PREFACE

Newcomers to lunar studies who need to make use of lunar nomenclature often express dismay at the apparently haphazard and illogical disposition of names and letters on lunar maps, and especially at the apparent lack of standardization between the numerous maps, catalogues and other publications that might reasonably be expected to show consistency. Their dismay is not without some foundation. Changes and alterations are the anathema of a stable, standardized nomenclature, yet errors and inconsistencies should be corrected, and additions have to be made as studies of the lunar surface become more extensive and detailed. Lunar nomenclature is, first and foremost, a method of communication — a kind of shorthand whereby important surface features can be visualized immediately upon seeing their names, and lesser features can be referred to without the need to resort to lengthy descriptions of their relative or absolute locations.

Unfortunately, these changes and additions have not always been carried out advisedly or with the users' best interests in view. This was especially the case for several years from 1972 onwards, when the basic concepts and ethics of the subject were subjugated to the supposed requirements for certain maps, and to the kudos deriving from the placement of many new names on lunar features. Although that situation was finally rectified, it has left a legacy of confusion that will plague lunar nomenclature for posterity.

For general convenience, it was originally intended to include in a single document both the many changes effected during the last two decades, and the NASA version of the currently approved nomenclature. A brief survey of the origins and earlier development of this nomenclature would have provided a useful background. However, an interest was expressed from several quarters in such extra related topics as when and by whom the various formations were named; what names have been moved or removed over the years; why are the Greek names clustered towards the north; what are the rules for proposing new names, and so on. For this reason it was thought more expedient to issue this historical, explanatory, and general reference material as a separate, companion publication. It is currently in preparation and will be titled "Handbook of Lunar Nomenclature".

One result stemming from the activities of the mid-1970's was a difference of opinion between the IAU and NASA over what constitutes "approved" nomenclature. This Catalogue presents the complete NASA-approved lunar nomenclature as of mid-1981. It differs from the IAU-approved version in that it includes letter designations for subsidiary craters, and uses a more familiar spelling for eight names. The official IAU catalogue of Solar System nomenclature, to be named "Gazetteer of Planets and Satellites" is now in preparation, and will list the IAU-approved nomenclature for features on all those bodies for which surface imagery exists. Letter-designated features are excluded. Those lists will provide brief but useful biographical or descriptive data for all the names, with coordinates, dimensions and cartographic information for location purposes. The portion of that catalogue pertaining to lunar nomenclature was compiled by staff of the Center for Earth and Planetary Sciences, National Air and Space Museum, under the direction of F. El-Baz. A close liaison was maintained with that group to ensure maximum compatibility between data common to their catalogue and this one, although some coordinates and dimensions will differ somewhat, especially for farside craters and for non-crater features with vague boundaries.

Acknowledgments The initial versions of the computer-printed lists of craters were prepared by the late Dr. Leif E. Andersson, who was also responsible for estimating coordinates for all the listed farside craters as well as for many in the nearside limb regions. He also computed the diameters of these craters from measurements made by LPL staff on Lunar Orbiter photographs, and wrote the preliminary version of the accompanying explanation of the crater listings. I thank Ed Rains and John Spencer for performing various checks and for incorporating several changes and updates into the lists, and the latter for producing the computer-printed versions reproduced here. I also thank Dan Kinsler, late of the Lunar and Planetary Institute, for valuable assistance throughout most phases of this project, and especially for his review of the new farside letter designations, which resulted in several improvements being made.

This work was supported by NASA grant NGL 03-002-191

Ewen A. Whitaker
Tucson, September 1981

CONTENTS

Preface iii

Part 1 - Explanation

General information 3
Explanation of the listings: CRATERS 5
 NON-CRATER FEATURES 9
 MINOR and MISCELLANEOUS FEATURES. 11

Part 2 - Listings

Group 1 -- CRATERS

(a) named and letter-designated craters -- whole Moon
(b) named and letter-designated craters -- nearside
(c) named and letter-designated craters -- farside
(d) named craters only -- whole Moon
(e) named craters only -- nearside
(f) named craters only -- farside
(g) replacement names (post-1972) for craters previously
 having letter designations

