SUMMARY

A wind-tunnel investigation incorporating both static and wind-on testing has been conducted in the Langley 4- by 7-Meter Tunnel to determine the effects of vectored thrust along with spanwise blowing on the low-speed aerodynamics of an advanced fighter configuration. Data were obtained over a large range of thrust coefficients corresponding to takeoff and landing thrust settings for many nozzle configurations. This report presents the complete set of static thrust data and the complete set of longitudinal aerodynamic data obtained in this investigation. These data are intended for reference purposes and, therefore, are presented here without analysis or comment. The analysis of the thrust-induced effects found in this investigation are not discussed in this report.

INTRODUCTION

In the past 4 or 5 years, there has been renewed interest in the Short Takeoff and Landing (STOL) performance of combat aircraft, not only for the Navy V/STOL programs, but also for future Air Force programs. The Air Force interest arises from the potential need to operate aircraft out of bomb damaged airfields in Western Europe where usable runway lengths may be reduced to 305 m to 610 m (1000 ft to 2000 ft). Thus, the next generation aircraft may have a requirement for substantially reduced field lengths from those of present day aircraft. While some of today's aircraft can takeoff from relatively short runways, none can land in the 305 m to 610 m (1000 ft to 2000 ft) runway lengths that may be required. It would appear that large improvements in aerodynamics as well as improved braking or thrust reversing will be required for aircraft to operate out of short fields.

There are several approaches which utilize thrust effects to improve the aerodynamics of fighter configurations. Vectoring the engine exhaust or bleeding engine air for spanwise blowing or flap boundary-layer control (BLC) are promising methods. One proposed configuration, developed by General Dynamics, the Vectored-Engine-Over wing (VEO wing) would employ both vectoring the main engine exhaust in the chordwise direction and diverting a portion of the engine exhaust in the spanwise direction over the wing upper surface. This concept was proposed to improve low-speed lift coefficients through direct thrust, thrust-induced circulation and BLC, and leading-edge vortex flow enhancement.

The VEO wing configuration shown in figures 1 and 2 is a close-coupled wing canard with twin, wide-spaced engine nacelles mounted above the wing with a rectangular nozzle which direct the exhaust flow over the upper surface of the wing trailing-edge flap system. A secondary nozzle located at the wing quarter chord on the side of the engine nacelle was used to divert a portion of the main engine exhaust for spanwise blowing on the wing upper surface. This configuration has been tested in the Langley 4- by 7-Meter Tunnel to obtain the static longitudinal aerodynamic characteristics and to define the thrust-induced effect of over the wing chordwise blowing along with spanwise blowing. (An earlier version of this configuration which had the nacelles next to the body has been reported in references 1 and 2.) Tests were run over the angle-of-attack range from -4° to 29° at free-stream dynamic pressures from 0.48 to

1.92 kPa (10 to 40 lb/ft²). This dynamic pressure range allowed thrust coefficient to vary from 0 to 5; however, most testing was conducted at a dynamic pressure of 1.92 kPa (40 lb/ft²) and over a thrust coefficient range from 0 to 2. Flap and main nozzles were deflected 0°, 15° and 30° while spanwise nozzles were deflected 40° or parallel to the wing leading edge and 60° or 20° aft of the wing leading edge.

SYMBOLS

All data have been reduced to coefficient form and are presented in the stability axis system. The model moment center was at 25 percent of the wing mean aerodynamic chord. All measurements and calculations were made in U.S. Customary Units; however, all data contained in this report are given in both S.I. and U.S. Customary Units. (See ref. 3.) The symbols enclosed in parentheses are used in the tabulated printouts and their usual notation precedes them.

A_e	nozzle exit area, cm ² (in ²)
A_s	spanwise nozzle throat area, cm ² (in ²)
A_t	main nozzle throat area, cm ² (in ²)
AF	axial force, N (lbf)
c	mean aerodynamic chord, cm (in.)
C_D (CD)	drag coefficient, Drag/qS
$C_{D,CT}$ (CDCT)	interpolated drag coefficient at constant thrust coefficient
$C_{D,e2}$ (CDE2)	thrust-removed drag coefficient, $C_D + C_{T,RF} \cos(\alpha + \delta_j)$
C_L (CL)	lift coefficient, Lift/qS
$C_{L,CT}$ (CLCT)	interpolated lift coefficient at constant thrust coefficient
$C_{L,e2}$ (CLE2)	thrust-removed lift coefficient, $C_L - C_{T,RF} \sin(\alpha + \delta_j)$
C_m (CPM)	pitching-moment coefficient, Pitching moment/qSc
$C_{m,CT}$ (CMCT)	interpolated pitching-moment coefficient at constant thrust coefficient
$C_{m,e2}$ (CME2)	thrust-removed pitching-moment coefficient, $C_m + \bar{x}/c C_{T,RF} \sin \delta_j + \bar{z}/c C_{T,RF} \cos \delta_j$
C_T (CT)	thrust coefficient, T_T/qS
$C_{T,RF}$ (CTRF)	reaction force thrust coefficient, T_{RF}/qS

