsystems of the Conventional Takeoff and Landing (CTOL) simulator. It discusses how and why specifications and tests must be developed which determine the cue synchronization and performance requirements for simulation systems. Author

REAL TIME SIMULATION OF MISSION ENVIRONMENTS FOR AVIONICS SYSTEMS INTEGRATION

R A WEEKS (Northrop Corp., Pico Rivera, CA) IN Flight Simulation Technologies Conference, Niagara Falls, NY, June 13-15, 1983, Collection of Technical Papers New York, American Institute of Aeronautics and Astronautics, 1983, p 123-129 (AIAA PAPER 83-1097)

This paper describes a real time simulation of mission environments for use in developing, synthesizing and analyzing complex avionics systems for fighter aircraft. The problem is one of creating an operationally correct environment for a pilot to operate in such that he is properly task loaded. Proper task loading insures the proper integration of the avionics subsystems (on an operation level) so as to verify that the mission objectives will be fulfilled. Author

COMPENSATION FOR TIME DELAY IN FLIGHT SIMULATOR VISUAL-DISPLAY SYSTEMS

D F CRANE (NASA, Ames Research Center, Moffett Field, CA) IN Flight Simulation Technologies Conference, Niagara Falls, NY, June 13-15, 1983, Collection of Technical Papers New York, American Institute of Aeronautics and Astronautics, 1983, p 163-171 refs (AIAA PAPER 83-1080)

A piloted aircraft can be viewed as a closed-loop, man-machine control system. When a simulator pilot is performing a precision maneuver, a delay in the visual display of aircraft response to pilot-control input decreases the stability of the pilot-aircraft system. The less stable system is more difficult to control precisely. Pilot dynamic response and performance change as the pilot attempts to compensate for the decrease in system stability, and these changes bias the simulation results by influencing the pilot's rating of the handling qualities of the simulated aircraft. Delay compensation, designed to restore pilot-aircraft system stability, was evaluated in several studies which are reported here. The studies range from single-axis, tracking-task experiments (with sufficient subjects and trials to establish statistical significance of the results) to a brief evaluation of compensation of a computer-generated imagery (CGI) visual display system in a full six-degree-of-freedom simulation. The compensation was effective - improvements in pilot performance and workload or aircraft handling-qualities rating (HQF) were observed. Results from recent aircraft handling-qualities research literature which support the compensation design approach are also reviewed. Author

A83-36224# VISUALLY-COUPLED SYSTEMS AS SIMULATION DEVICES

M W HAAS (USAF, Aerospace Medical Research Laboratory, Wright-Patterson AFB, OH) American Institute of Aeronautics and Astronautics, Flight Simulation Technologies Conference, Niagara Falls, NY, June 13-15, 1983 5 p (AIAA 83-1083)

It is pointed out that the technology development of visually-coupled systems (VCS) began in 1966. VCS provide a way to improve weapon aiming accuracy and efficiency while enlarging the operational delivery envelope of the weapon system. A VCS may derive control information from the operator and direct the weapon system, while simultaneously displaying weapon system information to the operator. Control information is derived by a helmet-mounted sight and/or helmet-mounted oculometer. Feedback information is provided by the helmet-mounted display. The combination of the considered components is termed 'visually-coupled system'. VCS technologies can also be used to provide low-cost visual systems for simulators, support research regarding critical issues of cockpit control, and display design and proper use of VCS components in the airborne environment. The Visually-Coupled Airborne System Simulator was developed to study the utilization of the VCS in the simulator. G R

NASA LOW-SPEED CENTRIFUGAL COMPRESSOR FOR FUNDAMENTAL RESEARCH

J R WOOD, P W ADAM, and A E BUGGELE (NASA, Lewis Research Center, Cleveland, OH) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 12 p refs (AIAA PAPER 83-1351)

A new centrifugal compressor facility being built by the NASA Lewis Research Center is described, its purpose is to obtain 'benchmark' experimental data for internal flow code verification and modeling. The facility will be heavily instrumented with standard pressure and temperature probes and have provisions for flow visualization and laser Doppler velocimetry. The facility will

accommodate rotational speeds to 2400 rpm and will be rated at pressures to 1.25 atm. The initial compressor stage for testing is geometrically and dynamically representative of modern high-performance stages with the exception of Mach number levels. Design exit tip speed for the initial stage is 500 ft/sec with a pressure ratio of 1.17. The rotor exit backsweep is 55 deg from radial. The facility is expected to be operational in the first half of 1985. Author

A83-36356# PERFORMANCE CAPABILITY OF A COMPACT MULTIMISSION AIRCRAFT PROPULSION SIMULATOR

C D WAGENKNECHT, C J DUSA (General Electric Co., Cincinnati, OH), and T J NORBUT (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 10 p refs (AIAA PAPER 83-1358)

The Compact Multimission Aircraft Propulsion Simulator is a flexible cycle miniature turbine engine powered by an external source of high pressure air. Its development has been to enhance the propulsion flowfield simulation capability during wind tunnel testing of subscale aircraft models. Currently, a data base on the utility of the simulator is being accumulated, however, it will be sometime before the complete capability of the simulator and parametric impact of significant variables will be fully characterized. In the interim, analysis results based on a cycle deck computer model are presented to parametrically define performance flexibility characteristics which will be a necessary consideration for any potential simulator user. A83-36421# SURVEY OF THE ONERA ACTIVITIES ON THE ADAPTIVE WALL APPLICATIONS AND COMMUTATION OF RESIDUAL CORRECTIONS

J P CHEVALLIER (ONERA, Chatillon-sous-Bagneux, Hauts-de-Seine, France) (Wind Tunnel Wall Interference-Assessment/Correction Workshop, NASA, Langley Research Center, Hampton, VA, Jan 25, 26, 1983) ONERA, TP, no 1983-11, 1983, 15 p refs (ONERA, TP NO 1983-11)

ONERA activities in the area of computing or reducing wind tunnel wall interferences are reviewed, emphasizing improvement in the determination of corrections and the use of adapted flexible walls. Corrections computed from wall measured data are presented for the two- and three-dimensional cases, and theoretical and experimental assessments of the model representation from the transverse speed component at the wall and from wall pressure measurements, respectively, are given. The ONERA two-dimensional T2 wind tunnel operation is described, and the iterative process used to adapt the wall is outlined. The validation of the adaptive wall operation is addressed. Finally, some general observations regarding the orientation of the work for the planned three-dimensional model are formulated. C D

A83-36433# NEW TRANSFORMATIONS OF S4 MODANE HYPERSONIC WIND TUNNEL FOR RAMJET MISSILES TESTS

J CHRISTOPHE (ONERA, Chatillon-sous-Bagneux, Hauts-de-Seine, France) (Supersonic Tunnel Association, Semi-Annual Meeting, 59th, Colorado Springs, CO, Apr 6, 7, 1983) ONERA, TP, no 1983-24, 1983, 14 p refs (ONERA, TP NO 1983-24)

The capabilities, equipment, and performance of the Modane S4 hypersonic wind tunnel are described. The tunnel has a Mach 6 nozzle, storage facilities for dry air at 400 bars, a heater bed of aluminum pebbles capable of raising the air temperature to 1850 K, and a mounting table with two degrees of freedom. Tests can be run on aerodynamics, air intakes, ablation or radome deformation, heat transfer, and the performance of complete engines at Mach 6. Full engine trials have included solid fueled ramjets, with adaptations permitting connected pipe and semi-free jet testing in conjunction with the hot gas generator. The ramjet

trials have been limited to a simulation of Mach 2.7 at ground level conditions and Mach 3.35 at altitudes over 11 km M S K

CONDENSATION STUDIES IN CRYOGENIC NITROGEN EXPANSIONS

M DUEKER 1982 14 p Presented at the ETW Cryogenic Technol Review Meeting, Amsterdam, 15-17 Sep 1982

Avail NTIS HC A02/MF A01

The Reynolds number range of wind tunnels is extended to higher values, when the wind tunnel operates under cryogenic conditions. With a stagnation temperature, however, chosen too low, the gas may expand into its liquid or solid phase region, which will cause condensation effects. Avoiding impurities in the streaming medium, heterogeneous condensation is prevented, but in an isentropic expansion, far enough into the liquid or solid phase region, homogeneous condensation will occur. The determination of condensation onset points in isentropic expansions around realistic airfoils is tested in the European Transonic Wind Tunnel (ETW). Real gas effects in cryogenic flows are not described Author

MATERIALS AND MODELLING TECHNOLOGY FOR CRYOGENIC ENVIRONMENT

J L PETITNIOT and F DUPRIEZ 1982 41 p refs

Avail NTIS HC A03/MF A01

Construction of a model and its support for use in a cryogenic wind tunnel induces the following problems relative to the choice of materials for the different model parts, lifting areas, fuselage, balance, sting line, construction techniques depending on the aim of the tests to be done, joints between model and its support, joints between model support and wind tunnel structure, and isolated or non-isolated board instrumentation. According to type of tests, solicitations on the model in the test section will be very variable. For static tests, aimed at the determination of aerodynamic coefficients, maximum stress levels were fixed, with the agreement of air frame designers, to 400 MPa for civil and 800 MPa for fighter models. A dynamic stress is added to the static one whose value is of the order of 20% of the static stress. The frequency range lies beyond 30 to 50 Hz. As an example for a Mirage delta 2000 classic 1/8 scale model, first wing flexure mode is about 100 Hz. At this level, the balance stiffness effect becomes preponderant and the first frequencies met in wind tunnel are those of the rigid modes of the model on its support Author

PROBLEMS INVOLVED BY THE INSTRUMENTATION AND THE CONCEPTION OF CRYOGENIC TESTS

A BLANCHARD and A MIGNOSI 1982 14 p refs Presented at the ETW Cryogenic Technol Rev Meeting, Amsterdam, 15-17 Sep 1982

Avail NTIS HC A02/MF A01

The studies carried out on stall pressure transducers tested at cool temperature, and the development of a probe which was used in T3 (a small cryogenic transonic wind tunnel driven with a fan) are presented. An important point concerns the precooling of the model, which is necessary in order to obtain a temperature ratio T_w/T_{aw} near 1 during a run (20 to 40 seconds). This precooling is planned to be performed in a cooling box beside the test section, therefore, the model is introduced during the run starting process. To distinguish the effects due to the increase of Reynolds number, from those of specious conditions, the influence of various parameters must be discerned S L

RUNWAY SURFACE CONDITION SENSOR SPECIFICATION GUIDE

22 Apr 1983 15 p

(AC-150/5220-13A) Avail NTIS HC A02/MF A01

Ice begins to form on pavements when the pavement surface is at the freezing temperature of the water solution on it. Remote runway surface condition sensors which will predict and detect the formation of ice on airport pavements will enhance runway safety while reducing airport equipment, manpower, and chemical costs. The use of air temperatures exclusively to predict the occurrence of ice on a pavement is not reliable enough, primarily because the temperature differences between pavement surface and ambient air vary so greatly. Factors such as runway surface color and composition, wind patterns, surface water quantity, ice control chemical residue, atmospheric moisture content, traffic, amount of sunlight as well as air temperature all influence ice formation. Since ice prevention is more desirable in terms of safety, time savings and cost than ice removal, primary emphasis should be placed on predicting ice before it actually occurs. Runway

A PLACEMENT MODEL FOR FLIGHT SIMULATORS M.S. Thesis

E P GEBHARD and J P ONEILL Sep 1982 139 p refs (AD-A123782, AFIT-LSSR-23-82) Avail NTIS HC A07/MF A01 CSCL 14B

The use of flight simulators has been increasing due to the rising costs of operating and maintaining aircraft. At the same time, a drive towards increased simulator fidelity has caused a rapid increase in simulator acquisition and support costs. The rising costs of simulator acquisition and support, coupled with the fact that aircrews assigned to any one of the majority of USAF aircraft types are stationed at numerous geographic locations, provide the impetus to develop an improved methodology for comparing the costs of simulator basing strategies. The methodology includes a comprehensive analysis of the relevant and significant costs of simulator ownership. Using these costs as inputs, a computer program was developed which incorporates learning curve and present value theory into a facility location algorithm. The program determines the number and location of the simulators to satisfy aircrew training at minimum cost. A demonstration of model capabilities and a sensitivity analysis based on the acquisition of the B-52G Weapon System Trainer are included. Author (GRA)

GREATER BENEFITS TO BE GAINED FROM DOD FLIGHT SIMULATORS

14 Nov 1983 19 p (AD-A123713, GAO/FPCD-83-4) Avail NTIS HC A02/MF A01 CSCL 05I

Our objectives were to determine whether the services are sufficiently analyzing their training needs and identifying those tasks that can best be taught on flight simulators, and whether simulators are training pilots to do the tasks intended. We selected seven flight simulators that were among the services' highest 20 percent in terms of total dollars invested, were used to train personnel for critical jobs (tasks that contribute substantially to readiness), and had been fully operational for at least 2 years. The locations we visited were in geographical areas within large concentrations of simulators. At each location, we examined course syllabi to determine how the simulators were to be used. We also determined how the simulators were being used, benefits derived, and problems with the simulators. GRA

NOVA-2S CORRELATION WITH KC-135A FUSELAGE SHOCK TUBE TEST RESULTS Final Report

L J MENTE and W N LEE Kirtland AFB, N Mex AFWL Nov 1982 138 p refs (Contract F29601-81-C-0031, AF PROJ 8809) (AD-A124013, AFWL-TR-82-101, KA-TR-202) Avail NTIS HC A07/MF A01 CSCL 20D

Correlation of the experimental results from KC-135A fuselage tests in the Sandia shock tube with analytical results generated through the NOVA-2LTS structural response code were performed in this effort. It was found that skin buckling between stringers was a very important factor in the overall response of the frames. NOVA-2LTS had to be modified to handle skin buckling in an approximate manner without generating a prohibitive large solution model. Comparisons are made between the experimental results and NOVA-2LTS analytical strain results for the unpressurized and pressurized KC-135A fuselage. Overall the strain response results for the central frame correlated well considering the uncertainties involved in defining structurally an actual large stiffened aircraft section. GRA

SIMULATOR DESIGN FEATURES FOR CARRIER LANDING. PART 2. IN-SIMULATOR TRANSFER OF TRAINING Interim Technical Report, 1 Sep. 1981 - 31 Aug. 1982

D P WESTRA Orlando, Fla Naval Training Equipment Center Dec 1982 82 p refs (Contract N61339-81-C-0105) (AD-A124024, NAVTRAEQUIPC-81-0105-1, CRG-TR-82-011) Avail NTIS HC A05/MF A01 CSCL 05I

The Visual Technology Research Simulator (VTRS) at the Naval Training Equipment Center was used to study the effects of six factors on carrier-landing training. An in-simulator transfer paradigm was chosen in which students were trained under various conditions and then tested under a standard condition that represented maximum realism. The experimental design permitted a relatively large number of variables to be studied, using a relatively small number of student subjects. Results showed some temporary transfer advantages for the wide field of view and high scene detail conditions. Training on straight-in approaches resulted in transfer performance that was better than that produced by training on circling approaches. There was no motion or FOLS rate cuing effects on the transfer task. Display and simulator transfer effects did not differ between the two pilot groups despite large differences in mean group performances. As a result of these findings, it was suggested that a simulator-to-field transfer study be conducted with field of view, scene detail and approach type as factors. Such a study, using pilots from the target population of undergraduate Naval aviators, would provide the necessary information to make final simulator design decisions for the carrier-landing task. A NOTE ON ADAPTIVE WIND TUNNELS WITH IMPERFECT CONTROL Final Report

W R SEARS In AFWAL A Collection of Papers in the Aerospace Sci p 191-207 Jun 1982 refs (Contract AF-AFOSR-2954E-76) Avail NTIS HC A99/MF A01 CSCL 14B

An earlier study of the convergence of the adaptive wall wind tunnel scheme for a sinusoidal model in a two dimensional tunnel is extended to the case where ideal matching at the interface cannot be achieved. It is assumed that, in place of the desired sinusoidal correction, a correction including an extraneous harmonic always occurs. Two different assumptions are made regarding the fitting of this distorted sinusoid to the observed error signal. The iteration converges for the same range of relaxation constants as for the ideal case, but that unconfined flow is not achieved. For reasonable numerical values, the iteration nevertheless appears to make substantial improvement in a flow involving boundary interference. Author

 (NASA-CR-166480, NAS 1 26 166480) Avail NTIS HC A05/MF A01 CSCL 14B

An analysis and survey with conjecture supporting a preliminary data base design is presented. The data base is intended for use in a Computer Image Generator visual subsystem for a rotorcraft flight simulator that is used for rotorcraft systems development, not training. The approach taken was to attempt to identify the visual perception strategies used during terrain flight, survey environmental and image generation factors, and meld these into a preliminary data base design. This design is directed at Data Base developers, and hopefully will stimulate and aid their efforts to evolve such a Base that will support simulation of terrain flight operations. Author

A SMALL PARAMETER METHOD IN PROBLEMS OF MANEUVERING SPACE VEHICLES WITH AERODYNAMIC EFFICIENCY

V P PLOKHIKH (Tsentrallyy Aerogidrodinamicheskii Institut, Moscow, USSR) and V V SONIN (Akademiya Nauk SSSR, Sovet Interkosmos, Moscow, USSR) (International Astronautical Federation, International Astronautical Congress, 32nd, Rome, Italy, Sept 7-12, 1981) Acta Astronautica (ISSN 0094-5765), vol 10, Jan 1983, p 1-8 refs

An analysis is performed of optimal bank angle and incidence control in the class of piecewise-constant functions for the problem of vehicle aerodynamic maneuvering along a low altitude near-circular orbit. The small parameter method is used to obtain an explicit general solution for adjoint equations system and to derive the vehicle trajectory characteristics. The motion is shown to be equivalent to gravitational skipping, irrespective of the value of vehicle lift-to-drag ratio, similar to Keplerian motion but with continuous descent. Suggestions for investigating an aerodynamic maneuver at several turns along a lowering orbit are outlined. Author

SPACE-STATION CREW-SAFETY REQUIREMENTS

R D WITCOFSKI (NASA, Langley Research Center, Hampton, VA) Conference and Workshops on Mission Assurance, Los Angeles, CA, June 7-9, 1983, Paper 10 p refs

Baseline rescue and survival concepts for future space station crews are described. Preliminary studies are being carried out to identify potential threats to crew safety and means to counteract the dangers. Significant factors being considered include the type of threat, the warning time, the number of crewmembers, strategies for protection of the crew (including life-support measures redundancy), and the dependence of space station crews on ground personnel. Attention is being given to the impact of safety devices on the space station geometry and cost, as well as the equipment necessary to maintain the crew in a psychological status positive enough to cope with emergencies. Typical threats would be fire, crewmember illness or injury, and abandonment of the station. A Shuttle launch could take up to 12 days, while equipping the space station with an emergency return capsule would permit return on the same day as the capsule was occupied. M S K

HIGHLY STRESSED MATERIALS, WITH AVIATION CONSIDERED AS AN EXAMPLE [WERKSTOFFE HOHER BEANSPRUCHUNG AM BEISPIEL DER LUFTFAHRT]

W BUNK, ED (Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Institut fuer Werkstoff-Forschung, Cologne, Aachen, Rheinisch-Westfaelische Technische Hochschule, Aachen, West Germany) and J HANSEN (Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Institut fuer Werkstoff-Forschung, Cologne, West Germany) Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1982, 220 p. In German and English

Materials in the mirror of aviation criteria are considered along with structural members made of high-strength cast aluminum and their properties, a high-strength aluminum high-quality casting alloy in aeronautics and astronautics, the development and qualification of welding technology for AZ 5 G (AlZn 4.5 Mg 1) of the Ariane primary structure, and the development of technical cracks on Al-2024-T3 in the case of one-stage and non-one-stage vibratory stresses. Attention is given to a comparison of microstructure and mechanical properties of Al-Li-X alloys made by conventional and by powder-metallurgy procedures, technologies for the production of titanium and titanium alloys, aspects of metallography and manufacturing technology regarding the superplastic forming of TiAl6V4, and powder metallurgy and hot isostatic pressing of the titanium alloy TiAl6V4. Other subjects investigated are related to oxide dispersion hardened mechanically alloyed materials for high temperature, and the influence of defects on the operational strength of disks and wheels in engines. A83-33953

MATERIAL, STRUCTURAL COMPONENT, SERVICE LIFE [WERKSTOFF - BAUTEIL - LEBENSDAUER]

D ENDEMANN (Dornier GmbH, Munich, West Germany), P ESSLINGER (Motoren- und Turbinen-Union Muenchen GmbH, Munich, West Germany), and K SCHRECK (KHD Luftfahrttechnik GmbH, Oberursel, West Germany) IN Highly stressed materials, with aviation considered as an example Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1982, p 33-52 In German

The present investigation is concerned with problems related to a guarantee with respect to a minimum service life for a structural component. The solution of these problems involves basically the development of an approach by which the failure probability for structural components can be calculated on a quantitative basis. The ideal conditions for conducting the required calculation can, however, currently not yet be satisfied. It is, therefore, necessary to use generous safety factors. Attention is given to structural components and their defects, approaches for eliminating defects, questions concerning the qualification of material and component, methods for ensuring reproducibility of the properties of the structural components of an aircraft, and future aspects related to the subject of failure probability. G R

A83-33954

STRUCTURAL MEMBERS MADE OF HIGH-STRENGTH CAST ALUMINUM AND THEIR PROPERTIES [BAUTEILE AUS HOCHFESTEM ALUMINIUMGUSS UND DEREN EIGENSCHAFTEN]

J WEILKE and H FROMMEYER (Vereinigte Flugtechnische Werke GmbH, Bremen, West Germany) IN Highly stressed materials, with aviation considered as an example Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1982, p 53-59 In German

Structural members made of aluminum casting alloys have been little used in the aviation industry. The reasons for this situation are related to the inferior strength of such members when compared with components made of wrought-aluminum alloys. However, aspects of economics make it now urgently necessary to reduce manufacturing costs by employing structural components made of cast metal. In connection with the absence of extensive machining requirements, the manufacturing costs of cast components are generally significantly lower than the costs for other parts. Requirements regarding a demonstration of economical achievements and technical reliability are considered. It will probably be possible to satisfy in 1995, for certain component types, up to 40 percent of the requirements with cast parts. The advantages of modern casting technology compared to conventional manufacturing procedures are illustrated with the aid of a number of examples involving components of the MRCA Tornado aircraft. G R

A83-33955

HIGH-STRENGTH ALUMINUM HIGH-QUALITY CASTING ALLOY IN AERONAUTICS AND ASTRONAUTICS [HOCHFESTE ALUMINIUM-FEINGUSS-LEGIERUNG IN DER LUFT- UND RAUMFAHRT]

G WEDEKING and CH LIESNER (Titan-Aluminium-Feinguss GmbH, Bestwig, West Germany) IN Highly stressed materials, with aviation considered as an example Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1982, p 61-64 In German

The method of investment ('lost wax') casting makes it possible to produce accurate castings characterized by a high surface quality. Since the obtained cast components are nearly ready for installation, an employment of this method leads to savings with respect to material and to the elimination of many processing stages. By combining high-quality casting techniques based on investment casting with an employment of suitable alloys of aluminum, magnesium, titanium, and zirconium, it is feasible to satisfy the rising demands of modern technology and to reduce manufacturing costs. A preferred aluminum alloy with particularly excellent casting characteristics is G-AlSi7Mg. Other alloys

considered include G-AlSi7Mg0.6 and G-AlCu4Ag1. It is pointed out that high-strength aluminum alloys can be employed in the aerospace industry for highly stressed structural components. G R

THE EFFECT OF PRODUCTS BASED ON HIGHER FATTY ACIDS ON THE PERFORMANCE CHARACTERISTICS OF JET FUELS [VLIANIE PRODUKTOV NA OSNOVE VYSSHIKH ZHIRNYKH KISLOT NA EKSPLOATATSIONNYE SVOISTVA REAKTIVNYKH TOPLIV]

O P LYKOV, T P VISHNIAKOVA, V V SASHEVSKII, and I E ORAKOVA (Moskovskii Institut Neftekhimicheskoi i Gazovoi Promyshlennosti, Moscow, USSR) Khimiia i Tekhnologia Topliva i Masel (ISSN 0023-1169), no 5, 1983, p 34-36 In Russian

Higher fatty acids and their oligomers are added to jet fuels refined through various hydrogenation processes to improve their performance characteristics. On the other hand, higher fatty acids may have a detrimental effect on the acidity and thermal stability of jet fuels. Here, a study is made of the properties of the jet fuels T-8, T-8V, and T-7 containing 0.002-0.01 percent by mass of additives based on higher fatty acids. These include the C17-C20 fraction of synthetic fatty acids, isocarbon acids extracted from the C17-C20 fraction by acetone, the bottoms of synthetic fatty acid production, and the acids extracted from the bottoms by cold methanol. It is found that the additives investigated significantly improve the anti-wear characteristics of the jet fuels and do not have any deleterious effects on the service-related properties of the fuels when their concentration does not exceed 0.003 percent by mass. HIGH TEMPERATURE EROSION STUDY OF INCO 600 METAL

W TABAKOFF and B V R VITTAL (Cincinnati, University, Cincinnati, OH) Wear (ISSN 0043-1648), vol 86, April 1, 1983, p 89-99 refs (Contract DAAG29-82-K-0029)

The erosive action of high speed particles can cause serious problems in connection with a number of applications. Applications affected are related to such diverse areas as aircraft gas turbines, rocket nozzles, and coal-fired boiler systems. The cost of maintaining gas turbines in dusty environments is great. The employment of air filtration for an alleviation of the problem has the disadvantage that both payload and engine performance are reduced. The incorporation of erosion as an engine design parameter is considered, taking into account the possible production of an erosion-tolerant engine by the considered approach. In many turbomachinery applications, erosion takes place at elevated temperatures near the strength limiting temperature of the materials used. An erosion test facility was designed to provide erosion and rebound data in range of operating temperatures experienced in compressors and turbines. The test facility was used to obtain basic erosion data for the INCO 600 material. G R

FURTHER STUDIES ON THE PREDICTION OF SPRAY EVAPORATION RATES

J S CHIN (Beijing Institute of Aeronautics and Astronautics, Beijing, People's Republic of China), A H LEFEBVRE (Purdue University, West Lafayette, IN), and W G FREEMAN IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers. New York, American Institute of Aeronautics and Astronautics, 1983, p 73-78 refs

Predictions based on the Chin, Durrett and Lefebvre (1983) equation for estimating the time required to evaporate any given fraction of the mass of a liquid fuel spray in stagnant air are compared with results obtained using a more accurate, but more tedious and time-consuming, iteration procedure. Attention is given to aviation gasoline, aviation kerosene, and the light diesel oil DF 2, over air pressure and air temperature ranges of 100-2000 kPa and 500-2000 K, respectively. The influence of fuel spray characteristics is examined by including mean drop size values of

30-120 microns in the calculations, while the Rosin-Rammler drop size distribution parameter is varied from 2.5 to 3.5. The comparison indicates that the equation proposed yields a simple and effective means for deriving the evaporation times of fuel sprays in stagnant air. O C

THE EFFECTS OF FUEL PROPERTIES UPON POLLUTANTS PRESENT IN GAS TURBINE AERO-ENGINES

J. ODGERS and D. KRETSCHMER (Université Laval, Québec, Canada) IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers. New York, American Institute of Aeronautics and Astronautics, 1983, p. 93-104. Research supported by the Natural Sciences and Engineering Research Council of Canada. refs

This paper discusses the probable impact of the alternative fuels upon the pollutants present in the exhaust of aircraft gas turbine. The major problem is identified as carbon (soot). Hydrocarbons, carbon monoxide and oxides of nitrogen are also considered. Possible solutions are suggested to minimize the various difficulties. Other phenomena (atomization, ignition and heat transfer) associated with alternative fuels are lightly touched upon. Author

A STUDY OF LEAN EXTINCTION LIMIT FOR PILOT FLAME HOLDER

X. N. ZHANG and L. Y. JIANG (Nanjing Aeronautical Institute, Nanjing, People's Republic of China) IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers. New York, American Institute of Aeronautics and Astronautics, 1983, p. 154-161. refs

An experimental and theoretical study has been carried out to determine the lean extinction limit of pilot flame holder with homogeneous mixture. Equations of entrainment in the recirculation of flame holder have been derived. The semi-experimental equation has been set up for predicting the lean blow-out equivalent ratio of approach mixture and that of the corresponding pilot mixture at variable inlet parameters (inlet temperature, pressure, velocity and pilot flow rate). The influence of blockage of pilot stabilizer is examined. Author

EXPERIMENTAL RESEARCH OF THE MECHANISM OF FLAME STABILIZATION IN TWO PHASE MIXTURE

J.-H. WANG (Nanjing Aeronautical Institute, Nanjing, People's Republic of China) and Y.-Z. CHANG IN International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers. New York, American Institute of Aeronautics and Astronautics, 1983, p. 162-171. refs

Pregutter vaporization efficiencies for a turbofan engine afterburner are simulated by the present two-phase mixture test apparatus, together with the inlet temperature and velocity, within lean flame stability limits. The relationship between lean flame stability limits for the cases of homogeneous fuel-air and the two-phase mixture have been obtained, allowing semiempirical formulas for the lean stability limits of a v-gutter flameholder with three blockage ratios (in a two-phase mixture) to be obtained. Fuel film temperature, length and vaporization efficiency are also experimentally investigated. O C

FLUOROELASTOMERS

Materials and Design (ISSN 0261-3069), vol. 4, Feb-Mar 1983, p. 657-662. refs

Fluoroelastomers became first available in 1955. The first commercial fluoroelastomer was a copolymer of vinylidene (VF) and chlorotrifluoroethylene (CTFE). These materials are still available today and offer high resistance to chemicals (especially acids) and moisture. They find applications in pumps, seals, and meters. FKM's still account for the vast majority of applications of fluoroelastomers. In addition to FKM elastomers, fluorosilicone elastomers have been employed for many years. These elastomers

have markedly enhanced resistance to fuels and petroleum products compared to silicone. They may be flexible to -55°C and brittle at -66°C, but their long-term heat, stress-relaxation, and chemical resistance is not equal to that of FKM. Fluorosilicone elastomers tend to be used in specialist applications where a combination of heat and fluid resistance and flexibility at subzero temperature is required. Examples are seals and diaphragms in aircraft fuel and hydraulic systems. G R