Group 2 -- NON-CRATER FEATURES

Group 3 -- MINOR and MISCELLANEOUS FEATURES

(a+b) craters and other features on NASA Lunar Topophotomaps
(c) features named to facilitate Apollo mission operations
(d) miscellaneous features

NASA CATALOGUE OF LUNAR NOMENCLATURE

Part 1 - *Explanation*

GENERAL INFORMATION

This Catalogue, together with its companion Handbook, are basically the outcome of the differing views, mentioned in the Preface, regarding what constitutes "approved" or "official" lunar nomenclature. The International Astronomical Union (IAU), which has had the responsibility of producing and maintaining a standard scheme of nomenclature since the Union's founding in 1919, published a definitive map and catalogue in 1935 which included not only all formations with accepted names (681 total) but also all those with letter designations (over 5400). Up to 1973, various additions, deletions and general improvements were made to the lists of both the named and the letter-designated formations. These were all given IAU approval, but in that year the IAU passed a resolution to drop all the letter designations for subsidiary craters and elevations, and also the Roman numeral designations for rilles. It was also proposed to assign new names progressively to the previously lettered craters, an action that stemmed in part from a NASA request to be provided with identifying names to be applied to the new LTO (Lunar Topographic Orthophotomap) series of large-scale map sheets. Some 123 new names were applied to craters previously designated by letters.

Bowing to pressure from users, the IAU in 1976 modified its complete excision of letter designations, but decided that it should still officially concern itself with named formations only, partly because of the greatly increased task of providing and keeping track of the many hundreds of extra names required for formations newly revealed on the planetary satellites and the terrestrial planets, and partly because the assignment of letter designations was considered to be more of a cartographic concern than a nomenclatural one. From that date, maps that included the new replacement names would also give, in brackets under those names, the letter designations being replaced. Thus although the use of the letter designations was no longer being discouraged, The IAU did not give them official recognition, and they would not be included in the IAU's forthcoming Gazetteer of Planets and Satellites.

However, succeeding NASA officials, as well as many users, felt that the letter designations still formed a very important part of the overall lunar nomenclature, and should be included with the named features. The US Government (USAF, AMS, USGS and NASA) had funded virtually all lunar mapping in the US from 1959 onwards, and the letters had been included in most of these extensively used maps. Many of the letters had been in use for up to 140 years, and were firmly entrenched in a large body of literature; they ranked an "official" status by virtue of long and widespread usage, and arbitrary decisions by the IAU could not diminish their importance.

For these reasons, this Catalogue includes the previously IAU-approved nearside letter designations, suitably amended, in addition to the entire listing of IAU-approved names as of mid-1981. Furthermore, in response to a demand for a denser network of identified craters on the Moon's farside, Whitaker devised a logical scheme of letter designations for subsidiary craters in that hemisphere. These new farside designations have received full NASA approval, and have been included on all relevant maps produced recently under NASA's direction and sponsorship. They are also included in this Catalogue, where they appear in tabular form for the first time. As already mentioned, a more recognizable spelling, corresponding with that used on the latest NASA-sponsored maps, has been used for eight names.

This Catalogue may therefore be used with full confidence by researchers, cartographers etc. Its listings supersede all earlier catalogues and maps; any names found on these older documents that do not appear here have been dropped or substituted for good reason, and should not be used.

EXPLANATION OF THE LISTINGS

The listed features have been divided into three main groups for cataloguing purposes, namely (1) Craters; (2) Non-crater features; and (3) Minor and miscellaneous features. The crater lists are reproduced from computer printouts, having been extracted from an extensive crater cataloguing program now nearing completion at this Laboratory.

(1) CRATERS

(a) General

For increased usefulness, these listings are provided for the whole Moon, for the nearside only, and for the farside only. Each of these subgroups lists named and letter-designated craters combined, and the named craters alone. There are 150 entries per page. Small craters having first-name designations (e.g. Agnes) and those that received names for operational purposes in Apollo landing areas (e.g. Shorty) are excluded from these lists, but will be found in Group 3. The 1973 IAU decision to replace the letter designations with new names resulted in 123 such replacements, but 11 were not approved, and the letters have thus been restored. Because of their small size, many of the remaining 112 craters have not appeared on small-scale maps. A separate list of these recently named craters and their previous letter designations is therefore included here to provide a link with earlier catalogues, maps and other literature.

