1. SCOPE

The "As-built" Design Specifications for the Production Film Production Film Converter Gains and Biases Program (PFCGAB) are the subject of this document.

PFCGAB is a batch-input stand-alone program, programmed in the Univac Fortran V language, for operation under the EXEC II operating system on the Univac 1108 computer.

The program was developed for the Earth Observations Division (TF) of NASA-JSC. The program requestor and source of requirements was Mr. Richard Nance (TF3).

2. APPLICABLE DOCUMENTS

The following documents, of issue shown, are pertinent to the authorization for development and requirements for the PFCGAB program.

- Requirements for a Computer Program to Investigate PFC Gains and Biases, by Richard Nance (TF3) (No date)
- Action Document 2640: changes to PFCGAB, originated by R. L. Nance (TF3) (No date)
- LEC Interdepartmental Communication 643-1447, dated 9/28/76: Subject: Modifications to Gains and Biases Program
- TIRF 76-0081

3. SYSTEM DESCRIPTION

A computer program, the Production Film Converter Gains and Biases program (PFCGAB), is described in following sections.

3.1 HARDWARE DESCRIPTION

PFCGAB is operational on the Univac 1108 computer, with the EXEC2 operating system. The program may be made completely compatible with operation on the Univac 1110 and the EXEC8 operating system, with a simple conversion of the EXEC2 PCF (Program Complex File) to an EXEC8 PF (Program File) as documented in the IDSD Procedures Manual, Part 20.

3.2 SOFTWARE DESCRIPTION

The program consists of a main element, PFCGAB, and twelve subprograms: IDHEAD, COVER, PRSTAT, PRXHIS, PFCHIS, PRPCT, PRGAB, TAPERD, UNPK8, UNPACK, TAPLAB, and BYTRAN.

PFCGAB and the first 10 subprograms named are programmed in the Univac Fortran V language. The last two subprograms, BYTRAN and TAPLAB, are programmed in the Univac assembly language SLEUTHII.

3.2.1 SOFTWARE COMPONENT NO.1 (PFCGAB)

PFCGAB (Production Film Converter Gains and Biases) is a program developed for the purpose of computing alternative gains and biases to be used by the PFC (Production Film Converter) when processing LACIE (Large Area Crop Inventory Experiment) images. The program is designed to input LACIE images from tape, and will accept either a GSFC (Goddard Space Flight Center) "CCT" LACIE image tape or ERIPS (Earth Resources Information Processing System) "merge" tape containing LACIE image(s). The program presumes 4-channels per image (ERTS acquisition).

3.2.1.1 Linkages

PFCGAB is the main element. PFCGAB calls the following subprograms:

(1) An assembly language subprogram, TAPLAB, to provide the label of the input tape(s); (2) TAPERD, a Fortran V subprogram which reads the header information and image data from the input LACIE image tape(s); (3) PRXHIS, a Fortran V subprogram which prints the histogram (frequency distribution) of pixels (radiance values) in the LACIE image, (4) PRSTAT, a Fortran V subprogram which prints 4-channel statistics computed over the 5x6 nautical mile sample segment area and the 10x11 nautical mile search area, (4) PRPCT, a Fortran V subprogram which prints a 4-channel tabulation of percentages of pixels, (6) PFCHIS, a Fortran V subprogram which prints a 4-channel histogram (frequency distribution) of PFC grey-shade levels (1-16) versus the number and percentage of pixels in the 5x6 nm sample segment area which are assigned to each grey-shade level, derived using the search area (10x11 nm) gains and biases A1, B1, and (7) PRGAB, a Fortran V subprogram which prints the 29 gains and biases derived in the main program PFCGAB.

3.2.1.2 Interfaces

PFCGAB interfaces with subprograms TAPLAB and TAPERD (entry points TAPHDR, FLDINT, and LINERD) by means of calling arguments. PFCGAB interfaces with the five output subprograms PRXHIS, PRSTAT, PRPCT, PFCHIS, PRGAB - by named common blocks: ALL, PFCH, PCENT, FREQ, HDATA, STCOMP, ST1011, ST5x6, PGLABL.

3.2.1.3 Inputs

Both card and tape input are required by PFCGAB.

Tape input is required to be assigned to Univac logical unit A (Fortran unit 1). Tape input is required to contain LACIE images either as provided on the LACIE (Large Area Crop Inventory Experiment) image tapes sent to JSC (Johnson Spacecraft Center) from GSFC (Goddard Space Flight Center) on "CCT" ("Computer compatible Tape") or as provided from an ERIPS (Earth Resources Image Processing System) "merge" output of LACIE images to tape. The format of the tapes may either be Universal format or LARSYS II format. The program will accept and process multi-file tapes.