THE EFFECT OF MICROSTRUCTURE ON THE FATIGUE BEHAVIOR OF NI BASE SUPERALLOYS

S. D. ANTOLOVICH (Cincinnati, University, Cincinnati, OH) and N. JAYARAMAN IN Fatigue Environment and temperature effects. New York, Plenum Press, 1983, p. 119-144. refs. (Contract AF-AFOSR-80-0065, NSG-3263)

Nickel-base superalloys are used in jet engine components such as disks, turbine blades, and vanes. Improvements in the fatigue behavior will allow the life to be extended or the payloads to be increased. The first part of the present investigation deals primarily with the effects of microstructural variations on the fatigue crack propagation (FCP) behavior of nickel-base alloys, while the second part is concerned with low-cycle fatigue (LCF) behavior of Ni base systems. Waspaloy at low temperature is considered, taking into account material heat treatment and test procedures, a composite plot of Waspaloy FCP data, Paris law fatigue crack propagation constants, monotonic tensile data, and overload FCP test results for Waspaloy. It is found that the FCP and overload behavior of nickel-base alloys may be markedly improved by heat treating. Attention is given to effects of cyclic deformation on microstructure and substructure, environmental damage, and an environmental/deformation model of high temperature LCF. G R

FEASIBILITY OF A FULL-SCALE DEGRADER FOR ANTIMISTING KEROSENE

R. J. MANNHEIMER (Southwest Research Institute, San Antonio, TX) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983. 8 p. Sponsorship: U.S. Department of Transportation. refs. (Contract DOT-FA79WA-4310) (AIAA PAPER 83-1137)

An improved degrader for eliminating fuel filtering and atomization problems with aviation kerosene treated with FM-9 polymer to avoid droplet formation in the event of a crash are described. The device was based on a prototype model that could only process 6 l of fuel (antimisting kerosene - AMK). The main features of the degrader comprised an axial piston pump, a needle valve, and a pressure gage and transducer. Maximum flow rates of 1500 kg/hr were examined, the same as with a JT8D engine in cruise conditions. The fuel was heated and cooled to examine different ambient temperature conditions. The needle valve features a variable area orifice to maintain a constant pressure drop over a wide range of flow rates. Measurements were taken of the upstream flow pressure and the ignition of the fuel and it was found that AMK could be degraded to Jet A performance standards over any flight conditions, although degradation was more difficult in low-temperature conditions. METHANOL COMBUSTION IN A CF6L-80A ENGINE COMBUSTOR

W. J. DODDS, E. E. EKSTEDT, and D. W. BAHR (General Electric Co., Aircraft Engine Business Group, Cincinnati, OH) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983. 8 p. (AIAA PAPER 83-1138)

A series of high pressure tests of a 60 deg sector of a General Electric CF6-80 engine combustor was conducted to evaluate operation on methanol fuel. The use of methanol fuel was successfully demonstrated and, relative to operation with Jet A, provided significant reductions in combustor liner temperatures, flame radiation, and NOx emissions. Combustion efficiency and

exit temperature profiles were similar with both methanol and Jet A. Because of the low heating value of methanol, fuel flow levels had to be more than doubled at all power levels, relative to those needed with Jet A, to satisfy engine turbine inlet temperature requirements

THERMAL STABILITY OF ALTERNATIVE AIRCRAFT FUELS

J TEVELDE, L J SPADACCINI, E J SZETELA (United Technologies Research Center, East Hartford, CT), and M R GLICKSTEIN (United Technologies Corp., Pratt and Whitney Group, West Palm Beach, FL) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 8 p refs (Contract N00140-80-C-0097) (AIAA PAPER 83-1143)

A heated-tube apparatus was used to evaluate the thermal stability characteristics of four liquid hydrocarbon fuels and to determine the effect fuel deposits have on the heat transfer characteristics of aircraft gas turbine fuel systems. The fuels tested were a low-aromatic JP-5, a blend of 80 percent JP-5 and 20 percent hydrocracked gas oil, a blend of 50 percent JP-5 and 50 percent No. 2 heating oil, and a shale derived JP-5. Deposit formation rates ranging from 10 to 3000 microgram/sq cm hr were obtained at tube wall temperatures ranging from 480 to 800 K, with peak formation rates occurring at initial surface temperatures of 644 to 672 K. Results indicate that deposit formation rate (1) correlates very well with initial surface temperature and (2) is relatively insensitive to fuel pressure in the range from 27.2 to 54.4 atm, and test duration in the range from 1 to 14 hr. The deposit thermal resistance, as calculated from heat transfer measurements, correlates well with measured deposit quantity and thickness

EVALUATION OF LOW-COST ALUMINUM COMPOSITES FOR AIRCRAFT ENGINE STRUCTURAL APPLICATIONS

D L MCDANIELS and R A SIGNORELLI 1983 31 p refs Presented at the 112th Ann Meeting of the Met Soc of the Am Inst of Mining, Met and Petroleum Engineers, Atlanta, 6-10 Mar 1983

(NASA-TM-83357, E-1618, NAS 1 15 83357) Avail NTIS HC A03/MF A01 CSCL 11D

Panels of discontinuous SiC composites, with several aluminum matrices, were fabricated and evaluated. Modulus, yield strength and tensile strength results indicated that the properties of composites containing SiC whisker, nodule or particulate reinforcements were similar. The modulus of the composites was controlled by the volume percentage of the SiC reinforcement content, while the strength and ductility were controlled by both the reinforcement content and the matrix alloy. The feasibility of fabricating structural shapes by both wire performs and direct casting was demonstrated for Al₂O₃/Al composites. The feasibility of fabricating high performance composites into structural shapes by low pressure hot molding was demonstrated for B4C-coated B/Al composites

A PARAMETRIC STUDY OF SURFACE IMPERFECTIONS AND SMALL CUTOUTS IN A COMPOSITE PANEL M.S Thesis

T C JANISSE Dec 1982 168 p refs (AD-A124739, AFIT/GAE/AA/82D-15) Avail NTIS HC A08/MF A01 CSCL 12A

A finite element computer code, STAGS C-1, was used to study the effects surface imperfections and cutouts have on the load bearing capability and the displacement patterns of a graphite-epoxy panel. A nonlinear collapse analysis was conducted on two different ply layups each with five different surface imperfection patterns. In addition three different ply orientations were studied each having two different size cutouts (a two inch by two inch square and a four inch by four inch square). The nonlinear branch of STAGS C-1 uses a energy technique using

the nonlinear stiffness matrix that was generated by using the Sanders' strain displacement equations. STAGS did a very good job in calculating the collapse load and displacement of a panel with surface imperfections when compared with experimentally tested panel. The collapse characteristics of composite panels are dependent on the ply layout and size of the cutout. Small cutouts had a displacement pattern that was not expected and is different than the larger cutouts. Changing the vertical boundary conditions on the panel with the small cutout had a negligible effect

AUTOMATIC CONTROL AND DATA ACQUISITION SYSTEM FOR COMBUSTION LABORATORY APPLICATIONS M.S Thesis

B J HANSEN Oct 1982 120 p refs (AD-A125195) Avail NTIS HC A06/MF A01 CSCL 21B

A modern computer based automatic data acquisition/control system was installed at the Department of Aeronautics' Combustion Laboratory. This system utilizes an HP-85 desktop computer as system controller for the HP-3054A data acquisition system. Large quantities of high quality data can be acquired at high data rates and stored for future use or processed real time in closed loop feedback control circuits for precise process control and display. Other electromechanical equipment such as Visicorders provide analog real time data and run in parallel with digital equipment but can be remotely controlled for precise timing of experiments. Interactive programs on the HP-85 computer allow the experimenter to do preliminary calculations, initial experiment set-up, and to perform accurate process control of system functions. On line data reduction and display of results is performed by the system CRT display, the 7225B Plotter, or the system printer. Four basic experiments/experimental apparatuses are currently automated using the automatic data acquisition system, a light scattering experiment, a vitiated air heater, a solid fuel ramjet, and a turbojet combustor test rig. The first three applications are discussed in subsequent sections along with the measurement techniques used to implement the process

PRELIMINARY SCIENCE REPORT ON THE DIRECTIONAL SOLIDIFICATION OF HYPEREUTECTIC CAST IRON DURING KC-135 LOW-G MANEUVERS

P A CURRERI, D M STEFANESCU, and J C HENDRIX Apr 1983 23 p refs

(NASA-TM-82528, NAS 1 15 82528) Avail NTIS HC A02/MF A01 CSCL 11F

An ADSS-P directional solidification furnace was reconfigured for operation on the KC-135 low-g aircraft. The system offers

many advantages over quench ingot methods for study of the effects of sedimentation and convection on alloy formation. The directional solidification furnace system was first flown during the September 1982 series of flights. The microstructure of the hypereutectic cast iron sample solidified on one of these flights suggests a low-g effect on graphite morphology. Further experiments are needed to ascertain that this effect is due to low-gravity and to deduce which of the possible mechanisms is responsible for it. Author

Different types of engines in the military system require specific fuels for normal operation. Spark-ignition engines require gasoline, compression-ignition engines and ground gas turbine engines require diesel fuel. The requirements of each engine type are listed in Army Regulation 703-1 as primary, alternate and emergency fuels. The work reported here identifies other combustible liquids that, in extreme emergency scenarios, could be used as field emergency fuels (FEF), either as extenders of the primary fuel supply, or as acquired. Correlations are presented that permit estimating the fuel blend properties considered to be crucial for operation of engines at a minimal performance level.

Avail NTIS HC A07/MF A01 CSCL 11D

For uni-directional fibrous composites and laminated composites, a heat balance integral method has been developed for the analysis of transient heat flow along the fibers or in the plane of laminates. The method is based on the construction of, for the two constituent media, temperature profiles which not only satisfy the necessary boundary conditions but also fulfill the asymptotic error function properties when inter-region conduction is vanishingly small or at very early times of the heat transient. By comparing with the results of exact solutions, accuracy of the method has been established to be dependent on a number of factors especially the inter-face conduction coefficient and thermal capacity ratio. For the case of a constant surface heat flux, a relevant engineering problem, surface temperature rises of the two regions may be quite different from each other. Temperature differences, however, diminish quite rapidly toward the interior and are only confined to a depth equal to a few fiber radii or laminate thicknesses. Author

The future usage of carbon fiber composite materials in both consumer and industrial products, and the resultant economic impact of the disposal of these products and industrial scrap in both the municipal and industrial waste streams are estimated. The technical and economic substitutability of carbon fiber composite materials for materials now in use is analyzed, and the major uses of this material forecasted. Potential problems relating to the disposal of products containing carbon fiber materials are

analyzed, and estimates made of the economic impacts of the disposal of these products for alternative scenarios that cover a wide range of disposal technologies. The economic impact of the disposal of products and industrial scrap containing carbon fiber composite materials is found to be insignificant for all of the scenarios investigated. GRA

Experimental studies of the penetration, break-up and atomization of transverse liquid and slurry jets were performed. All tests were with an air cross flow at Mach 3.0 with $P_o = 4$ atm and $T_o = 300$ deg K. The processes studied were (1) the effects of injectant viscosity and surface tension, (2) the performance of an impinging jet injector and (3) the effects of particle loading for a slurry jet with 3-50 micrometer particles. The diffractively scattered light method was employed at these high-density, supersonic conditions to study droplet sizes. The major results are, (1) mean droplet size is approximately 10 microns for injectors of 0.05 in, (2) it has an inverse relation with jet/free stream dynamic pressure ratio, (3) it has a direct relation with orifice diameter, (4) it decreases downstream, (5) transverse variation has no simple pattern and (6) droplet size increases with viscosity. AN INVESTIGATION OF THE EFFECTIVENESS OF SMOKE SUPPRESSANT FUEL ADDITIVES FOR TURBOJET APPLICATIONS M.S. Thesis

J R BRAMER Oct 1982 72 p refs
(AD-A125025) Avail NTIS HC A04/MF A01 CSCL 21E

Seven fuel additives were tested to investigate their effectiveness at reducing exhaust stack gas opacity in a turbojet test cell. Exhaust particle sizes and mass concentrations were determined at the engine and stack exhausts using measurements of light transmittance at three frequencies. Particle samples were also collected at the engine exhaust and measured with a scanning electron microscope to verify the optical technique. Nitrous oxide emissions were measured at the test cell stack exhaust. Four of the additives tested were found effective at reducing stack exhaust opacity and particulate mass concentration. None of the additives had any measurable effect on particle diameters. No meaningful changes in particle size or mass occurred between the engine and stack exhausts. The optical technique for determining particle size was verified effective using the scanning electron microscope. No additive had any significant effect on nitrous oxide production. Author (GRA)

Military jet aircraft flight procedures make it necessary to jettison excess fuel in the event of certain in-flight operational situations. These fuel expulsions can be sizable, and in the presence of sunlight and NOx emissions from engine exhaust there exists the potential for formation of ozone and other manifestations of photochemical smog. Since these fuel dumping procedures are carried out at elevated altitudes the atmospheric properties involved

are significantly different from those at ground level

EVALUATION OF THE EFFECT OF VOIDS IN COMPOSITE MAIN ROTOR BLADES

D G ORLINO (U.S. Army Applied Technology Laboratory, Fort Eustis, VA), R J SHUFORD, and W W HOUGHTON (U.S. Army, Army Materials and Mechanics Research Center, Watertown, MA) American Helicopter Society, Journal (ISSN 0002-8711), vol 27, Oct 1982, p 49-56

Design and fabrication of the Improved Main Rotor Blade, designated K-747, as a replacement for the Bell Model AH-1S Cobra, evolved through mission requirements necessitating higher armament payloads, and thus a need to improve rotor lifting capacity. Required increases in performance appeared to be obtainable by directly replacing the main rotor blades with new blades having increased aerodynamic efficiency. Attention was given to a test program directed at assessing void growth characteristics and rates for composite structures. A description is presented of void growth measurements conducted in connection with fatigue testing one K-747 main rotor blade for 29 million cycles, taking into account the nondestructive techniques used during the test program. MICROECONOMIC MODELS FOR PROCESS DEVELOPMENT

V A TIPNIS, U WATWE (Tipnis Associates, Inc., Cincinnati, OH), S J MANTEL, JR (Cincinnati, University, Cincinnati, OH), and G L RAVIGNANI. IN Advanced processing methods for titanium, Proceedings of the Symposium, Louisville, KY, October 13-15, 1981. Warrendale, PA, Metallurgical Society of AIME, 1982, p 289-308. refs (Contract F33615-79-C-5119)

The evaluation of return on added investments, and economic sensitivities during process development, have been introduced into the 'macro', or processing sequence level, and 'micro', or cut/stroke level, in order to identify opportunity windows, and ranges of operating variables, within which a novel process can be made competitive with existing ones. The process model consists of process inputs, constraints, and outputs for the unit under investigation, and is ultimately related to phenomenological models derived from constitutive relationships, interface phenomena such as friction and wear, and fracture limit instability. The microeconomic model is based on the process model at the level of the processing unit. The overall relationship between the process and microeconomic models is presently investigated for the case of Ti airframe milling. O C

THE INFLUENCE OF DEFECTS ON THE OPERATIONAL STRENGTH OF DISKS AND WHEELS IN ENGINES [FEHLEREINFLUSS AUF DIE BETRIEBSFESTIGKEIT VON TRIEBWERKSSCHEIBEN UND -RAEDERN]

G KOENIG and J WORTMANN (Motoren- und Turbinen Union Muenchen GmbH, Munich, West Germany). IN Highly stressed materials, with aviation considered as an example. Oberursel, West Germany, Deutsche Gesellschaft fuer Metallkunde, 1982, p 155-167. In German.

It is pointed out that rotating parts belong to those components of an aircraft engine which have to satisfy the most exacting safety requirements. Safety hazards are related to the risk of engine failure, and, in addition, also to the possibly very serious effects which can be produced in connection with the rupture of a rotating component with its enormous kinetic energy. The relative frequency of an occurrence of various types of failure mechanisms is considered, taking into account also the relative importance of the responsible causes. Low-frequency cyclic stresses related to changes in the rotational speed in connection with changes from one flight phase to another are found to be particularly critical. Attention is given to the sections of a component for which the possibility of crack formation is especially great, aspects of crack propagation, the maximum size of defects which cannot be discovered with the employed inspection methods, the effect of defects on operational conditions, and the results of tests conducted with disks made of various materials. RESIDUAL LIFE PREDICTION FOR JET ENGINE ROTOR DISKS AT ELEVATED TEMPERATURE

H OHNABE, M ZAKO, T KAWASHIMA (Ishikawajima-Harima Heavy Industries Co., Ltd., Tokyo, Japan), and T MIYOSHI (Tokyo, University, Tokyo, Japan). Metallurgical Society of AIME, Annual Meeting, 111th, Dallas, TX, Feb 14-18, 1982, Paper 11 p. refs.

The life prediction method of rotor disks at elevated temperatures is presented, assuming crack initiation to occur at the rim slot of an aircraft jet engine rotor disk and converting the two-dimensional stress into a quasi-three-dimensional one. Thermal and centrifugal stress at the cracked part of the rim slot is calculated by the finite element method, and Paris's rule is used for calculation of the crack propagation. Assuming K_{Ic} and the difference between K_{Ic} and calculated K_I , that is, $K_{Ic} - K_I$, to be a Gaussian distribution, safety is estimated by the relationship between fracture probability and standard deviation. In the numerical examples, an elliptic surface crack being assumed at three different parts of the rim slot of a rotor disk at elevated temperature, the crack propagation after the 2000th cycle is calculated and then compared with the case of constant (room) temperature. The safety of rotor disks is judged by the value of $K_{Ic} - K_I$. Author

OPTIMIZATION FOR STRUCTURES OF DISCRETE-SIZE ELEMENTS

H M HUA (Aero Industry Development Center, Republic of China). Computers and Structures (ISSN 0045-7949), vol 17, no 3, 1983, p 327-333. refs.

An optimization algorithm for finding the minimum weight design of a structure assembled with material of discrete sizes is

presented Examples of the use of this method for aerospace structure design problems are presented, including the four-bar space truss, the ten-bar truss, and the eighteen-member wing box. The results of these examples show that the structures under displacement and stress constraints can be optimized by using this search algorithm. Although the algorithm is formulated to find the feasible solution through direct evaluation, it can be extended easily to solving the optimization problem with dynamic constraints. The method is very flexible and it can be applied to selecting an optimal design among the material available and to determining the optimal fiber layer distribution of various orientations in the structures of composite materials. NONLINEAR SUPERSONIC FLUTTER OF PANELS CONSIDERING SHEAR DEFORMATION AND ROTARY INERTIA

K S RAO and G V RAO (Indian Space Research Organization, Vikram Sarabhai Space Centre, Div., Trivandrum, India) *Computers and Structures* (ISSN 0045-7949), vol 17, no 3, 1983, p 361-364 refs

The finite element method is employed to study the nonlinear supersonic flutter of panels for end conditions of simply supported, clamped, and partial restraint against rotation. The effect of shear deformation and rotary inertia on the nonlinear flutter boundary is investigated for varying thicknesses of the panel. Results show that shear and rotary inertia reduce the critical dynamic pressure parameter, while the large deflection increases the critical dynamic pressure parameter. It is concluded that for panels with L/h less than or equal to 10, where L is the length of the panel and h is the thickness of the panel, the shear and rotary inertia effects are considerable and should be included. NB

THE DISTRIBUTION OF THE DISPERSE FRACTION OF A POLYDISPERSE JET INJECTED INTO A GAS FLOW [O RASPREDELENII V GAZOVOM POTOKE DISPERGIROVANNOI FRAKTSII IZ VVODIMOI V NEGO POLIDISPERSNOI STRUI]

I L MOSTINSKII, D I LAMDEN, and O G STONIK (Akademiia Nauk SSR, Institut Vysokikh Temperatur, Moscow, USSR) *Inzhenerno-Fizicheskii Zhurnal* (ISSN 0021-0285), vol 44, May 1983, p 739-748 In Russian refs

Analytical expressions describing the distribution of a polydisperse jet in a gas flow are obtained, and the cases of longitudinal and transverse aerosol injection are examined. The spray geometry and the droplet size distribution functions are used in sufficiently arbitrary form and are suitable for both direct-jet and centrifugal nozzles. The solutions employ relationships for the trajectories of individual droplets that have been obtained by using an empirical drag coefficient in a two-dimensional equation of motion. The resulting expressions for the disperse phase distribution over the flow cross section are reduced to a form convenient for engineering applications. Illustrative examples are given. VL

FURTHER STUDY ON THE PREDICTION OF LIQUID FUEL SPRAY CAPTURE BY V-GUTTER DOWNSTREAM OF A PLAIN ORIFICE INJECTOR UNDER UNIFORM CROSS AIR FLOW

M-H CAO and J-S CHIN (Beijing Institute of Aeronautics and Astronautics, Beijing, People's Republic of China) *IN International Symposium on Air Breathing Engines*, 6th, Paris, France, June 6-10, 1983, Symposium Papers. New York, American Institute of Aeronautics and Astronautics, 1983, p 64-72 refs

On the basis of the Chin and Cao (1983) flat fan spray and fuel capture models, flame holder liquid fuel spray capture is predicted in route to a consideration of the effect of different factors on fuel spray capture for a wide range of parameters. A comparison is then undertaken between fuel spray capture by vertically and horizontally positioned flame holders, and a correlation for maximum fuel spray capture is determined. The results obtained indicate that the vertically positioned flame holder provides more effective fuel capture, as well as the ability to change fuel capture over a wide range through simple alteration of juxtaposition distance. EXPERIMENTAL INVESTIGATION ON THE ROLE OF FLEXBARS AND METALLIC END SEALS IN SQUEEZE FILM DAMPERS

V A KUMAR (National Aeronautical Laboratory, Bangalore, India), S C KAUSHAL, and K LAKSHMIKANTAN (GTRE, Research Div., Bangalore, India) *IN International Symposium on Air Breathing Engines*, 6th, Paris, France, June 6-10, 1983, Symposium Papers. New York, American Institute of Aeronautics and Astronautics, 1983, p 530-534 refs

A performance evaluation is undertaken for squeeze film dampers by means of a novel test program which highlights the effect of several related parameters on damper performance. Attention is given to the effects of flexbars and metallic end seals on the performance of squeeze film dampers. Damping coefficient quantitative values were calculated by direct measurement of the force transmitted to the foundation, damper sleeve displacement, phase angle between force transmitted and damper sleeve displacement, and excitation frequency, for various oil supply pressures and rotor speeds. Flexbars and metallic end seals

generally improve system damping characteristics, and it is noted that the location of the end seal gap, in relation to the position of the squeeze film oil supply inlet ports, plays a significant role in making the introduction of the end seal more effective in system damping O C

INTEGRO-DIFFERENTIAL EQUATIONS OF THE DYNAMICS OF ELASTIC SYSTEMS IN NONSTATIONARY FLOWS [INTEGRO-DIFFERENTSIAL'NYE URAVNENIYA DINAMIKI UPRUGIKH SISTEM V NESTATSIONARNOM POTOKE]

V I MOROZOV and A T PONOMAREV (Voenno-Vozdushnaia Inzhenernaia Akademiia, Moscow, USSR) Prikladnaia mekhanika (ISSN 0032-8243), vol 19, May 1983, p 128-131 In Russian refs

A mathematical model of nonstationary aeroelasticity has been developed by combining the numerical methods of aerodynamics with elasticity theory. The aerodynamics is described using a linearized approach, in the elastic part of the problem, both linear and nonlinear relationships are employed. The two parts are combined by using the convolution for determining the variable pressure fields. The possibilities of the model are illustrated by examples involving the behavior of a flight vehicle as a whole and its components in turbulent nonseparated flow. Results are presented in graphical form V L

LIFE PREDICTION FOR TURBINE ENGINE COMPONENTS

T NICHOLAS and J M LARSEN (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) IN Fatigue Environment and temperature effects New York, Plenum Press, 1983, p 353-375 USAF-supported research refs

An alternate approach to life management of turbine engines is being considered considered by the U.S. Air Force. Whereas most major structural components are currently limited by low cycle fatigue and are retired from service after their design life has been reached, a 'Retirement for Cause' approach would keep components in service until a fatigue crack has been detected. The approach is based on non-destructive inspection and prediction of fatigue crack growth behavior under engine operating conditions. This paper discusses the concept of retirement for cause and reviews the problems associated with the prediction of crack growth. Several aspects of crack growth under engine spectrum loading including creep crack growth and crack retardation are

discussed. Recommendations for future research efforts are presented Author

ECCENTRIC END WEAR IN CYLINDRICAL ROLLER BEARINGS CAN BE PREDICTED AND PREVENTED

W E POOLE and G E CHETTA (United Technologies Corp., Pratt and Whitney Group, West Palm Beach, FL) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 7 p

(AIAA PAPER 83-1132)

Cylindrical roller bearings are widely used for rotor support in gas turbine engines because of their high load capacity, suitability for high speed and their capability to allow relative axial movement between the engine rotor and case. However, problems may arise, as the gas turbine environment becomes more demanding. Although not new, eccentric end wear occurs more frequently and may progress to secondary engine damage more rapidly in modern high speed turbine engines. Several theories were developed as potential causes of eccentric end wear based on earlier work. A test program was structured to evaluate each theory with the goal of duplicating the cage fracture sequence in a bearing rig and, if successful, in an engine. It is found that wear can be initiated by roller dynamic unbalance. Other observed causes of eccentric end wear are local end defects and end runout. High internal radial clearance contributes to wear progression. Wear progression leading to large end runout depends only on geometry G R

DESIGN ANALYSIS OF A SELF-ACTING SPIRAL-GROOVE RING SEAL FOR COUNTER-ROTATING SHAFTS

EL DI RUSSO (NASA, Lewis Research Center, Cleveland, OH) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 8 p

(AIAA PAPER 83-1134)

A self-acting spiral groove inter-shaft ring seal of nominal 16.33 cm (6.43 in.) diameter for sealing fan bleed air between counter rotating shafts in advanced turbofan engines was analyzed. The analysis focused on the lift force characteristics of the spiral grooves. A NASA Lewis developed computer program for predicting the performance of gas lubricated face seals was used to optimize the spiral groove geometry to produce maximum lift force. Load capacity curves (lift force as function of film thickness) were generated for four advanced turbofan engine operating conditions at relative seal speeds ranging from 17,850 to 29,800 rpm, sealed air pressures from 6 to 42 N/sq cm (9 to 60 Psi) absolute and temperatures from 95 to 327 C (203 to 620 F). The relative seal sliding speed range was 152 to 255 m/sec (500 to 836 ft/sec). The analysis showed that the spiral grooves are capable of producing sufficient lift force such that the ring seal will operate in a noncontacting mode over the operating range of typical advanced turbofan engines. EXPERIMENTS IN DILUTION JET MIXING

J D HOLDEMAN (NASA, Lewis Research Center, Cleveland, OH),
R SRINIVASAN, and A BERENFELD (Garrett Turbine Engine Co.,
Phoenix, AZ) AIAA, SAE, and ASME, Joint Propulsion Conference,
19th, Seattle, WA, June 27-29, 1983 14 p refs
(AIAA PAPER 83-1201)

Experimental results are presented on the mixing of a single row of jets with an isothermal mainstream in a straight duct, with flow and geometric variations typical of combustion chambers in gas turbine engines included. It is found that at a constant momentum ratio, variations in the density ratio have only a second-order effect on the profiles. A first-order approximation to the mixing of jets with a variable temperature mainstream can, it is found, be obtained by superimposing the jets-in-an-isothermal-crossflow and mainstream profiles. Another finding is that the flow area convergence, especially injection-wall convergence, significantly improves the mixing. For opposed rows of jets with the orifice cone centerlines in-line, the optimum ratio of orifice spacing to duct height is determined to be 1/2 of the optimum value for single injection at the same momentum ratio. For opposed rows of jets with the orifice centerlines staggered, the optimum ratio of orifice spacing to duct height is found to be twice the optimum value for single side injection at the same momentum ratio. EFFECTS OF COMPRESSOR HUB TREATMENT ON STATOR STALL MARGIN AND PERFORMANCE

P CHENG, M E PRELL, E M GREITZER, and C S TAN (MIT, Cambridge, MA) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 9 p refs
(Contract F49620-82-K-0002)
(AIAA PAPER 83-1352)

The application of grooves or slots over the rotor tips in the casing of an axial flow compressor can have a large effect on compressor stall margin and performance. Relative motion between endwall and blade is found to be an important element for the success of the grooves in reducing the endwall boundary layer blockage in the rotor tip region. In this connection, the question has been asked whether a rotating 'hub treatment' below a row of cantilevered stator blades would also be effective in improving the stall margin. The present investigation is concerned with the effect of hub treatment on the stall margin and performance of a 'hub critical' stator. Two sets of blading configurations were tested, each with a solid wall and with hub treatment. It was found that for the first set of blading (low stagger) the application of hub treatment did not have a major effect on the stator performance. However, for the second set of blading (high stagger), the hub treatment improved the compressor performance. G R

FEASIBILITY OF DRY LUBRICATION FOR LIMITED-DUTY GAS TURBINE ENGINES

J DILL (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, OH), D BRANDES, P KAMSTRA, and R SOLOMON (Garrett Turbine Engine Co., Phoenix, AZ) AIAA, SAE, and ASME, Joint Propulsion Conference, 19th, Seattle, WA, June 27-29, 1983 14 p DARPA-USAF-supported research refs
(AIAA PAPER 83-1130)

The advantages and disadvantages of dry-lubrication systems for limited duty engines, those that are of only intermittent or emergency use, are discussed, together with technology areas needing development to produce a dry lubricated turbine engine. Two approaches have been identified, one in which the lubricant is already in the bearing, the second involving an external feed to the bearing. Dry lubricated bearings have two critical material properties, thermal conductance and the thermal expansion coefficient. The materials must be resistant to oxidation and corrosion. Hot-pressed silicon nitride ceramics have demonstrated the desired features, but at a high cost, with surface cleanliness problems, and some doubt is present as to their uniformity.

