2 INTRODUCTION

The NASA - Langley Vortex Lattice FORTRAN Program (VLM) is designed to estimate the subsonic aerodynamic characteristics of up to four complex planforms. The concepts embodied in this program are mostly detailed in references 1 and 2; this document is intended to serve as an update to these references and include the additional concept of reference 3 for users of this program.

Basically, the VLM program is a segmented program designed to run on the CDC computers with the NOS operating system, as described in reference 4. The run time will vary with different applications, but the field length is constant and requires 130K (octal) words of memory. This document describes the input to the program, sample cases (Appendix A) and the required NOS job card setup.

3 MODELING THE CONFIGURATION

The configuration can be modeled with up to four planforms, all of which must extend to the plane of symmetry ($Y = 0.0$). The fuselage is represented by its planar projection; experience to date indicates that this produces acceptable global forces and moments for most wing-body-tail configurations.

Winglets can be modeled, but the dihedral angle must be less than 90.0 degrees and greater than -90.0 degrees. Both upper (positive dihedral) and lower (negative dihedral) winglets can be accounted for in this code. The program uses as its solution surface the chord plane which may be inclined due to dihedral. Moreover, the only out of "X-Y plane" displacement specifically allowed for is dihedral. Local camber and twist is assumed to be small and can be represented by its slope projection to the local solution surface. The wind and body axes are assumed to be coincidental in the code.

4 RUNNING THE PROGRAM

4.1 INPUT DATA SETUP

The very first card of input is the Title card, and the user can have up to 80 characters of free field information on it about the data being run. This is only used by the program as a header for output. Note that there is only one title card per input deck. The actual input data to VLM is organized into two distinct groups - group 1 defines the reference planform(s), and group 2 defines the details for the particular solution. See figure 1 for the input data layout. The individual details of the items in the deck layout are given in the following sections.

4.2 GROUP 1 DATA

This group of data defines the planform(s) projected into the X-Y plane, with all the coordinates being given for the left half of the configuration. The axis system is shown in figure 2. The $Y = 0$ intercept coincides with the plane of symmetry and is positive to the right of this plane. The $X = 0$ intercept may be taken to occur anywhere along the symmetry plane of the configuration; X is positive pointing into the wind. All cards use the SF10.6 format for the group 1 data. The fields in this group are as follows:

1. (Cols.1-10) PLAN - Number of planforms for this configuration; PLAN can assume values of 1.0, 2.0, 3.0, or 4.0.
2. (Cols.11-20) TOTAL - Number of sets of group 2 data specified for this configuration. The maximum number of data sets is limited by the computation time (specified by the user) and the print limit (50000 lines).
3. (Cols.21-30) CREF - Reference chord of the configuration. This chord is used only to nondimensionalize the pitching-moment terms and must be greater than zero.
4. (Cols.31-40) SREF - Reference area; this is used only to nondimensionalize the computed output data such as lift and pitching moment and must always be greater than zero.
5. (Cols.41-50) XLOCTN - Pitching moment reference point location relative to the coordinate origin and along the X axis.
6. (Cols.51-60) CTILDA - Characteristic chord in the augmented vortex lift computations (see reference 3.)
7. (Cols.61-70) XTILDA - X location of the centroid of augmented vortex lift.
8. (Cols.71-80) DISTALE - Distance along the leading edge where

the vortex flow is developed that leads to the augmented vortex lift.

The data required to define the planform(s) is provided in the next set of group 1 cards as follows:

1. (Cols.1-10) AAN - Number of line segments used to define the left half of the planform (does not include the innermost streamwise edge). A maximum of 24 line segments may be used per planform, and each planform must extend to the plane of symmetry.
2. (Cols.11-20) XS - X location of the pivot; use 0.0 for a fixed planform.
3. (Cols.21-30) YS - Y location of the pivot; use 0.0 for a fixed planform.
4. (Cols.31-40) RTCDHT - Vertical distance of the particular planform being read in with respect to the reference planform root chord height; use 0. for the reference planform.
5. (Cols.41-50) STLOIND - Streamwise load indicator; Set this value to 0. if the loading along the entire outer streamwise edge or at the outermost breakpoint of this planform is to be 0.0. If the loading is to be non-zero along the entire edge, or at the outermost breakpoint, set this indicator to 1.0

The rest of this set of data describes the breakpoints used to define the AAN line segments on this planform. There are ANN + 1 breakpoints and all data subsequently described are required on all except the last card of this set; the last card uses only the first two variables in the following list:

1. (Cols.1-10) XREG(I) - X location of the Ith breakpoint. The first breakpoint is located at the most inboard location of the leading edge for the left-hand side of this planform. The

other breakpoints are numbered around the planform perimeter in increasing order for each intersection of lines in a counterclockwise direction.