Card input is expected by the program. Card input is required to be in Fortran V "NAMELIST" format. The "NAMELIST" name for the input is "\$CARDIN."

The parameters to be card-input are described in Section 4.0, Program Operation.

3.2.1.4 Outputs

PFCGAB utilizes the printer for all output. Output consists of five tabulations. All tabulations are 4-channel. The output is as follows:

(1) A frequency distribution of pixel (radiance value) versus number and percentage of 5x6 nm sample segment area pixels having each radiance value, (2) basic statistics for the 5x6 nm sample segment area (minimum radiance value, maximum radiance value, radiance value range, arithmetic mean (P2), standard deviation (S2), mean deviation, median, and mode. The 10x11 nm search area statistics output are the arithmetic mean (P1) and standard deviation (S1), along with the search area gain (A1) and second bias (B1). (3) A tabulation of the percentage of 5x6 nm sample segment area pixels which exceed a radiance value of 60, 90, 60-sun angle corrected, 70-sun angle

~~3/3~~
5

corrected, 80-sun angle corrected, and 90-sun angle corrected. (4) A frequency distribution of the PFC grey-shade levels (1-16) versus the number and percentage of 5x6 nm sample segment area pixels assigned to each PFC grey-shade level, using the search area gain and bias (A1, B1). (5) A print-out of all 10x11 nm search area and 5x6 nm sample segment area gains and biases derived by PFCGAB.

If more than 4 channels are processed (i.e., ERIPS "merge" images), the output tabulations are by 4-channel increments-i.e., channels 1-4, 5-8, 9-12, etc.

All output is labeled such that the output variables are self-identified and self-explanatory.

3.2.1.5 Storage Requirements

The computer core-storage requirement for PFCGAB and all sub-programs is 5956 I-bank locations, 16728 D-bank locations, and 2647 locations for all 9 Named common blocks. Total core-storage requirement is 25331 locations.

3.2.1.6 Description

PFCGAB presumes that the input images are LACIE images as provided to JSC from Goddard Space Flight Center, or as derived on ERIPS and output on an ERIPS "merge" tape. The program considers an "image" to contain 4-channel pixels, with 196 pixels per scan line, and 117 scan lines per "image." A maximum of 32 channels will be processed by the program; i.e., up to 8 "images," each "image" being a 4-channel image. This is the method used to process the ERIPS "merge" tapes with multiple LACIE acquisitions.

PFCGAB inputs LACIE images from tape, computes statistics (mean, standard deviation) for the 10x11 nautical mile search area and the 5x6 nautical mile sample segment area (mean, standard deviation, range, mean deviation, median, and mode), computes 5 gains and biases using 10x11 nm search area statistics, and computes 23 gains and biases using 5x6 nm sample segment area statistics.

The 10x11 nautical mile search area gain is A1, and the second bias is B1. A1 is either extracted from the input tape header for Goddard Tapes, or input via namelist "\$CARDIN" for ERIPS "merge" tapes. B1 is computed from the search area bias, B0, extracted from the Goddard tape header or input via "\$CARDIN." B1 is computed as follows:

$$B1_i = \frac{B0_i}{A1_i}, \quad i = \text{channel no.}$$

The 10x11 search area mean, P1, is computed as follows:

$$P1_i = \frac{-B1_i + 128}{A1_i}$$

The 10x11 search area standard deviation, S1, is computed as follows:

$$S1_i = \frac{42.666667}{A1_i}$$

The five gains, biases computed using 10x11 nm search area statistics (P1, S1) are: A9, B9, A10, B10, A24, B24, A26, B26, A27, B27. The 10x11 nm search area related gains and biases are computed as follows:

$$\frac{A9, B9}{A9_i} = 256 / (40S1_i)$$

$$B9_i = (P1_i - 2S1_i)$$

3.5
7

$$\underline{A10, B10}$$

$$A10_i = 256 / (5 S1_i) \quad i = 1, \text{ No. Channels}$$

$$B10_i = - (P1_i - 2.5 S1_i)$$

A24, B24 (truncated)