Promising lubricants include MoS₂, graphite, WSe₂-GaIn, and AgHg-PTFE-MoS₂. Attempts at simulating dry lubricated bearing behavior and performance by computer program are outlined.

DETERMINATION OF THE SENSITIVITY OF U.S. AIR FORCE AIRCRAFT HYDRAULIC SYSTEM COMPONENTS TO PARTICULATE CONTAMINATION

C E SNYDER, JR, L J GSCHWENDER, and C J PELLERIN (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) Lubrication Engineering (ISSN 0024-7154), vol 39, July 1983, p 450-455, Discussion, p 455, 456, Authors' Closure, p 456, 457

The effect of particulate contamination on aircraft hydraulic system components was determined using a 3000 psi hydraulic multipass test stand equipped with a horizontal stabilator actuator and hydraulic pump used in the F-4 hydraulic system. The test fluid was MIL-H-5606 hydraulic fluid. Particulate contamination was introduced into the system in the form of AC test dust and was added in incremental amounts while changing the actuator piston dither position for a total of nine piston positions with increasing contamination. Filtration was added to the stand late in the experiment. Fluid samples were drawn throughout the experiment and properties were monitored. Both the actuator and the pump were monitored for leakage rates and the pump was monitored for outlet pressure during the experiment. Post-test inspection of the hardware and fluid analyses lead to wear/contamination conclusions which were relevant to Air Force aircraft operations.

 (Contract DTFA01-80-Y-10524)
 (FAA-RD-82-69) Avail NTIS HC A05/MF A01

The lifetimes of significant features in typical storm phenomena were investigated and the results are expected to help in deciding the scan strategy of NEXRAD radars. In particular, the question of the adequacy of a 5 minute information update rate for NEXRAD in its aviation weather surveillance role was addressed. Two methods are used for the lifetime study: photo-interpretive and computer based correlation. The basis and program steps of the correlation method are discussed. Several storms are studied using both methods. It is found that the storms studied contain no feature that might have been missed by a 5 minute scan cycle provided that data from all the three moment fields (reflectivity, radial velocity, and Doppler spectrum width) at several elevations are utilized in the detection of hazardous phenomena. This document is a design manual for the Remote Link Unit Demonstration System (RLUDS). The Remote Link Unit (RLU) is a new design concept for remote terminals. This document contains detailed design information on the RLUDS. The RLUDS described in this design manual is an operational hardware breadboard prototype that performs most of the important RLU functions. This effort has demonstrated the feasibility of implementation of the Link Module (LM), the Interface Configuration Adapter (ICA), the Electronic Nameplate (NP) and the Interface between the Link Module and the Link Manager. The Link Manager (LMG) was simulated with a PDP-11 computer. The extent of RLU implementation encompassed by the demonstration unit is illustrated. The configuration of the RLUDS is presented. GRA

The purpose of this manual is to provide a guide for the use and operation of the Remote Link Unit Demonstration System (RLUDS) without the details of the design of the system. The sections of this manual provide information on inspection of the equipment to verify a correct physical configuration, external cable connections, procedures for operation. This manual provides all the details necessary for operations of the RLUDS, assuming the user is generally knowledgeable of the concept, purpose, and configuration of the RLU and its major components. Both background information and design details may be found in the Design Manual (Part III). GRA

This report summarizes the results of the program of implementation of an RLU Demonstration System. This system allows the evaluation of the most unique parts of the RLU and has facilitated the resolution of problem areas in the RLU design. Enhancements to the RLU functional design are presented and an implementation plan for an RLU prototype is proposed. The User's Manual and the Design Manual for the system are included as Parts II and III, respectively. Author (GRA)

ANALYSIS OF F-16 RADAR DISCREPANCIES M.S. Thesis

K A RICKE Dec 1982 44 p refs
 (AD-A124749, AFIT/GE/EE/82D-56) Avail NTIS HC A03/MF A01 CSCL 15E

One hundred and eight aircraft were randomly selected from three USAF F-16 bases and examined. These aircraft included 63 single-seat F-16As and 45 two-seat F-16Bs and encompassed 8,525 sorties and 748 radar system write-ups. Programs supported by the Statistical Package for the Social Sciences (SPSS) were run on the data. Of the 748 discrepancies, over one-third of them occurred within three sorties of each other and half within six sorties. Sixteen percent of all aircraft which had a discrepancy within three sorties had another write-up within the next three sorties. Designated repeat/recurring write-ups represented one-third of all the instances in which the write-up separation interval was three sorties or less. This is an indication that maintenance is unable to correct equipment failures as they occur, most likely because the false alarm rate is too high and maintenance is unable to duplicate the error conditions on the ground for correct error diagnosis.  (AD-A124792, AFIT/GAE/AA/82D-3) Avail NTIS HC A05/MF A01 CSCL 16D

Five different shock-positioning cascades, for short-radius turns in ramjet inlet diffusers, were designed and tested on the AFIT water table. These flow controllers were to perform the same function as the conventional arrangement of an aerodynamic grid and a long-radius turn. The tests were to determine the suitability of the water table for such experimentation, in addition to determining the flow-control capabilities and pressure recovery of the cascades. All five designs accomplished the flow-control function as designed, and two designs exhibited the same or better pressure recovery than the aerodynamic grid. The water table proved to be an excellent means of testing these cascades, primarily due to the ease of flow visualization in the tests done. The shock-positioning cascade, short-radius turn concept shows promise and should be tested further in gas-dynamic apparatus

This program was a study to develop and optimize an ultrasonic weld bonding procedure for the fabrication of primary structural components for helicopters. This procedure, a combination of ultrasonic welding and adhesive bonding, was studied through a series of coupon tests. Various adhesives and surface treatments were evaluated with regard to their adaptability of ultrasonic weld bonding. Adhesive bond quality and weld quality were evaluated through various T-shear, fatigue, and environmental salt-spray tests. Environmental degradation of the adhesively bonded areas occurred consistently and could not be resolved. It was determined that the surface condition required for good adhesive bonding was not compatible with that required for good ultrasonic welding and the program was terminated Author (GRA)

STATIC AEROELASTIC ANALYSIS OF FLEXIBLE WINGS VIA NASTRAN, PART 1 M. S. Thesis

K JONES Dec 1982 97 p refs
 (AD-A124662, AFIT/GAE/AA/82D-16-PT-1) Avail NTIS HC A05/MF A01 CSCL 01C

The purpose of this study was to expand the capabilities of the Static Flexible Wing Aeroelastic Sequence that Captain Lance P. Chrisinger developed for NASTRAN as his Master's Thesis at AFIT. Captain Chrisinger developed a basic procedure to enable NASTRAN to analyze flexible wing airloads and stresses. That capability is expanded to enable analysis of standard wing models. A subroutine was incorporated into NASTRAN to eliminate extensive hand-calculation of transformation matrices. The capability to tolerate control surfaces was discovered. Also, a survey of wing models in the Air Force inventory was taken to determine the characteristics of the average wing model. This was used to determine where the aeroelastic procedure was lacking in its ability to analyze wing models Author (GRA)

STRUCTURAL MODEL TUNING VIA VECTOR OPTIMIZATION M.S. Thesis

C R DEVORE Dec 1982 82 p refs
 (AD-A124791, AFIT/GAE/AA/82D-8) Avail NTIS HC A05/MF A01 CSCL 13M

This report examines tuning a finite element model using vector optimization techniques. Structural models using finite element theory often need to be adjusted so they can accurately simulate the real structure. The goal is to tune the model such that it will reproduce data derived from the structure. The tuning procedure is complicated by many factors. First of all, the model may be required to reproduce several sets of different performance data which may have conflicting effects on the model. The number and kinds of parameters to modify may be large or uncertain. Also, there may be many constraints on the model. With all these considerations and several performances indices to extremize, there may be many compromise solutions to examine in order to select the best one. Therefore, the problem has been broken into two parts. First, the performance indices are extremized using multiple objective optimization theory, producing a set of possible solutions. Next, the solutions are ranked ordered according to a decision maker's preferences. The solution ranked number one is, then, the best answer. The tuning process was applied to a T-38 horizontal stabilator. Four static deformation and two natural frequency experimentally determined data sets were used as the objective functions for the three parameter model GRA

 Avail NTIS HC A99/MF A01 CSCL 20D

A brief review of the significant accomplishments made at ARL in the basic understanding of the aerothermo fluid dynamic characteristics of ejectors is given. The studies of AFFDL which further enhanced the state-of-the-art of the ejectors for V/STOL applications are also indicated. The spectrum of activities in the Air Force not only gave a great deal of insight into the characteristics of the ejector flows, but also resulted in the development of compact ejectors that are relevant for aircraft application. The saga of ejector investigations is continuing and it is within the realm of possibility that ejector systems will be successfully applied for a variety of aircraft operations in the coming years B W

CSCL 20D

The results of an investigation of boundary layers close to the stagnation point of an oscillating airfoil are reported. Two procedures for generating initial conditions, the characteristics box scheme and a quasi-static approach, were investigated, and the quasi-static approach was shown to be appropriate provided the initial region was far from any flow separation. With initial conditions generated in this way, the unsteady boundary layer equations were solved for the flow in the leading edge region of a NACA 0012 airfoil oscillating from 0 to 5 deg. Results were obtained for both laminar and turbulent flow, and, in the latter case, the effect of transition was assessed by specifying its occurrence at different locations. The results demonstrate the validity of the numerical scheme and suggest that the procedures should be applied to calculation of the entire flow around oscillating airfoils. Author

A class of implicit upwind differencing methods for the compressible Navier-Stokes equations is described and applied. The methods are based on the use of local eigenvalues or wave speeds to control spatial differencing of inviscid terms and are aimed at increasing the level of accuracy and stability achievable in computation. Techniques for accelerating the rate of convergence to a steady state solution are also used. Applications to inviscid and viscous transonic flows are discussed and compared with other methods and experimental measurements. It is shown that accurate and efficient transonic airfoil calculations can be made on the Cray-I computer in less than 2 min. Author

NTIS HC A17/MF A01 CSCL 13I

A high speed, high pressure liquid hydrogen turbopump was designed, fabricated, and tested under a previous contract. This design was then modified to incorporate hybrid hydrostatic/ball bearings on both the pump end and turbine end to replace the original conventional ball bearing packages. The design, analysis, turbopump modification, assembly, and testing of the turbopump with hybrid bearings is presented here. Initial design considerations and rotordynamic performance analysis was made to define expected turbopump operating characteristics and are reported. The results of testing the turbopump to speeds of 9215 rad/s (88,000 rpm) using a wide range of hydrostatic bearing supply pressures are presented. The hydrostatic bearing test data and the rotordynamic behavior of the turbopump was closely analyzed and are included in the report. The testing of hybrid hydrostatic/ball bearings on a turbopump to the high speed requirements has indicated the configuration concept is feasible. The program has presented a great deal of information on the technology requirements of integrating the hybrid bearing into high speed turbopump designs for improved bearing life. Author

ANALYSIS OF PROGRESSIVE COLLAPSE OF COMPLEX
STRUCTURES Ph.D. Thesis

G E RIGGS Dec 1982 205 p refs

(AD-A125266, AFIT-CI-NR-82-63D) Avail NTIS HC A10/MF
A01 CSCL 12A

The principal goal of the study was to evaluate an analytical procedure for predicting progressive collapse in damaged complex structures. A structure was modeled for analysis by the finite element method using relatively large, simple elements. There was little or no refinement of mesh size in areas of initial damage or damage propagation. A method was developed for determining and applying allowable stresses to help compensate for the absence of model detail. Stress results of a finite element analysis were examined by a computer post-processor program written for this study to make selective changes to the finite element model. The modified model was analyzed using the finite element method and the procedure was repeated in an iterative fashion to predict progressive collapse. Analytical results were compared to experimental test data to determine the validity of the analytical procedure. The analytical procedure provided a relatively economical method for predicting progressive collapse in a complex structure. Evaluation of a complex structure subjected to three initial damage conditions showed acceptable correlation between experimental and analytical results. The method of determining appropriate allowable stresses was general enough to apply to a wide range of materials and structures. The procedure proved to be an economical estimating tool for predicting residual structural strength. Author (GRA)

A04/MF A01 CSCL 09B

The Federal Aviation Administration's Integrated Noise Model (INM) is a series of computer programs designed to estimate environmental noise levels in the vicinity of an airport. As part of the effort's to validate INM outputs for the FAA, comparisons were made between the Sound Exposure Levels (SEL) of actual aircraft flyovers at Seattle-Tacoma International Airport and SELs which were computed by the INM for identical conditions. Data for this analysis were obtained from the FAA ARTS-III radar to determine the actual slant range and velocity of observed aircraft, and from noise monitors located beyond each runway end to determine actual SEL values associated with observed aircraft. The report presents the results of the comparison of INM and observed SEL values for seven transport-category aircraft. GRA

A SURVEY OF HELICOPTER AND AMBIENT URBAN NOISE LEVELS IN PHOENIX, ARIZONA Final Report

J S NEWMAN Sep 1982 44 p

(AD-A123856, FAA-EE-82-20) Avail NTIS HC A03/MF A01

CSCL 20A

The FAA has been conducting controlled helicopter noise measurement programs since 1976. The data have been used for a variety of purposes including evaluation of proposed U S and international noise standards, validation of helicopter noise prediction methodologies, and development of practical helicopter design guidance. In order to supplement the results of the controlled tests, field survey data are also being gathered to represent in-service operating conditions. Measurements are intended to represent helicopter noise within the context of urban ambient background noise. The results reported in this document are termed 'survey measurements', as opposed to controlled test data, in order to reflect the limited control imposed over factors which contribute to the variability of measured noise levels. Noise data are presented for the Bell 206-L, Aerospatiale Alouette III, and the Aerospatiale A-Stare, SA-350. Operational modes include approach, takeoff, hover, and flat-pitch-idle. Noise data include A-weighted Sound Level time histories, maximum A-Weighted Sound Level (LASm), Sound Exposure Level (LAE), and Equivalent Sound Level (Leq). Author (GRA)

A REVIEW AND COMPARISON OF LIGHTNING RETURN STROKE MODELS USING EXPERIMENTAL DATA M.S. Thesis

S M HANIF Dec 1982 182 p refs

(AD-A124680, AFIT/GE/EE/82D-61) Avail NTIS HC A09/MF

A01 CSCL 12A

Over the last three decades many lightning return stroke models have been proposed to predict the current pulse of the return stroke as it propagates in the channel. These models were mainly proposed by trying to solve the inverse problem of suggesting the current in the channel which will give the experimental measurement of the electromagnetic (EM) fields on the ground.

Due to the lack of airborne data, the validity of these models as a function of height have not been verified. In this thesis we provide a discussion of all the significant return stroke models and their credibility as a function of height by comparing their EM fields with recent acquired airborne lightning data. The equations to compute the electric and magnetic fields in space due to a vertical channel are also derived. The last part of the thesis is related to the comparison of these models. The predicted fields due to Master et al. were plotted and compared with the empirical results. Also, the Master et al. model was modified for the channel current pulse propagation velocity and the channel current wave form. The plots due to these modifications are included and compared with the experimental data. GRA

ANALYSIS AND SPECIFICATION OF SLANT WIND SHEAR Interim Report

H A BROWN 8 Nov 1982 44 p refs

(AD-A125883, AFGL-TR-82-0366, ERP-810) Avail NTIS HC

A03/MF A01

Wind data collected at the Air Force Geophysics Laboratory (AFGL) Otis Weather Test Facility (WTF) for the period 28 March 1981 to 4 May 1981 have been analyzed to produce frequencies of occurrence of slant wind shear with respect to surface wind speed, time of day, vertical temperature gradient and wind shear direction differences. Slant wind shear (SWS) is a measurement that more closely approximates the shear encountered by an aircraft on takeoff or landing. It is computed as the wind shear between a higher level wind (in this study, 60 m) and the surface separated by a horizontal distance equivalent to that which an aircraft would traverse in descending or ascending that height. AERODYNAMIC RESEARCH ON TIPVANE WINDTURBINES

G J W VANBUSSEL, T VANHOLTEN, and G A M VANKUIK Apr 1982 19 p refs

(PB83-147413, LR-355) Avail NTIS HC A02/MF A01 CSCL

10B

The research on tipvane turbines aims at a process improvement of the wind energy conversion system, which is more than component improvement such as efficient aerofoils and optimized transmission systems. These latter developments make it possible for a modern wind turbine to approach the Betz maximum power coefficient. However, process improvements are possible based on flow phenomena which are not consistent with the assumptions made in Betz theory. Power coefficients far above the Betz maximum value are possible when for example forces are applied perpendicular to the wind direction and when viscous effects play an important role. The effect of tipvanes, which are small auxiliary wings at the end of the turbine blades inducing a mass flow augmentation by the creation of a venturi flow is investigated. GRA

RF RADIATION FROM LIGHTNING CORRELATED WITH AIRCRAFT MEASUREMENTS DURING STORM HAZARDS-82

D M LEVINE Mar 1983 27 p refs

(NASA-TM-85007, NAS 115 85007) Avail NTIS HC A03/MF

A01 CSCL 04B

During the Storm Hazards Experiment 1982, the Goddard Space Flight Center monitored radiation from lightning from a site at the Wallops Flight Facility, Wallops Island, VA. Measurements were made while the NASA F106 penetrated thunderstorms to obtain data on lightning strikes to the aircraft. The objective of the ground-based measurements was to help determine if the events recorded by the F106 were part of lightning discharges. During the experiment, 53 cases were obtained in which events were recorded aboard the aircraft while reliable quality RF radiation was recorded on the ground. These cases came from 12 different

15 MATHEMATICAL AND COMPUTER SCIENCES

storms occurring from June through August 1982. The data confirms that the aircraft was measuring events which were part of lightning and indicates that the events recorded on the aircraft tend to occur early in the flash. Author

SINUSOIDAL INTEGRATION FOR SIMULATION OF SECOND-ORDER SYSTEMS

D R ROLSTON (McDonnell Aircraft Co., St Louis, MO) IN Flight Simulation Technologies Conference, Niagara Falls, NY, June 13-15, 1983, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1983, p 52-63 refs (AIAA PAPER 83-1086)

Many classical numerical methods for differential equations are based on the exact integration of polynomial functions. However, methods based on sinusoidal functions may be better suited to analysis of oscillatory systems. Discrete time difference equations have been developed for sinusoidal extrapolation, predictor integration, and corrector integration and tested in the equations of motion of real-time flight simulation. The computational stability and accuracy were significantly improved when a sinusoidal function frequency was chosen to match the natural frequency of the aircraft. Author

ANALYSIS OF A REAL-TIME APPLICATION

R SHASTRI (Gould, Inc., S E L Computer Systems Div., Fort Lauderdale, FL) IN Flight Simulation Technologies Conference, Niagara Falls, NY, June 13-15, 1983, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1983, p 71-74 (AIAA PAPER 83-1088)

In most real-time applications such as simulation and process control, the scope of the project at its onset is usually much smaller than what it turns out to be downstream into the project. As the project progresses, additional requirements are specified

and a situation is reached wherein the programs expand to consume all available compute power and/or resources. This paper describes the characteristics of a real-time application in the field of simulation and process control, explores the nature of the problem and suggests some implementation considerations that should be adapted in the initial design phase. In doing so, down-the-line enhancements are readily accommodated and, if necessary, resources may be added incrementally, such that the system as a whole never reaches a performance or resource threshold. OLD PROBLEM/NEW SOLUTIONS - MOTION CUEING ALGORITHMS REVISITED

F M CARDULLO (New York, State University, Binghamton, NY) and R L KOSUT (Integrated Systems, Inc., Palo Alto, CA) American Institute of Aeronautics and Astronautics, Flight Simulation Technologies Conference, Niagara Falls, NY, June 13-15, 1983, 8 p refs (AIAA 83-1082)

The design concept of a nonlinear cue-shaping filter to exploit the motion-system-hardware capability of flight simulators is presented. Cue-error and sensory-error expressions are derived from the models of platform, aircraft, and sensory dynamics and inserted as parameters in a cost functional for the optimal-tracking-control problem. The resulting nonlinear filters are shown to be indirectly sensitive to cue magnitude, increasing onset duration and washout-to-onset cue magnitude as input cue magnitude decreases. The approach used is seen as applicable to simulators incorporating other cues such as visual displays, g-seats, or vibration systems. T K

INTERACTIVE FINE-TUNING OF LINEAR-QUADRATIC GOVERNORS BY SELECTIVE AND DIRECT ACTION ON THE POLES OF THE CONTROL SYSTEM [MISE AU POINT INTERACTIVE DES REGULATEURS LINEAIRES-QUADRATIQUES PAR ACTION DIRECTE ET SELECTIVE SUR LES POLES DU SYSTEME CONTROLE]

O L MERCIER (ONERA, Chatillon-sous-Bagneux, Hauts-de-Seine, France), Y JOANNIC, and O MOREIGNE (ONERA, Chatillon-sous-Bagneux, Hauts-de-Seine, Institut Industriel du Nord de la France, Villeneuve d'Ascq, France) (International Association of Science and Technology for Development, Symposium d'Informatique Appliquee, Lille, France, Mar 15-17, 1983) ONERA, TP, no 1983-21, 1983, 7 p. In French refs (ONERA, TP NO 1983-21)

Interactive software for fine-tuning linear-quadratic governors for use in engineering the control of optimal multivariable gains is presented. Analytical relationships are defined for characterizing the response of the control system to variations in a specified value corresponding to the variation of a system parameter. The resulting response gradients account for cause-effect relations existing between the fitted values and the coefficients of the weighting matrices for the cost function. The algorithm permits qualitatively setting the end-points of a system's performance, i.e., use of the nondiagonal coefficients of the Q matrix that defines the degrees of freedom of the system. Furthermore, interaction between the machine and the operator is provided. An example is provided of the case of multivariable piloting of an aircraft, and other aerospace applications are indicated. A MODIFIED ALGORITHM FOR DETERMINING STRUCTURAL CONTROLLABILITY

C R BURROWS and M N SAHINKAYA (Strathclyde, University, Glasgow, Scotland) International Journal of Control (ISSN 0020-7179), vol 37, June 1983, p 1417-1431. Research supported by the Science and Engineering Research Council refs

The algorithm of Burrows and Sahinkaya (1981) for determining the structural controllability of multi-input time invariant processes with ill-defined parameter values is modified to take account of insights arising from an examination of three counter-examples

The modified algorithm has the same underlying philosophy as the original method. It can be applied without computational aids to determine the controllability of many practical problems and this is demonstrated by examining a twelfth order model of a rotor-bearing system. The method also provides an aid to system design. A graphical procedure is presented for determining the rank of the pair (A, b). The extension to multiple inputs is discussed.

DEVELOPMENT OF AN OCULOMETER DATA COLLECTION SUBSYSTEM M.S. Thesis

N L WOOD Dec 1982 259 p refs
(AD-A124700, AFIT/GE/EE/82D-72) Avail NTIS HC A12/MF A01 CSCL 09B

A SYM-1 microprocessor with dual 5-1/4 inch disk drives was used to develop software to gather and reduce data from a Cubic-Foot Remote Oculometer built by Honeywell, Inc. The primary function of the oculometer is to measure the look direction of a pilot's eye in a ground cockpit simulator. The output of the oculometer used for this effort is eye lookpoint in azimuth and elevation and whether the oculometer is tracking the eye or not. The line-of-sight measurement covers a viewing field of plus and minus 30 degrees in azimuth and zero to plus 30 degrees in elevation. This viewing field is broken into instruments whose boundaries are defined by the data collection subsystem. Performance measures are printed out at the end of the data mission. The software for the SYM-1 was developed modularly with each module tested separately and then the whole subsystem tested. Simulated oculometer data was used to test the software. The data collection subsystem was designed to run with minimal knowledge and interaction required by the user.

AN INTERACTIVE BOMBING MISSION SIMULATION WITH COMPUTER GRAPHICS INTERFACE M.S. Thesis

M J GOCI Dec 1982 151 p refs
(AD-A124661, AFIT/GCS/MA/82D-4) Avail NTIS HC A08/MF A01 CSCL 09B

An interactive flight simulation with computer graphics interface was designed using top-down structured analysis techniques. The project converts a passive bombing mission simulation used in the Avionics Laboratory, Air Force Wright Aeronautical Laboratories at Wright-Patterson AFB, into an interactive, real-time, man-in-loop simulation. The design was documented using SofTech's Structured Analysis and Design Technique (SADT) then coded in FORTRAN. The graphics were implemented using TEKTRONIX PLOT-10 software and the system operates on a VAX-11/780 computer coupled through a TEKTRONIX 4016 terminal.

HAND-HELD COMPUTER PROGRAMS FOR PRELIMINARY HELICOPTER DESIGN M.S. Thesis

P J FARDINK Oct 1982 180 p refs
(AD-A125036) Avail NTIS HC A09/MF A01 CSCL 09B

This project gives the user of the HP-41 handheld programmable calculator a series of programs that give acceptable results during the preliminary phases of the helicopter design process. The project consists of three parts. The first part consists of several short programs and their subroutine form. These programs and subroutines compute density altitude, density, disc area, solidity, tip velocity, induced velocity, coefficient of thrust, tip loss factor, equivalent chord, and ground effect. The second part consists of major subroutines. These subroutines compute profile power, induced power, climb power, parasite power, and total power, equivalent area and induced power for tandem rotor, and data input and change. The third part consists of the main programs. These programs compute the various power requirements for hovering flight, forward (straight and level), flight, vertical flight, and forward climbing flight, also tail rotor power, autorotative flight, and tandem rotor flight.

ACOUSTIC MODAL ANALYSIS OF A FULL-SCALE ANNULAR COMBUSTOR

A M KARCHMER (NASA, Lewis Research Center, Cleveland, OH) American Institute of Aeronautics and Astronautics, Aeroacoustics Conference, 8th, Atlanta, GA, Apr 11-13, 1983 17 p refs
(AIAA PAPER 83-0760)

An acoustic modal decomposition of the measured pressure field in a full scale annular combustor installed in a ducted test rig is described. The modal analysis, utilizing a least squares optimization routine, is facilitated by the assumption of randomly occurring pressure disturbances which generate equal amplitude clockwise and counter-clockwise pressure waves, and the assumption of statistical independence between modes. These assumptions are fully justified by the measured cross spectral phases between the various measurement points. The resultant modal decomposition indicates that higher order modes compose the dominant portion of the combustor pressure spectrum in the range of frequencies of interest in core noise studies. A second major finding is that, over the frequency range of interest, each individual mode which is present exists in virtual isolation over significant portions of the spectrum. Finally, a comparison between the present results and a limited amount of data obtained in an operating turbofan engine with the same combustor is made. The comparison is sufficiently favorable to warrant the conclusion that the structure of the combustor pressure field is preserved between the component facility and the engine. CROSS SPECTRA BETWEEN TEMPERATURE AND PRESSURE IN A CONSTANT AREA DUCT DOWNSTREAM OF A COMBUSTOR

J H MILES, C A WASSERBAUER, and E A KREJSA (NASA, Lewis Research Center, Cleveland, OH) American Institute of Aeronautics and Astronautics, Aeroacoustics Conference, 8th, Atlanta, GA, Apr 11-13, 1983 27 p refs
(AIAA PAPER 83-0762)

The feasibility of measuring pressure temperature cross spectra and coherence and temperature-temperature cross spectra and coherence at spatially separated points along with pressure and temperature auto-spectra in a combustion rig was investigated. The measurements were made near the inlet and exit of a 6.44 m long duct attached to a J-47 combustor. The fuel used was Jet A. The cross spectra and coherence measurements show the pressure and temperature fluctuations correlate best at low frequencies. At the inlet the phenomena controlling the phase relationship between pressure and temperature could not be identified. However, at the duct exit the phase angle of the pressure is related to the phase angle of the temperature by the convected flow time delay. Previously announced in STAR as N83-23116

FULL-SCALE MEASUREMENTS OF BLADE-VORTEX INTERACTION NOISE

D A BOXWELL and F H SCHMITZ (U S Army, Aeromechanics Laboratory, Moffet Field, CA) American Helicopter Society, Journal (ISSN 0002-8711), vol 27, Oct 1982, p 11-27 refs

Full-scale far-field acoustic data on four different two-bladed rotors encountering blade-vortex interaction are compared. The UH-1H helicopter was tested with its standard NACA 0012 airfoil rotor. Data are also presented for the AH-1S helicopter configured with its standard 540 rotor, the Kaman K747 rotor, and the OGEE tip rotor. The data were reduced using 'time-windowing' of the impulsive noise event, thus enhancing the signal-to-noise ratio of the in-flight data. Strong pressure gradients, isolated in the UH-1H and AH-1S 540 rotor signatures, strongly influenced the subjective annoyance of the rotor. The peak amplitudes and power spectrum of the K747 and OGEE rotors were about equal and generated less annoyance than the standard AH-1S or UH-1H rotors.

THE RELATIONSHIP BETWEEN THE AERODYNAMIC AND ACOUSTIC CHARACTERISTICS OF COAXIAL JETS [O SVIAZI AERODINAMICHESKIKH I AKUSTICHESKIKH KHARAKTERISTIK SOOSNYKH STRUI]

V M KUZNETSOV, M P LAVRUKHINA, and G MUNIN (Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza (ISSN 0568-5281), Mar-Apr 1983, p 124-128. In Russian. refs

The results of an experimental study of the mean and peak velocity distributions in the mixing zone of isothermal coaxial jets are presented for jets with both regular and inverted velocity profiles (in the latter case the velocity of the outer flow exceeds that of the inner flow). Based on experimental results, estimates are obtained for the noise of coaxial jets with different initial profile velocities. These estimates are then compared with experimental acoustic data.