2. (Cols.11-20) YREG(I) - Y location of the ith breakpoint. Once the absolute value of Y starts to decrease, it cannot be increased.
3. (Cols.21-30) DIH(I) - Dihedral angle (degrees) in the Y-Z plane of the line from breakpoint i to i+1, positive upward. Note that along a streamwise line, the dihedral angle is not defined, so use 0.0. for these lines. Note the sign of the dihedral angle is the same along the leading and trailing edges.
4. (Cols.31-40) AMCD - The move code; this number indicates whether the line segment is on the movable panel of a variable-sweep wing. Use 1.0 for a fixed line (defaults to 1.0 if not set), or 2.0 for a movable line.

4.3 GROUP 2 DATA

There are five different sections of data that comprise the group 2 data. All five cannot be used together. However, the first section of data must always be used, either alone or in combination with one or more of the others. This first section is a single card that describes the details of the particular configuration for which the loading is desired. This card requires a format of: 2A10, 8F5.2, 7F2.0.

4.3.1

Section one data is to be supplied in the following order:

1. (Cols.1-20) CONFIG - An arbitrary configuration designation of ~~up to 20~~ alphanumeric characters.
2. (Cols.21-25) SCW - The number of chordwise horseshoe vortices to be used at a spanwise station for each planform. The maximum value for this variable is 20. If varying values of chordwise horseshoe vortices are desired due to either multiple planforms or large discontinuities in chord across the span, the user can input a value of 0. that will cause the program to expect user-supplied data at this point in the input stream. The data are in the form of a table that contains the number of chordwise horseshoe vortices from the tip to root, and is called TBLSCW(I). This SCW=0. option can only be used for planforms without dihedral and for coplanar configurations. SCW must be greater than, or equal to, 2. for cambered wing vortex flow aerodynamic and KV,se solutions.
3. (Cols.26-30) VIC - The nominal number of spanwise stations at which chordwise horseshoe vortices will be located. This variable must not cause more than 100 spanwise stations to be used by the program in describing the left half of the configuration. In addition, the product of the stations spanwise and SCW cannot exceed 400. If SCW is 0., then the sum of the values in TBLSCW(I) cannot exceed 400. The use of variable VIC is discussed in references 1 and 2. VIC should always be greater than, or equal to, 10. so that the near-field drag or vortex flow forces on cambered configurations can be properly computed.
4. (Cols.31-35) MACH - Mach number; use a value other than 0.0 only if the Prandtl-Glauert compressibility correction factor is to be applied. The value used should be less than that of the critical Mach number.
5. (Cols.36-40) CLDES - Desired lift coefficient, CL,d. The number specified here is used to obtain the span load distribution at a particular lift coefficient. If the drag polar is required over a CL range from -0.1 to 1.0, use CLDES = 11.; if the vortex flow aerodynamic characteristics are required on a cambered and/or twisted configuration, use CLDES=100.0 (see page 19).
6. (Cols.41-45) SA(1) - Variable sweep angle for the first planform. Specify the leading edge sweep-angle (in degrees)

for the first movable line adjacent to the fixed portion of the planform. For a fixed planform, this quantity may be omitted.

7. (Cols.46-50) SA(2) - same, for the second planform.
8. (Cols.51-55) SA(3) - same, for the third planform.
9. (Cols.56-60) SA(4) - same, for the fourth planform.
10. (Cols.61-62) TWIST(1) - Twist code for the first planform. If this planform has no twist and/or camber, use a value of 0.; otherwise, specify a value of 1. or 2. Use 1. if the data in section four is in radians; use a 2. if the data is in degrees.
11. (Cols.63-64) TWIST(2) - same, for the second planform.
12. (Cols.65-66) TWIST(3) - same, for the third planform.
13. (Cols.67-68) TWIST(4) - same, for the fourth planform.
14. (Cols.69-70) PTEST - Cl_p indicator; if the damping-in-roll parameter is desired, use 1.0 for this quantity. Except for the Delta Cp and Cl_p, all other aerodynamic data will be omitted. Use a 0. if Cl_p is not required.
15. (Cols.71-72) QTEST - CL_q and C_m_q indicator; if these stability derivatives are desired, use a 1.0 for this quantity. Except for Delta Cp, CL_q, and C_m_q, all other aerodynamic data will be omitted. It should be noted that both PTEST and QTEST cannot be set equal to 1. simultaneously for a particular configuration. Use 0. if CL_q and C_m_q are not required.
16. (Cols.73-74) ATPCOD - Set to 0., it will cause only linear aerodynamic results to be printed out. Set to 1., this will cause the program to print out the contributions to the lift, drag and moment from the separated flow around the leading/side edges. Set to 2., it will provide the local flow field velocities away from the configuration, and set to 3., it will provide the attached flow longitudinal load distribution (see page-19).