$$A24_i = 8$$

$$B24_1 = (P1_1 - 16) * 8$$

$$A24_2 = 5$$

$$B24_2 = - (P1_2 - 26) * 5$$

$$A24_3 = 5$$

$$B24_3 = - (P1_3 - 32) * 5$$

$$A24_4 = 10$$

$$B24_4 = (P1_4 - 13) * 10$$

A26, B26 (Bands 1, 2, 4 dependent)

$$P_{\text{new}} = \text{MEAN}_{\text{new}} = \frac{P1_1 + P1_2 + 2 P1_4}{3}$$

$$M = \text{MAX}[(P1_i + 3 S1_i - P_{\text{new}}), (-P1_i + 3 S1_i + P_{\text{new}})]$$

for $i = \text{channels } 1, 2, \text{ and } 4$

where for $i = 4, P1_i = 2 * P1_i$

$$XHI = P_{\text{new}} + M$$

$$XLO = P_{\text{new}} - M$$

$$A26 = 256 / (XHI - XLO)$$

$$B26 = - XLO * A26$$

A27, B27 (Bands 2, 3, 4 dependent)

$$P_{\text{new}} = \text{MEAN}_{\text{new}} = \frac{P1_2 + P1_3 + 2 P1_4}{3}$$

~~3-6~~
8

$$M = \text{MAX}[(P1_i + 3S1_i - P_{\text{new}}), (-P1_i + 3S1_i + P_{\text{new}})]$$

for $i = 2, 3, 4$ and when $i = 4, P1_i = 2 * P1_i$

$$XHI = P_{\text{new}} + M$$

$$XLO = P_{\text{new}} - M$$

$$A27 = 256 / (XHI - XLO), B27 = -XLO * A27$$

The 5x6 nm sample segment area statistics are computed as follows:

for X_i = radiance value; channel i

NX_i = Number of pixels having radiance value X_i ;

N_{TOTAL} = Total number of pixels

$XMIN_i = X_{\text{min}_i} = \text{MIN} [X_i] = \text{minimum radiance value, channel } i$

$XMAX_i = X_{\text{max}_i} = \text{MAX} [X_i] = \text{maximum radiance value, channel } i$

$XRANGE_i = RANGE_i = X_{\text{max}_i} - X_{\text{min}_i}$

$XMED_i = \text{MEDIAN}_i = X_i, \text{ for the } X_i \text{ at which } NX_i > \frac{N_{\text{TOTAL}}}{2}$

$XMODE_i = \text{MODE}_i = X_i, \text{ for the } X_i \text{ satisfying } \text{MAX}[NX_i]$

$$P2_i = \text{MEAN}_i = \frac{\sum X_i}{N_{\text{TOTAL}}}$$

$$XMNDEV_i = \text{MEAN DEVIATION}_i = \frac{\sum |X_i - P2_i|}{N_{\text{TOTAL}}}$$

$$S2_i = \text{STANDARD DEVIATION}_i = \left(\frac{\sum X_i^2 - \frac{(\sum X_i)^2}{N_{\text{TOTAL}}}}{N_{\text{TOTAL}} - 1} \right)^{1/2}$$

The gains and biases computed using the 5x6 nm sample segment area means and standard deviation (P2 and S2) or mean deviation are as follows:

A2 ,B2

$$A2_i = 256/6 S2_i \quad B2_i = - (P2_i - 3 S2_i)$$

A3,B3 (truncated distribution)

$$P3_i = \frac{\sum X_i}{N_{TOTAL_i}} = \text{MEAN}$$

$$S3_i = \left(\frac{\sum X_i^2 - \frac{(\sum X_i)^2}{N_{TOTAL_i}}}{N_{TOTAL_i} - 1} \right)^{1/2}$$

where, for $i = 1, 4 \leq X_i \leq 120$

for $i = 2, 3 \leq X_i \leq 120$

for $i = 3, 5 \leq X_i \leq 120$

for $i = 4, 2 \leq X_i \leq 61$

$$A3_i = 256/6 S3_i, B3_i = (P3_i - 3 S3_i)$$

A4,B4 (truncated distribution)

$$P4_i = \text{MEAN} = \frac{\sum X_i}{N_{TOTAL_i}}$$

$$S4_i = \text{std. deviation} = \left(\frac{\sum X_i^2 - \frac{(\sum X_i)^2}{N_{TOTAL_i}}}{N_{TOTAL_i} - 1} \right)^{1/2}$$