DERIVATION OF THE FUNDAMENTAL EQUATION OF SOUND GENERATED BY MOVING AERODYNAMIC SURFACES

H R AGGARWAL (Santa Clara University, Santa Clara, CA) AIAA Journal (ISSN 0001-1452), vol 21, July 1983, p 1048-1050 refs (Contract NCC2-191)

Ffowcs Williams and Hawkins (1969) based their derivation of the fundamental equation of the sound generated by arbitrarily moving aerodynamic surfaces on the study of mass and momentum balance of a control volume imbedding a mathematical surface(s) exactly corresponding to real surface(s). These investigators also sketched an alternative method, employing generalized functions, for its derivation. This latter method, which was later developed by Farassat (1975), is purely mathematical and formal. Goldstein (1976) used the free-space Green function to produce an implicit derivation of the Ffowcs Williams and Hawkins equation. In the study presented here, Lowson's (1965) concept of moving point singularities is generalized to moving surface singularities, and a new derivation is given of the fundamental equation. The derivation is based on topological considerations of the underlying space, the fluid medium, and the integral properties of the Dirac delta function.

Inflow control device (ICD's) of various shapes and sizes have been used to simulate inflight fan tone noise during ground static tests. A small, simple inexpensive ICD design was optimized from previous design and fabrication techniques. This compact two-fan-diameter ICD exhibits satisfactory acoustic performance characteristics without causing noise attenuation or redirection. In addition, it generates no important new noise sources. Design and construction details of the compact ICD are discussed and acoustic performance test results are presented.

JT150 1/2-SCALE NOZZLE JET NOISE EXPERIMENT AND COMPARISON WITH PREDICTION

D E GROESBECK and C A WASSERBAUER May 1983 26 p refs

(NASA-TM-83370, E-1636, NAS 1 15 83370) Avail NTIS HC A03/MF A01 CSCL 20A

As part of a program to study flight effects on the exhaust noise of a full scale JT15D engine, static half scale model jet noise experiments were conducted. Acoustic data were recorded for microphone angles of 45 deg to 155 deg with jet conditions for the model scale nozzle corresponding closely to those at 55, 73 and 97 percent of corrected rated speed for the full scale engine. These data are useful for determining the relative importance of jet and core noise in the static full scale engine test data and will in turn allow for a proper evaluation of flight effects on the exhaust noise results. The model scale data are also compared with the coaxial jet noise prediction. Above 1000 Hz, the prediction is nominally 0 to 3 dB higher than the data. The arithmetic mean of the differences between the experimental OASPL and the predicted OASPL for all angles for each run ranged from 0 to -3.2 dB. The standard deviation of all the OASPL differences is 2.2 dB. The discrepancies are greatest at low primary jet velocities and appear to be due to inadequacy in the variable jet density exponent incorporated in the prediction procedure.

LOW FLIGHT SPEED ACOUSTIC RESULTS FOR A SUPERSONIC INLET WITH AUXILIARY INLET DOORS

R P WOODWARD, F W GLASER, and J G LUCAS 1982 47 p refs Presented at the 19th Joint Propulsion Conf., Seattle, Wash., 27-29 Jun 1983, sponsored by AIAA, SAE, and ASME (NASA-TM-83411, E-1694, NAS 1 15 83411) Avail NTIS HC A03/MF A01 CSCL 20A

A model supersonic inlet with auxiliary inlet doors and boundary layer bleeds was acoustically tested in simulated low speed flight up to Mach 0.2 in the NASA Lewis 9x15 Anechoic Wind Tunnel and statically in the NASA Lewis Anechoic Chamber. A JT8D refan model was used as the noise source. Data were also taken for a CTOL inlet and for an annular inlet with simulated centerbody support struts. Inlet operation with open auxiliary doors increased the blade passage tone by about 10 dB relative to the closed door configuration although noise radiation was primarily through the main inlet rather than the doors. Numerous strong spikes in the noise spectra were associated with the bleed system, and were strongly affected by the centerbody location. The supersonic inlet appeared to suppress multiple pure tone (MPT) generation at the fan source. Inlet length and the presence of support struts were shown not to cause this MPT suppression.

INVESTIGATION OF THE COUPLING OF UNSTEADY LIFT TO LOW ORDER ACOUSTIC DUCT MODES IN AN AXIAL FLOW FAN M.S. Thesis

J P COWAN 17 Jun 1982 145 p refs

(Contract N00024-79-C-6043)

(AD-A124819, ARL/PSU-TM-82-137) Avail NTIS HC A07/MF A01 CSCL 20A

By using flow distortion screens, the plane wave (0,0) and first higher order (-1,0) and (1,0) spinning modes were generated in a low-speed axial flow fan. The perpendicular unsteady lift force on a segment of a nine-bladed rotor and the acoustic pressure along the duct were measured simultaneously by a strain gage sensor and a flush-mounted microphone, respectively. The total pressure field downstream of the screens was measured by circumferentially traversing a Kiel probe. The typical signal-to-noise ratio was sufficiently high for the desired signal isolation with a spectrum analyzer. A phase-locked ensemble averaging technique was used to obtain amplitude and phase measurements of the periodic unsteady signals. Standing waves set up in the duct between the rotor and duct inlet seemed to cause a back-reaction effect which resulted in an increase and reduction of the unsteady lift force above and below expected levels. If these effects are taken into account, theoretical predictions coupling unsteady lift to acoustic far field pressure levels conform to measured data. Therefore, it is concluded that there is a definite coupling between unsteady lift and acoustic pressure in the duct, yet determination of an unambiguous coupling factor would require more extensive data acquisition. (AD-A124974) Avail NTIS HC A06/MF A01 CSCL 20A

The development and use of lands near U.S. Air Force base is of continuing concern to Air Force officials. It is recognized that the public must be protected from noise and other hazards of air base operations. At the same time it is recognized that lands near air bases often are highly attractive areas for development. Aircraft operations are likely to continue from Mather AFB for the indefinite future. Operations will include the T-37, T-43, B-52, KC-135 or replacement aircraft. The types of aircraft, flight tracks, frequency, and other characteristics will be continuously evaluated by Mather AFB to determine the effects on the AICUZ and the community. The AICUZ study was prepared to promote orderly and compatible land use around Mather AFB. Land use guidelines and noise measurement techniques are based on recent technology. Data from this study should be considered for incorporation into existing land use plans and ordinances of surrounding communities, and used as a basis for decisions on future land development requests. SANDIA HELICOPTER ACOUSTIC DETECTOR (SHAD)

H D ARLOWE May 1982 12 p refs

(Contract DE-AC04-76DP-00789)

(DE82-018925, SAND-81-0538) Avail NTIS HC A02/MF A01

The Sandia Helicopter Acoustic Detector was developed to provide a low cost alternative to radar for countering the helicopter threat at new DOE facilities. The main buildings of these new designs are generally hardened to provide significant delay to a helicopter borne adversary team. Under these circumstances the sensor is only required to detect helicopters that are in their final landing phase and at close range (less than 75 m). This short detection range allows the use of a fairly simple acoustic detection algorithm without making the system overly sensitive to wind noise, motor vehicles, and ventilation/heat exchange blowers. This work was sponsored by the Department of Energy/Office of Safeguards

and Security as part of the overall Sandia Fixed Facility Physical Protection Program DOE

FEASIBILITY STUDY OF THREE-DIMENSIONAL HOLOGRAPHIC INTERFEROMETRY FOR AERODYNAMICS Final Report

J E CRAIG May 1983 64 p refs

(Contract NAS2-19573)

(NASA-CR-166483, NAS 1 26 166483) Avail NTIS HC A04/MF A01 CSCL 20F

Laser holographic interferometry was tried as a nonintrusive diagnostic tool for studying unsteady two dimensional flows. A NACA 0012 airfoil was tested, while undergoing dynamic stall, over a range of Mach numbers of 0.3 to 0.5, Reynolds number of 0.5×10^6 to the 6th power to 2×10^6 to the 6th power, and at reduced frequencies of 0.015 to 0.15. It was found that both quantitative and qualitative data could be obtained by the technique. Surface pressures on the airfoil can be measured to within 1% of those measured with orifices and pressure transducers when the flow is attached. Velocity profiles were measured near the wake region, and they compared very well with laser velocimeter data for attached flows. For separated flows with large scale vortices, densities can be measured, but pressures and velocities cannot be deduced with the assumption of constant pressure gradient in the normal direction. The sensitivity of the interferograms was good at a Mach number of 0.4 and a Reynolds number of 4×10^6 to the 6th power/ft, the sensitivity worsened at smaller Mach numbers and Reynolds numbers, and improved at larger ones.

This research program consisted of an integrated and interrelated effort of basic and applied research in chemical thermodynamics and thermochemistry. Knowledge of variation of physical and thermodynamic properties with molecular structure was used to select compounds for study that because of high ring strain or unusual steric effects may have good energy characteristics per unit volume or per unit mass and thus be useful in the synthesis of high energy fuels. These materials were synthesized, and their thermodynamic properties were evaluated. In cooperation with researchers at Wright-Patterson Air Force Base, ramjet fuels currently in use were subjected to careful thermodynamic evaluation by measurements of heat capacity, enthalpy of combustion and vapor pressure. During the last year of this effort, seven kerosene-type fuels produced by British Petroleum and seven jet fuels produced from shale oil were studied. Author (GRA)

A83-34475**AIRLINE SAFETY AND LABOR RELATIONS LAW - BALANCING RIGHTS AND RESPONSIBILITY**

G D SKONING (Seyfarth, Shaw, Fairweather and Geraldson, Chicago, IL) (Flight Safety Foundation, Annual International Air Safety Seminar, 35th, Johannesburg, Republic of South Africa, Sept 6-9, 1982) Air Law (ISSN 0165-2079), vol 8, no 2, 1983, p 104-116 refs

The legal status of conflicts between an airline's obligation to provide the highest degree of safety and federal antidiscrimination statutes is reviewed, with a focus on the age-60-mandatory-retirement and maximum-age-at-hiring policies for pilots, and on mandatory pregnancy leaves and physical-handicap restrictions for flight attendants. It is shown that the FAA highest-safety requirement has been broadly interpreted by the courts as a justification for policies which are prima facie violations of the Age Discrimination in Employment Act or of Title VII of the Civil Rights Act. Safety-based criteria have generally been accepted as bona fide occupation qualifications under those acts. Employees were found to be unjustifiably discriminated against, however, when the airline could not show that a policy was safety-related, or when there was evidence suggesting that safety was being used as a pretext for economically determined actions. A83-34851**CANADIAN SYMPOSIUM ON AIR CUSHION TECHNOLOGY, 16TH, CHARLOTTETOWN, PRINCE EDWARD ISLAND, CANADA, OCTOBER 19-21, 1982, PREPRINTS**

Symposium sponsored by the Canadian Aeronautics and Space Institute and Hovercraft Society. Ottawa, Canadian Aeronautics and Space Institute, 1982, 110 p.

Among the topics discussed are the application of system identification flight analysis techniques to the pitch-heave dynamics of an air cushion vehicle (ACV), the dynamic stability of ACVs, surface impulse propulsion principles, the improvement of ACV performance with wave-forming keels, an innovative icebreaker vessel design for arctic environments, diesel versus gas turbine engine concepts in hovercraft design, combat damage considerations for ACVs, the potential application of military hovercraft in NATO's northern flank, and the US Coast Guard's operational evaluation of a 110-foot surface-effect ship. Also considered are the design, development and testing of such ACVs as the AEROBAC AB-7, LARUS, VP-1, the HM5 prototype, and the AP 1-88. O C

A83-34852**APPLICATION OF SYSTEM IDENTIFICATION FLIGHT ANALYSIS TECHNIQUES TO THE PITCH-HEAVE DYNAMICS OF AN AIR CUSHION VEHICLE**

P A SULLIVAN, P V HARTMANN, and T A GRAHAM (Toronto, University, Toronto, Canada) IN Canadian Symposium on Air Cushion Technology, 16th, Charlottetown, Prince Edward Island, Canada, October 19-21, 1982, Preprints. Ottawa, Canadian Aeronautics and Space Institute, 1982, p 2-16. Research supported by the National Research Council of Canada and Transport Canada, Natural Sciences and Engineering Research Council of Canada refs

(Contract NSERC-A-3378, NSERC-A-1613)

Flight test data obtained for the Vampire 1 Air Cushion Vehicle are analyzed. The skirt used in these tests was of the uncompartmented segmented skirt type, and the test data,

consisting of the outputs from accelerometers, angular rate gyros, etc., was obtained by flying the vehicle over a ramp installed in a 43-m diameter circular track. The analysis employed a maximum likelihood, Gauss-Newton system identification technique developed for the interpretation of aircraft flight test data. Reasonable agreement was obtained between the estimates of stiffness and damping in pitch, and the corresponding values measured in the static pitch tests. It was also confirmed that the hysteresis observed in the static pitch tests can have a major effect of vehicle dynamics. O C

A83-34853**AN OVER-VIEW OF UTIAS RESEARCH ON THE DYNAMIC STABILITY OF AIR CUSHION VEHICLES**

M J HINCHEY (Toronto, University, Toronto, Canada) IN Canadian Symposium on Air Cushion Technology, 16th, Charlottetown, Prince Edward Island, Canada, October 19-21, 1982, Preprints. Ottawa, Canadian Aeronautics and Space Institute, 1982, p 17-29. Research supported by the National Research Council of Canada and Transport Canada. refs

Dynamic instabilities have been encountered by a number of Canadian operators of air cushion vehicles. This paper presents an overview of research at the University of Toronto, Institute for Aerospace Studies (UTIAS), dedicated to understanding the phenomenon. It includes a brief review of theoretical and experimental work on the destabilizing effect of cushion air supply ducts. The duct-plenum system is shown to behave as a Helmholtz resonator with the slug of air in the duct oscillating on the plenum air spring. For this work, a unique facility was developed which used a large hollow sphere as a pneumatic filter to isolate the duct-plenum system from the fan. The paper also outlines recently completed work on limit cycle oscillations, skirt material damping, large air cushion platforms, and air cushions hovering over water. Author

A83-34855**HOW TO IMPROVE AIR CUSHION VEHICLE PERFORMANCE WITH VUMP EQUIPPED WAVE-FORMING KEELS**

A JONES, JR (FASTCO, Virginia Beach, VA) IN Canadian Symposium on Air Cushion Technology, 16th, Charlottetown, Prince Edward Island, Canada, October 19-21, 1982, Preprints. Ottawa, Canadian Aeronautics and Space Institute, 1982, p 39-41.

Vent-pump, or 'VUMP'-equipped Wave Forming (W-F) keels are suggested as a means of imparting hydrodynamic lift to air cushion lift. The planning surfaces of the W-F keels are lubricated by air pumped by the venturi-effect action of the VUMP. The concept is similar to that of the Muller-Thomamuhl (1915) air cushion hydroplane, although instead of requiring a blower, it is powered by the action of the forward motion of the air cushion vehicle on the VUMP. O C

A83-34858**TECHNICAL ASPECTS OF THE AEROBAC AB-7**

J BOUDREAU (Bombardier, Ltd, Valcourt, Quebec, Canada), G HERROUIN (Dubigeon-Normandie, S A, Paris, France), and D GAWISH IN Canadian Symposium on Air Cushion Technology, 16th, Charlottetown, Prince Edward Island, Canada, October 19-21, 1982, Preprints. Ottawa, Canadian Aeronautics and Space Institute, 1982, p 55-60.

The AEROBAC AB-7, an off-road vehicle concept combining air cushion and conventional tracks, is the subject of a feasibility study which has as its goal the formulation of an economical means of transportation in the northern regions of Canada (where low population density and harsh terrain make the building of a conventional transportation system prohibitive). Attention is given to the design features and projected performance capabilities of the AEROBAC AB-7, which with a 7 metric ton payload has a weight of 21 metric tons, and is able to travel at a maximum speed of 30 km/hr over terrain that would be impassable for conventional off-road vehicles. O C

A83-34859**'LARUS' AND 'VP-1' TESTED IN WINTER 1982**

S KORPPOO (Oy Wartsila AB, Helsinki, Finland) IN Canadian Symposium on Air Cushion Technology, 16th, Charlottetown, Prince Edward Island, Canada, October 19-21, 1982, Preprints Ottawa, Canadian Aeronautics and Space Institute, 1982, p 61-63

Two air-cushion vehicles, 'Larus' and 'VP-1', were tested in the south-western archipelago of Finland. The tests were carried out in March 1982, when the sea was frozen and covered with 50 mm of snow. During the tests 'Larus' operated independently and also towed 'VP-1'. Measurements were made of the speed, resistance and manoeuvrability of the two craft. Author

A83-34860**NEW CONCEPT IN HOVERCRAFT DESIGN DIESEL VERSUS GAS TURBINES**

D E EMMAS IN Canadian Symposium on Air Cushion Technology, 16th, Charlottetown, Prince Edward Island, Canada, October 19-21, 1982, Preprints Ottawa, Canadian Aeronautics and Space Institute, 1982, p 64-68

The fuel cost increases experienced during the 1970s compelled certain hovercraft designers to investigate the relative advantages of the use of lightweight diesel engines rather than the previously favored gas turbines, which had higher fuel consumption. The AP1-88 hovercraft presently considered has been tested with both air-cooled and water-cooled diesel engines. Although fuel consumption reduction was the paramount consideration in the test program undertaken, engine weight reduction was also sought, and resulted in the choice of turbocharged versions of both the air- and water-cooled engines. O C

A83-34861**ACV LIFT AIR SYSTEMS - MORE PUFF FOR LESS POWER**

H S FOWLER (National Research Council, Ottawa, Canada) IN Canadian Symposium on Air Cushion Technology, 16th, Charlottetown, Prince Edward Island, Canada, October 19-21, 1982, Preprints Ottawa, Canadian Aeronautics and Space Institute, 1982, p 70-74 refs

While Air Cushion Vehicle lift air supplies are often considered as merely isolated fans by designers, an attempt is presently made to take into account all aerodynamic factors involved in fan intake and exhaust duct design. It is noted that the frequently employed fan scroll exhaust duct is not necessarily the most efficient alternative, and other are proposed within the constraints presented by vehicle design. Emphasis is put on overall air system stability and efficiency. O C

A83-34862**AP.1-88 CRAFT 001 PROTOTYPE CLEARANCE TRIALS**

R L WHEELER (British Hovercraft Corp., Ltd., East Cowes, Isle of Wight, England) IN Canadian Symposium on Air Cushion Technology, 16th, Charlottetown, Prince Edward Island, Canada, October 19-21, 1982, Preprints Ottawa, Canadian Aeronautics and Space Institute, 1982, p 75-80

The AP 1-88 001 is the first prototype of an 80-passenger hovercraft design which, relative to the SR N6-type craft which have served in the cross-Solent (U.K.) route for which the AP 1-88 is intended since 1965, represents an entirely new design incorporating such novel features as a welded aluminum hull and four air-cooled diesel engines with twin ducted propulsors. A major feature retained in the new design from the latest of the development versions of the SR N6 craft is the highly responsive, low pressure ratio skirt which permits reduced propulsion and lift power levels relative to weight, thereby improving ride comfort. O C

A83-34864**OPERATIONAL DEPLOYMENT OF THE AIR CUSHION VEHICLE**

R W HELM (Bell Aerospace Canada Textron, Grand Bend, Ontario, Canada) IN Canadian Symposium on Air Cushion Technology, 16th, Charlottetown, Prince Edward Island, Canada, October 19-21, 1982, Preprints Ottawa, Canadian Aeronautics and Space Institute, 1982, p 87-92

An analysis of air cushion vehicle program objectives is the basis for the formulation of fielding and support plans, with the type or types of vehicles to be used determining the requirements for the base of operations, the type and quality of ground support equipment, and the supply of spare parts and special tools. Payload types, either passenger or cargo, also influence requirements, especially with respect to the provisioning of mechanical handling equipment. Mission profiles and route stage lengths determine fuel requirements. Each operational deployment task is accomplished through some function that is in turn influenced by the preceding task. The failure to identify any given task, or to make allowances for those which have been identified, will have a detrimental impact on the achievement of program objectives. O C

A83-35052**FROM VOYAGEUR ON - THE EXPLOITATION OF AN OPPORTUNITY TO DEVELOP A CANADIAN AIR CUSHION VEHICLE INDUSTRY**

R W HELM (Bell Aerospace Canada Textron, Grand Bend, Ontario, Canada) IN Canadian Symposium on Air Cushion Technology, 15th, Toronto, Canada, September 29, 30, 1981, Proceedings Ottawa, Canadian Aeronautics and Space Institute, 1981, p 62-71

Experiences of Canadian developers of air cushion vehicles (ACV) are surveyed. Markets for ACVs were projected to include applications as active river-crossing ferries, off-road freight hauling, air-cushion on-road transports, and icebreaking, as well as landing craft in military use. The first Canadian hovercraft was completed in 1972 and subjected to trials on Lake Ontario. Several models of this Voyageur ACV were built, with learning and redesign experience in operations, including offshore discharge of container ships in a military role. The Viking, a small ACV with one power module and two propellers, was designed as an SAR vessel, but encountered sea-keeping problems. The U.S. Army ordered two Voyageurs, each able to carry 30 tons, in 1975. Design improvements have recently been incorporated in the LACV-30s, of which eight have been ordered as amphibious landing craft for the U.S. Army. Older Voyageurs are currently employed as training craft in the Gulf of Mexico. M S K

A83-35053**A NEW CLASS ACV - TANKER-FREIGHTER**

R G LONGAKER IN Canadian Symposium on Air Cushion Technology, 15th, Toronto, Canada, September 29, 30, 1981, Proceedings Ottawa, Canadian Aeronautics and Space Institute, 1981, p 74-87

A qualitative examination of the concept-to-delivery to the Coast Guard of a 70 ST air cushion hoverbarge is presented. The entire process consumed only 51 weeks, beginning with a decision to proceed with hardware that was rugged and reliable and required a common welding rig and diesel engine tools. The project was the Demonstration Program Alaskan Air Cushion vehicle with an eight wheel, hydraulically powered, dual direction driving system. The axles were built to steer, level, extend, retract, and displace horizontally about a central mounting shaft, and the vehicle was outfitted with all-terrain tires. Contract specifications allowed 36 short tons of fuel as part of the 70 ton cargo capacity. The vehicle was intended to transport freight and people between ports and remote Alaskan villages in all weather conditions. Operating personnel were brought in at the early manufacture phase. Test runs in 20-27 in of new snow were performed at 7-10 mph, and a winter test program in Alaska covered 2600 mi. Details of the experience gained in the hoverbarge development are provided, including a checklist to summarize monthly activities. M S K

DYNAMIC MODELING OF AN AIR CUSHION VEHICLE

A J AMATO (ORI, Inc., Ship Technology Div., Silver Spring, MD) and D D MORAN (David W Taylor Naval Ship Research and Development Center, Bethesda, MD) IN Canadian Symposium on Air Cushion Technology, 15th, Toronto, Canada, September 29, 30, 1981, Proceedings Ottawa, Canadian Aeronautics and Space Institute, 1981, p 89-98 refs

A time domain nonlinear analytic model in four-degrees-of-freedom of the dynamic motion response of an air cushion supported vehicle is presented. Predicted craft response to both declining oscillation tests and gully overpassage are presented and compared with published experimental data.

COMPUTER STUDIES OF ACV HEAVE DYNAMICS STABILIZATION

J R AMYOT (National Research Council, Ottawa, Canada) IN Canadian Symposium on Air Cushion Technology, 15th, Toronto, Canada, September 29, 30, 1981, Proceedings Ottawa, Canadian Aeronautics and Space Institute, 1981, p 100-112

A hybrid computer model of an air cushion vehicle (ACV) capable of heave instability was postulated based on experimental data from a heave test rig. The model was developed to study automatic vent valve control in ACV heave dynamics stabilization. Results have shown that it is a potentially effective means of stabilizing ACV's and improving their ride quality. Furthermore, it provides the designer with more flexibility in determining plenum volume and bearing area.

DEVELOPMENTS IN AIR CUSHION VEHICLE SPRAY SUPPRESSION

R W DYKE (Aerojet Liquid Rocket Co., Panama City, FL) IN Canadian Symposium on Air Cushion Technology, 15th, Toronto, Canada, September 29, 30, 1981, Proceedings Ottawa, Canadian Aeronautics and Space Institute, 1981, p 113-142

The development of improved spray aprons for air cushion vehicles has been driven by the need to improve crew and passenger vision, as well as to reduce ice accretion, salt corrosion, erosion, and water ingestion in the engine and machinery rooms. The spray is produced by the cushion pressure (up to 70 lb/sq ft) and the skirt design. Initial studies involving a weighted apron permitted development of an empirical expression that numerically modeled the performance of the suppressor. The most important design considerations included the need to vent the spray, avoid overloading the skirt, and to ensure the security of the suppressor attachments. Specific successful designs implemented on the Voyageur 004 and, in another configuration, on the Jeff A (a Navy seacraft) are described, noting that the suppressors were introduced with no increase in drag.

A DESIGN SYNTHESIS MODEL FOR ACV/SES LIFT SYSTEMS

J A TREMILLS (Defence Research Establishment Atlantic, Dartmouth, Nova Scotia, Canada), E G U BAND (Band, Lavis and Associates, Inc., Severna Park, MD), and R ST LAURENT (Davis Engineering, Ltd., Canada) IN Canadian Symposium on Air Cushion Technology, 15th, Toronto, Canada, September 29, 30, 1981, Proceedings Ottawa, Canadian Aeronautics and Space Institute, 1981, p 144-180 refs

This paper describes a design synthesis model for Air Cushion Vehicle (ACV) and Surface Effect Ship (SES) lift systems for craft of 100 to 10,000 tons. The details of the basic technology, and the cushion and the fan system design procedures and algorithms are described. The resulting interactive computer program is extensively modular and flexible in operation. The program, which is designed for easy modification to include different algorithms or to increase the size of the data base, outputs details on the cushion, air ducting, fans, power transmission and engines.

SKIRTS - TIME FOR A NEW LOOK?

H S FOWLER (National Research Council, Ottawa, Canada) IN Canadian Symposium on Air Cushion Technology, 15th, Toronto, Canada, September 29, 30, 1981, Proceedings Ottawa, Canadian Aeronautics and Space Institute, 1981, p 181-186

The development of skirts for air cushion vehicles (ACV) is traced, with a focus on skirts for overland hovercraft. Initial applications for ACVs were all for sea-going missions, and mainly involved production of a flexible skirt to reduce weight and increase clearance in hover. However, the marine skirt is not directly applicable to the terrain changes, conditions, and roughness encountered in overland operations. Lighter fabrics permit the flexibility and low inertia necessary to rapid responses to obstacles. Abrasion of the material takes on the significance that flutter fatigue has on water. Low speed motion defrays the abrasive damage to the skirt, allowing a stiffer and heavier material to be used. The segment needed for spray suppression on water can be dispensed with on land, although synthetic 'dragon scales' are under development in order to protect the skirt's flat underside from the abrasion caused by movements over ground obstacles.

THE TRANSPORTATION DEVELOPMENT CENTRE CONTRIBUTION TO AIR CUSHION TECHNOLOGY

J E LAFRAMBOISE (Transport Canada, Transportation Development Centre, Montreal, Canada) IN Canadian Symposium on Air Cushion Technology, 15th, Toronto, Canada, September 29, 30, 1981, Proceedings Ottawa, Canadian Aeronautics and Space Institute, 1981, p 187-207 refs

Projects in which the Transport Development Center of Canada has been testing, redesigning, and defining applications for air cushion vehicles (ACV) are summarized. Specific studies have concentrated on using hovercraft for overland transportation, evaluating the potential for using ACVs in the Northwest Territories, testing the effectiveness of ACVs as ice breakers, and analyzing air cushion system dynamics. Trials have been performed with various skirt systems and overland hovercraft trailers. Attention has been given to using the overland hovercraft as transport vehicles in sparsely populated regions, where traffic virtually stops during the spring thaw and where no road systems exist. Two modes of ice breaking, one suitable for rivers and one for lakes, have been defined and are under development. Finally, the stability of the air cushion on large ACVs is being examined.

LACV-30 SUPPORTABILITY

J SARGENT (U S Army, Mobility Equipment Research and Development Command, Fort Belvoir, VA) IN Canadian Symposium on Air Cushion Technology, 15th, Toronto, Canada, September 29, 30, 1981, Proceedings Ottawa, Canadian Aeronautics and Space Institute, 1981, p 244-266

The steps necessary for bringing the U S Army LACV-30 amphibious support vehicles to operational status are reviewed, together with the projected missions. Containerized cargo handling raised the expected loads to 22.5 tons, delivered to a secured beach through the surf and blowing sand from ships moored 1.5 miles offshore. The first air cushion vehicle tested was the Canadian Voyageur, which was the prototype for the LACV-30 craft. Each craft in the LACV-30 program required 15 crewmembers, including the maintenance and repair teams. Assigning specific teams to one craft enhanced efficiency and enthusiasm. Procedures were defined for recycling defective parts to the manufacturer and providing for technical assistance on an organizational maintenance level. Details of the manual definition, spare parts packaging, handling, and storage, transportation provisions, and designing the berthing facilities for the LACV-30 craft are summarized.