Section one data can exist alone, or in combination with sections two, three, four or five data.

4.3.2

The second section of data consists of two cards and is required if ATPCOD=1. These cards contain the limits of integration used in the computations of the wing leading-edge and side-edge suction values. If the configuration does not have side edges, input zeroes for the values of XL(I) and XT(I) on the second card. The format of these two cards is 8F10.6 and the fields are as follows:

First Card -

1. (Cols.1-10) YINNER(1) - Represents the Y inner for the first planform.
2. (Cols.11-20) YOUTER(1) - Represents the Y outer for the first planform.
3. (Cols.21-30,31-40) YINNER(2), YOUTER(2) - same, for the second planform.
4. (Cols.41-50,51-60) YINNER(3), YOUTER(3) - same, for the third planform.
5. (Cols.61-70,71-80) YINNER(4), YOUTER(4) - same, for the fourth planform.

Second Card -

1. (Cols.1-10) XL(1) - The leading edge tip X-coordinate for the first planform.
2. (Cols.11-20) XT(1) - The trailing edge tip X-coordinate for the first planform.
3. (Cols.21-30,31-40) XL(2), XT(2) - same, for the second planform.

4. (Cols.41-50,51-60) XL(3), XT(3) - same, for the third planform.
5. (Cols.61-70,71-80) XL(4), XT(4) - same, for the fourth planform.

4.3.3

The third section of data is required when SCW = 0.0 and the number of horseshoe vortices used at each spanwise station is not constant; this data set consists of two or more cards. The first card for each planform set contains the number of spanwise stations, STA, for that planform and is followed by the cards containing the values of TBLSCW(I) for that planform. The format of these cards is 16F5.1 and the fields are as follows:

1. (Cols.1-5) STA - Number of spanwise stations of horseshoe vortices on the left half of the planform. This variable sets the number of TBLSCW values read in for that planform.
2. (Cols.1-5,6-10,etc.) TBLSCW(I) - Number of horseshoe vortices at each spanwise station beginning at the station nearest the tip of the first planform and proceeding toward the station nearest the root.

These sets of STA and TBLSCW(I) cards are to be repeated for each planform. The sum of all the STA values cannot exceed 100.

4.3.4

Section four data are described as follows: if the configuration has

twist and/or camber ($\text{TWIST}(I) \neq 0.$), the local angles of attack are to be specified. If the configuration has no twist/camber, the program will set them equal to zero. If the configuration consists of more than one planform, local angles of attack may be specified for any or all of the planforms. A nonzero twist code requires that these values be input to the program. The format is 8F10.6.

1. (Cols.1-10,11-20,etc.) ALP - Local streamwise angles of attack, eg. camber slope, twist and/or flap deflection, in radians if $\text{TWIST} = 1.$, or in degrees if $\text{TWIST} = 2.$ These are the values at the control point for each horseshoe vortex on the planform when the innermost streamwise edge of the reference planform has an angle of attack of 0. degrees. The volume of this data will usually require several input cards. For the first value on the first card, use the local angle of attack for the horseshoe vortex nearest the first planform leading edge at the tip; for the second value, use the angle of attack for the horseshoe vortex immediately behind in the chordwise direction. Continue in the same manner for the rest of the horseshoe vortices at the tip. Begin a new card for the next inboard station and input the data in the same chordwise manner. Repeat for all successive inboard spanwise stations on that planform. For each planform with twist/camber, start the data on a new card and specify the data from the tip and proceed chordwise and then inboard, as detailed above.