~~38~~
10

where; for $i = 1, 10 \leq X_i \leq 80$
 $i = 2, 10 \leq X_i \leq 80$
 $i = 3, 10 \leq X_i \leq 80$
 $i = 4, 5 \leq X_i \leq 40$

$$A4_i = 256/6 S4_i, B4_i = - (P4_i - 3 S4_i)$$

A5, B5 (truncated distribution)

$$P5_i = \text{MEAN} = \frac{\sum X_i}{N_{\text{TOTAL}_i}}$$

$X_{\text{LO}} = P_{\text{NEW}} - M$

$$P_{\text{NEW}} = \text{new mean} = \frac{P_2 + P_3 + P_4}{3}$$

$$M = \text{MAX} \left[\left(P_2 + 3S_2 - P_{\text{NEW}} \right), \left(-P_2 + 3S_2 + P_{\text{NEW}} \right) \right]$$

for $i = \text{channels } 2, 3, 4$

PFCGAB also computes and outputs the frequency distribution of PFC grey-shade levels for the input image radiance values, using the 10x11 nm search area gain, A1, and second bias, B1. The PFC grey-shade levels are computed such that there is equal probability of image radiance values being assigned to the 16 PFC grey levels, as follows:

$$Y_i = A1_i * (X_i + B1_i) = \text{gain, and bias corrected radiance value, channel } i$$

$$Y_{MAX_i} = \text{MAX } [Y_i]$$

$$Y_{MIN_i} = \text{MIN } [Y_i]$$

$$\Delta Z_i = \text{grey-level increment} = \frac{16.0}{Y_{MAX_i} - Y_{MIN_i}}$$

$$Ny = \text{Number of Y-values} = Y_{MAX} - Y_{MIN} + 1.0$$

$$\text{LEVEL} = J * \Delta Z + 1, J = 1, 2, \dots, Ny$$

with constraint that $1(\leq \text{LEVEL}) \leq 16$, integers.

$$\text{FREQUENCY}_J = \sum N_{X_i} \Rightarrow Y_{J_i}; \text{ i.e., the number of pixels at PFC level } J = \text{the number of pixels mapped into } Y_J \text{ and } Y_J = 1 * \Delta Z \leq Y_J \leq Y_J + 1 * \Delta Z$$

A sun angle may be input to PFCGAB from either the input image tape header (for GSFC tapes) or by NAMELIST \$CARDIN card input. If available, a sun angle correction factor is computed as follows:

$$\text{CFACT} = \text{sun angle correction factor} = \frac{\text{SIN } (60^\circ)}{\text{SIN } (\text{Sun angle})}$$

If the sun-angle is available the sun angle correction is applied to the 5x6 nm sample segment area statistics for output of sun angle-corrected statistics computed as follows:

$$\text{CXMIN}_i = \text{CFACT} * \text{XMIN}_i = \text{corrected } X_{MIN}$$

$$\text{CXMAX}_i = \text{CFACT} * \text{XMAX}_i = \text{corrected } X_{MAX}$$

$$\text{CRANGE}_i = \text{CFACT} * \text{XRANGE}_i = \text{corrected range}$$

$CMEAN_i = CFACT * P2_i =$ corrected mean
 $CSTDEV_i = CFACT * S2_i =$ corrected standard deviation
 $CMNDEV_i = CFACT * XMNDEV_i =$ corrected mean deviation
 $CMODE_i = CFACT * XMODE_i =$ corrected mode
 $CMED_i = CFACT * XMED_i =$ corrected median
for $i =$ band 1, 2, 3, 4

3.2.1.7 Flowcharts

The detail flowchart for PRCGAB is contained in Appendix A of this document.

3.2.1.8 Program Listings

The listing for every element in the PFCGAB program is contained in Appendix B of this document.

4. OPERATION

Program PFCGAB is executed via a batch-run deck submitted to the NASA-JSC central computing complex in Building 12. The run deck must have as the initial card in the deck the Univac "Run" card ("7/8 RUN ...") as documented in the Institutional Data Systems Division (IDSD) Procedures Manual, Part 19. The necessary Univac system control cards to assign the input data tape and the program tape to the run are illustrated in the "Sample Deck" illustration, section 4.5. Execution of the program, after the program tape contents have been entered into the Program Complex File area of the drum, is by means of the Univac Control card, "7/8 XQT PFCGAB." Following the "7/8 XQT PFCGAB" control card one or more Fortran V NAMELIST inputs are expected. The NAMELIST Name for input is "\$CARDIN," with "\$" always punched in card column 2 of the card.