Number statistics may be of interest, and are as follows:

	Nearside	Farside	Whole Moon
Named craters	796	599	1395
Letter-designated craters	5435	1667	7102
Total craters	6231	2266	8497

(b) Sources of names and letter designations

The basic starting list for nearside craters was that given in *The System of Lunar Craters*, by D. W. G. Arthur *et al.*, (Communications of the Lunar and Planetary Laboratory, nos. 30, 40, 50 and 70; 1963-1966), which was approved by the IAU in 1964 and 1967 as an improved version of its *Named Lunar Formations*, by M. A. Blagg and K. Müller (1935). The basic list for farside craters was that given in *Report on Lunar Nomenclature*, by D. Menzel *et al.*, *Space Science Reviews* 12, 136-186, (1971). The net results of all the changes reported in the Transactions of the IAU for 1973, 1976 and 1979, together with those proceeding from the 1980 and 1981 meetings of the IAU Working Group for Planetary System Nomenclature, have been incorporated into the lists given here. The nearside letter designations from the Arthur list referred to above have been corrected and updated as necessary except for some small areas towards the Moon's limbs. Following the decision of a NASA-convened committee, double-letter designations have either been dropped or replaced by single letters, except in a few cases where such action was clearly not practical.

The letter designation scheme for the farside was devised for maximum ease in locating craters on maps, and works as follows: each "patronymic" crater is considered to be the center of a 24 hour clockface in which the numbers have been replaced with Roman capital letters (I and O omitted, 24 h. = Z), with Z at the north point. Thus each letter represents a fixed azimuth from the patronymic crater, and the chosen subsidiary craters are lettered according to their closest azimuths. In a few cases where two or more significant craters lay along similar azimuths, some compromises were necessary. Future improved cartography may reveal a few cases where an adjacent letter might have been preferable to the one chosen. This lettering scheme has been adopted *in toto* for the new 1:5 million scale maps of the lunar farside produced for NASA by USGS.

(c) Spelling and typography

The first column of each block gives the name or designation of each crater. As computers do not give lower-case letters or diacritical marks, some names require further information on the correct form to use in texts or on maps. A separate list is given on the next page for all instances where the normal form differs from a capital letter followed only by lower-case letters for each word of a name, whether separated by spaces or hyphens.

Examples:	<u>Catalogue form</u>	<u>Normal form</u>
	ABENEZRA	Abenezra
	AL-BAKRI	Al-Bakri
	DE FOREST	De Forest
	but...	
	DE GASPARIS	de Gasparis
	DE LA RUE	de la Rue
	VON DER PAHLEN	von der Pahlen

Following IAU guidelines, diacritical marks have been retained except where they are non-standard, in which case they have been either changed or dropped. Thus Rømer becomes Römer, and Skłodowska becomes Sklodowska.

Alphabetization is strictly according to the form of the name used in the listings; thus W. Bond is at the beginning of the W's, not in the B's, and St. John is considered to begin with St., not Saint. Spaces, periods, hyphens and apostrophes are lexicographically equivalent and precede the letter A. Thus le Verrier precedes Leakey and O'Day precedes Obruchev.

The spelling of the following eight names differs from the IAU versions: Bellingshausen, Ceraski, Engelhardt, Friedmann, Hanskiy, Lenz, Lütke, Sternberg. The IAU versions are as follows: Bellinsgauzen, Tseraskiy, Engel'gardt, Fridman, Ganskiy, Lents, Litke, Shternberg.