d_e	distance from nozzle exit to trailing-edge flap hinge line on, cm (in.)
h	vertical dimension of nozzle on (in.)
NF	normal force, N (lbf)
NPR_E (NPR)	main nozzle pressure ratio, $P_{T,E}/P_\infty$
NPR_S (NPRS)	spanwise nozzle pressure ratio, $P_{T,S}/P_\infty$
NPR_{TOT} (NPRTOT)	area-weighted overall nozzle pressure ratio, $NPR_E \left[\frac{A_t}{A_s + A_t} \right] + NPR_S \left[\frac{A_s}{A_s + A_e} \right]$
P_T	total pressure, kPa (lbf/ft ²)
P_∞	tunnel static pressure, kPa (lbf/ft ²)
q (Q)	dynamic pressure, kPa (lbf/ft ²)
S	wing reference area, m ² (ft ²)
SF	side force, N (lbf)
T	static thrust force $[NF^2 + AF^2 + SF^2]^{1/2}$, N (lbf)
T_E	main nozzle static thrust, N (lbf)
T_{RF}	reaction force static thrust, N (lbf)
T_S	spanwise nozzle static thrust, N (lbf)
T_T	total nozzle static thrust, $T_E + T_S$, N (lbf)
TOH	static thrust divided by static pressure, T/P_∞
x, y, z	axis system dimensions, cm (in.)
α (ALPHA)	angle of attack, deg
δ_C	canard deflection, deg
δ_{LE}	wing leading-edge flap deflection, deg
δ_{TE}	canard trailing-edge flap deflection, deg
δ_{TEI}	wing inboard trailing-edge flap deflection, deg
δ_{TEO}	wing outboard trailing-edge flap deflection, deg

Λ_S	spanwise blowing angle, deg
θ_j (THETAJ)	jet deflection angle, $-\tan^{-1} NF/AF$, deg
θ_C	nozzle cowling angle, deg
θ_R	nozzle ramp angle, deg
θ_U	upper surface angle of nozzle, N_{20}
θ_L	lower surface angle of nozzle, N_{20}

Nomenclature:

B_2	baseline fuselage
BLC	boundary-layer control
F.S.	fuselage station, cm (in.)
H_2^a	canard with 50° leading-edge sweep
H_3^a	canard with 55° leading-edge sweep
N	baseline nacelle
N_1	baseline main nozzle (see fig. 4)
N_4	large area round spanwise blowing nozzle (see fig. 8)
N_{4a}	small area round spanwise blowing nozzle (see fig. 8)
N_{11}	40° rectangular spanwise blowing nozzle (see fig. 8)
N_{13}	alternate nozzle (see fig. 5)
N_{20}	alternate nozzle (see fig. 6)
N_{21}	60° rectangular spanwise blowing nozzle (see fig. 8)
N_{22}	alternate nozzle (see fig. 7)
W_1	baseline wing
WCP	wing chord plane

Subscript:

a	15° main nozzle ramp without spanwise blowing (see fig. 4)
b	15° main nozzle ramp with spanwise blowing (see fig. 4)

- e 30° main nozzle ramp with spanwise blowing (see fig. 4 or nozzle exit)
- f 30° main nozzle ramp without spanwise blowing (see fig. 4)
- s spanwise
- SWB spanwise blowing nozzle
- t nozzle throat

Superscript:

- a forward nozzle location
- b aft nozzle location

MODEL DESCRIPTION

The VEO-wing model is a close-coupled wing-canard configuration with engine nacelles mounted above the wing as shown in the Langley 4- by 7-Meter Tunnel in figures 1 and 2. A planform drawing (fig. 3) shows the major components of the model. General model dimensional characteristics are given in tables 1 and 2. The wing has a full-span leading-edge flap which could be deflected 0° or 20° and a part-span trailing-edge flap which could be deflected 0°, 15°, and 30°. The trailing-edge flap had an inboard section, located behind the exhaust nozzle, which could be deflected separately from the outboard section. The canard, which could be deflected to +20°, had a trailing-edge flap which could be deflected 0° to 20° but did not have a leading-edge device. The simple body on this model was of circular cross section with an ogive nose cone and was not intended to represent an actual fuselage but rather was to shield the balance, airlines, and instrumentation from the tunnel flow.