This technical objective Document was prepared by the Materials Laboratory and describes the Materials Technology Planning Objectives (TPOs) for meeting future Air Force operational needs. The six TPOs encompass the full spectrum of materials capabilities required for future aircraft, missile, space, and electronic systems - Thermal Protection Materials, Aerospace Structural Materials, Aerospace Propulsion Materials, Fluid, Lubricant, and Elastomeric Materials, Protective Coatings and Materials, and Electromagnetic Windows and Electronics. Presented for each TPO is the general objective, specific goals, technical approaches, and a Laboratory focal point who can facilitate face-to-face discussions with Laboratory engineers and scientists GRA

Typical Subject Index Listing

The subject heading is a key to the subject content of the document. The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, the title extension is added, separated from the title by three hyphens. The (NASA or AIAA) accession number and the page number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document. Under any one subject heading, the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

CONTROL UNITS (COMPUTERS)

Automatic control and data acquisition system for combustion laboratory applications
[AD-A125195] p 470 N83-25829

CONTROL VALVES

Computer studies of ACV heave performance as a function of vent valve control parameters
p 460 A83-34854

CONTROLLABILITY

Bring cohesion to handling-qualities engineering
p 434 A83-35772
A modified algorithm for determining structural controllability
p 480 A83 36455

CONVECTIVE HEAT TRANSFER

Profile losses during the release of air onto the surface of nozzle vanes
p 418 A83-35590

CONVERGENT NOZZLES

JT150 1/2-scale nozzle jet noise experiment and comparison with prediction
[NASA TM-83370] p 482 N83-27793

CONVERGENT-DIVERGENT NOZZLES

A static investigation of yaw vectoring concepts on two-dimensional convergent-divergent nozzles
[AIAA PAPER 83-1288] p 421 A83-36324

COOLERS

Preliminary investigation on the performance of regenerative turbofan with inter-cooled compressor and its influence to aircraft
p 446 A83-35830

COOLING

Early experience in using the Cryogenic Test Facility at RAE Bedford, England
p 465 N83-25726

COST ANALYSIS

A placement model for flight simulators
[AD-A123782] p 466 N83-25730

COST EFFECTIVENESS

Cost effective performance restoration of high by-pass engines
p 447 A83-35833

COST ESTIMATES

Development and production cost estimating relationships for aircraft turbine engines
[AD-A123753] p 459 N83-25714

COST REDUCTION

Structural members made of high-strength cast aluminum and their properties --- and reduction of aircraft production costs
p 468 A83-33954

COUNTER ROTATION

Design analysis of a self-acting spiral-groove ring seal for counter-rotating shafts --- o ring seals
[AIAA PAPER 83-1134] p 474 A83-36239

COUNTING

Statistical review of counting accelerometer data for Navy and Marine fleet aircraft
[AD-A124966] p 443 N83-26834

COVERINGS

The use of vortex generators as inexpensive compressor casing treatment
p 459 N83-26798

CRACK PROPAGATION

Residual life prediction for jet engine rotor disks at elevated temperature
p 472 A83-33974
The effect of microstructure on the fatigue behavior of Ni base superalloys
p 469 A83-36166
Life prediction for turbine engine components
p 474 A83-36174

LCC evaluation of advanced engine damage tolerance goals for a hot-section disk --- in aircraft engines
[AIAA PAPER 83-1407] p 456 A83-36396

CREW STATIONS

Space-station crew-safety requirements
p 467 A83-36408

CRITERIA

Criteria for optimizing starting cycles for high performance fighter engines
[AIAA PAPER 83-1127] p 450 A83-36236

CROSS FLOW

An assessment of factors affecting prediction of near-field development of a subsonic VSTOL jet in cross-flow
[AD-A124583] p 441 N83-25699

CRUISE MISSILES

Cruise missile propulsion versus commercial airliner propulsion - Different challenges can produce similar engine cycles
[AIAA PAPER 83-1176] p 451 A83-36261

CRUISING FLIGHT

Application of maximum likelihood estimation to the identification of the stability derivatives of a wide body transport aircraft
p 460 A83-35121

CRYOGENIC EQUIPMENT

Early experience in using the Cryogenic Test Facility at RAE Bedford, England
p 465 N83-25726

CRYOGENIC WIND TUNNELS

High Reynolds number tests of the CAST 10-2/DOA 2 airfoil in the Langley 0.3-meter transonic cryogenic tunnel, phase 1
[NASA-TM-84620] p 424 N83-25660

Condensation studies in cryogenic nitrogen expansions
p 465 N83-25720

Temperature response of a model to set-point changes and conditioning in ETW
p 465 N83-25721

Materials and modelling technology for cryogenic environment
p 465 N83-25723

Problems involved by the instrumentation and the conception of cryogenic tests
p 465 N83-25725

CUES

Old problem/new solutions - Motion cuing algorithms revisited
[AIAA 83-1082] p 480 A83-36223

CULTURE (SOCIAL SCIENCES)

Transportation Energy Conservation Through Land Use Planning
[PB83-148387] p 475 N83-25919

CUTTERS

Verification testing of an AH-1S Wire Strike Protection System (WSPS)
[AD-A123188] p 429 N83-25684

CYCLIC LOADS

The use of a structural model for determining the adaptability curve for turbine disks in stress concentration zones
p 445 A83-35039
Life estimation methods of gas turbine rotating components
p 449 A83-35870

CYLINDRICAL BODIES

Computation of incompressible potential flow over an airfoil using a high order aerodynamic panel method based on circular arc panels
[AD-A124896] p 428 N83-26825

D**DAMAGE ASSESSMENT**

LCC evaluation of advanced engine damage tolerance goals for a hot-section disk --- in aircraft engines
[AIAA PAPER 83-1407] p 456 A83-36396
Analysis of progressive collapse of complex structures
[AD-A125266] p 478 N83-27260

DAMPERS

Design of dry-friction dampers for turbine blades
p 450 A83-35883

DAMPING

Optimum wire screens for control of turbulence in wind tunnels
p 417 A83-33772
Damping seal for turbomachinery
[NASA-CASE-MFS-25842-1] p 477 N83-26080

DATA ACQUISITION

Automatic control and data acquisition system for combustion laboratory applications
[AD-A125195] p 470 N83-25829
FAA integrated noise model validation Analysis of air carrier flyovers at Seattle Tacoma Airport
[AD-A124097] p 479 N83-26320
Development of an oculometer data collection subsystem
[AD-A124700] p 481 N83-26501

DATA BASE MANAGEMENT SYSTEMS

Research and analysis of head-directed area-of-interest visual system concepts
[NASA-CR-166480] p 467 N83-26849

DATA BASES

Data base considerations for a tactical environment simulation
[AIAA PAPER 83-1099] p 463 A83-36219
Research and analysis of head-directed area-of-interest visual system concepts
[NASA-CR-166480] p 467 N83-26849

DATA CORRELATION

Correlation and evaluation of inplane stability characteristics for an advanced bearingless main rotor
[NASA-CR-166448] p 440 N83-25695

DATA LINKS

The remote link unit A demonstration of operational performance Part 3 Design manual, volume 1
[AD-A124621] p 476 N83-25934

The remote link unit A demonstration of operational performance Part 3 Design manual Volume 2 Appendices A - C
[AD-A124622] p 476 N83-25935

The remote link unit A demonstration of operational performance Part 2 User's manual
[AD-A124620] p 476 N83-25938

The remote link unit A demonstration of operational performance, part 1
[AD-A124619] p 476 N83-25939

DATA PROCESSING

AISA - Program for automated treatment of aeronautical data --- for civil aviation applications
p 462 A83-35598

Programs for the transonic wind tunnel data processing installation Part 10 Six component measurements updated
[AD-A122248] p 427 N83-26824

DATA REDUCTION

Development of an oculometer data collection subsystem
[AD-A124700] p 481 N83-26501

DE HAVILLAND AIRCRAFT

The Dash 8 development program
p 433 A83-33546

DECONTAMINATION

Spectral decontamination of a real-time helicopter simulation
[AIAA PAPER 83-1087] p 436 A83-36211

DEFECTS

A parametric study of surface imperfections and small cutouts in a composite panel
[AD-A124739] p 470 N83-25793

DEFENSE PROGRAM

Concepts for a future joint airlift development program
[AIAA PAPER 83-1591] p 429 A83-36951

DEFLECTION

Experimental results of a deflected thrust V/STOL nozzle research program
[NASA-TM-83069] p 423 N83-25657

DEGREES OF FREEDOM

Coupled flap-lag-torsional dynamics of hingeless rotor blades in forward flight
p 435 A83-35948

DEICERS

Numerical simulation of electrothermal de-icing systems
[AIAA PAPER 83-0114] p 428 A83-36043

DELTA WINGS

Temperature response of a model to set-point changes and conditioning in ETW
p 465 N83-25721

DEMOGRAPHY

Transportation Energy Conservation Through Land Use Planning
[PB83-148387] p 475 N83-25919

DEPLOYMENT

Operational deployment of the air cushion vehicle
p 485 A83-34864

DESCENT TRAJECTORIES

Description of the computations and pilot procedures for planning fuel-conservative descents with a small programmable calculator
[NASA-TM-85642] p 444 N83 25707

DESIGN ANALYSIS

New concept in hovercraft design diesel versus gas turbines
p 485 A83-34860
ACV lift air systems - More puff for less power
p 485 A83-34861

AP 1-88 craft 001 prototype clearance trials
p 485 A83-34862

Developments in air cushion vehicle spray suppression
p 486 A83-35056
A design synthesis model for ACV/SES lift systems
p 486 A83-35057

Experimental study of a high-through-flow transonic axial compressor stage
p 419 A83 35853
Contribution to centrifugal compressor impeller design
p 448 A83-35865

A comprehensive method for preliminary design optimization of axial gas turbine stages II - Code verification
[AIAA PAPER 83-1403] p 456 A83-36393

Monte Carlo simulation of the engine development process
[AIAA PAPER 83-1405] p 456 A83-36394

Advanced manufacturing development of a composite empennage component for L-1011 aircraft
[NASA-CR-172658] p 440 N83-25692

DIESEL ENGINES

New concept in hovercraft design diesel versus gas turbines
p 485 A83-34860

An update on high output lightweight diesel engines for aircraft applications
[AIAA PAPER 83-1339] p 458 A83-36925

DIESEL FUELS

Emergency fuels technology
[AD-A125275] p 471 N83-25904

DIFFERENTIAL EQUATIONS

Integro-differential equations of the dynamics of elastic systems in nonstationary flows --- flight vehicle dynamics in turbulent nonseparated flow
p 474 A83-35933

DIFFUSERS

The effect of variation of diffuser design on the performance of centrifugal compressors
p 448 A83-35866

Experimental investigation of the effects of wall suction and blowing on the performance of highly offset diffusers
[AIAA PAPER 83-1169] p 423 A83-36922

DIFFUSION

Advances in ejector technology A tribute to Hans von Ohain's vision
p 477 N83-26805

DIGITAL SYSTEMS

Fight/propulsion control system integration
[AIAA PAPER 83-1238] p 453 A83-36301

- Comparison of an experience with full authority digital engine controls in rotary wing and jet lift VSTOL aircraft [AIAA PAPER 83-1241] p 454 A83-36304
- Automatic control and data acquisition system for combustion laboratory applications [AD-A125195] p 470 N83-25829
- Digital flight control system validation [AD-A124506] p 462 N83-26847
- DIRECTION FINDING**
- Multimode planar spiral for DF applications p 430 A83-35089
- DIRECTIONAL SOLIDIFICATION (CRYSTALS)**
- Preliminary science report on the directional solidification of hypereutectic cast iron during KC-135 low-G maneuvers [NASA-TM-82528] p 470 N83-25854
- DIRECTIONAL STABILITY**
- Analysis of nonplanar wing-tip-mounted lifting surfaces on low-speed airplanes [NASA-CR-3684] p 424 N83-25667
- DISORIENTATION**
- Theory underlying the peripheral vision horizon device [AD-A124426] p 445 N83-25710
- DISPLAY DEVICES**
- Advanced display techniques for training the multi-member tactical air crew [AIAA PAPER 83-1079] p 443 A83-36207
- Compensation for time delay in flight simulator visual-display systems [AIAA PAPER 83-1080] p 464 A83-36222
- Precision navigational filmstrips for use in DOD aircraft [AD-A124761] p 432 N83-25688
- DISTORTION**
- Dynamic distortion in a short s-shaped subsonic diffuser with flow separation --- Lewis 8 by 6 foot Supersonic Wind Tunnel [NASA-TM-84312] p 459 N83-26838
- DOPPLER RADAR**
- Numerical treatment of Doppler radar signals --- airport radar, video data [ENST E 82014] p 478 N83-27114
- DRAW MEASUREMENT**
- Friction drag measurements of acoustic surfaces [AIAA PAPER 83 1356] p 422 A83-36414
- DRIFT**
- Investigation of a third order baro-damped verticle channel of INS [AD-A124882] p 432 N83-26828
- DROP SIZE**
- Effect of air, liquid and injector geometry variables upon the performance of a plain-jet airblast atomizer p 473 A83-35809
- Further studies on the prediction of spray evaporation rates --- for aircraft fuels p 468 A83-35811
- The effect of fuel atomization on soot free combustion in a prevaporizing combustor p 446 A83-35812
- DRY FRICTION**
- Design of dry-friction dampers for turbine blades p 450 A83-35883
- DUCTED FANS**
- ACV lift air systems - More puff for less power p 485 A83-34861
- DUCTED FLOW**
- The swirl in an S-duct of typical air intake proportions p 418 A83-35620
- Semi implicit calculation method of the flow field in a duct with the flame stabilized by a step --- for aircraft engine combustion chamber design p 446 A83-35820
- DUCTS**
- Cross spectra between temperature and pressure in a constant area duct downstream of a combustor [AIAA PAPER 83-0762] p 481 A83-33487
- Early experience in using the Cryogenic Test Facility at RAE Bedford, England p 465 N83-25726
- DURABILITY**
- Deterioration trending enhances jet engine hardware durability assessment and part management [AIAA PAPER 83-1234] p 453 A83-36297
- Development trends in engine durability -- for USAF aircraft gas turbines [AIAA PAPER 83-1297] p 455 A83-36329
- DUST**
- High temperature erosion study of INCO 600 metal p 468 A83-35247
- DYNAMIC CHARACTERISTICS**
- Application of system identification flight analysis techniques to the pitch-heave dynamics of an air cushion vehicle p 484 A83-34852
- Forced and self-excited vibrations of gas-turbine assemblies with perfect and perturbed symmetry p 458 A83-36791
- DYNAMIC MODELS**
- An algorithm of flight simulation on a dynamic stand of support type p 462 A83-34429
- Dynamic modeling of an air cushion vehicle p 486 A83-35054
- A dynamic model of turbojet in starting at high altitude p 447 A83-35846
- DYNAMIC RESPONSE**
- Coupled flap-lag-torsional dynamics of hingeless rotor blades in forward flight p 433 A83-33506
- Impact damping and airplane towing p 428 A83-33625
- The response of aircraft to pulse excitation p 434 A83-34312
- Coupled flap-lag-torsional dynamics of hingeless rotor blades in forward flight p 435 A83-35948
- DYNAMIC STABILITY**
- An over-view of UTIAS research on the dynamic stability of air cushion vehicles p 484 A83-34853
- Technical aspects of the AEROBAC AB-7 p 484 A83-34858
- Computer studies of ACV heave dynamics stabilization p 486 A83-35055
- DYNAMIC STRUCTURAL ANALYSIS**
- Advanced manufacturing development of a composite empennage component for L-1011 aircraft [NASA-CR-172659] p 440 N83-25693
- E**
- ECONOMIC ANALYSIS**
- Transportation Energy Conservation Through Land Use Planning [PB83-148387] p 475 N83-25919
- ECONOMIC IMPACT**
- Status, trends and implications of carbon fiber material use [PB83-147751] p 471 N83-26934
- EFFICIENCY**

- Airframe RDT&E cost estimating A justification for and development of unique cost estimating relationships according to aircraft type
[AD-A123848] p 417 N83-25656

FAILURE ANALYSIS

- The influence of defects on the operational strength of disks and wheels in engines p 472 A83-33964
 Analysis of F-16 radar discrepancies [AD-A124749] p 476 N83-25948

FAILURE MODES

- Development of simulated mission endurance test acceleration factors in determining engine component serviceability and failure mode critically [AIAA PAPER 83-1409] p 457 A83-36398

FAN BLADES

- Containment of turbine engine fan blades p 449 A83-35871

FAST FOURIER TRANSFORMATIONS

- Numerical treatment of Doppler radar signals --- airport radar, video data [ENST-E-82014] p 478 N83-27114

FATIGUE LIFE

- Residual life prediction for jet engine rotor disks at elevated temperature p 472 A83-33974
 On improving the fatigue performance of a double-shear lap joint p 473 A83-34744
 Life estimation methods of gas turbine rotating components p 449 A83-35870
 Investigation methods on residual stresses in aero engines components p 449 A83-35879
 Life prediction for turbine engine components p 474 A83-36174
 In-flight computation of helicopter transmission fatigue life expenditure p 439 A83-36921

FATIGUE TESTS

- Evaluation of the effect of voids in composite main rotor blades p 472 A83-33507
 Canadian forces tracker aircraft full-scale fatigue test at the national aeronautical establishment p 433 A83-33548
 On improving the fatigue performance of a double-shear lap joint p 473 A83-34744
 Evaluation of the effect of voids in composite main rotor blades p 435 A83-35950

FATTY ACIDS

- The effect of products based on higher fatty acids on the performance characteristics of jet fuels p 468 A83-34500

FEASIBILITY ANALYSIS

- Feasibility of dry lubrication for limited-duty gas turbine engines [AIAA PAPER 83-1130] p 475 A83-36405
 Feasibility study of three-dimensional holographic interferometry for aerodynamics [NASA-CR-166483] p 483 N83-27845

FEDERAL BUDGETS

- NASA authorization for fiscal year 1984 [GPO-19-200] p 487 N83-27921

FEEDBACK CONTROL

- Using adaptive control to synthesize invariant and partially autonomous automatic stabilization systems p 460 A83-33900
 Aircraft active controls - New era in design p 461 A83-35773
 High-gain error actuated flight control systems for continuous linear multivariable plants [AD-A124871] p 462 N83-26848

FIBER REINFORCED COMPOSITES

- Evaluation of the effect of voids in composite main rotor blades p 472 A83-33507
 Evaluation of the effect of voids in composite main rotor blades p 435 A83-35950
 Light aircraft and sailplane structures in reinforced plastics p 435 A83-36065

FIGHTER AIRCRAFT

- Aircraft design philosophy I - Lee Begin of Northrop p 434 A83-35624
 Real time simulation of mission environments for avionics systems integration [AIAA PAPER 83 1097] p 463 A83-36217
 Criteria for optimizing starting cycles for high performance fighter engines [AIAA PAPER 83 1127] p 450 A83-36236
 Thrust reverser exhaust plume Reingestion tests for a STOL fighter model [AIAA PAPER 83-1229] p 452 A83-36293
 A static investigation of yaw vectoring concepts on two-dimensional convergent-divergent nozzles [AIAA PAPER 83 1288] p 421 A83-36324
 Fighter engine cycle selection [AIAA PAPER 83-1300] p 457 A83-36412
 The application of low-cost demonstrators for advanced fighter technology evaluation [AIAA PAPER 83-1052] p 438 A83-36462
 X-29 integrated technology demonstrator and ATF [AIAA PAPER 83 1058] p 438 A83-36469
 GE's APG-67 - Fighter radar with a future p 432 A83-36625
 Dynamics of air combat p 416 A83-36914
 The future of the manned aircraft p 416 A83-36960

The effects of the Production Oriented Maintenance Organization (POMO) concept on ADTAC aircraft maintenance productivity and quality [AD A123981] p 416 N83-25655

- Pressures measured in flight on the aft fuselage and external nozzle of a twin-jet fighter [NASA TP-2017] p 424 N83-25665
 Resonance tests on the tail of a CT4 aircraft [AD-A124566] p 441 N83-25703
 Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft [NASA-TP-2120] p 427 N83-26821
 Lateral flying qualities of highly augmented fighter aircraft, volume 1 [AD-A118070] p 443 N83-26835
 Pilot human factors in stall/spin accidents of supersonic fighter aircraft [NASA-TM-84348] p 462 N83-26846

FILM COOLING

- Profile losses during the release of air onto the surface of nozzle vanes p 418 A83-35590

FINITE DIFFERENCE THEORY

- Application of a finite difference method to the transonic airfoil problem [AD-A124720] p 425 N83-25674
 Higher-order computational methods for transonic wing/body flowfields [AD-A124079] p 426 N83-25679

FINITE ELEMENT METHOD

- Investigation of an improved finite element model for a repaired T-38 horizontal stabilizer flutter analysis using NASTRAN [AD-A124741] p 461 N83-25717
 Temperature response of a model to set-point changes and conditioning in ETW p 465 N83-25721
 A parametric study of surface imperfections and small cutouts in a composite panel [AD-A124739] p 470 N83-25793
 Structural model tuning via vector optimization [AD-A124791] p 477 N83-26103
 Finite element program for calculating flows in turbomachines with results for NASA task-1 compressor [AD A124987] p 460 N83-26841
 Analysis of progressive collapse of complex structures [AD-A125266] p 478 N83-27260

FINS

- Thermal cycling in compact plate-fin heat exchangers --- in aircraft gas turbines p 445 A83-34253
 Advanced manufacturing development of a composite empennage component for L-1011 aircraft [NASA CR-172657] p 440 N83-25694

FIRE CONTROL

- Microprocessor-based optimal controllers for a helicopter turret control system p 434 A83-35138
 GE's APG-67 - Fighter radar with a future p 432 A83-36625

FIRING (IGNITING)

- A dynamic model of turbojet in starting at high altitude p 447 A83-35846

FLAME HOLDERS

- Further study on the prediction of liquid fuel spray capture by v-gutter downstream of a plain orifice injector under uniform cross air flow p 473 A83-35810
 A study of lean extinction limit for pilot flame holder p 469 A83-35821
 Coaxial dump combustor investigations p 459 N83-26791

FLAME STABILITY

- Semi implicit calculation method of the flow field in a duct with the flame stabilized by a step --- for aircraft engine combustion chamber design p 446 A83-35820
 Experimental research of the mechanism of flame stabilization in two phase mixture p 469 A83-35822

FLAPS (CONTROL SURFACES)

- Wind tunnel investigation of varying hinged flaps [AD A124703] p 424 N83-25668

FLAT PLATES

- Thermal cycling in compact plate-fin heat exchangers --- in aircraft gas turbines p 445 A83-34253

FLEXIBLE WINGS

- Static aeroelastic analysis of flexible wings via NASTRAN, part 1 [AD-A124662] p 477 N83-26099

FLIGHT

- Greater benefits to be gained from DoD flight simulators [AD A123713] p 466 N83-25731

FLIGHT ALTITUDE

- On the use of height rules in off-route airspace p 431 A83-35274
 Survivability of interdiction aircraft Sensitivity to terrain following, command altitude, velocity and electronic counter measures [AD-A124870] p 443 N83-26833

FLIGHT CHARACTERISTICS

- CF34 upgrades Challenger capabilities p 434 A83-35315
 In-flight simulation at the U S Air Force and Naval Test Pilot Schools [AIAA PAPER 83-1078] p 436 A83-36206
 Proposed MIL standard and handbook Flying qualities of air vehicles Volume 2 Proposed MIL handbook [AD-A123726] p 441 N83-25704
 Airworthiness and flight characteristics test Part 2 YAH-64 advanced attack helicopter [AD-A125270] p 442 N83-25705
 A preliminary assessment of helicopter/VSTOL handling qualities specifications [AD-A124667] p 461 N83-25716

FLIGHT CONDITIONS

- Dynamics of air combat p 416 A83-36914
 Generalized maximum specific range performance p 439 A83-36918

FLIGHT CONTROL

- Aircraft active controls - New era in design p 461 A83-35773
 Indoctrination of Navy test pilots to vectored thrust flight in the X-22A in-flight simulator [AIAA PAPER 83-1076] p 436 A83-36205
 Flight/pulsion control system integration [AIAA PAPER 83-1238] p 453 A83-36301
 AFTI/F-111 mission adaptive wing technology demonstration program [AIAA PAPER 83-1057] p 438 A83-36468
 Digital flight control system validation [AD-A124506] p 462 N83-26847
 High-gain error actuated flight control systems for continuous linear multivariable plants [AD-A124871] p 462 N83-26848

FLIGHT CREWS

- Airline safety and labor relations law - Balancing rights and responsibility p 484 A83-34475

FLIGHT HAZARDS

- Scanning strategies for next generation weather radars A study based on lifetimes of convective atmospheric phenomena hazardous to aviation [FAA-RD-82-69] p 476 N83-25929
 Aircraft lightning-induced voltage test technique developments [NASA CR 170403] p 442 N83-26829

FLIGHT OPERATIONS

- Flight operations A study of flight deck management --- Book p 428 A83-33767

FLIGHT OPTIMIZATION

- Advanced navigation systems and fuel conservation p 428 A83-33545

FLIGHT PATHS

- Computer model of a collision-avoidance system for air traffic control p 431 A83-35275
 All weather heliports and airway system - The future need p 463 A83-36073
 An interactive bombing mission simulation with computer graphics interface [AD-A124661] p 481 N83-26637

FLIGHT SAFETY

- Airline safety and labor relations law - Balancing rights and responsibility p 484 A83-34475
 On the use of height rules in off-route airspace p 431 A83-35274
 Space-station crew-safety requirements p 467 A83-36408
 Flight tests of tow wire forces while flying a racetrack pattern p 439 A83-36919

FLIGHT SIMULATION

- An algorithm of flight simulation on a dynamic stand of support type p 462 A83-34429
 Propulsion system simulation technique for scaled wind tunnel model testing p 463 A83-35850
 Flight Simulation Technologies Conference, Niagara Falls, NY, June 13-15, 1983, Collection of Technical Papers p 415 A83-36203
 Indoctrination of Navy test pilots to vectored thrust flight in the X-22A in-flight simulator [AIAA PAPER 83-1076] p 436 A83-36205
 In-flight simulation at the U S Air Force and Naval Test Pilot Schools [AIAA PAPER 83-1078] p 436 A83-36206
 Sinusoidal integration for simulation of second-order systems [AIAA PAPER 83-1086] p 480 A83-36210
 Spectral decontamination of a real-time helicopter simulation [AIAA PAPER 83-1087] p 436 A83-36211
 Analysis of a real-time application [AIAA PAPER 83-1088] p 480 A83-36212
 Error sources in hybrid computer based flight simulation [AIAA PAPER 83-1090] p 436 A83-36214

- Use of flight test results to improve the flying qualities simulation of the B-52H weapon system trainer
[AIAA PAPER 83-1091] p 437 A83-36215
- Real time simulation of mission environments for avionics systems integration
[AIAA PAPER 83-1097] p 463 A83-36217

- FLOW VELOCITY**
- The aerodynamics of hypersonic velocities (On flows with low Mach numbers)
p 417 A83-35535
- FLOW VISUALIZATION**
- Thrust reverser exhaust plume Reingestion tests for a STOL fighter model
[AIAA PAPER 83-1229] p 452 A83-36293
- Design of choking cascade turns
[AD-A124792] p 477 N83-26023
- FLUID DYNAMICS**
- Technical evaluation report on the Fluid Dynamics Panel Specialists' Meeting on Prediction of Aerodynamic Loads on Rotorcraft
[AGARD-AR-189] p 426 N83-25682
- Advances in ejector technology A tribute to Hans von Ohan's vision
p 477 N83-26805
- Implicit upwind methods for the compressible Navier-Stokes equations
[NASA-TM-84364] p 478 N83-27149

FLUID INJECTION

- The distribution of the disperse fraction of a polydisperse jet injected into a gas flow
p 473 A83-34472
- Experiments in dilution jet mixing
[AIAA PAPER 83-1201] p 475 A83-36277

FLUID MECHANICS

- Advanced manufacturing development of a composite empennage component for L-1011 aircraft
[NASA-CR-172658] p 440 N83-25692
- Condensation studies in cryogenic nitrogen expansions
p 465 N83-25720

FLUID-SOLID INTERACTIONS

- Recent studies at NASA-Langley of vortical flows interacting with neighboring surfaces
p 417 A83-33972

FLUORINE ORGANIC COMPOUNDS

- Fluoroelastomers --- materials for hostile fluid environments
p 469 A83-36066

FLUTTER

- Investigation of an improved finite element model for a repaired T-38 horizontal stabilizer flutter analysis using NASTRAN
[AD-A124741] p 461 N83-25717
- Flutter prediction in forward-swept wings by assumed modes and strip theory
[AD-A124715] p 461 N83-25719
- Model mount system for testing flutter
[NASA-CASE-LAR 12950-1] p 465 N83-25727

FORCED VIBRATION

- Excitation and vibration of flexible bladed disks under operating and simulated operation conditions
p 449 A83-35881
- Variation of rotor blade vibration due to interaction of inlet and outlet distortion
p 450 A83-35882
- Design of dry friction dampers for turbine blades
p 450 A83-35883
- Forced and self-excited vibrations of gas-turbine assemblies with perfect and perturbed symmetry
p 458 A83-36791

FORECASTING

- Worldwide aviation outlook --- for passenger and freight traffic 1982-1992
[AIAA PAPER 83-1597] p 429 A83-36952
- FAA aviation forecasts Fiscal years 1983-1994
[AD-A124611] p 416 N83-25652

FORTRAN

- An interactive bombing mission simulation with computer graphics interface
[AD-A124661] p 481 N83-26637

FRAGMENTATION

- Containment of turbine engine fan blades
p 449 A83-35871

FREE FLIGHT

- Evaluation of aerodynamic derivatives from Do-28-TNT free-flight model tests
[ESA-TT-784] p 442 N83-25706

FREIGHTERS

- A new class ACV - Tanker freighter
p 485 A83-35053

FREQUENCIES

- Structural model tuning via vector optimization
[AD-A124791] p 477 N83-26103

FREQUENCY RESPONSE

- Response of a supersonic inlet to downstream perturbations
[AIAA PAPER 83-2017] p 422 A83-36403

FREQUENCY STANDARDS

- Phase 2A bench model development tactical rubidium frequency standard
[AD-A124462] p 477 N83-25990

FRICTION DRAG

- Friction drag measurements of acoustic surfaces
[AIAA PAPER 83-1356] p 422 A83-36414

FUEL COMBUSTION

- New trends in combustion research for gas turbine engines
p 446 A83-35806
- Methanol combustion in a CF6I-80A engine combustor
[AIAA PAPER 83-1138] p 469 A83-36241
- Effect of fuel composition on Navy aircraft engine hot section components
[AIAA PAPER 83-1147] p 450 A83-36244
- Application of 3D aerodynamic/combustion model to combustor primary zone study
[AIAA PAPER 83-1265] p 454 A83-36316
- Thermodynamics of organic compounds
[AD-A125022] p 483 N83-27895