Table of adopted typographic forms where different from printout

Abul Wáfa	Gärtner	Milankovič	Strömgren
Anděl	Henry Frères	Möbius	ten Bruggencate
Angström	Kästner	Mohorovičić	Väisälä
Armiński	Kekulé	Mösting	van Albada
Bečvář	Kepiński	Müller	Van de Graaff
Bürg	Kohlschütter	Nièpce	van den Bergh
Büsching	Kolhörster	Nöggerath	van den Bos
Catalán	König	Nušl	van der Waals
Chrétien	la Caille	O'Day	van Gent
Crüger	la Condamine	Pingré	van Maanen
d'Alembert	la Pérouse	Planté	van Rhijn
d'Arrest	Lamé	Poincaré	van't Hoff
d'Arsonval	Lamèch	Pontécoulant	van Wijk
da Vinci	le Gentil	Purkyně	Vasco da Gama
Daubrée	le Monnier	Réaumur	von Behring
de Gasparis	le Verrier	Römer	von Békésy
de la Rue	Lemaître	Röntgen	von der Pahlen
de Moraes	Linné	Šafařík	von Kármán
de Morgan	Lütke	Schlüter	von Neumann
de Roy	Mädler	Schönfeld	von Zeipel
de Sitter	McAdie	Schrödinger	Widmanstätten
de Vico	McClure	Schröter	Wöhler
de Vries	McDonald	Sierpiński	Wróblewski
Dunér	McKellar	Sömmering	Zähringer
Eötvös	McLaughlin	Spörer	Zöllner
Fényi	McMath	Stöfler	
Feuillée	McNally	Störmer	

(d) Positions

The coordinates in the second and third columns are intended for location purposes only, and should not be used as exact positions. This is particularly the case for limb and farside craters, where existing maps and catalogues may differ by a degree or more anyway. Longitudes are given in the traditional IAU-approved system of 0-180°E and W. Other schemes using 0-360°, in either direction, are not approved and should not be used.

(e) Diameters

Column 4 gives the mean diameter of the crater in km. For elongated craters, the largest dimension is given. The values given are for identification purposes only and as with the coordinates, values for some farside craters may differ somewhat from those estimated from maps.

(f) Miscellaneous

Note that the name Apollo appears in the listings, even though this feature is a multi-ring basin with a central mare rather than a crater or a mare-free basin.

(2) NON-CRATER FEATURES

The listings are divided into the IAU-approved generic categories, alphabetically arranged. They are complete except for a few minor features that have first-name designations (e.g. Rima Carmen) on the NASA Lunar Topophotomap series of large-scale charts, and for features specially named to aid operations on the Apollo missions (e.g. Bear Mountain), all of which appear in Group 3. The generic categories, with their meanings, are as follows:

Catena...crater chain	Oceanus.....ocean
Dorsa....network or group of ridges	Palus.....marsh
Dorsum...mare ridge	Promontorium...cape
Lacus....lake	Rima.....rille
Mare.....sea	Rimae.....network or group of rilles
Mons.....mountain	Rupes.....scarp
Montes...mountain range or group of peaks	Sinus.....bay
	Vallis.....valley

In the case of dorsa, dorsum, lacus, mare, oceanus, palus, promontorium and sinus, all names are individual, i.e. they are not taken from nearby named craters or other features.

For mons and montes, all names are individual except for Gruithuisen Gamma, Gruithuisen Delta and Hadley Delta, where the original Greek letter designations (spelled out in full) have been retained, and for Mons Hansteen, Mons Herodotus, Mons Maraldi, Mons Vitruvius, Montes Archimedes and Montes Secchi, which are recent changes and additions.

For catena, rima and rimae, the names are taken from the nearest most appropriate named feature. Note, however, that Rima Schröter is not the sinuous rille in Vallis Schröteri, as on some maps.

For rupes and vallis, the names are again taken from local named features except for Rupes Altai, Rupes Recta, Vallis Bouvard and Vallis Schröteri.

In the case of these last five categories, where features take the names of local craters or other formations, the distinction between what is and what is not approved is clearly less important. The main point of possible issue is in the choice of the local named feature. For the categories rima and rimae, all previously IAU-approved designations are listed except for a few that are clearly inappropriate. Also omitted are a few names (e.g. Rima Delisle) that are included on LTO charts, but which are not official since they have not been checked for unambiguous choice of name.

Coordinates give the approximate centers of the various formations, while the dimensions apply to their greatest lengths.