The engine nacelles housed airlines which provided compressed air to the main rectangular nozzles located just upstream from the hinge of the inboard flap. There were several nozzle types available which varied the internal geometry as shown in figures 4 to 7. The baseline of N_1 nozzle had interchangeable ramps which varied both throat area and nozzle deflection angle as required to match the trailing-edge flap angle. That is, when the flap deflections were equal to 15°, the actual upper-surface angle of the flap was 20° and the "a-ramp" or 20° ramp was used to give a continuous upper surface. When the 30° flap deflection was used, the upper surface angle was 35°; however, to prevent overexpanding the nozzle, the "f-ramp" or 25° ramp was used which reduced the break in the upper surface to only 10°. This nozzle also had a pair of nozzle ramps which not only matched trailing-edge deflection but also reduced A_{TH} when the spanwise blowing nozzles were opened such that total exhaust area remained constant. That is,

$$A_t \Big|_{\text{No SWB}} = A_t \Big|_{\text{SWB}} + A_s \tag{1}$$

The geometry for the spanwise blowing nozzles is shown in figure 8. The N_{11} and N_{21} nozzles are representative of the type of nozzles that could be incorporated into an actual configuration where a port could be opened in the side of the nacelle and a portion of the exhaust flow would be diverted by vanes in the spanwise direction. In this case, the two nozzles could blow 40° or 60° or parallel to and 20° aft of the leading edge. These spanwise blowing ports were located just above the wing surface and approximately at $0.25 c$ as shown in figure 3. These nozzles were intended to be massive blowing concepts where approximately 25 percent of exhaust mass flow would be directed in the spanwise direction, as opposed to the low mass flow concepts more typical of spanwise blowing at or near the leading edge.

INSTRUMENTATION

Forces and moments, including thrust forces, were measured on an NASA Langley six-component strain-gage balance. However, since the airline/balance interaction calibration was only completed for longitudinal components only normal force, axial force and pitching moment were used in the data reduction. Angle of attack was measured by an internally mounted accelerometer which measured actual model attitude in the tunnel including balance and/or sting deflection. Nozzle total pressures were obtained from three total pressure probes in each main nozzle and a single total pressure probe in each spanwise nozzle. Nozzle interval statics as well as external nacelle and wing surface statics were measured by pressure transducers and multiple scanning pressure valves.

STATIC THRUST AND DATA REDUCTION

Static thrust performance of each individual nozzle as well as various combinations of nozzles were obtained in the static thrust calibration phase of the test. This was done to define not only the static thrust force but also the jet-turning angle and efficiencies of the various nozzles. The thrust force and turning angle were determined for each nozzle as follows:

$$T = \sqrt{NF^2 + AF^2 + SF^2} \quad (2)$$

and

$$\theta_j = - \tan^{-1} \frac{NF}{AF} \quad (3)$$

From these individual thrusts, the total gross static thrust of a configuration could be determined by summing the spanwise and main nozzle thrust

$$T_T = T_{Sleft} + T_{Sright} + T_{Eleft} + T_{Eright} \quad (4)$$

This thrust (T_T) is equivalent to the engine thrust output or throttle setting of the configuration.

As mentioned in the last section, individual nozzle total pressure ratios were obtained; these were area weighted to arrive at an overall configuration nozzle pressure ratio

$$NPR_{TOT} = NPR_E \left[\frac{A_t}{A_s + A_t} \right] + NPR_S \left[\frac{A_s}{A_s + A_t} \right] \quad (5)$$

While these values are indicative of the sort of performance that must be available from the engine, there is a different thrust that must be removed from the aerodynamic data if thrust effects are to be examined. Thus, during the actual wind-tunnel test static thrust calibrations were obtained for the all up configuration (i.e. flaps deflected and all nozzles blowing). This reaction force thrust (T_{RF}) is then the appropriate thrust to remove from the aerodynamic data and will be lower than T_T due to the cancellation of side force produced by the spanwise blowing nozzle. Thus, to produce a given force on the configuration, T_{RF} , the engine will need to produce a greater thrust, T_T , when the spanwise nozzles are used than when only the main nozzles are used. The T_{RF} is then removed from the aerodynamic data as follows:

$$C_{L,e2} = C_L - C_{T,RF} \sin (\alpha + \theta_j) \quad (6)$$

$$C_{D,e2} = C_D + C_{T,RF} \cos (\alpha + \theta_j) \quad (7)$$

$$C_{m,e2} = C_m + \bar{x}/\bar{c} C_{T,RF} \sin \theta_j + \bar{z}/\bar{c} C_{T,RF} \cos \theta_j \quad (8)$$