4.3.5

Section five data is used if the flow field option is to be exercised; i.e., $\text{ATPCOD} = 2.$ and CLDES is not equal to 11. or 100. The data consists of two or more cards; the number of field lines where the flow is to be determined will go on the first card by itself, and will be followed by the specific details of each field line on succeeding

cards. The format of these cards is 8F10.6 and the fields are as follows:

1. (Cols.1-10) TOTFL - Total number of field lines. This also controls the reading of the field line data cards (maximum of 60); each of which contains the following items:
 1. (Cols.1-10) XDOWN - X location where the field line intersects the plane of symmetry. (positive forward)
 2. (Cols.11-20) SWEP - Sweep angle of field line in X-Y plane in degrees. (sweepback is positive and $-90.$ deg. $<$ SWEP $<$ 90. deg.)
 3. (Cols.21-30) ZREF - Z height of the field line at the plane of symmetry. (positive down)
 4. (Cols.31-40) DIHED - Dihedral angle of the field line in the Y-Z plane, in degrees. (standard convention is employed to determine the positive angle and $-90.$ deg. $<$ DIHED $<$ 90. deg.)

5 OUTPUT DATA

The printed results of this computer program appear in two parts: geometry data and aerodynamic data.

5.1 GEOMETRY DATA

The geometry data are described in the order that they are found on the printout.

5.1.1

The first group of the data describes the basic configuration: it states the numbers of lines used to describe each planform, the root chord height, pivot position, and then lists the breakpoints, sweep and dihedral angles, and move codes. These data are basically a listing of input data except that the X coordinates are adjusted to the reference point location and the sweep angle is computed from the input.

5.1.2

The second group of data describes the particular configuration for which the aerodynamic data are being computed. Included are the configuration designation, sweep position, a listing of the breakpoints of the planform (X,Y, and Z), the sweep and dihedral angles, and the move codes. The data are listed primarily for variable-sweep wings to provide a definition of the planform where the outer panel sweep is different from that of the reference planform. This is followed by a "printer plot" of the approximate configuration.

5.1.3

The third group of data presents a detailed description of the horseshoe vortices used to represent the configuration. These data are listed in nine columns with each line describing one elemental panel of the configuration (see figure 3) in the same order that the twist

and/or camber angles of attack are to be provided. The following items of data are presented for each elemental panel:

1. X C/4 - X location of quarter-chord at the horseshoe vortex midspan.
2. X 3C/4 - X location of three-quarter-chord at the horseshoe vortex midspan. This is the X location of the control point.
3. Y - Y location of the horseshoe vortex midspan.
4. Z - Z location of the horseshoe vortex midspan.
5. S - Semiwidth of horseshoe vortex.
6. C/4 SWEEP ANGLE - Sweep angle of the quarter-chord of the elemental panel and horseshoe vortex.
7. DIHEDRAL ANGLE - Dihedral angle of elemental panel.
8. LOCAL ALPHA IN RADIANS - Local angle of attack in radians at control point (X @ 3C/4,Y,Z).
9. DELTA CP AT DESIRED CL - Delta Cp or Net Cp normal to the surface at dihedral for each elemental panel when the total lift is CL,d.

5.1.4

The fourth group of data presents the following geometric results:

1. REF.CHORD - Reference chord of the configuration.
2. C AVERAGE - Average chord, cav, true configuration area divided by true span.
3. TRUE AREA - True area computed from the configuration listed in second group of geometry data.
4. REF. AREA - Reference area.
5. B/2 - Maximum semispan of all planforms listed in second group of geometry data.

6. REF.AR - Reference aspect ratio computed from reference planform area and true span.
7. MACH NUMBER - Mach number.

5.2 AERODYNAMIC DATA

If PTEST = 1. or QTEST = 1. on the configuration card, then either Clp or CLq and Cmq are computed and printed, followed by program termination. Otherwise, the aerodynamic data are described by at least two groups of results. The first is always present, but the second depends on what is requested on the configuration card. The following items of the first group of data are given in the order that they are found on the printout. Note that CL ALPHA, CL(TWIST), CM/CL, CMO, CDI/CL**2 are based on the specified reference dimensions. Many of the items that follow are for the complete configuration.

5.2.1

1. DESIRED CL - Desired lift coefficient, CL,d, specified in Input Data for complete configuration.
2. COMPUTED ALPHA - Angle of attack at which the desired lift is developed: CL,d/(CL ALPHA) + ALPHA at CL=0.
3. CL(WB) - That portion of desired lift coefficient developed by the planform with the maximum span when multiple planforms are specified. When one planform is specified, this is the desired lift coefficient. (If two or more planforms have the same span, and this value is equal to the maximum, the planform used here is the latter one read in).
4. CDI AT CL(WB) - Induced drag coefficient for lift coefficient

in the previous item. When two or more planforms are specified, this is the induced drag coefficient of only the planform with the maximum span. This result is based on the far-field solution.