The final card in the batch-run deck, following all NAMELIST "\$CARDIN...\$END" sets of variable values input to the program, should be the Univac End-of-File control card, "7/8 EOF." The EOF card is the program's signal to stop attempting to read "\$CARDIN...\$END" inputs, and terminate execution.

The specific variables which may be card-input to the program via NAMELIST \$CARDIN are described below. The user is cautioned that NAMELIST input demands that the variables be input by "Name = value," and that the Name must be spelled accurately in the input.

The two required tapes to be input, and the program's printed output are also described below.

4.1 CARD INPUT

Input is by MEANS of NAMELIST "\$CARDIN," i.e., "\$CARDIN
VAR1 = XX, VAR2 = Y, VAR3 = Z, VAR4(1) = XYZ.W,..., \$END "

The variables which may be input, by NAME, are:

<u>Variable</u>	<u>Description</u>
GSFCTP	(Integer) Flag to indicate that the input tape is a Goddard-generated tape- GSFCTP \geq 1, input tape <u>is</u> a Goddard tape GSFCTP \leq 0, input tape is <u>not</u> a Goddard tape
REGTP	(Integer) Flag to indicate that the input tape is one produced from segment-registration studies- REGTP \geq 1, input tape <u>is</u> a registration tape. REGTP \leq 0, input tape is <u>not</u> a "registration" tape (NOTE: The capability to process registration tapes is not in the program at this time)
MERGTP	(Integer) Flag to indicate that the input Tape is a "merged-image" Tape from ERIPS- MERGTP \geq 1, input tape <u>is</u> a merged-image tape. MERGTP \leq 0, input tape is <u>not</u> a merged-image tape.
NFILES	(Integer) number of files to process, on the input tape (default = 1).
FSTART	(Integer) FIRST FILE NUMBER, at which processing is to begin on the input tape (default = 1) Processing of the input Tape begins at

Variable

Description

FSTART, and NFILES files will be sequentially processed on the Tape.

NUMCH

(Integer) The total number of channels on the Tape-input image; should be an integral multiple of 4 channels (i.e.; 4, 8, 12, 16, 20, ..., 32)
(default set = 4 channels)

EL

(Integer) Sun angle. If the Sun angle is input, the input sun angle will be used in computing sun-angle corrections to the 5x6 area statistics. If the sun angle is not input, and is not available from the input tape header record, no sun-angle corrections will be attempted by the program.

(default set = 0)

A

(floating point) dimensioned = 4 - the 10x11 search area gain for 4 channels (A1), may be input as: "A(1) = XX.X, A(2) = XX.X, A(3) = XX.X, A(4) = XX.X"
(default set = 0.0)

B

(floating point) dimensioned = 4 - the 10x11 search area biases (B1) for 4 channels may be input as: "B(1) = XX.X, B(2) = XX.X, B(3) = XX.X B(4) = XX.X"
(default set = 0.0)

(NOTE: If A1 and B1 are input via A and B, the input gains and biases will be used, instead of the Tape-supplied A1, B1, if available. If A1, B1 are

Variable

Description

are neither input nor available from the tape, the gains and biases computed from A1, B1 are bypassed in the program, and will not be present in the printed output)

The default (program-set) values assigned to the input variables are:

GSFCTP = 1 (i.e., Goddard tape is the default)
REGTP = 0
MERGTP = 0
FSTART = 1 (file no. 1 is the default)
NFILES = 1 (the number of files = 1 is the default)
MUMCH = 4 (total No. of channels on the tape = 4 is the default)
A(1), A(2), A(3), A4 = 0.0
B(1), B(2), B(3), B(4) = 0.0

Any variable not specifically input, by NAME and value, will go into execution with the program-set default value. An "empty" NAMELIST input (" \$CARDIN \$END") will result in program execution with all input variables set to the default values.

The program expects and will execute multiple "\$CARDIN... \$END" inputs. There is No requirement to order multiple "\$CARDIN \$END" namelist inputs with respect to type of tape being processed, or the files to be processed.

The program expects to be terminated by an "End-of-file" card ("7/8 EOF"), following the last "\$CARDIN...\$END" NAMELIST input.

4.2 TAPE INPUT

The input Tape must be assigned to (logical) Univac unit "A" (Fortran unit 1). The input tape is presumed to be in the "Univeral" (or LARSYS2) tape format, one or more files, and four or more channels per input image up to a maximum of 32 channels. The program internally processes "images" with 4-channels per "image" pixel, 196 pixels per scan line and 117 scan lines. The input tape is also presumed to be a 9-TRACK tape, on the sample deck set-up shown in a succeeding section.