TEST CONDITIONS

Data were obtained in the 4- by 7-Meter Tunnel on the VEO-wing configuration at angles of attack from -4° to 24° without sideslip or roll angles. Data were taken at tunnel dynamic pressures between 1.91 kPa (40 lbf/ft²) and 0.96 kPa (20 lbf/ft²) and thrust was varied to give a C_T range from 0 to 5 as shown in the following table:

C_T	q_∞ , kPa (lbf/ft ²)		T, N (lbf)	
0	1.91	(40)	0	0
.1			62	(14)
.2			124	(28)
.4			249	(56)
.8			498	(112)
1.2			747	(168)
1.6			996	(224)
2.0			1245	(280)
3.2	1.43	(30)	1494	(336)
4.8	0.96	(20)	1494	(336)

A set of runs for each configuration generally consisted of a power-off ($C_T = 0$) baseline run, a period of jet on running while the model temperature was stabilized, a static thrust calibration to obtain T_{RF} , a series of α sweeps at several constant C_T and finally data at a constant α while C_T was varied. A complete run schedule for both the static and wind-on portions of the test is given in table 3.

A comment should be made about the accuracy with which the thrust coefficients were held during a given set of runs. Because of the difficulty of setting a given plenum pressure in the model (and thus the resulting thrust coefficient), these data were obtained at a range of thrust coefficients near the desired values listed in the table. For example, during run 167, C_T varied from 1.94 to 1.97 rather than holding constant at 2.0. Further, during Run 171, C_T varied from 2.01 to 2.03; again, this is not the desired 2.0. Moreover, the problem of directly comparing power-on data from Runs 167 and 171 is apparent in that the thrust setting is different. Although a worst case of $\Delta C_T = 0.09$ (i.e. 2.03 to 1.94) for these two runs or about 4 to 5 percent is not a large error, 900 counts of drag make comparing drag polars difficult. Therefore, all the data have been scaled to the constant C_T value. In doing this, it is assumed that there are no changes in the induced effects and that the total coefficients are changed by only small increments in the direct thrust components. This scaling is accomplished by first removing the actual direct thrust components (at the incorrect thrust coefficient) from the total aerodynamic coefficients (see eqs. 6, 7, and 8) and then adding the corrected direct thrust components (at the correct thrust coefficients) back to the data to obtain the scaled total aerodynamic coefficients. Therefore, the data for both Runs 167 and 171 have been scaled to $C_T = 2$ as have all other data been scaled at the values given in the table in this section.

PRESENTATION OF RESULTS

A complete set of primary tabular results from this test is found in table 4 (for the static run) and in table 5 (for the wind-on runs). Presented in table 4 are engine nozzle pressure ratio (NPR), spanwise nozzle pressure ratio (NPRS) and total weighted nozzle measure ratio (NPRTOT). Also presented are

static thrust divided by static pressure (TOH) and jet turning angle (THETAJ). It should be noted that TOH is the measured thrust for the given configuration (i.e., the one listed by run number) and will correspond to a T_T or T_{RF} depending on the configuration. In general, all static runs after Run 150 are T_{RF} for complete configurations tested in the wind tunnel.

Presented in table 5 are the wind-on longitudinal data, C_L , C_D , and C_m along with the thrust-removed longitudinal data, $C_{L,e2}$, $C_{D,e2}$, and $C_{m,e2}$, and the static thrust data needed to generate the thrust-removed aerodynamics. Also presented is a set of data, $C_{L,CT}$, $C_{D,CT}$, and $C_{m,CT}$, or longitudinal coefficients at constant thrust coefficients as discussed earlier.

This report is intended to be a reference which contains a complete set of data, a reasonable description of the model geometry, and description of the test condition for an extensive wind-tunnel investigation of the thrust-induced effects on the VEO-wing configuration. These data have been analyzed and reported in several reports (refs. 2 to 7).

16. Abstract <p>A wind-tunnel investigation incorporating both static and wind-on testing has been conducted in the Langley 4- by 7-Meter Tunnel to determine the effects of vectored thrust along with spanwise blowing on the low-speed aerodynamics of an advanced fighter configuration. Data were obtained over a large range of thrust coefficients corresponding to takeoff and landing thrust settings for many nozzle configurations. This report presents the complete set of static thrust data and the complete set of longitudinal aerodynamic data obtained in this investigation. These data are intended for reference purposes and, therefore, are presented here without analysis or comment. The analysis of the thrust-induced effects found in this investigation are not discussed in this report.</p>