5. CDI/(CL(WB)**2) - Induced drag parameter computed from the two previous items.
 6. 1/(PI*AR REF) - Induced drag parameter for an elliptic load distribution based on reference aspect ratio.
 7. CL ALPHA - Lift-curve slope per radian, and per degree.
 8. CL(TWIST) - Lift coefficient due to twist and/or camber at zero angle of attack (CL,tc).
 9. ALPHA AT CL=0 - Angle of attack at zero lift in degrees; nonzero only when twist and/or camber is specified.
 10. Y CP - Spanwise distance in fraction of semispan from root chord to center of pressure on left wing panel.
 11. CM/CL - Longitudinal stability parameter based on a moment center about the reference point.
 12. CMO - Pitching-moment coefficient at CL=0.
 13. CL ALPHA, CL(TWIST), ALPHA, and Y CP are also printed for each planform.
-

For each spanwise station, the following data are presented; from the left tip towards the root:

1. 2Y/B - Location of midpoint of each spanwise station in fraction of wing semispan.

The next two columns of data describe the additional (or angle of attack) wing loading at a lift coefficient of 1. (based on the total lift achieved and the true configuration area). The third column is the chord ratio result, and the other columns detail specific kinds of span loadings and local centers of pressure for the configuration. The

preceding is done on a planform basis.

1. SL COEF - span-load coefficient, c_{lc}/CL_{cav} .
2. CL RATIO - Ratio of local lift to total lift, c_l/CL .
3. C RATIO - Ratio of local chord to average chord, c/cav .
4. LOAD DUE TO TWIST - Distribution of Span-load coefficient due to twist and camber at 0. degrees angle of attack for the configuration.
5. ADD. LOAD AT CL= - Distribution of additional span-load coefficient at CL_{tc} .
6. BASIC LOAD AT $CL=0$ - Basic span-load-coefficient distribution at zero lift coefficient. These data are the difference of the previous two columns of data.
7. SPAN LOAD AT DESIRED CL - Distribution of the combination of the basic span load and additional span-load coefficients at the desired CL.
8. AT CL DES - X LOCATION OF LOCAL CENT PR - The X location of the local center of pressure for the resulting span load at CL_d as a function of $2Y/b$.

5.2.2

The other options available as group two aerodynamic data are accessed based on the values of CLDES and ATPCOD. For instance, with CLDES=11., and ATPCOD=0.0, the program will produce a drag polar, CDI at $CL(WB)$ versus $CL(WB)$, based on the linear aerodynamics in the middle of the first part of group one aerodynamic data. This, and other combinations, are given in the table below, along with their purposes:

<u>COMBINATION</u>	<u>CLDES</u>	<u>ATPCOD</u>	<u>PURPOSE</u>
i	100. > $CL_d > 0.$	0.	Determine linear aerodynamics
ii	11.	0.	Linear aerodynamic drag polar
iii	100.	0.	not valid
iv	100. > $CL_d > 0.$	1.	Planar-wing vortex-flow aerodynamics

<u>COMBINATION</u>	<u>CLDES</u>	<u>ATPCOD</u>	<u>PURPOSE</u>
v	11.	1.	not valid
vi	100.	1.	Cambered-wing vortex-flow aerodynamics
vii	100. $\geq CL,d > 0.$	2.	Determine flow field off wing
viii	11.	2.	not valid
ix	100.	2.	not valid
x	100. $\geq \underline{CL,d} > 0.$	3.	Determine longitudinal load distribution
xi	11.	3.	not valid
xii	100.	3.	not valid

For combinations i, iv, and x, the induced drag, leading-edge thrust, and suction coefficient characteristics computed from a near-field solution for the additional loading at CL,d at each spanwise station are presented. This is valid only for planforms without twist and/or camber; similar information can be generated for those wings with twist and/or camber by setting $CLDES (CL,d) = 100.$ on input.

1. L. E. SWEEP ANGLE - Leading-edge sweep angle in degrees.
2. CDII C/2B - Nondimensional section induced-drag-coefficient term.
3. CT C/2B - Nondimensional section leading-edge thrust-coefficient term.
4. CS C/2B - Nondimensional section leading-edge suction-coefficient term.
5. CDII/CL**2 - Total drag coefficient over $(CL,d)^2$
6. CT - Total leading-edge thrust coefficient.
7. CS - Total leading-edge suction coefficient.