FUEL CONSUMPTION

- Advanced navigation systems and fuel conservation
p 428 A83-33545
- New concept in hovercraft design diesel versus gas turbines
p 485 A83-34860
- Some aspects of development of power plant optimum control to increase aircraft fuel efficiency
p 447 A83-35841
- Flight management concepts development for fuel conservation
p 447 A83-35843

- Effect of fuel composition on Navy aircraft engine hot section components
[AIAA PAPER 83-1147] p 450 A83-36244
- Concepts for increased power and enhanced fuel conservation with newly patented multiple power-cycle gas turbine engines
[AIAA PAPER 83-1209] p 452 A83-36282
- Description of the computations and pilot procedures for planning fuel-conservative descents with a small programmable calculator
[NASA-TM-85642] p 444 N83-25707
- FUEL FLOW REGULATORS**
- Electrohydraulic fuel-flow regulator for gas-turbine-engine control systems p 458 A83-36793
- FUEL INJECTION**
- Effect of air, liquid and injector geometry variables upon the performance of a plain-jet airblast atomizer
p 473 A83-35809
- A JT8D low emissions combustor by radial zoning
[AIAA PAPER 83-1324] p 455 A83-36339
- FUEL OILS**
- Emergency fuels technology
[AD-A125275] p 471 N83-25904
- FUEL PUMPS**
- Component life reduction due to use of AVGAS in gas turbine engines p 449 A83-35869
- FUEL SPRAYS**
- Effect of air, liquid and injector geometry variables upon the performance of a plain jet airblast atomizer
p 473 A83-35809
- Further study on the prediction of liquid fuel spray capture by v-gutter downstream of a plain orifice injector under uniform cross air flow p 473 A83-35810

p 469 A83-35821
Applications of computational techniques in the design
of ramjet engines p 418 A83-35828
The prediction of performance of turbojet engine with
distorted inlet flow and its experimental studies
p 446 A83-35832

- Vanation of rotor blade vibration due to interaction of
inlet and outlet distortion p 450 A83-35882
Importance of inlet boundary conditions for numerical
simulation of combustor flows
[AIAA PAPER 83-1263] p 454 A83-36314

- Response of a supersonic inlet to downstream
perturbations
[AIAA PAPER 83-2017] p 422 A83-36403
Dynamic distortion in a short s-shaped subsonic diffuser
with flow separation --- Lewis 8 by 6 foot Supersonic Wind
Tunnel
[NASA-TM-84312] p 459 N83-26838

INLET NOZZLES

- Model aerodynamic test results for a refined actuated
inlet ejector nozzle at simulated takeoff and cruise
conditions
[NASA-CR-168051] p 426 N83-26816

INLET PRESSURE

- Aircraft engine inlet pressure distortion testing in a
ground test facility
[AIAA PAPER 83-1233] p 453 A83-36296

INLET TEMPERATURE

- A study of the response of a turbojet engine to the inlet
temperature transients p 448 A83-35849
Coaxial dump combustor investigations
p 459 N83-26791

INSPECTION

- A strategy is needed to deal with peaking problems at
international airports
[GAO/GGD-83-4] p 429 N83-25683

INSTRUMENT ORIENTATION

- Performance capabilities of photographic flight
navigation and sensor orientation systems
p 431 A83-36122

INTAKE SYSTEMS

- Investigation of the coupling of unsteady lift to low order
acoustic duct modes in an axial flow fan
[AD-A124819] p 483 N83-27796

INTEGRAL EQUATIONS

- Integro-differential equations of the dynamics of elastic
systems in nonstationary flows --- flight vehicle dynamics
in turbulent nonseparated flow p 474 A83-35933

INTERACTIVE CONTROL

- Interactive fine-tuning of linear-quadratic governors by
selective and direct action on the poles of the control
system
[ONERA, TP NO 1983-21] p 480 A83-36430

INTERCEPTORS

- The effects of the Production Oriented Maintenance
Organization (POMO) concept on ADTAC aircraft
maintenance productivity and quality
[AD-A123981] p 416 N83-25655

INTERNAL PRESSURE

- Coaxial dump combustor investigations
p 459 N83-26791

INTERPOLATION

- Surfaces in computer aided geometric design,
Proceedings of the Conference, Oberwolfach, West
Germany, April 25-30, 1982 p 480 A83-33613

INVERSIONS

- Net-skirt addition to a parachute canopy to prevent
inversion p 428 A83-36911

INVESTMENT CASTING

- High-strength aluminum high-quality casting alloy in
aeronautics and astronautics p 468 A83-33955

INVISCID FLOW

- Applications of computational techniques in the design
of ramjet engines p 418 A83-35828
Evaluation of a surface panel method coupled with
several boundary layer analyses
[AIAA PAPER 83-0011] p 474 A83-36039
Finite difference calculation of an inviscid transonic flow
over oscillating airfoils
[AD-A123982] p 426 N83-25677
Aircraft aerodynamic prediction method for V/STOL
transition including flow separation
[NASA-CR-166467] p 426 N83-26818

IRON ALLOYS

- Preliminary science report on the directional solidification
of hypereutectic cast iron during KC-135 low-G
maneuvers
[NASA-TM-82528] p 470 N83-25854

ISENTROPIC PROCESSES

- Condensation studies in cryogenic nitrogen
expansions p 465 N83-25720

ITERATION

- A note on adaptive wind tunnels with imperfect control
p 466 N83-26792

J**JET AIRCRAFT**

- Large jet aircraft validation and demonstrations - An
overview of Boeing experience
[AIAA PAPER 83-1049] p 439 A83-36472

JET AIRCRAFT NOISE

- A compact inflow control device for simulating flight fan
noise
[NASA-TM-83349] p 482 N83-26643
JT150 1/2-scale nozzle jet noise experiment and
comparison with prediction
[NASA-TM-83370] p 482 N83-27793
AICUZ (Air Installation Compatible Use Zone) report
[AD-A124974] p 483 N83-27801

JET ENGINE FUELS

- The effect of products based on higher fatty acids on
the performance characteristics of jet fuels
p 468 A83-34500

- Emergency fuels technology
[AD-A125275] p 471 N83-25904
High altitude jet fuel photochemistry
[AD-A125035] p 471 N83-27035

- Thermodynamics of organic compounds
[AD-A125022] p 483 N83-27895

JET ENGINES

- Residual life prediction for jet engine rotor disks at
elevated temperature p 472 A83-33974
Effect of humidity on jet engine axial-flow compressor
performance p 448 A83-35856
Deterioration trending enhances jet engine hardware
durability assessment and part management
[AIAA PAPER 83-1234] p 453 A83-36297
CARS temperature and species measurements in
augmented jet engine exhausts --- Coherent Anti-Stokes
Raman Spectroscopy
[AIAA PAPER 83-1294] p 455 A83-36328

JET EXHAUST

- CARS temperature and species measurements in
augmented jet engine exhausts --- Coherent Anti-Stokes
Raman Spectroscopy
[AIAA PAPER 83-1294] p 455 A83-36328
Definition of vectored nonaxisymmetric nozzle plumes
--- for aircraft thrust vector control
[AIAA PAPER 83-1290] p 423 A83-36924

JET FLOW

- The distribution of the disperse fraction of a polydisperse
jet injected into a gas flow p 473 A83-34472
An assessment of factors affecting prediction of
near-field development of a subsonic VSTOL jet in
cross-flow
[AD-A124583] p 441 N83-25699

JET MIXING FLOW

- Profile losses during the release of air onto the surface
of nozzle vanes p 418 A83-35590
The relationship between the aerodynamic and acoustic
characteristics of coaxial jets p 482 A83-35712
Edge tones in high-speed flows and their application
to multiple-jet mixing p 482 A83-36077
Experiments in dilution jet mixing
[AIAA PAPER 83-1201] p 475 A83-36277

JET PROPULSION

- Flight/propulsion control system integration
[AIAA PAPER 83-1238] p 453 A83-36301
Some historical trends in the research and development
of aircraft
[NASA-TM-84665] p 417 N83-26785
A collection of papers in the aerospace sciences
[AD-A122667] p 417 N83-26787

JP-4 JET FUEL

- Coaxial dump combustor investigations
p 459 N83-26791

K**KEELS**

- How to improve air cushion vehicle performance with
VUMP equipped wave-forming keels --- Vent-pump
p 484 A83-34855

KEROSENE

- Feasibility of a full-scale degrader for antimisting
kerosene
[AIAA PAPER 83-1137] p 469 A83-36240
Emergency fuels technology
[AD-A125275] p 471 N83-25904
Thermodynamics of organic compounds
[AD-A125022] p 483 N83-27895

L**L-1011 AIRCRAFT**

- Advanced manufacturing development of a composite
empennage component for L-1011 aircraft
[NASA-CR-172658] p 440 N83-25692
Advanced manufacturing development of a composite
empennage component for L-1011 aircraft
[NASA-CR-172659] p 440 N83-25693
Advanced manufacturing development of a composite
empennage component for L-1011 aircraft
[NASA-CR-172657] p 440 N83-25694

LAMINAR FLOW

- Natural laminar flow data from full-scale flight and
wind-tunnel experiments p 422 A83-36409

LAMINATES

- Transient heat flow along uni-directional fibers in
composites
[AD-A122926] p 471 N83-26929

LAND USE

- Transportation Energy Conservation Through Land Use
Planning
[PB83-148387] p 475 N83-25919
AICUZ (Air Installation Compatible Use Zone) report
[AD-A124974] p 483 N83-27801

LANDING GEAR

- The response of aircraft to pulse excitation
p 434 A83-34312
From new technology development to operational
usefulness B-36, B-58, F-111/FB-111
[AIA PAPER 83-1046] p 415 A83-36459

M

LANDING SIMULATION

- Simulator design features for carrier landing Part 2
In-simulator transfer of training
[AD-A124024] p 466 N83-25733

LAP JOINTS

- On improving the fatigue performance of a double-shear lap joint p 473 A83-34744

LAPLACE TRANSFORMATION

- Impact damping and airplane towing p 428 A83-33625

LASER APPLICATIONS

- Lasers in aircraft construction --- Russian book p 472 A83-34170

- Laser safety of air bathymetry
[FOA-C-30292-E1] p 478 N83-27210

LASER DOPPLER VELOCIMETERS

- Aerodynamic measurements about a rotating propeller with a laser velocimeter
[AIAA PAPER 83-1354] p 421 A83-36355

LASER INTERFEROMETRY

- Feasibility study of three-dimensional holographic interferometry for aerodynamics
[NASA-CR-166483] p 483 N83-27845

LATERAL CONTROL

- Lateral flying qualities of highly augmented fighter aircraft, volume 1
[AD-A118070] p 443 N83-26835

LATERAL STABILITY

- Application of maximum likelihood estimation to the identification of the stability derivatives of a wide body transport aircraft p 460 A83-35121

LATTICES (MATHEMATICS)

- Application of the vortex-lattice method to propeller performance analysis
[AD-A124837] p 459 N83-26840

LEADING EDGES

- Recent studies at NASA Langley of vortical flows interacting with neighboring surfaces p 417 A83-33972

- Prediction of stagnation flow heat transfer on turbomachinery airfoils
[AIAA PAPER 83-1173] p 420 A83-36259

LEAR JET AIRCRAFT

- Aircraft accident report IBEX Corporation Gates Learjet 23, N100TA, Atlanta, near Savannah, Georgia, 6 May 1982
[PB83-910401] p 430 N83-26827

LIFE (DURABILITY)

- Scanning strategies for next generation weather radars
A study based on lifetimes of convective atmospheric phenomena hazardous to aviation
[FAA-RD-82-69] p 476 N83-25929

LIFE CYCLE COSTS

- The impact of engine usage on life cycle cost
[AIAA PAPER 83-1406] p 456 A83-36395
LCC evaluation of advanced engine damage tolerance goals for a hot-section disk -- in aircraft engines
[AIAA PAPER 83-1407] p 456 A83-36396

LIFT

- Applications of advanced upper surface blowing propulsive-lift technology
[SAE PAPER 820956] p 433 A83-33628

- How to improve air cushion vehicle performance with VUMP equipped wave forming keels --- Vent-pump p 484 A83-34855

- ACV lift air systems - More puff for less power p 485 A83-34861

- A technique to determine lift and drag polars in flight p 422 A83-36913

- Theoretical determination of the lift of a simulated ejector wing
[AD-A124695] p 425 N83-25670

- Design analysis of a self-acting spiral-groove ring seal for counter-rotating shafts
[NASA-TP-2142] p 458 N83-25712

- Investigation of the coupling of unsteady lift to low order acoustic duct modes in an axial flow fan
[AD-A124819] p 483 N83-27796

LIFT AUGMENTATION

- Theoretical determination of the lift of a simulated ejector wing
[AD-A124695] p 425 N83-25670

LIFT DEVICES

- Analysis of nonplanar wing-tip-mounted lifting surfaces on low-speed airplanes
[NASA-CR-3684] p 424 N83-25667

- Theoretical determination of the lift of a simulated ejector wing
[AD-A124695] p 425 N83-25670

LIFT DRAG RATIO

- Recent studies at NASA-Langley of vortical flows interacting with neighboring surfaces p 417 A83-33972

LIFTING BODIES

- Theoretical determination of the lift of a simulated ejector wing
[AD-A124695] p 425 N83-25670

LIGHT AIRCRAFT

- Performance flight testing --- Book p 433 A83-33621

- Light aircraft and sailplane structures in reinforced plastics p 435 A83-36065

LIGHTNING

- A review and comparison of lightning return stroke models using experimental data
[AD-A124680] p 479 N83-26345

- Aircraft lightning-induced voltage test technique developments p 442 N83-26829

- RF radiation from lightning correlated with aircraft measurements during storm hazards-82
[NASA-TM-85007] p 479 N83-27537

LINEAR POLARIZATION

- New advances in wide band dual polarization antenna elements for EW applications p 430 A83-35087

LINEAR SYSTEMS

- Interactive fine-tuning of linear-quadratic governors by selective and direct action on the poles of the control system
[ONERA, TP NO 1983-21] p 480 A83-36430

LIQUID ATOMIZATION

- Injection, atomization, ignition and combustion of liquid fuels in high-speed air streams
[AD-A125237] p 471 N83-27033

LIQUID COOLING

- Development and application of a liquid-cooled V-8 piston engine for general aviation aircraft
[AIAA PAPER 83-1342] p 455 A83-36347

LIQUID FUELS

- Further study on the prediction of liquid fuel spray capture by v-gutter downstream of a plain orifice injector under uniform cross air flow p 473 A83-35810

- Further studies on the prediction of spray evaporation rates --- for aircraft fuels p 468 A83-35811

- Thermal stability of alternative aircraft fuels
[AIAA PAPER 83-1143] p 470 A83-36243

- Injection, atomization, ignition and combustion of liquid fuels in high-speed air streams
[AD-A125237] p 471 N83-27033

LIQUID INJECTION

- Injection, atomization, ignition and combustion of liquid fuels in high-speed air streams
[AD-A125237] p 471 N83-27033

LOAD TESTS

- Canadian forces tracker aircraft full-scale fatigue test at the national aeronautical establishment p 433 A83-33548

- High frequency fatigue of turbine blade material
[AD-A124585] p 458 N83-25713

LOG PERIODIC ANTENNAS

- A network formulation for phased arrays - Application to log-periodic arrays of monopoles on curved surfaces p 431 A83-35090

LOG SPIRAL ANTENNAS

- Multimode planar spiral for DF applications p 430 A83-35089

LONGITUDINAL STABILITY

- Use of flight test results to improve the flying qualities simulation of the B-52H weapon system trainer
[AIAA PAPER 83-1091] p 437 A83-36215

LOW COST

- The application of low-cost demonstrators for advanced fighter technology evaluation
[AIAA PAPER 83-1052] p 438 A83-36462

LOW GRAVITY MANUFACTURING

- Preliminary science report on the directional solidification of hypereutectic cast iron during KC-135 low-G maneuvers
[NASA-TM-82528] p 470 N83-25854

LOW SPEED

- NASA low-speed centrifugal compressor for fundamental research
[AIAA PAPER 83-1351] p 464 A83-36353

LOW VISIBILITY

- Guidance control systems for aircraft on airport surfaces
[AIAA PAPER 83-1579] p 429 A83-36953

LUBRICANTS

- Air Force technical objective document FY 1984
[AD-A123961] p 487 N83-26783

LUBRICATION SYSTEMS

- Simulation of advanced engine lubrication and rotor dynamics systems - Rig design and fabrication
[AIAA PAPER 83-1133] p 450 A83-36238

- Feasibility of dry lubrication for limited-duty gas turbine engines
[AIAA PAPER 83-1130] p 475 A83-36405

MAINTAINABILITY

- Airframe RDT&E cost estimating A justification for and development of unique cost estimating relationships according to aircraft type
[AD-A123848] p 417 N83-25656

MAINTENANCE

- The effects of the Production Oriented Maintenance Organization (POMO) concept on ADTAC aircraft maintenance productivity and quality
[AD-A123981] p 416 N83-25655

MAN MACHINE SYSTEMS

- Compensation for time delay in flight simulator visual-display systems
[AIAA PAPER 83-1080] p 464 A83-36222

- The remote link unit A demonstration of operational performance Part 2 User's manual
[AD-A124620] p 476 N83-25938

MANEUVERABILITY

- Configuration development of a research aircraft with post-stall maneuverability p 439 A83-36915

MANEUVERABLE REENTRY BODIES

- Aerospace technology demonstrators/research and operational options
[AIAA PAPER 83-1054] p 438 A83-36465

MANUAL CONTROL

- Bring cohesion to handling-qualities engineering p 434 A83-35772

MAPS

- AISA Program for automated treatment of aeronautical data --- for civil aviation applications p 462 A83-35598

MARINE PROPULSION

- New concept in hovercraft design diesel versus gas turbines p 485 A83-34860

MASS FLOW

- Aerodynamic research on Tipvane windturbines
[PB83-147413] p 479 N83-27476

MASS FLOW RATE

- The transient performance of turbojet engines and axial compressors p 447 A83-35847

MATERIALS SCIENCE

- Highly stressed materials, with aviation considered as an example --- Book p 467 A83-33951

- Materials in the mirror of aviation criteria p 434 A83-33952

- Material, structural component, service life -- of aircraft construction materials p 468 A83-33953

- Fluoroelastomers --- materials for hostile fluid environments p 469 A83-36066

MATERIALS TESTS

- The influence of defects on the operational strength of disks and wheels in engines p 472 A83-33964

MATHEMATICAL MODELS

- Microeconomic models for process development p 472 A83-33650

- Dynamic modeling of an air cushion vehicle p 486 A83-35054

- The prediction of performance of turbojet engine with distorted inlet flow and its experimental studies p 446 A83-35832

- Numerical simulation of airfoil ice accretion
[AIAA PAPER 83-0112] p 428 A83-36042

- Progress in propulsion system/airframe structural integration
[AIAA PAPER 83-1123] p 437 A83-36234

- Application of 3D aerodynamic/combustion model to combustor primary zone study
[AIAA PAPER 83-1265] p 454 A83-36316

- Mathematical models of the acoustic properties of propellers p 458 A83-36792

MATRICES (MATHEMATICS)

- Static aeroelastic analysis of flexible wings via NASTRAN, part I
[AD-A124662] p 477 N83-26099

- A note on adaptive wind tunnels with imperfect control p 466 N83-26792

MAXIMUM LIKELIHOOD ESTIMATES

- Application of maximum likelihood estimation to the identification of the stability derivatives of a wide body transport aircraft p 460 A83-35121

METAL FATIGUE

- Investigation methods on residual stresses in aero engines components p 449 A83-35879

- The effect of microstructure on the fatigue behavior of Ni base superalloys p 469 A83-36166

- High frequency fatigue of turbine blade material
[AD-A124585] p 458 N83-25713

METAL MATRIX COMPOSITES

- Evaluation of low cost aluminum composites for aircraft engine structural applications
[NASA-TM-83357] p 470 N83-25790

METALLURGY

- Highly stressed materials, with aviation considered as an example --- Book p 467 A83-33951

METEOROLOGICAL RADAR

Scanning strategies for next generation weather radars
A study based on lifetimes of convective atmospheric phenomena hazardous to aviation
[FAA-RD 82-69] p 476 N83-25929

METHOD OF MOMENTS

Multimode planar spiral for DF applications
p 430 A83-35089

METHYL ALCOHOLS

Methanol combustion in a CF6I-80A engine combustor
[AIAA PAPER 83-1138] p 469 A83-36241

MICROSTRUCTURE

The effect of microstructure on the fatigue behavior of Ni base superalloys
p 469 A83-36166

MILITARY AIRCRAFT

Vectored thrust afterbody nozzles for future combat aircraft
p 448 A83-35859

Data base considerations for a tactical environment simulation
[AIAA PAPER 83-1099] p 463 A83-36219

United Kingdom military engine usage, condition and maintenance systems experience
[AIAA PAPER 83-1239] p 453 A83-36302

The impact of engine usage on life cycle cost
[AIAA PAPER 83-1406] p 456 A83-36395

Aircraft Prototype and Technology Demonstrator Symposium, Dayton, OH, March 23, 24, 1983, Proceedings
p 415 A83-36457

Prototyping for fun and profit --- military aircraft design
[AIAA PAPER 83-1045] p 415 A83-36458

Variable sweep wing design
[AIAA PAPER 83-1051] p 438 A83-36461

Propulsion prototypes at general electric
[AIAA PAPER 83-1053] p 457 A83-36463

X-29 integrated technology demonstrator and ATF
[AIAA PAPER 83-1058] p 438 A83-36469

MILITARY AVIATION

Concepts for a future joint airlift development program
[AIAA PAPER 83-1591] p 429 A83-36951

USAF mobility requirements --- USER REQUIREMENTS
[AIAA PAPER 83-1588] p 429 A83-36954

MILITARY HELICOPTERS

Microprocessor-based optimal controllers for a helicopter turret control system
p 434 A83-35138

Accelerated simulated mission endurance test of a turboshaft engine for military attack helicopter application
[AIAA PAPER 83-1359] p 455 A83-36357

Climatic laboratory survey Hughes YAH-64 helicopter
[AD-A124670] p 440 N83-25698

Airworthiness and flight characteristics test Part 2
YAH-64 advanced attack helicopter
[AD-A125270] p 442 N83-25705

YAH-64 advanced attack helicopter
[AD-A125270] p 442 N83-25705

YAH-64 advanced attack helicopter
[AD-A125270] p 442 N83-25705

MILITARY OPERATIONS

FAA aviation forecasts Fiscal years 1983-1994
[AD-A124611] p 416 N83-25652

The effects of the Production Oriented Maintenance Organization (POMO) concept on ADTAC aircraft maintenance productivity and quality
[AD-A123981] p 416 N83-25655

Proposed MIL standard and handbook Flying qualities of air vehicles Volume 2 Proposed MIL handbook
[AD-A123726] p 441 N83-25704

An interactive bombing mission simulation with computer graphics interface
[AD-A124661] p 481 N83-26637

An interactive bombing mission simulation with computer graphics interface
[AD-A124661] p 481 N83-26637

An interactive bombing mission simulation with computer graphics interface
[AD-A124661] p 481 N83-26637

MILITARY TECHNOLOGY

Design for testing of a low altitude night-in-weather attack system
[AIAA PAPER 83-1061] p 432 A83-36470

AFTI/F 16 technology demonstrator
[AIAA PAPER 83-1059] p 439 A83-36474

MILITARY VEHICLES

LACV-30 supportability
p 486 A83-35062

MILLING (MACHINING)

Microeconomic models for process development
p 472 A83-33650

MISSILE TESTS

New transformations of S4 Modane hypersonic wind tunnel for ramjet missiles tests
[ONERA, TP NO 1983-24] p 464 A83-36433

Advances in ejector technology A tribute to Hans von Ohain's vision
p 477 N83-26805

MIXING

Advances in ejector technology A tribute to Hans von Ohain's vision
p 477 N83-26805

MOBILITY

USAF mobility requirements -- USER REQUIREMENTS
[AIAA PAPER 83 1588] p 429 A83-36954

MODAL RESPONSE

Acoustic modal analysis of a full-scale annular combustor
[AIAA PAPER 83-0760] p 481 A83-33486

MODULUS OF ELASTICITY

Evaluation of low-cost aluminum composites for aircraft engine structural applications
[NASA-TM-83357] p 470 N83-25790

MOISTURE RESISTANCE

Fluoroelastomers --- materials for hostile fluid environments
p 469 A83-36066

MOMENTUM

End wall flow characteristics and overall performance of an axial flow compressor stage
[NASA-CR-3671] p 427 N83-26819

MONOPOLE ANTENNAS

A network formulation for phased arrays - Application to log-periodic arrays of monopoles on curved surfaces
p 431 A83-35090

MONOPULSE ANTENNAS

Comparative analysis of a phase and an amplitude processor for amplitude monopulse systems
p 431 A83-35192

MONTE CARLO METHOD

A Monte Carlo simulation of the engine development process
[AIAA PAPER 83-1230] p 452 A83-36294

Monte Carlo simulation of the engine development process
[AIAA PAPER 83-1405] p 456 A83-36394

MORPHOLOGY

Preliminary science report on the directional solidification of hypereutectic cast iron during KC-135 low-G maneuvers
[NASA-TM-82528] p 470 N83-25854

MOTION SIMULATION

Old problem/new solutions - Motion cuing algorithms revisited
[AIAA 83-1082] p 480 A83-36223

MRCA AIRCRAFT

A technique to determine lift and drag polars in flight
p 422 A83-36913

N**NACELLES**

Progress toward the analysis of complex propulsion installation flow phenomenon
[AIAA PAPER 83-1367] p 421 A83-36363

PANAIR Pilot Code application to subsonic nacelle type interior flows
[AIAA PAPER 83-1369] p 421 A83-36365

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

NOISE MEASUREMENT

Full-scale measurements of blade-vortex interaction noise
p 435 A83-35947

In-flight acoustic test results for the SR-2 and SR-3 advanced-design propellers
[AIAA PAPER 83-1214] p 452 A83-36286

A survey of helicopter and ambient urban noise levels in Phoenix, Arizona
[AD-A123856] p 479 N83-26322

NOISE POLLUTION

A survey of helicopter and ambient urban noise levels in Phoenix, Arizona
[AD-A123856] p 479 N83 26322

AICUZ (Air Installation Compatible Use Zone) report
[AD-A124974] p 483 N83-27801

NOISE PREDICTION (AIRCRAFT)

JT150 1/2-scale nozzle jet noise experiment and comparison with prediction
[NASA-TM-83370] p 482 N83-27793

NOISE REDUCTION

Friction drag measurements of acoustic surfaces
[AIAA PAPER 83-1356] p 422 A83-36414

NOISE SPECTRA

Cross spectra between temperature and pressure in a constant area duct downstream of a combustor
[AIAA PAPER 83-0762] p 481 A83-33487

NOISE TEMPERATURE

Cross spectra between temperature and pressure in a constant area duct downstream of a combustor
[AIAA PAPER 83-0762] p 481 A83-33487

NONDESTRUCTIVE TESTS

Evaluation of the effect of voids in composite main rotor blades
p 472 A83-33507

Evaluation of the effect of voids in composite main rotor blades
p 435 A83-35950

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Life prediction for turbine engine components
p 474 A83-36174

Effect of empennage location on twin-engine
afterbody-nozzle aerodynamic characteristics at Mach
Numbers from 0.6 to 1.2 -- wind tunnel tests
[NASA-TP-2116] p 424 N83-25666

NOZZLE THRUST COEFFICIENTS

Experimental results of a deflected thrust V/STOL
nozzle research program
[NASA-TM-83069] p 423 N83-25657

NUMERICAL ANALYSIS

Application of the vortex-lattice method to propeller
performance analysis
[AD-A124837] p 459 N83-26840

NUMERICAL CONTROL

Microprocessor-based optimal controllers for a
helicopter turret control system p 434 A83-35138
Computer model of a collision-avoidance system for air
traffic control p 431 A83-35275
Comparison of an experience with full authority digital
engine controls in rotary wing and jet-lift VSTOL aircraft
[AIAA PAPER 83-1241] p 454 A83-36304

NUMERICAL INTEGRATION

Sinusoidal integration for simulation of second-order
systems
[AIAA PAPER 83-1086] p 480 A83-36210

O**O RING SEALS**

Design analysis of a self-acting spiral-groove ring seal
for counter-rotating shafts -- o ring seals
[AIAA PAPER 83-1134] p 474 A83-36239

OCULOMETERS

Development of an oculometer data collection
subsystem
[AD-A124700] p 481 N83-26501

OH-58 HELICOPTER

A tubular braided composite main rotor blade spar
p 435 A83-35949

OMEGA NAVIGATION SYSTEM

Omega application in the Indonesian region
p 431 A83-35599

OMNIDIRECTIONAL ANTENNAS

A rapid-tuning high-power pod-mounted VHF antenna
system p 430 A83-35088

ONBOARD DATA PROCESSING

Modern technology and airborne engine vibration
monitoring systems
[AIAA PAPER 83-1240] p 444 A83-36303

OPERATING COSTS

Cost effective performance restoration of high by-pass
engines p 447 A83-35833
Aspects of the T56 power section usage/operating
costs
[AIAA PAPER 83-1408] p 457 A83-36397

OPERATING TEMPERATURE

Method of studying the operating temperature of gas
turbines -- aeroengines
[PNR-90159] p 460 N83-26842

OPTICAL MEASURING INSTRUMENTS

Lasers in aircraft construction -- Russian book
p 472 A83-34170

OPTIMAL CONTROL

Aerodynamic optimization theory of A 3-D axial-flow
rotor-blading via optimal control p 418 A83-35839
Some aspects of development of power plant optimum
control to increase aircraft fuel efficiency
p 447 A83-35841

