FOREWORD

This document is a bibliography by year of the research published in the open literature by the workers in the Materials Processing in Space program. (Also included are a listing of submitted papers for which acceptance is pending and an appendix which provides a complete listing of the bibliography arranged alphabetically.) This work was sponsored by NASA, either directly or indirectly, and generally pertains to the influence (or lack of influence) of gravity on processes involved in crystal growth, solidification, fluid transport, containerless phenomena, and various separation techniques of interest to the biomedical community. Also included are studies of the possibilities of using the high vacuum in the wake of orbiting vehicles for performing processes involving large heat loads and evolution of gases.

The research reported in this document has a widely varying scope. For the most part, it represents ground-based studies aimed at exploring the role of gravity in a process, how to control its effects, and the determination of the limitations of ground-based techniques. It is anticipated that flight experiments will evolve naturally from this type of research. In cases where a clear rationale for space experiments has been perceived and the experiment is under development, much ancillary work is required to assure the success of the experiment. Often this work is of sufficient interest to merit publication in the open literature. Finally, work actually done in low gravity, either in early spaceflight experiments, current rocket flights, or in drop towers, drop tubes, and aircraft flying ballistic trajectories, is reported.

It is particularly noteworthy that the number of open literature publications produced by the program has increased dramatically in recent years. This reflects the emphasis on science recommended by the National Academy of Science (STAMPS Report*) and the philosophy of the present program administration.