This completes the printout for combination i; however, for combination iv additional printout is produced. In particular, K_p and K_v values, and respective centroids in both chordwise and spanwise directions, and the associated limits of integration for the leading-edge and side-edge values of K_v. (The item entitled "Sum of the positive side edge contributions" which appears here on the printout is indicative of the contribution to the side-edge forces for that particular planform which were oppositely-signed to those that contributed in a manner to increase K_{v,se}. The value of K_{v,se} does contain these positive contributions provided the sweep angle is positive. They should not be, and therefore are not added in for the planform with a swept forward leading edge). Furthermore, aerodynamic performance values for each planform and for the entire configuration will be listed over an angle of attack range by the use of the Polhamus Suction Analogy. The headings are explained below:

KP	K _p
KVLE	K _{v,le}
KV SE	K _{v,se}
ALPHA	α
CN	CN,tot
CLP	CL,p
CLVLE	CL,vle
CLVSE	K _{v,se} sin α sin α cos α
CMP	pitching-moment coefficient due to CL,p
CMVLE	pitching-moment coefficient due to CL,vle
CMVSE	pitching-moment coefficient due to CL,vse
CM	total pitching moment
CD	CL,tot · tan α
CL**2/(PI*AR)	(CL,tot) ² /(PI*(Aspect Ratio))

The additional printout associated with combination x , which determines the longitudinal load distribution, is as follows:

1. X - The X location at which the spanwise integration of Delta Cp or Net Cp is to occur.
2. Y - The Y value at which Delta Cp or Net Cp is interpolated.
3. INTERPOLATED DELTA CP - The values of Delta Cp interpolated from the chordwise arrangement to that of a spanwise one.
4. BL(X) - Local span. ($b_1(x)$)

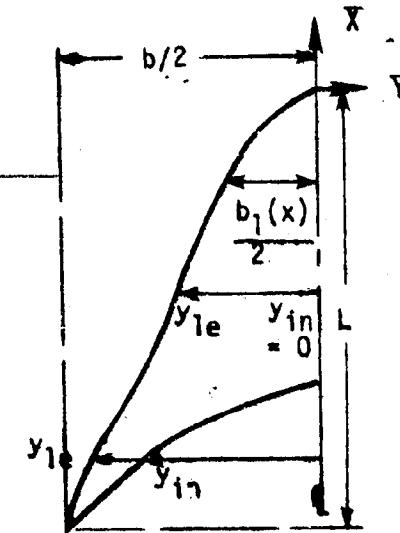

$$5. \text{CNL} = \frac{2b_1(x)}{b} \int_{\frac{2y_{le}}{b_1(x)}}^{\frac{2y_{in}}{b_1(x)}} \Delta C_p d \left(\frac{2y}{b_1(x)} \right)$$

6. CN FOR PLANFORM I -

$$7. \text{CN}(I) = \frac{L(b/2)}{S_{ref}} \int_0^1 \text{CNL} d(x/L)$$

7. TOTAL CN - Total value of CN for the configuration where

$$\text{CN}_{tot} = \sum_{I=1}^{\text{PLAN}} \text{CN}(I)$$

The vortex flow aerodynamics for cambered wings are determined when combination vi is specified, and is done from a solution in the body axis system of the leading-edge suction force acting on a deflected surface, over a range of angles of attack. $K_{v,le}$ is not solved for in this solution, but its effect is calculated at each internally prescribed body axis angle of attack. $K_{v,se}$ is solved for in the manner described in reference 2, and is tabulated.

The headings on the printout are divided into attached flow and separated flow regions. Under the attached flow heading are the lift, drag, and pitching moment (CL , CD , CM) coefficients for both zero leading-edge suction and full leading-edge suction over the angle of attack range. These items include all the appropriate trigonometric terms. Regarding the vortex induced separated flow terms, some headings include the potential flow terms and some do not. Those which include the potential flow terms lead to "total" results whereas those which are isolated, such as side-edge or augmented vortex lift terms, do not lead to "total" values. The augmented vortex lift is described in reference 3. Combination vii determines the flow field around the configuration in the attached flow. First the elemental panel circulation values, Γ/U , associated with the basic load and the additional load at $CL=1.0$ are listed, followed by those associated with the total load and the additional load at the desired CL . This is followed by a heading which lists out the geometric data for the prescribed field line, along with the desired CL and the required configuration angle of attack from linear attached-flow aerodynamics.