Old problem/new solutions - Motion cuing algorithms
revisited
[AIAA 83-1082] p 480 A83-36223

Interactive fine-tuning of linear-quadratic governors by
selective and direct action on the poles of the control
system
[ONERA, TP NO 1983-21] p 480 A83-36430

Investigation of a third order baro damped vehicle
channel of INS
[AD-A124882] p 432 N83-26828

OPTIMIZATION

Optimization for structures of discrete-size elements
p 472 A83-34311
Criteria for optimizing starting cycles for high
performance fighter engines
[AIAA PAPER 83-1127] p 450 A83-36236

Structural model tuning via vector optimization
[AD-A124791] p 477 N83-26103

OSCILLATING FLOW

Finite difference calculation of an inviscid transonic flow
over oscillating airfoils
[AD-A123982] p 426 N83-25677

OSCILLATIONS

Calculation of boundary layers near the stagnation point
of an oscillating airfoil
[NASA-TM-84305] p 478 N83-27148

OZONE

High altitude jet fuel photochemistry
[AD-A125035] p 471 N83-27035

P**PANEL METHOD (FLUID DYNAMICS)**

Evaluation of a surface panel method coupled with
several boundary layer analyses
[AIAA PAPER 83-0011] p 474 A83-36039

Numerical calculation of nonlinear aerodynamics of
wing-body configurations p 420 A83-36076
PAN AIR applications to aero-propulsion integration
[AIAA PAPER 83-1368] p 421 A83-36364

PANAIPI Pilot Code application to subsonic nacelle type
interior flows
[AIAA PAPER 83-1369] p 421 A83-36365

PANELS

Nonlinear supersonic flutter of panels considering shear
deformation and rotary inertia p 473 A83-34315
Advanced manufacturing development of a composite
empennage component for L-1011 aircraft
[NASA-CR-172658] p 440 N83-25692

A parametric study of surface imperfections and small
cutouts in a composite panel
[AD-A124739] p 470 N83-25793

PARABOLIC DIFFERENTIAL EQUATIONS

An assessment of factors affecting prediction of
near-field development of a subsonic VSTOL jet in
cross flow
[AD-A124583] p 441 N83-25699

PARACHUTE DESCENT

The motion dynamics of parachute systems -- Russian
book p 422 A83-36450

PARACHUTES

Net-skirt addition to a parachute canopy to prevent
inversion p 428 A83-36911
Wind tunnel investigation of cargo extraction parachutes
in the wake of a Lockheed C-141B Starlifter aircraft
[AD-A124523] p 425 N83-25675

PARAMETER IDENTIFICATION

Evaluation of aerodynamic derivatives from Do-28-TNT
free-flight model tests
[ESA TT-784] p 442 N83-25706

PARAMETERIZATION

A small parameter method in problems of maneuvering
space vehicles with aerodynamic efficiency
p 467 A83-34849
A parametric study of surface imperfections and small
cutouts in a composite panel
[AD-A124739] p 470 N83-25793

PARTICLE SIZE DISTRIBUTION

The distribution of the disperse fraction of a polydisperse
jet injected into a gas flow p 473 A83-34472
An investigation of the effectiveness of smoke
suppressant fuel additives for turbojet applications
[AD-A125025] p 471 N83-27034

PASSENGER AIRCRAFT

SAAB-Fairchild 340 - Transatlantic frontrunner
p 434 A83-35623
The future of the manned aircraft p 416 A83-36960

PASSENGERS

A strategy is needed to deal with peaking problems at
international airports
[GAO/GGD-83-4] p 429 N83-25683

PAVEMENTS

Runway surface condition sensor specification guide
[AC-150/5220-13A] p 465 N83-25728

PERFORMANCE PREDICTION

On improving the fatigue performance of a double-shear
lap joint p 473 A83-34744
Computer studies of ACV heave performance as a
function of vent valve control parameters
p 460 A83-34854

Technical aspects of the AEROBAC AB-7
p 484 A83-34858

Further study on the prediction of liquid fuel spray capture
by v-gutter downstream of a plain orifice injector under
uniform cross air flow p 473 A83-35810
Further studies on the prediction of spray evaporation
rates -- for aircraft fuels p 468 A83-35811

The prediction of performance of turbojet engine with
distorted inlet flow and its experimental studies
p 446 A83-35832
The transient performance of turbojet engines and axial
compressors p 447 A83-35847

A study of the response of a turbojet engine to the inlet
temperature transients p 448 A83-35849
Effect of sand erosion on the performance deterioration
of a single stage axial flow compressor
p 448 A83-35854

Eccentric end wear in cylindrical roller bearings can be
predicted and prevented
[AIAA PAPER 83-1132] p 474 A83-36237

The performance of single-shaft gas turbine load
compressor auxiliary power units

[AIAA PAPER 83-1159] p 451 A83-36251
Maximum loading capability of axial flow compressors
[AIAA PAPER 83-1163] p 451 A83-36254

The performance of an annular vane swirler -- to aid
in modeling gas turbine combustor flowfields and swirling
confined flow turbulence

[AIAA PAPER 83-1326] p 455 A83-36340
A comprehensive method for preliminary design
optimization of axial gas turbine stages II - Code
verification

[AIAA PAPER 83-1403] p 456 A83-36393
Dynamic characteristics of aenal refueling systems
[AD-A124770] p 442 N83-26830

Application of the vortex-lattice method to propeller
performance analysis
[AD-A124837] p 459 N83-26840

PERFORMANCE TESTS

'Larus' and 'VP-1' tested in winter 1982
p 485 A83-34859
AP 1-88 craft 001 prototype clearance trials
p 485 A83-34862

Experimental investigation on the role of flexbars and
metallic end seals in squeeze film dampers -- of gas turbine
engines p 473 A83-35862
Contribution to centrifugal compressor impeller design
p 448 A83-35865

Flight fidelity testing of the F/A-18 simulators
[AIAA 83-1094] p 437 A83-36225
Accelerated Mission Testing of the F110 Engine
[AIAA PAPER 83-1235] p 453 A83-36298

Effects of compressor hub treatment on stator stall
margin and performance
[AIAA PAPER 83-1352] p 475 A83-36354
Accelerated simulated mission endurance test of a
turbohaft engine for military attack helicopter
application

[AIAA PAPER 83-1359] p 455 A83-36357
Experimental investigation of the effects of wall suction
and blowing on the performance of highly offset
diffusers

[AIAA PAPER 83-1169] p 423 A83-36922
PERIPHERAL VISION
Theory underlying the peripheral vision horizon device
[AD-A124426] p 445 N83-25710

PERTURBATION

Some recent applications of XTRAN3S
[NASA-TM-85641] p 426 N83-26815

PHASED ARRAYS

A network formulation for phased arrays - Application
to log-periodic arrays of monopoles on curved surfaces
p 431 A83-35090

PHOTOCHEMICAL REACTIONS

High altitude jet fuel photochemistry
[AD-A124035] p 471 N83-27035

PHOTOELASTIC ANALYSIS

Stress analysis of critical areas of low-pressure
compressor-disc assembly of a developmental
aero-engine p 449 A83-35880

PILOT ERROR

Modeling the helmet-mounted sight system
[AD-A124681] p 444 N83-25709

PILOT PERFORMANCE

Flight operations A study of flight deck management
-- Book p 428 A83-33767
Bring cohesion to handling-qualities engineering
p 434 A83-35772

PILOT TRAINING

A placement model for flight simulators
[AD-A123782] p 466 N83-25730
Simulator design features for carrier landing Part 2
In-simulator transfer of training
[AD-A124024] p 466 N83-25733

PILOTLESS AIRCRAFT

A dynamic model of turbojet in starting at high altitude
p 447 A83-35846

PILOTS (PERSONNEL)

Airline safety and labor relations law - Balancing rights
and responsibility p 484 A83-34475
Pilot human factors in stall/spin accidents of supersonic
fighter aircraft
[NASA-TM-84348] p 462 N83-26846

PISTON ENGINES

The effect of variation of diffuser design on the
performance of centrifugal compressors
p 448 A83-35866
Development and application of a liquid-cooled V-8
piston engine for general aviation aircraft
[AIAA PAPER 83-1342] p 455 A83-36347

PITCH (INCLINATION)

Gust response prediction of an airfoil using a modified
von Karman-Pohlhausen technique
[AD-A124716] p 461 N83-25718

PITCHING MOMENTS

Evaluation of aerodynamic derivatives from Do-28 TNT free-flight model tests
[ESA-TT-784] p 442 N83-25706

PLASMA PHYSICS

A collection of papers in the aerospace sciences
[AD-A122667] p 417 N83-26787

PLASTIC DEFORMATION

The use of a structural model for determining the adaptability curve for turbine disks in stress concentration zones p 445 N83-35039

PLATES (STRUCTURAL MEMBERS)

Impact damping and airplane towing p 428 N83-33625

PLUMES

Thrust reverser exhaust plume Reingestion tests for a STOL fighter model
[AIAA PAPER 83-1229] p 452 N83-36293
Definition of vectored nonaxisymmetric nozzle plumes --- for aircraft thrust vector control
[AIAA PAPER 83-1290] p 423 N83-36924

POLARIZATION CHARACTERISTICS

New advances in wide band dual polarization antenna elements for EW applications p 430 N83-35087

POLICIES

Concepts for a future joint airlift development program [AIAA PAPER 83-1591] p 429 N83-36951

POLLUTION CONTROL

An investigation of the effectiveness of smoke suppressant fuel additives for turbojet applications
[AD-A125025] p 471 N83-27034

POSITION (LOCATION)

Precision navigational filmstrips for use in DOD aircraft
[AD-A124761] p 432 N83-25688

POSITION ERRORS

A theoretical framework for analysis of lateral position errors in VOR jet-route systems p 431 N83-35273

POTENTIAL FLOW

Progress toward the analysis of complex propulsion installation flow phenomenon
[AIAA PAPER 83-1367] p 421 N83-36363
Correction to the wing source velocity error in Woodward's USSAERO code p 423 N83-36920
Helicopter rotor loads using discretized matched asymptotic expansions
[NASA-CR-166092] p 423 N83-25658
Helicopter rotor loads using matched asymptotic expansions User's manual
[NASA-CR-166093] p 423 N83-25659

POWER EFFICIENCY

Vectored thrust afterbody nozzles for future combat aircraft p 448 N83-35859
The aerodynamic design and performance of the General Electric/NASA EEE fan --- Energy Efficient Engine
[AIAA PAPER 83-1160] p 451 N83-36252
Concepts for increased power and enhanced fuel conservation with newly patented multiple power-cycle gas turbine engines
[AIAA PAPER 83-1209] p 452 N83-36282
An update on high output lightweight diesel engines for aircraft applications
[AIAA PAPER 83-1339] p 458 N83-36925

PRECOOLING

Problems involved by the instrumentation and the conception of cryogenic tests p 465 N83-25725

PREDICTION ANALYSIS TECHNIQUES

Residual life prediction for jet engine rotor disks at elevated temperature p 472 N83-33974
Technical evaluation report on the Fluid Dynamics Panel Specialists' Meeting on Prediction of Aerodynamic Loads on Rotorcraft
[AGARD-AR-189] p 426 N83-25682
Flutter prediction in forward-swept wings by assumed modes and strip theory
[AD-A124715] p 461 N83-25719
Analysis of progressive collapse of complex structures
[AD-A125266] p 478 N83-27260

PREMIXED FLAMES

Semi implicit calculation method of the flow field in a duct with the flame stabilized by a step --- for aircraft engine combustion chamber design p 446 N83-35820

PREPREGS

Advanced manufacturing development of a composite empennage component for L-1011 aircraft
[NASA-CR-172659] p 440 N83-25693

PRESSURE DISTRIBUTION

Variation of rotor blade vibration due to interaction of inlet and outlet distortion p 450 N83-35882
Improved numerical method for unsteady lifting surfaces in incompressible flow p 422 N83-36917
Force and pressure measurements on a research model with a low- mid- and T-tail at Mach numbers of 0.60 to 0.90 Volume 2 Tabulated data
[AD-A124068] p 425 N83-25676

Application of the vortex-lattice method to propeller performance analysis
[AD-A124837] p 459 N83-26840

PRESSURE EFFECTS

Experimental investigation of the effects of wall suction and blowing on the performance of highly offset diffusers
[AIAA PAPER 83-1169] p 423 N83-36922

PRESSURE MEASUREMENT

The swirl in an S-duct of typical air intake proportions p 418 N83-35620

Aircraft engine inlet pressure distortion testing in a ground test facility
[AIAA PAPER 83-1233] p 453 N83-36296

Pressures measured in flight on the aft fuselage and external nozzle of a twin-jet fighter
[NASA-TP-2017] p 424 N83-25665

PRESSURE OSCILLATIONS

Response of a supersonic inlet to downstream perturbations
[AIAA PAPER 83-2017] p 422 N83-36403

PRESSURE RATIO

Experimental results of a deflected thrust V/STOL nozzle research program
[NASA-TM-83069] p 423 N83-25657

PRESSURE REDUCTION

Advanced manufacturing development of a composite empennage component for L-1011 aircraft
[NASA-CR-172658] p 440 N83-25692

PRESSURE SENSORS

Seven-hole cone probes for high angle flow measurement Theory and calibration p 474 N83-36085

Problems involved by the instrumentation and the conception of cryogenic tests p 465 N83-25725

PROCESS CONTROL (INDUSTRY)

Microeconomic models for process development p 472 N83-33650

PROCUREMENT

Airframe RDT&E cost estimating A justification for and development of unique cost estimating relationships according to aircraft type
[AD-A123848] p 417 N83-25656

PRODUCT DEVELOPMENT

Microeconomic models for process development p 472 N83-33650
A Monte Carlo simulation of the engine development process
[AIAA PAPER 83-1230] p 452 N83-36294
Compound cycle turbofan engine
[AIAA PAPER 83-1338] p 455 N83-36346
Technology and engine demonstrator programs
[AIAA PAPER 83-1064] p 457 N83-36464

PRODUCTION COSTS

Development and production cost estimating relationships for aircraft turbine engines
[AD-A123753] p 459 N83-25714

PRODUCTIVITY

The effects of the Production Oriented Maintenance Organization (POMO) concept on ADTAC aircraft maintenance productivity and quality
[AD-A123981] p 416 N83-25655

PROGRAM VERIFICATION (COMPUTERS)

NASA low-speed centrifugal compressor for fundamental research
[AIAA PAPER 83-1351] p 464 N83-36353

PROJECT MANAGEMENT

SAAB-Fairchild 340 - Transatlantic frontrunner p 434 N83-35623
Aircraft Prototype and Technology Demonstrator Symposium, Dayton, OH, March 23, 24, 1983, Proceedings p 415 N83-36457

PROP-FAN TECHNOLOGY

Prop-fan powered aircraft - An overview
[SAE PAPER 820957] p 434 N83-33629
Advanced propfan engine characteristics and technology needs
[AIAA PAPER 83-1155] p 450 N83-36250
Method for calculating effects of a propfan on aircraft aerodynamics at subsonic speeds
[AIAA PAPER 83-1216] p 420 N83-36287

PROPAGATION MODES

Acoustic modal analysis of a full-scale annular combustor
[AIAA PAPER 83-0760] p 481 N83-33486

PROPELLER BLADES

Application of the vortex-lattice method to propeller performance analysis
[AD-A124837] p 459 N83-26840

PROPELLER EFFICIENCY

Prop-fan powered aircraft - An overview
[SAE PAPER 820957] p 434 N83-33629

PROPELLER SLIPSTREAMS

Method for calculating effects of a propfan on aircraft aerodynamics at subsonic speeds
[AIAA PAPER 83-1216] p 420 N83-36287

PROPELLERS

In-flight acoustic test results for the SR-2 and SR-3 advanced-design propellers
[AIAA PAPER 83-1214] p 452 N83-36286
Aerodynamic measurements about a rotating propeller with a laser velocimeter
[AIAA PAPER 83-1354] p 421 N83-36355
Mathematical models of the acoustic properties of propellers p 458 N83-36792

PROPULSION

Applications of advanced upper surface blowing propulsive-lift technology
[SAE PAPER 820956] p 433 N83-33628

PROPULSION SYSTEM CONFIGURATIONS

Advanced propfan engine characteristics and technology needs
[AIAA PAPER 83-1155] p 450 N83-36250
NASA propulsion controls research
[NASA-TM-83343] p 458 N83-25711
Generalization of the air jet propulsion systems, the 'N' flow turbo-jet engine
[AD-A123932] p 459 N83-25715

PROPULSION SYSTEM PERFORMANCE

On the propulsion system of the NAL quiet STOL research aircraft p 446 N83-35831
Propulsion system simulation technique for scaled wind tunnel model testing p 463 N83-35850
Cruise missile propulsion versus commercial airliner propulsion - Different challenges can produce similar engine cycles
[AIAA PAPER 83-1176] p 451 N83-36261
Advanced turboprop and dual cycle engine performance benefits and installation options on a Mach 0.7 shorthaul transport aircraft
[AIAA PAPER 83-1212] p 452 N83-36284
Ejector nozzle test results at simulated flight conditions for an advanced supersonic transport propulsion system
[AIAA PAPER 83-1287] p 454 N83-36323
A static investigation of yaw vectoring concepts on two-dimensional convergent-divergent nozzles
[AIAA PAPER 83-1288] p 421 N83-36324
Advanced propulsion controls - A total system view p 457 N83-36612
Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft
[NASA-TP-2120] p 427 N83-26821

PROPULSIVE EFFICIENCY

Concepts for increased power and enhanced fuel conservation with newly patented multiple power-cycle gas turbine engines
[AIAA PAPER 83-1209] p 452 N83-36282
Generalized maximum specific range performance p 439 N83-36918

PROTECTIVE COATINGS

Air Force technical objective document FY 1984
[AD-A123961] p 487 N83-26783

PROTOTYPES

AP 1-88 craft 001 prototype clearance trials p 485 N83-34862
Aircraft Prototype and Technology Demonstrator Symposium, Dayton, OH, March 23, 24, 1983, Proceedings p 415 N83-36457
Prototyping for fun and profit --- military aircraft design
[AIAA PAPER 83-1045] p 415 N83-36458
XB-70 technology advancements p 437 N83-36460
Propulsion prototypes at general electric
[AIAA PAPER 83-1053] p 457 N83-36463
The F-16 - A technology demonstrator, a prototype, and a flight demonstrator p 438 N83-36467
[AIAA PAPER 83-1063]
The Northrop Flying Wing prototypes p 416 N83-36471
Large jet aircraft validation and demonstrations - An overview of Boeing experience p 439 N83-36472
[AIAA PAPER 83-1049]
The F-5 story - Prototype and technology demonstrator p 439 N83-36473
[AIAA PAPER 83-1062]
PULSE DOPPLER RADAR
GE's APG-67 - Fighter radar with a future p 432 N83-36625

Q**QUADRATIC EQUATIONS**

Interactive fine-tuning of linear-quadratic governors by selective and direct action on the poles of the control system
[ONERA, TP NO 1983-21] p 480 N83-36430

QUALITY CONTROL

Some applications of ultrasonic methods for the quality control of nonmetallic objects p 475 N83-36794

R

RADAR EQUIPMENT

Analysis of F-16 radar discrepancies
[AD-A124749] p 476 N83-25948

RADAR SCANNING

Scanning strategies for next generation weather radars
A study based on lifetimes of convective atmospheric phenomena hazardous to aviation
[FAA-RD-82 69] p 476 N83-25929

RADIATION HAZARDS

Laser safety of air bathymetry
[FOA-C-30292-E1] p 478 N83-27210

RADIO ANTENNAS

A rapid-tuning high-power pod-mounted VHF antenna system
p 430 A83-35088

RADIO FREQUENCY SHIELDING

Composite material aircraft electromagnetic properties and design guidelines
[AD-A124016] p 470 N83-25795

RADIO RECEIVERS

SH-3 helicopter/Global Positioning System integration analysis
[AD-A125005] p 432 N83-25691

RADIO WAVES

RF radiation from lightning correlated with aircraft measurements during storm hazards-82
[NASA-TM-85007] p 479 N83-27537

RADOMES

Wind tunnel test of a C-18 aircraft modified with the advanced range instrumentation aircraft radome
[AD-A124771] p 425 N83-25671

RAMAN SPECTROSCOPY

CARS temperature and species measurements in augmented jet engine exhausts - Coherent Anti-Stokes Raman Spectroscopy
[AIAA PAPER 83-1294] p 455 A83-36328

RAMJET ENGINES

Applications of computational techniques in the design of ramjet engines
p 418 A83-35828
Response of a supersonic inlet to downstream perturbations
[AIAA PAPER 83-2017] p 422 A83-36403

RAMJET MISSILES

New transformations of S4 Modane hypersonic wind tunnel for ramjet missiles tests
[ONERA, TP NO 1983-24] p 464 A83-36433
Coaxial dump combustor investigations
p 459 N83-26791

REAL TIME OPERATION

Sinusoidal integration for simulation of second-order systems
[AIAA PAPER 83-1086] p 480 A83-36210
Spectral decontamination of a real-time helicopter simulation
[AIAA PAPER 83-1087] p 436 A83-36211
Analysis of a real-time application
[AIAA PAPER 83-1088] p 480 A83-36212
Real time simulation of mission environments for avionics systems integration
[AIAA PAPER 83-1097] p 463 A83-36217
Design of a real-time CGSI system
[AIAA PAPER 83 1101] p 474 A83-36221
Automatic control and data acquisition system for combustion laboratory applications
[AD-A125195] p 470 N83-25829

RECIRCULATIVE FLUID FLOW

The effect of fuel atomization on soot-free combustion in a prevaporizing combustor
p 446 A83-35812

RECORDING INSTRUMENTS

Materials and modelling technology for cryogenic environment
p 465 N83-25723

RECTANGULAR WINGS

Calculation of subsonic flow past rectangular wings and their combinations on the basis of a discrete vortex scheme
p 418 A83-35541
Improved numerical method for unsteady lifting surfaces in incompressible flow
p 422 A83-36917
Some recent applications of XTRAN3S
[NASA-TM-85641] p 426 N83-26815

REGENERATIVE COOLING

Preliminary investigation on the performance of regenerative turbofan with inter-cooled compressor and its influence to aircraft
p 446 A83-35830

REGULATORS

Interactive fine-tuning of linear-quadratic governors by selective and direct action on the poles of the control system
[ONERA, TP NO 1983-21] p 480 A83-36430

RELIABILITY ANALYSIS

A dynamic model of turbojet in starting at high altitude
p 447 A83-35846

REMOTE CONSOLES

The remote link unit A demonstration of operational performance Part 3 Design manual, volume 1
[AD-A124621] p 476 N83-25934

The remote link unit A demonstration of operational performance Part 3 Design manual Volume 2
Appendices A - C
[AD-A124622] p 476 N83-25935

The remote link unit A demonstration of operational performance Part 2 User's manual
[AD-A124620] p 476 N83-25938

The remote link unit A demonstration of operational performance, part 1
[AD-A124619] p 476 N83-25939

REMOTELY PILOTED VEHICLES

A true air speed sensor for miniature unmanned aircraft
p 444 A83-36613

RESEARCH AIRCRAFT

On the propulsion system of the NAL quiet STOL research aircraft
p 446 A83-35831
Indoctrination of Navy test pilots to vectored thrust flight in the X-22A in-flight simulator
[AIAA PAPER 83-1076] p 436 A83-36205
The F-16 - A technology demonstrator, a prototype, and a flight demonstrator
[AIAA PAPER 83-1063] p 438 A83-36467
X-29 integrated technology demonstrator and ATF
[AIAA PAPER 83-1058] p 438 A83-36469
The Northrop Flying Wing prototypes
[AIAA PAPER 83-1047] p 416 A83-36471
Configuration development of a research aircraft with post-stall maneuverability
p 439 A83-36915

RESEARCH AND DEVELOPMENT

From Voyageur on - The exploitation of an opportunity to develop a Canadian air cushion vehicle industry --- developing Canadian Air Cushion Vehicle Industry
p 485 A83-35052
Developments in air cushion vehicle spray suppression
p 486 A83-35056
Skirts - Time for a new look?
p 486 A83-35058
The Transportation Development Centre contribution to air cushion technology
p 486 A83-35059
Design and development of a small gasturbine engine
Results today - A basis for design criteria of a next generation
p 446 A83-35829
Design and development of a nozzle extendible exit cone
[AIAA PAPER 83-1410] p 467 A83-36399
Fighter engine cycle selection
[AIAA PAPER 83-1300] p 457 A83-36412
Aerospace technology demonstrators/research and operational options
[AIAA PAPER 83-1054] p 438 A83-36465
V/STOL status from the engine technology viewpoint
p 458 A83-36912
Air Force technical objective document FY 1984
[AD-A123961] p 487 N83-26783
AGARD Bulletin Meetings, publications, membership
[AGARD-BUL-83/1] p 417 N83-26786

RESEARCH FACILITIES

The man-vehicle systems research facility - A new NASA aeronautical R & D facility
[AIAA PAPER 83-1098] p 463 A83-36218

RESEARCH PROJECTS

An over view of UTIAS research on the dynamic stability of air cushion vehicles
p 484 A83-34853

RESIDUAL STRESS

Investigation methods on residual stresses in aero engines components
p 449 A83-35879

RESONANT FREQUENCIES

Resonance tests on the tail of a CT4 aircraft
[AD A124566] p 441 N83-25703

RESONANT VIBRATION

Excitation and vibration of flexible bladed disks under operating and simulated operation conditions
p 449 A83-35881

RETROFITTING

The use of vortex generators as inexpensive compressor casing treatment
p 459 N83-26798

REVERSED FLOW

Application of 3D aerodynamic/combustion model to combustor primary zone study
[AIAA PAPER 83-1265] p 454 A83-36316

REYNOLDS NUMBER

Condensation studies in cryogenic nitrogen expansions
p 465 N83-25720
Problems involved by the instrumentation and the conception of cryogenic tests
p 465 N83-25725

REYNOLDS STRESS

Numerical computation of turbulent flow around the spinner of a turbofan engine
p 418 A83-35838

RIGID ROTORS

Coupled flap-lag torsional dynamics of hingeless rotor blades in forward flight
p 433 A83-33506
Coupled flap-lag-torsional dynamics of hingeless rotor blades in forward flight
p 435 A83-35948

ROCKET ENGINES

International Symposium on Air Breathing Engines, 6th, Paris, France, June 6-10, 1983, Symposium Papers
p 445 A83-35801

ROLL

Experimental testing of flying qualities theories
[AD-A124699] p 440 N83-25697

ROLLER BEARINGS

Eccentric end wear in cylindrical roller bearings can be predicted and prevented
[AIAA PAPER 83-1132] p 474 A83-36237

ROTARY STABILITY

F-14 rotary balance tests for an angle-of-attack range of 0 deg to 90 deg
[AD-A124468] p 441 N83-25700

ROTARY WING AIRCRAFT

Research and analysis of head-directed area of-interest visual system concepts
[NASA-CR-166480] p 467 N83-26849

ROTARY WINGS

Evaluation of the effect of voids in composite main rotor blades
p 472 A83-33507
A tubular braided composite main rotor blade spar
p 435 A83-35949
Evaluation of the effect of voids in composite main rotor blades
p 435 A83-35950
The super stallion --- CH-53E helicopter design features
p 435 A83-36075
Spectral decontamination of a real-time helicopter simulation
[AIAA PAPER 83-1087] p 436 A83-36211
Helicopter rotor loads using discretized matched asymptotic expansions
[NASA-CR-166092] p 423 N83-25658
Helicopter rotor loads using matched asymptotic expansions User's manual
[NASA-CR-166093] p 423 N83-25659
Verification testing of an AH-1S Wire Strike Protection System (WSPS)
[AD-A123188] p 429 N83-25684
Experimental study of main rotor/tail rotor/airframe interactions in hover Volume 1 Text and figures
[NASA-CR-166485] p 427 N83-26820
Simulation program of rotary wings
[FOA-C-30308-E1] p 443 N83-26836

ROTATING DISKS

The influence of defects on the operational strength of disks and wheels in engines
p 472 A83-33964

ROTATING STALLS

Flow measurements within rotating stall cells in single and multistage axial-flow compressors
p 419 A83-35873
Flow in rotating stall cells of a low speed axial flow compressor
p 419 A83-35874

ROTOR AERODYNAMICS

Helicopter rotor loads using discretized matched asymptotic expansions
[NASA-CR-166092] p 423 N83-25658
Helicopter rotor loads using matched asymptotic expansions User's manual
[NASA-CR-166093] p 423 N83-25659
Technical evaluation report on the Fluid Dynamics Panel Specialists' Meeting on Prediction of Aerodynamic Loads on Rotorcraft
[AGARD-AR-189] p 426 N83-25682
Correlation and evaluation of inplane stability characteristics for an advanced bearingless main rotor
[NASA-CR-166448] p 440 N83-25695

ROTOR BLADES

Excitation and vibration of flexible bladed disks under operating and simulated operation conditions
p 449 A83-35881

Variation of rotor blade vibration due to interaction of inlet and outlet distortion
p 450 A83-35882
Full-scale measurements of blade vortex interaction noise
p 435 A83-35947

Some applications of ultrasonic methods for the quality control of nonmetallic objects
p 475 A83-36794

ROTOR BLADES (TURBOMACHINERY)

Effect of entry boundary layer thickness on secondary flows in an annular cascade of turbine nozzle and rotor blades
p 419 A83-35868
Effects of compressor hub treatment on stator stall margin and performance
[AIAA PAPER 83-1352] p 475 A83-36354
End wall flow characteristics and overall performance of an axial flow compressor stage
[NASA-CR-3671] p 427 N83-26819

ROTORS

Damping seal for turbomachinery
[NASA-CASE-MFS-25842-1] p 477 N83-26080

ROUTES

A theoretical framework for analysis of lateral position errors in VOR jet-route systems
p 431 A83-35273
On the use of height rules in off-route airspace
p 431 A83-35274

RUBIDIUM

Phase 2A bench model development tactical rubidium frequency standard
[AD-A124462] p 477 N83-25990