(3) MINOR AND MISCELLANEOUS FEATURES

(a) craters

Small craters with first-name designations appear only on NASA Lunar Topophotomap charts; the specific map on which each appears is given in the list, and should be quoted when using the name.

(b) non-crater features

The names listed here also appear only on the above maps, and again the specific map should be referred to when using the name.

(c) features named to facilitate Apollo mission operations

These appear only on very large-scale maps and photographs of the landing sites. Explanations of the names may be found in Transactions of the IAU, XVII, 363-369, 1976.

(d) miscellaneous

Items not included in any of the previous categories.

NASA CATALOGUE OF LUNAR NOMENCLATURE

(c) Features named to facilitate Apollo mission operations

<u>Apollo 11</u>	<u>Apollo 15</u>	<u>Apollo 16</u>	<u>Apollo 17</u>
(a) crater	(a) craters and cluster	(a) craters and cluster	(a) craters and cluster
West	Bridge	Baby Ray	Brontë
	Dune	Cinco	Bowen-Apollo
	Earthlight	End	Camelot
	Elbow	Flag	Cochise
	Index	Gator	Emory
	Last	Halfway	Falcon
(a) craters and clusters	Rhydling	Kiva	Hess-Apollo
Bench	South Cluster	North Ray	Horatio
Block	Spur	Palmetto	Lara
Crescent	St.George	Plum	Mackin
Halo	(b) other features	Ravine	Nansen-Apollo
Head	Apennine Front	South Ray	Powell
Middle Crescent	North Complex	Spook	Shakespeare
Sharp-Apollo	Plain	Spot	Sherlock
Snowman	Terrace	Stubby	Shorty
Surveyor		Trap	Steno-Apollo
		Wreck	Trident
			Van Serg
			Victory
<u>Apollo 14</u>		(b) other features	(b) other features
(a) craters and clusters		Smoky Mountains	Bear Mountain
Cone		Stone Mountain	Family Mountain
Doublet			Light Mantle
Flank			North Massif
Old Nameless			Scarp
Triplet (N, center, S)			Sculptured Hills
Weird			South Massif
			Tortilla Flat
			Wessex Cleft
			Taurus-Littrow Valley

(d) Miscellaneous features

<u>NAME</u>	<u>LAT</u>	<u>LONG</u>
(1) Planitia Descensus	7 N	64 W
(2) Statio Tranquillitatis	1 N	23 E
(3) Reiner Gamma	7 N	59 W

- (1) *refers to the landing site of Luna 9*
- (2) *refers to the landing site of Apollo 11*
- (3) *refers to the unique, bright surface marking at the specified location. The Greek letter designation was taken from a nearby mare ridge, now anonymous*

				15. Supplementary Notes	
16. Abstract Newcomers to lunar studies who need to make use of lunar nomenclature often express dismay at the apparently haphazard and illogical disposition of names and letters on lunar maps, and especially at the apparent lack of standardization between the numerous maps, catalogues and other publications. Changes, alterations, errors and inconsistencies should be corrected, and additions have to be made as studies of the lunar surface become more extensive and detailed. Lunar nomenclature is a method of communication - whereby important surface features can be visualized immediately upon seeing their names, and lesser features can be referred to without the need to resort to lengthy descriptions of their relative or absolute locations. One result stemming from the activities of the mid-1970's was a difference of opinion between the IAU and NASA over what constitutes "approved" nomenclature. This Catalogue presents the complete NASA used lunar nomenclature as of mid-1981. It differs from the <u>IAU-approved</u> version in that it includes letter designations for subsidiary craters, and uses a more familiar spelling for eight names. The US Government (USAF, AMS, USGS and NASA) had funded virtually all lunar mapping in the US from 1959 onwards, and the letters had been included in most of these extensively used maps. Many of the letters had been in use for up to 140 years, and were firmly entrenched in a large body of literature. The listed features have been divided into three main groups for cataloguing purposes, namely (1) Craters; (2) Non-crater features; and (3) Minor and miscellaneous features. This Catalogue may therefore be used with full confidence by researchers, cartographers etc. Its listings supersede all earlier catalogues and maps.