Then from near the plane of symmetry to approximately three times the configuration semispan, the flow field properties are determined along that line. The X, Y, and Z coordinates of each field point and the associated normalized downwash (w/U), sidewash (v/U), and backwash (u/U) values are then listed. Note that the positive directions for these are downward for w/U , out the right wing for v/U , and forward for u/U . These are followed by the induced downwash angles DWNWH, $\arctan(w/U)$ in degrees, Epsilon, $d(Epsilon)/d(\text{Alpha})$, the ratio of local dynamic pressure to free-stream dynamic pressure, $Q(\text{LOCAL})/Q(\text{INF})$, and the sidewash angle SIGMA, $\arctan(v/U)$ in degrees. Epsilon is a particular kind of downwash angle, given in degrees and defined by:

$$\text{Epsilon} = \text{Alpha} - \arctan (\sin(\text{Alpha}) - (w/U)) / (\cos(\text{Alpha}) - (u/U))$$

$d(Epsilon)/d(\text{Alpha})$ is just the differential of the above equation with respect to Alpha and may be useful in certain wing-tail-body problems.

6 NOS JOB CARD SETUP

The VLM program is run on the CDC equipment, and while the user must supply the appropriate JOB, USER, and CHARGE information, all commands needed to retrieve and execute the VLM program are contained on the CYBER Control Language (CCL) procedure file RUNVLMF. This file is shown in Appendix B, and stored on User Number

UN=503400N. This procedure, by default, expects the data to be on the file INPUT, and produces an output file, OUTPUT. To use this file in executing the VLM program, the job control card setup would be as follows:

```
JOB,T500,CM130000.           BINXX J.USER
USER,XXXXXX.
CHARGE,YYYYYY,LRC.
GET,RUNVLMF/UN=503400N.
BEGIN,,RUNVLMF.
PLOT.device (if plotting is to be done)
EXIT.
7/8/9
TITLE CARD
CONFIGURATION 1 DATA
CONFIGURATION 2 DATA
etc.
6/7/8/9
```

Note that any plot device currently available on NOS can be specified. If the user has the data contained on some alternate file, or wishes the output to be written to some alternate file, the job control cards can be specified as follows:

```
GET,datafile. (File containing the input to VLM)
GET,RUNVLMF/UN=503400N.
BEGIN,,RUNVLMF,datafile,outfile.
```

where - datafile - contains the input, and - outfile - will contain the printed output from the program at the end of the run.

APPENDIX A - SAMPLE CASES WITH OUTPUT

SAMPLE CASE 1 - TEST DATA FOR 4 PLANFORMS (DEFLECTED PLANFORMS - LINEAR AERODYNAMICS)

SAMPLE CASE 2 - TEST DATA FOR 4 PLANFORMS INVOLVING V-S, DIHEDRAL AND VERTICAL DISPLACEMENT

SAMPLE CASE 3 - TEST DATA FOR 3 PLANFORMS (CAMBERED WING VORTEX FLOW AERODYNAMICS PLUS AUGMENTED TERMS)

SAMPLE CASE 4 - TEST DATA FOR LONGITUDINAL LOAD DISTRIBUTION

SAMPLE CASE 5 - TEST DATA FOR STRAKE WING
(LINEAR AERODYNAMICS - FLOWFIELD ANALYSIS)

APPENDIX B - PROCEDURE FILE RUNVLMF

The RUNVLMF procedure file contains the following cards:

```
.PROC, RUNVLMF, INPUT, OUTPUT.  
*  
* THIS PROCEDURE RETREIVES  
* AND EXECUTES THE - VLM -  
* PROGRAM  
*  
GET, LG0=VMLLG0/UN=503400N.  
MAP, OFF.  
GET, SEGDIR/UN=503400N.  
ATTACH, LRCGOSF/UN=LIBRARY.  
SEGLOAD, I=SEGDIR, B=VLMABS.  
LDSET, LIB=LRCGOSF.  
LOAD, LG0.  
NOGO.  
RETURN, LG0, LRCGOSF, SEGDIR.  
VLMABS, INPUT, OUTPUT, PL=50000.  
RETURN, VLMABS.  
REVERT. *** END RUNVLMF ***
```