The program (PCF) tape may be assigned to any unit other than "A" ("B" - "Z"). The program is entered into the computer from the program tape by appropriate use of the EXEC II system "CUR" ("Complex utility Routines") commands. See the sample deck set-up for the format and sequence of the control cards and commands to bring in the program from tape.

The current Bldg. 12 library tape number for the program tape is X01400.

4.3 OUTPUT

All output is printer output, as follows:

The first page contains various self-identified quantities from the "universal" tape header record, which are pertinent to the imagery in the file being processed.

The second and succeeding pages of output are generated by program PFCGAB. Each page of output of a given type is headed by:

File No., of current input tape file being processed
LACIE Sample Segment No., of current input tape file being processed.

Sample Segment I.D. (LANDSAT Orbit) of the segment
Latitude, Longitude, of sample segment center
Sun elevation,
Sun Azimuth, at the time the imagery was LANDSAT-acquired
(in degrees)

All these quantities are obtained from the tape header record associated with the input tape file being processed.

The first page of program PFCGAB output contains the uncorrected and (sun elevation) corrected statistics for the 5x6 nm sample segment, and the statistics and bias and gain from the 10x11 nm search area, on a per-channel basis.

The second page of program PFCGAB output contains a tabulation of the percentage of pixels in the 5x6 nm sample segment, which exceed certain pre-selected pixel values, on a per-channel basis.

The third (and probably fourth) pages of PFCGAB output are a frequency distribution histogram of the input 5x6 sample segment pixels, on a per-channel basis.

The page following the 5x6 sample segment histogram is a histogram of the frequency distribution of the Production Film Converter (PFC) gray-shade levels for 5x6 nm sample segment, after application of the Goddard (or input) bias and scale factors (A1,B1) to the input imagery.

Following the PFC Frequency Distribution, the PFCGAB program outputs the gain, bias, mean, and standard deviation for the 10x11 nm search area (A1, B1, P1, S1), the 5x6 NM sample segment area (A2, B2, P2, S2) and the program-computed gain, bias, mean, standard deviation for 3 pre-selected truncated distributions of the 5x6 NM area, the bias and scaling factor for "modified" (4 std dev.) standard deviation, the "average" (256/6x mean deviation) scaling and bias (= sample mean - 3 mean deviations), and the "percent" scale and bias factor computed from the sample segment distribution within .00135 tail limits. All computations shown on a per-channel basis. Succeeding pages of output contain the self-identified gains and biases computed by the program using various combinations of multiples of the standard deviation. See section 3.2.1.6, Description, for the method of computing the output gains and biases.

4.4 PROGRAM USE RESTRICTIONS

Although input is set up for three types of input tapes, the program is currently restricted to input and processing of the Goddard or ERIPS "merge" tapes only. Processing of the registration tapes requires additional specialized card-input variables to compensate for the lack of usable header information on the "registration" tapes.

Also, the user is cautioned that NAMELIST input variables retain their values until specifically changed by input of the variable, by NAME, on a "\$CARDIN...\$END" namelist input.