RUNWAYS

- U S sets own standards for airport lighting p 463 A83-35625
Runway surface condition sensor specification guide [AC-150/5220-13A] p 465 N83-25728

S

SAFETY

- Foreign Technology Alert - Bibliography Transportation safety [PB83-101659] p 430 N83-25686

SANDS

- Effect of sand erosion on the performance deterioration of a single stage axial flow compressor p 448 A83-35854

SCALE MODELS

- Development of a turbojet engine simulator for scale model wind tunnel testing of multi-mission aircraft p 447 A83-35848
Propulsion system simulation technique for scaled wind tunnel model testing p 463 A83-35850
STOL wind tunnel test results for a tactical supercruiser [AIAA PAPER 83-1224] p 420 A83-36291
Performance capability of a Compact Multimission Aircraft Propulsion Simulator [AIAA PAPER 83-1358] p 464 A83-36356
Materials and modelling technology for cryogenic environment p 465 N83-25723

SCREEN EFFECT

- Optimum wire screens for control of turbulence in wind tunnels p 417 A83-33772

SEALS (STOPPERS)

- Experimental investigation on the role of flexbars and metallic end seals in squeeze film dampers --- of gas turbine engines p 473 A83-35862
Fluoroelastomers --- materials for hostile fluid environments p 469 A83-36066
Design analysis of a self-acting spiral-groove ring seal for counter-rotating shafts [NASA-TP-2142] p 458 N83-25712
Damping seal for turbomachinery [NASA-CASE-MFS-25842-1] p 477 N83-26080

SEAT BELTS

- ACES II negative Gz restraint investigation [AD-A124713] p 430 N83-25685

SECONDARY FLOW

- A contribution to the calculation of secondary flows in an axial flow compressor p 419 A83-35852
Effect of entry boundary layer thickness on secondary flows in an annular cascade of turbine nozzle and rotor blades p 419 A83-35868

SECURITY

- Sandia Helicopter Acoustic Detector (SHAD) [DE82-018925] p 483 N83-27803

SELF INDUCED VIBRATION

- Forced and self-excited vibrations of gas turbine assemblies with perfect and perturbed symmetry p 458 A83-36791

SENSITIVITY

- Survivability of interdiction aircraft Sensitivity to terrain following, command altitude, velocity and electronic counter measures [AD-A124870] p 443 N83-26833

SENSORS

- Performance capabilities of photographic flight navigation and sensor orientation systems p 431 A83-36122

SEPARATED FLOW

- Separated flows on a concave conical wing p 418 A83-35707
Dynamic distortion in a short s-shaped subsonic diffuser with flow separation --- Lewis 8 by 6 foot Supersonic Wind Tunnel [NASA-TM-84312] p 459 N83-26838

SERVICE LIFE

- Material, structural component, service life --- of aircraft construction materials p 468 A83-33953
Component life reduction due to use of AVGAS in gas turbine engines p 449 A83-35869
Life prediction for turbine engine components p 474 A83-36174

SHEAR STRESS

- Nonlinear supersonic flutter of panels considering shear deformation and rotary inertia p 473 A83-34315
Experimental studies of the separating confluent boundary layer Volume 1 Summary [NASA-CR-3655] p 427 N83-26822

SHOCK TUBES

- NOVA-25 correlation with KC-135A fuselage shock tube test results [AD-A124013] p 466 N83-25732

SHORT HAUL AIRCRAFT

- Applications of advanced upper surface blowing propulsive-lift technology [SAE PAPER 820956] p 433 A83-33628
SAAB-Fairchild 340 - Transatlantic frontrunner p 434 A83-35623
Advanced turboprop and dual cycle engine performance benefits and installation options on a Mach 0.7 shorthaul transport aircraft [AIAA PAPER 83-1212] p 452 A83-36284

SHORT TAKEOFF AIRCRAFT

- On the propulsion system of the NAL quiet STOL research aircraft p 446 A83-35831
Entrainment and mixing in thrust augmenting ejectors [AIAA PAPER 83-0172] p 419 A83-36046
STOL wind tunnel test results for a tactical supercruiser [AIAA PAPER 83-1224] p 420 A83-36291
A high speed wind tunnel test evaluation of STOL dedicated advanced exhaust nozzle concepts [AIAA PAPER 83-1225] p 421 A83-36292
Thrust reverser exhaust plume Reingestion tests for a STOL fighter model [AIAA PAPER 83-1229] p 452 A83-36293
Definition of vectored nonaxisymmetric nozzle plumes - - for aircraft thrust vector control [AIAA PAPER 83-1290] p 423 A83-36924
A preliminary assessment of helicopter/VSTOL handling qualities specifications [AD-A124667] p 461 N83-25716
A flight-test and simulation evaluation of the longitudinal final approach and landing performance of an automatic system for a light wing loading STOL aircraft [NASA-TM-84270] p 461 N83-26845

SIGNAL PROCESSING

- Comparative analysis of a phase and an amplitude processor for amplitude monopulse systems p 431 A83-35192
Numerical treatment of Doppler radar signals -- airport radar, video data [ENST-E-82014] p 478 N83-27114

SIGNAL TO NOISE RATIOS

- Comparative analysis of a phase and an amplitude processor for amplitude monopulse systems p 431 A83-35192
Investigation of the coupling of unsteady lift to low order acoustic duct modes in an axial flow fan [AD-A124819] p 483 N83-27796

SINE WAVES

- Sinusoidal integration for simulation of second order systems [AIAA PAPER 83-1086] p 480 A83-36210
Computation of incompressible potential flow over an airfoil using a high order aerodynamic panel method based on circular arc panels [AD-A124896] p 428 N83-26825

SKID LANDINGS

- Some applications of ultrasonic methods for the quality control of nonmetallic objects p 475 A83-36794

SKIIRTS

- Skirts - Time for a new look? p 486 A83-35058
Net-skirt addition to a parachute canopy to prevent inversion p 428 A83-36911

SMOKE

- An investigation of the effectiveness of smoke suppressant fuel additives for turbojet applications [AD-A125025] p 471 N83-27034

SOFTWARE TOOLS

- An interactive bombing mission simulation with computer graphics interface [AD-A124661] p 481 N83-26637

SOLID LUBRICANTS

- Feasibility of dry lubrication for limited-duty gas turbine engines [AIAA PAPER 83-1130] p 475 A83-36405

SOUND FIELDS

- Investigation of the coupling of unsteady lift to low order acoustic duct modes in an axial flow fan [AD-A124819] p 483 N83-27796

SOUND PRESSURE

- Cross spectra between temperature and pressure in a constant area duct downstream of a combustor [AIAA PAPER 83-0762] p 481 A83-33487

SOUND PROPAGATION

- Edge tones in high-speed flows and their application to multiple-jet mixing p 482 A83-36077

SOUND TRANSDUCERS

- Sandia Helicopter Acoustic Detector (SHAD) [DE82-018925] p 483 N83-27803

SPACE SHUTTLE ORBITERS

- Transient heat-transfer measurement technique in wind tunnel and data analysis technique using system identification theory [AD-A124663] p 424 N83-25669

SPACE STATIONS

- Space-station crew-safety requirements p 467 A83-36408

SPACECRAFT CONSTRUCTION MATERIALS

- Air Force technical objective document FY 1984 [AD-A123961] p 487 N83-26783

SPACECRAFT DESIGN

- Surfaces in computer aided geometric design, Proceedings of the Conference, Oberwolfach, West Germany, April 25-30, 1982 p 480 A83-33613

SQUARE WAVES

- A note on adaptive wind tunnels with imperfect control p 466 N83-26792

SQUEEZE FILMS

- Experimental investigation on the role of flexbars and metallic end seals in squeeze film dampers --- of gas turbine engines p 473 A83-35862

STABILITY

- Flutter prediction in forward swept wings by assumed modes and strip theory [AD-A124715] p 461 N83-25719

STABILITY DERIVATIVES

- Application of maximum likelihood estimation to the identification of the stability derivatives of a wide body transport aircraft p 460 A83-35121

STABILIZERS (FLUID DYNAMICS)

- Advanced manufacturing development of a composite empennage component for L-1011 aircraft [NASA-CR-172657] p 440 N83-25694
Investigation of an improved finite element model for a repaired T-38 horizontal stabilizer flutter analysis using NASTRAN [AD-A124741] p 461 N83-25717
Structural model tuning via vector optimization [AD-A124791] p 477 N83-26103

STACKS

- An investigation of the effectiveness of smoke suppressant fuel additives for turbojet applications [AD-A125025] p 471 N83-27034

STAGNATION FLOW

- Prediction of stagnation flow heat transfer on turbomachinery airfoils [AIAA PAPER 83-1173] p 420 A83-36259

STAGNATION POINT

- Calculation of boundary layers near the stagnation point of an oscillating airfoil [NASA-TM-84305] p 478 N83-27148

STAGNATION TEMPERATURE

- Condensation studies in cryogenic nitrogen expansions p 465 N83-25720

STALLING

- Effects of compressor hub treatment on stator stall margin and performance [AIAA PAPER 83-1352] p 475 A83-36354

STANDARDS

- U S sets own standards for airport lighting p 463 A83-35625
Proposed MIL standard and handbook Flying qualities of air vehicles Volume 2 Proposed MIL handbook [AD-A123726] p 441 N83-25704

STANDING WAVES

- Investigation of the coupling of unsteady lift to low order acoustic duct modes in an axial flow fan [AD-A124819] p 483 N83-27796

STATIC PRESSURE

- The swirl in an S-duct of typical air intake proportions p 418 A83-35620
Force and pressure measurements on a research model with a low-, mid- and T-tail at Mach numbers of 0.60 to 0.90 Volume 2 Tabulated data [AD-A124068] p 425 N83-25676
Experimental study of strength and existence domain of ground-to-air inlet vortices by ground board static pressure measurements [PB83-144865] p 460 N83-26843

STATISTICAL ANALYSIS

Statistical experimental designs in computer aided optimal aircraft design p 442 N83-26812
 Statistical review of counting accelerometer data for Navy and Marine fleet aircraft p 443 N83-26834

STATOR BLADES

Effects of compressor hub treatment on stator stall margin and performance p 475 A83-36354
 [AIAA PAPER 83-1352]

STATORS

Damping seal for turbomachinery p 477 N83-26080
 [NASA CASE-MFS 25842-1]

STEADY FLOW

Flutter prediction in forward-swept wings by assumed modes and strip theory p 461 N83-25719
 [AD-A124715]

STEPS

Semi implicit calculation method of the flow field in a duct with the flame stabilized by a step --- for aircraft engine combustion chamber design p 446 A83-35820

STOCHASTIC PROCESSES

Investigation of a third order baro-damped vehicle channel of INS p 432 N83-26828
 [AD-A124882]

STORMS

Scanning strategies for next generation weather radars p 476 N83-25929
 A study based on lifetimes of convective atmospheric phenomena hazardous to aviation
 [FAA-RD-82-69]

STRAIN GAGES

Application of thin film strain gages and thermocouples for measurement on aircraft engine parts p 444 A83-36326
 [AIAA PAPER 83-1292]

STRESS ANALYSIS

Coupled flap-lag torsional dynamics of hingeless rotor blades in forward flight p 433 A83-33506
 Stress analysis of critical areas of low-pressure compressor-disc assembly of a developmental aero-engine p 449 A83-35880
 Flight tests of tow wire forces while flying a racetrack pattern p 439 A83-36919
 Static aeroelastic analysis of flexible wings via NASTRAN, part 1 p 477 N83-26099
 [AD-A124662]

STRESS CONCENTRATION

The use of a structural model for determining the adaptability curve for turbine disks in stress concentration zones p 445 A83-35039

STRESS MEASUREMENT

Investigation methods on residual stresses in aero engines components p 449 A83-35879

STRUCTURAL ANALYSIS

Resonance tests on the tail of a CT4 aircraft p 441 N83-25703
 [AD-A124566]
 Analysis of progressive collapse of complex structures p 478 N83-27260
 [AD-A125266]

STRUCTURAL DESIGN

Optimization for structures of discrete-size elements p 472 A83-34311
 Progress in propulsion system/airframe structural integration p 437 A83-36234
 [AIAA PAPER 83-1123]
 Development trends in engine durability --- for USAF aircraft gas turbines p 455 A83-36329
 [AIAA PAPER 83-1297]

STRUCTURAL DESIGN CRITERIA

Composite material aircraft electromagnetic properties and design guidelines p 470 N83-25795
 [AD-A124016]

STRUCTURAL FAILURE

Containment of turbine engine fan blades p 449 A83-35871

STRUCTURAL MEMBERS

Materials and modelling technology for cryogenic environment p 465 N83-25723

STRUCTURAL RELIABILITY

Advanced manufacturing development of a composite empennage component for L-1011 aircraft p 440 N83-25693
 [NASA-CR-172659]

STRUCTURAL VIBRATION

Aircraft equipment random vibration test criteria based on vibrations induced by turbulent airflow across aircraft external surfaces p 440 N83-25696
 [AD-A123281]
 Airworthiness and flight characteristics test Part 2 YAH-64 advanced attack helicopter p 442 N83-25705
 [AD-A125270]

SUBSONIC FLOW

The aerodynamics of hypersonic velocities (On flows with low Mach numbers) p 417 A83-35535
 Calculation of subsonic flow past rectangular wings and their combinations on the basis of a discrete vortex scheme p 418 A83-35541
 The swirl in an S-duct of typical air intake proportions p 418 A83-35620

Seven-hole cone probes for high angle flow measurement Theory and calibration p 474 A83-36085

Method for calculating effects of a propfan on aircraft aerodynamics at subsonic speeds p 420 A83-36287
 [AIAA PAPER 83-1216]
 Finite element program for calculating flows in turbomachines with results for NASA task-1 compressor p 460 N83-26841
 [AD-A124987]

SUBSONIC SPEED

Model aerodynamic test results for a refined actuated inlet ejector nozzle at simulated takeoff and cruise conditions p 426 N83-26816
 [NASA-CR-168051]

SUCTION

Experimental investigation of the effects of wall suction and blowing on the performance of highly offset diffusers p 423 A83-36922
 [AIAA PAPER 83-1169]

SUPERCritical WINGS

Some recent applications of XTRAN3S p 426 N83-26815
 [NASA-TM-85641]

SUPERSONIC AIRCRAFT

Pilot human factors in stall/spin accidents of supersonic fighter aircraft p 462 N83-26846
 [NASA-TM-84348]

SUPERSONIC CRUISE AIRCRAFT RESEARCH

Inlet, engine, airframe controls integration development for supercruising aircraft p 447 A83-35842

SUPERSONIC DIFFUSERS

Dynamic distortion in a short S-shaped subsonic diffuser with flow separation --- Lewis 8 by 6 foot Supersonic Wind Tunnel p 459 N83-26838
 [NASA-TM-84312]

SUPERSONIC FLIGHT

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft p 427 N83-26821
 [NASA-TP-2120]

SUPERSONIC FLOW

Applications of computational techniques in the design of ramjet engines p 418 A83-35828

SUPERSONIC FLUTTER

Nonlinear supersonic flutter of panels considering shear deformation and rotary inertia p 473 A83-34315

SUPERSONIC INLETS

Inlet, engine, airframe controls integration development for supercruising aircraft p 447 A83-35842
 Response of a supersonic inlet to downstream perturbations p 422 A83-36403
 [AIAA PAPER 83-2017]
 Low flight speed acoustic results for a supersonic inlet with auxiliary inlet doors p 482 N83-27794
 [NASA-TM-83411]

SUPERSONIC NOZZLES

Effects of varying podded nacelle-nozzle installations on transonic aeropropulsive characteristics of a supersonic fighter aircraft p 427 N83-26821
 [NASA-TP-2120]

SUPERSONIC SPEEDS

Model aerodynamic test results for a refined actuated inlet ejector nozzle at simulated takeoff and cruise conditions p 426 N83-26816
 [NASA-CR-168051]

SUPERSONIC TRANSPORTS

Technology status for an advanced supersonic transport p 433 A83-33627
 [SAE PAPER 820955]
 Ejector nozzle test results at simulated flight conditions for an advanced supersonic transport propulsion system p 454 A83-36323
 [AIAA PAPER 83-1287]

SUPPORT INTERFERENCE

An algorithm of flight simulation on a dynamic stand of support type p 462 A83-34429

SUPPORT SYSTEMS

Operational deployment of the air cushion vehicle p 485 A83-34864
 LACV-30 supportability p 486 A83-35062

SUPPORTS

Model mount system for testing flutter p 465 N83-25727
 [NASA-CASE-LAR-12950-1]

SURFACE EFFECT SHIPS

From Voyageur on - The exploitation of an opportunity to develop a Canadian air cushion vehicle industry --- developing Canadian Air Cushion Vehicle Industry p 485 A83-35052

A new class ACV - Tanker-freighter p 485 A83-35053

A design synthesis model for ACV/SES lift systems p 486 A83-35057

SURFACE GEOMETRY

Surfaces in computer aided geometric design p 480 A83-33613
 Proceedings of the Conference, Oberwolfach, West Germany, April 25-30, 1982

SURFACE PROPERTIES

Runway surface condition sensor specification guide [AC-150/5220-13A] p 465 N83-25728

SURFACE ROUGHNESS

Damping seal for turbomachinery p 477 N83-26080
 [NASA-CASE-MFS-25842-1]

SURFACE TEMPERATURE

Temperature response of a model to set-point changes and conditioning in ETW p 465 N83-25721

SWEEP FORWARD WINGS

X-29 integrated technology demonstrator and ATF p 438 A83-36469
 [AIAA PAPER 83-1058]
 A wind tunnel study of the effects of a close-coupled canard on the aerodynamic characteristics of a forward-swept wing in incompressible flow p 425 N83-25673
 [AD-A124722]
 Flutter prediction in forward-swept wings by assumed modes and strip theory p 461 N83-25719
 [AD-A124715]

SWEEP WINGS

Progress toward the analysis of complex propulsion installation flow phenomenon p 421 A83-36363
 [AIAA PAPER 83-1367]

SWIRLING

The swirl in an S-duct of typical air intake proportions p 418 A83-35620
 The performance of an annular vane swirler --- to aid in modeling gas turbine combustor flowfields and swirling confined flow turbulence p 455 A83-36340
 [AIAA PAPER 83-1326]

SYSTEM IDENTIFICATION

Application of system identification flight analysis techniques to the pitch-heave dynamics of an air cushion vehicle p 484 A83-34852
 Transient heat-transfer measurement technique in wind tunnel and data analysis technique using system identification theory p 424 N83-25669
 [AD-A124663]

SYSTEMS ANALYSIS

Simulator performance definition by cue synchronization analysis p 463 A83-36216
 [AIAA PAPER 83-1092]
 An interactive bombing mission simulation with computer graphics interface p 481 N83-26637
 [AD-A124661]
 Dynamic characteristics of aenal refueling systems p 442 N83-26830
 [AD-A124770]

SYSTEMS ENGINEERING

The man-vehicle systems research facility - A new NASA aeronautical R & D facility p 463 A83-36218
 [AIAA PAPER 83-1098]
 Design of a real-time CGSI system p 474 A83-36221
 [AIAA PAPER 83-1101]
 NASA low-speed centrifugal compressor for fundamental research p 464 A83-36353
 [AIAA PAPER 83-1351]
 Advanced propulsion controls - A total system view p 457 A83-36612

SYSTEMS INTEGRATION

Inlet, engine, airframe controls integration development for supercruising aircraft p 447 A83-35842
 Flight/propulsion control system integration p 453 A83-36301
 [AIAA PAPER 83-1238]
 Design for testing of a low altitude night-in-weather attack system p 432 A83-36470

WIND TUNNEL MODELS

Survey of the ONERA activities on the adaptive wall applications and commutation of residual corrections [ONERA, TP NO 1983 11] p 464 A83-36421
 Wind tunnel test of a C 18 aircraft modified with the advanced range instrumentation aircraft radome [AD-A124771] p 425 N83-25671

WIND TUNNEL TESTS

Recent studies at NASA-Langley of vortical flows interacting with neighboring surfaces

p 417 A83-33972

The swirl in an S-duct of typical air intake proportions p 418 A83-35620

Separated flows on a concave conical wing p 418 A83-35707

Development of a turbojet engine simulator for scale model wind tunnel testing of multi-mission aircraft p 447 A83-35848

Propulsion system simulation technique for scaled wind tunnel model testing p 463 A83-35850

STOL wind tunnel test results for a tactical supercruiser

[AIAA PAPER 83-1224] p 420 A83-36291

A high speed wind tunnel test evaluation of STOL dedicated advanced exhaust nozzle concepts

[AIAA PAPER 83-1225] p 421 A83-36292

Ejector nozzle test results at simulated flight conditions for an advanced supersonic transport propulsion system [AIAA PAPER 83-1287] p 454 A83-36323

Performance capability of a Compact Multimission Aircraft Propulsion Simulator

[AIAA PAPER 83-1358] p 464 A83-36356

Natural laminar flow data from full-scale flight and wind-tunnel experiments p 422 A83-36409

New transformations of S4 Modane hypersonic wind tunnel for ramjet missiles tests

[ONERA, TP NO 1983-24] p 464 A83-36433

Configuration development of a research aircraft with post-stall maneuverability p 439 A83-36915

High Reynolds number tests of the CAST 10-2/DOA 2 airfoil in the Langley 0.3-meter transonic cryogenic tunnel, phase 1

[NASA-TM-84620] p 424 N83-25660

Effect of empennage location on twin-engine afterbody nozzle aerodynamic characteristics at Mach Numbers from 0.6 to 1.2 -- wind tunnel tests

[NASA-TP-2116] p 424 N83-25666

Wind tunnel investigation of varying hinged flaps [AD-A124703] p 424 N83-25668

Transient heat transfer measurement technique in wind tunnel and data analysis technique using system identification theory

[AD-A124663] p 424 N83-25669

Wind tunnel test of a C-18 aircraft modified with the advanced range instrumentation aircraft radome [AD-A124771] p 425 N83-25671

Force and pressure measurements on a research model with a low-, mid- and T-tail at Mach numbers of 0.60 to 0.90 Volume 2 Tabulated data

[AD-A124068] p 425 N83 25676

F-14 rotary balance tests for an angle-of-attack range of 0 deg to 90 deg

[AD-A124468] p 441 N83-25700

Model mount system for testing flutter [NASA-CASE-LAR-12950-1] p 465 N83-25727

Experimental study of strength and existence domain of ground-to-air inlet vortices by ground board static pressure measurements

[PB83-144865] p 460 N83-26843

Low flight speed acoustic results for a supersonic inlet with auxiliary inlet doors

[NASA-TM-83411] p 482 N83-27794

WIND TUNNEL WALLS

Survey of the ONERA activities on the adaptive wall applications and commutation of residual corrections [ONERA, TP NO 1983-11] p 464 A83-36421

WIND TUNNELS

Optimum wire screens for control of turbulence in wind tunnels p 417 A83-33772

A note on adaptive wind tunnels with imperfect control p 466 N83-26792

WIND TURBINES

Aerodynamic research on Tipvane windturbines [PB83-147413] p 479 N83-27476

WIND VANES

Aerodynamic research on Tipvane windturbines [PB83-147413] p 479 N83-27476

WIND VELOCITY

Analysis and specification of slant wind shear [AD-A125883] p 479 N83-26367

WIND CAMBER

AFTI/F-111 mission adaptive wing technology demonstration program [AIAA PAPER 83-1057] p 438 A83-36468

WING FLOW METHOD TESTS

Wind tunnel tests of over-the-wing nacelles --- supported on 'stub-wings' p 422 A83-36916

WING LOADING

Helicopter rotor loads using discretized matched asymptotic expansions

[NASA-CR-166092] p 423 N83-25658

Helicopter rotor loads using matched asymptotic expansions User's manual

[NASA-CR-166093] p 423 N83-25659

WING NACELLE CONFIGURATIONS

Aerodynamic design of propfan powered transports [AIAA PAPER 83-1213] p 437 A83-36285

Wind tunnel tests of over-the-wing nacelles --- supported on 'stub-wings' p 422 A83-36916

WING PANELS

Correction to the wing source velocity error in Woodward's USSAERO code p 423 A83-36920

WING PROFILES

Separated flows on a concave conical wing p 418 A83-35707

WING SLOTS

Theoretical determination of the lift of a simulated ejector wing [AD-A124695] p 425 N83-25670

WING TIPS

Analysis of nonplanar wing-tip-mounted lifting surfaces on low-speed airplanes

[NASA-CR-3684] p 424 N83-25667

WINGLETS

CF34 upgrades Challenger capabilities p 434 A83-35315

Analysis of nonplanar wing-tip-mounted lifting surfaces on low-speed airplanes

[NASA-CR-3684] p 424 N83-25667

WINGS

Theoretical determination of the lift of a simulated ejector wing [AD-A124695] p 425 N83-25670

Force and pressure measurements on a research model with a low-, mid- and T-tail at Mach numbers of 0.60 to 0.90 Volume 2 Tabulated data

[AD-A124068] p 425 N83-25676

Analysis of progressive collapse of complex structures [AD-A125266] p 478 N83-27260

WIRE

Impact damping and airplane towing p 428 A83-33625

Flight tests of tow wire forces while flying a racetrack pattern

[AD-A124703] p 439 A83-36919

Verification testing of an AH-1S Wire Strike Protection System (WSPS)

[AD-A123188] p 429 N83-25684

WIRE CLOTH

Optimum wire screens for control of turbulence in wind tunnels p 417 A83-33772

X**X-22A AIRCRAFT**

Indoctrination of Navy test pilots to vectored thrust flight in the X-22A in-flight simulator

[AIAA PAPER 83-1076] p 436 A83-36205

XV-15 AIRCRAFT

A preliminary assessment of helicopter/VSTOL handling qualities specifications

[AD-A124667] p 461 N83-25716

Y**YAW**

A static investigation of yaw vectoring concepts on two-dimensional convergent-divergent nozzles

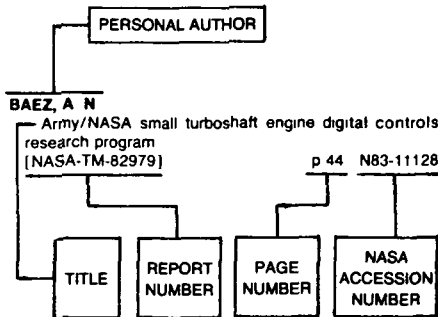

[AIAA PAPER 83-1288] p 421 A83-36324

YIELD STRENGTH

Evaluation of low-cost aluminum composites for aircraft engine structural applications

[NASA-TM-83357] p 470 N83-25790

Typical Personal Author Index Listing

Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title. Under any one author's name the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

A

- ABBASY, I**
Determination of stability and control parameters of a general aviation airplane from flight data
[NASA-TM-84635] p 461 N83-26844
- ABDELMALIK, F I**
The transient performance of turbojet engines and axial compressors p 447 A83-35847
- ABE, T**
Variation of rotor blade vibration due to interaction of inlet and outlet distortion p 450 A83-35882
- ABIBOV, A L**
Aircraft production technology (2nd revised and enlarged edition) p 415 A83-36443

Typical Corporate Source
Index Listing

Listings in this index are arranged alphabetically by corporate source. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

CONTRACT NUMBER INDEX

AERONAUTICAL ENGINEERING / A Continuing Bibliography (Supplement 165)

SEPTEMBER 1983

Typical Contract Number Index Listing

Listings in this index are arranged alphabetically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the AIAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

REPORT NUMBER INDEX

AERONAUTICAL ENGINEERING / A Continuing Bibliography (Supplement 165)

SEPTEMBER 1983

Typical Report Number Index Listing

Listings in this index are arranged alphanumerically by report number. The page number indicates the page on which the citation is located. The accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

ACCESSION NUMBER INDEX

AERONAUTICAL ENGINEERING / A Continuing Bibliography (Supplement 165)

SEPTEMBER 1983

Typical Accession Number Index Listing

Listings in this index are arranged alphanumerically by accession number. The page number listed to the right indicates the page on which the citation is located. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

U.S. GOVERNMENT PRINTING OFFICE: NASA DOCUMENT LIBRARY

LIBRARIES

NASA distributes its technical documents and bibliographic tools to eleven special libraries located in the organizations listed below. Each library is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

GA 000000
University of California, Berkeley

GO 000000
University of Colorado, Boulder

00 000000
Library of Congress

00 000000
Georgia Institute of Technology, Atlanta

00 000000
The John Crerar Library, Chicago

MA 000000
Massachusetts Institute of Technology, Cambridge

MO 000000
Linda Hall Library, Kansas City

NY 000000
Columbia University, New York

OK 000000
University of Oklahoma, Bizzell Library

PA 000000
Carnegie Library of Pittsburgh

WA 000000
University of Washington, Seattle

NASA publications (those indicated by an * following the accession number) are also received by the following public and free libraries:

CA 000000
Los Angeles Public Library

CA 000000
San Diego Public Library

CO 000000
Denver Public Library

CT 000000
Hartford Public Library

MD 000000
Enoch Pratt Free Library, Baltimore

MA 000000
Boston Public Library

MI 000000
Detroit Public Library

MN 000000
Minneapolis Public Library and Information Center

NJ 000000
Trenton Public Library

NY 000000
Brooklyn Public Library

NY 000000
Buffalo and Erie County Public Library

NY 000000
Rochester Public Library

NY 000000
New York Public Library

OH 000000
Akron Public Library

OH 000000
Cincinnati and Hamilton County Public Library

OH 000000
Cleveland Public Library

OH 000000
Dayton Public Library

OH 000000
Toledo and Lucas County Public Library

TX 000000
Dallas Public Library

TX 000000
Fort Worth Public Library

WA 000000
Seattle Public Library

WI 000000
Milwaukee Public Library

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

BRITISH LIBRARY

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. By virtue of arrangements other than with NASA, the British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy of microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from ESA - Information Retrieval Service, European Space Agency, 8-10 rue Mario Nikis, 75738 Paris CEDEX 15, France.