4.6 PROGRAM EXECUTION CHARACTERISTICS

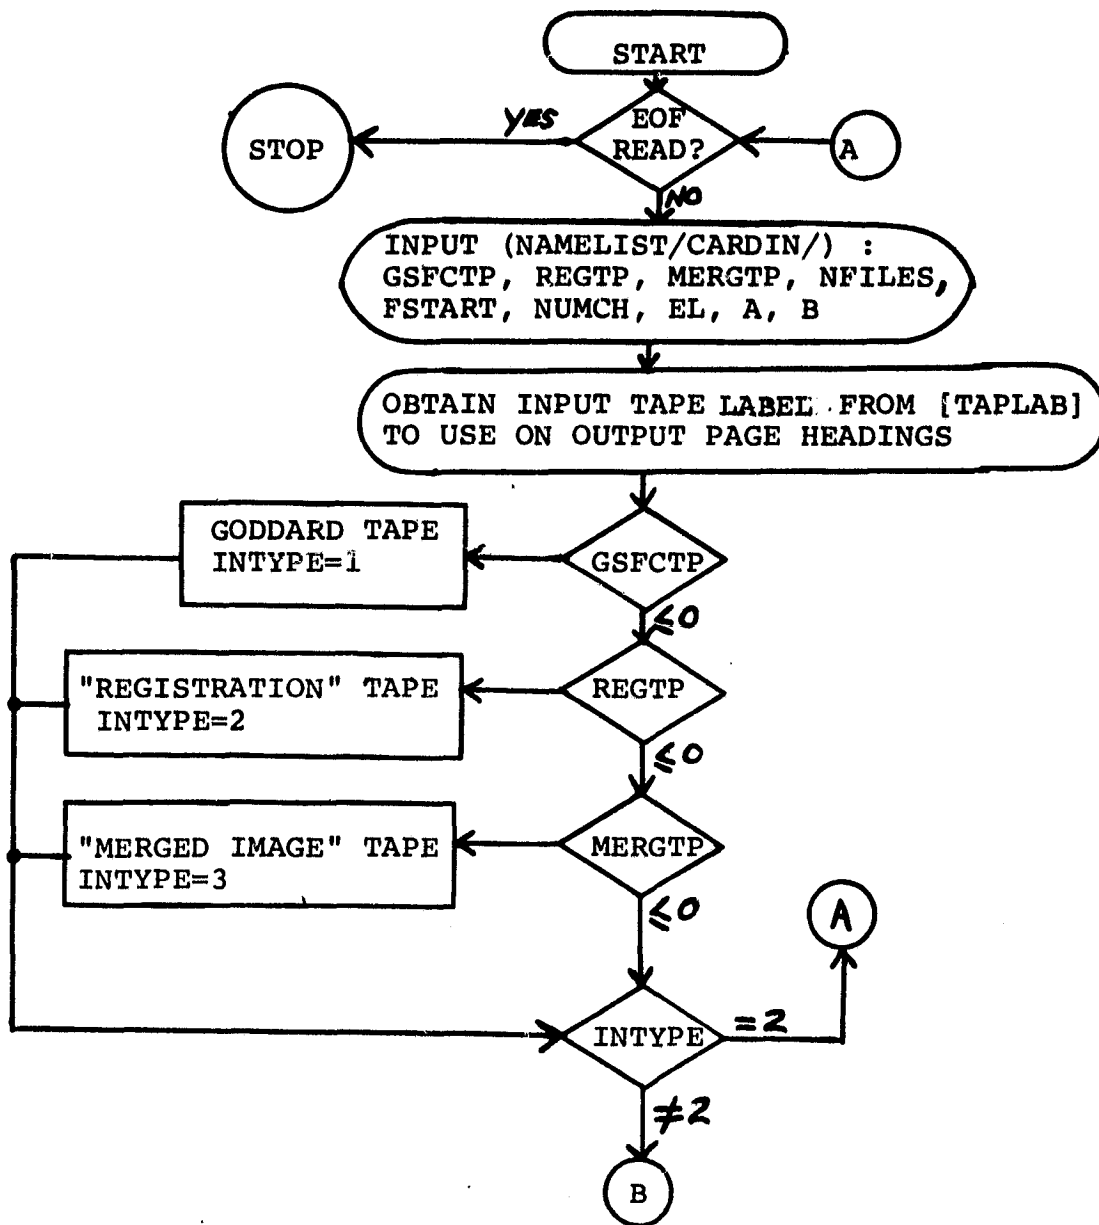

Typical run-time, for a multi-file execution, is on the order of 1 minute per file. The amount (No. of pages) of print-out to be expected is estimated as 4 pages + no. files x 10 pages per file.

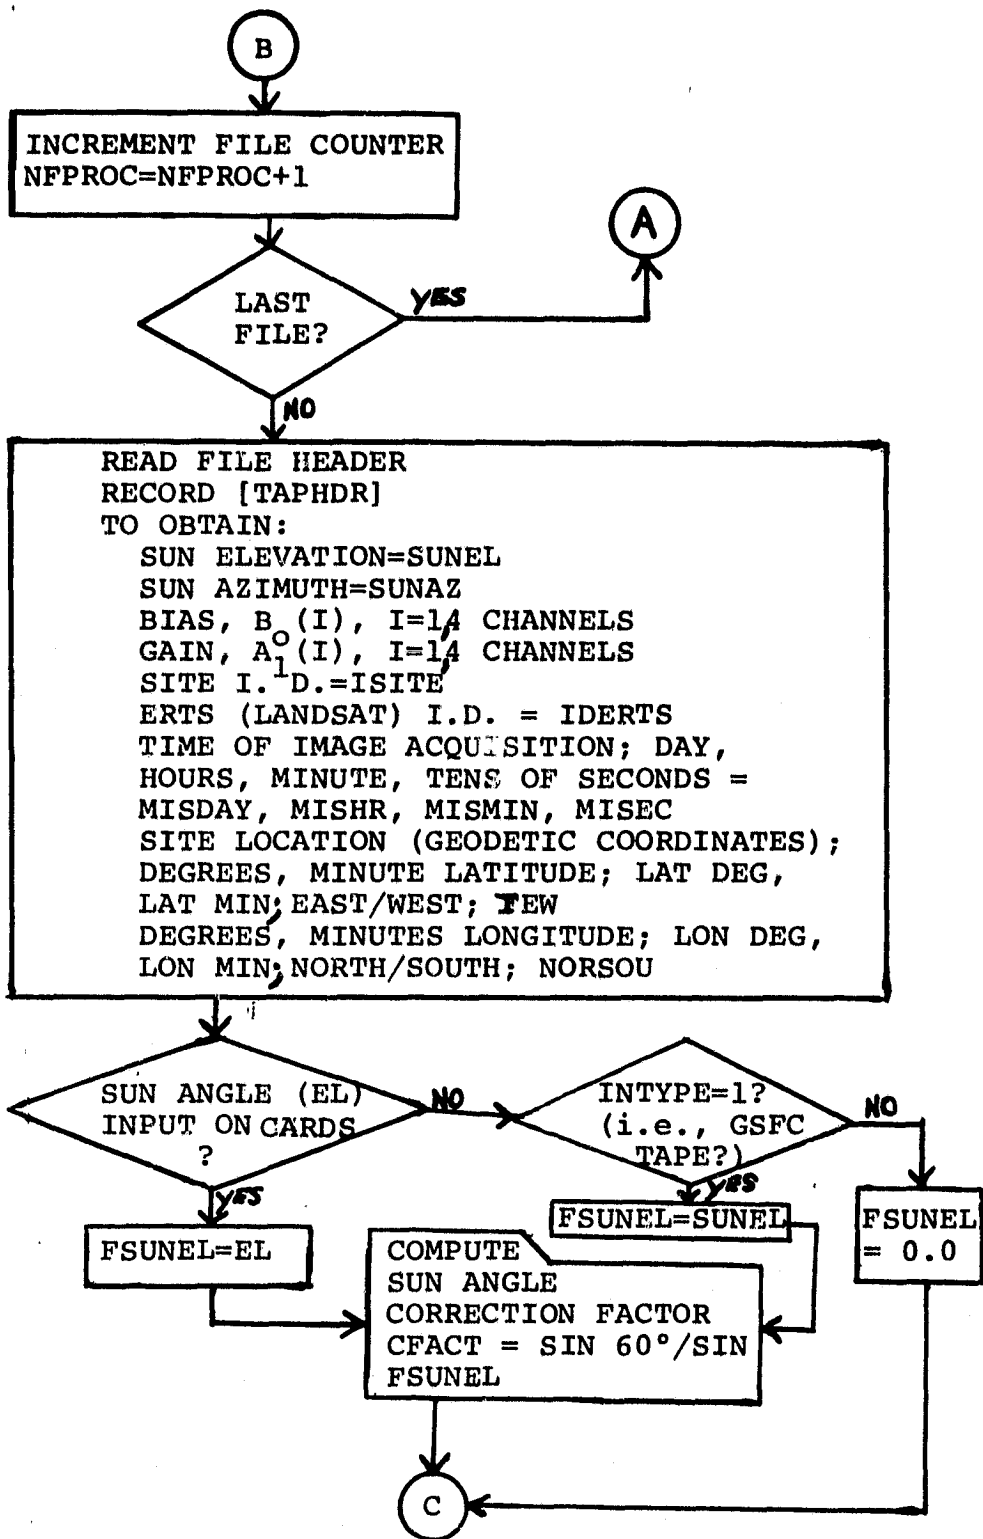

The program executes on the UNIVAC 1108, EXEC2 operating system, in batch mode. The program run deck, user-supplied input tape, and the required form 588, "Instructions for Central Computer Complex Runs," are submitted to the dispatch desk in building 12. The tape, if properly labeled by the user, and printed output from the run will be returned to the location code supplied on the "7/8 RUN" card of the deck, and noted in the proper place on the form 588 input to the dispatch area with the run deck.

It is advisable to note on the F m 588, in the "Programmer Comments" area, that a 9-track tape unit is required for the run, and also on the form 588 under "Input Tapes," where the input tape unit and number are shown, to add a notation beside the input tape that it is a 9-track tape.

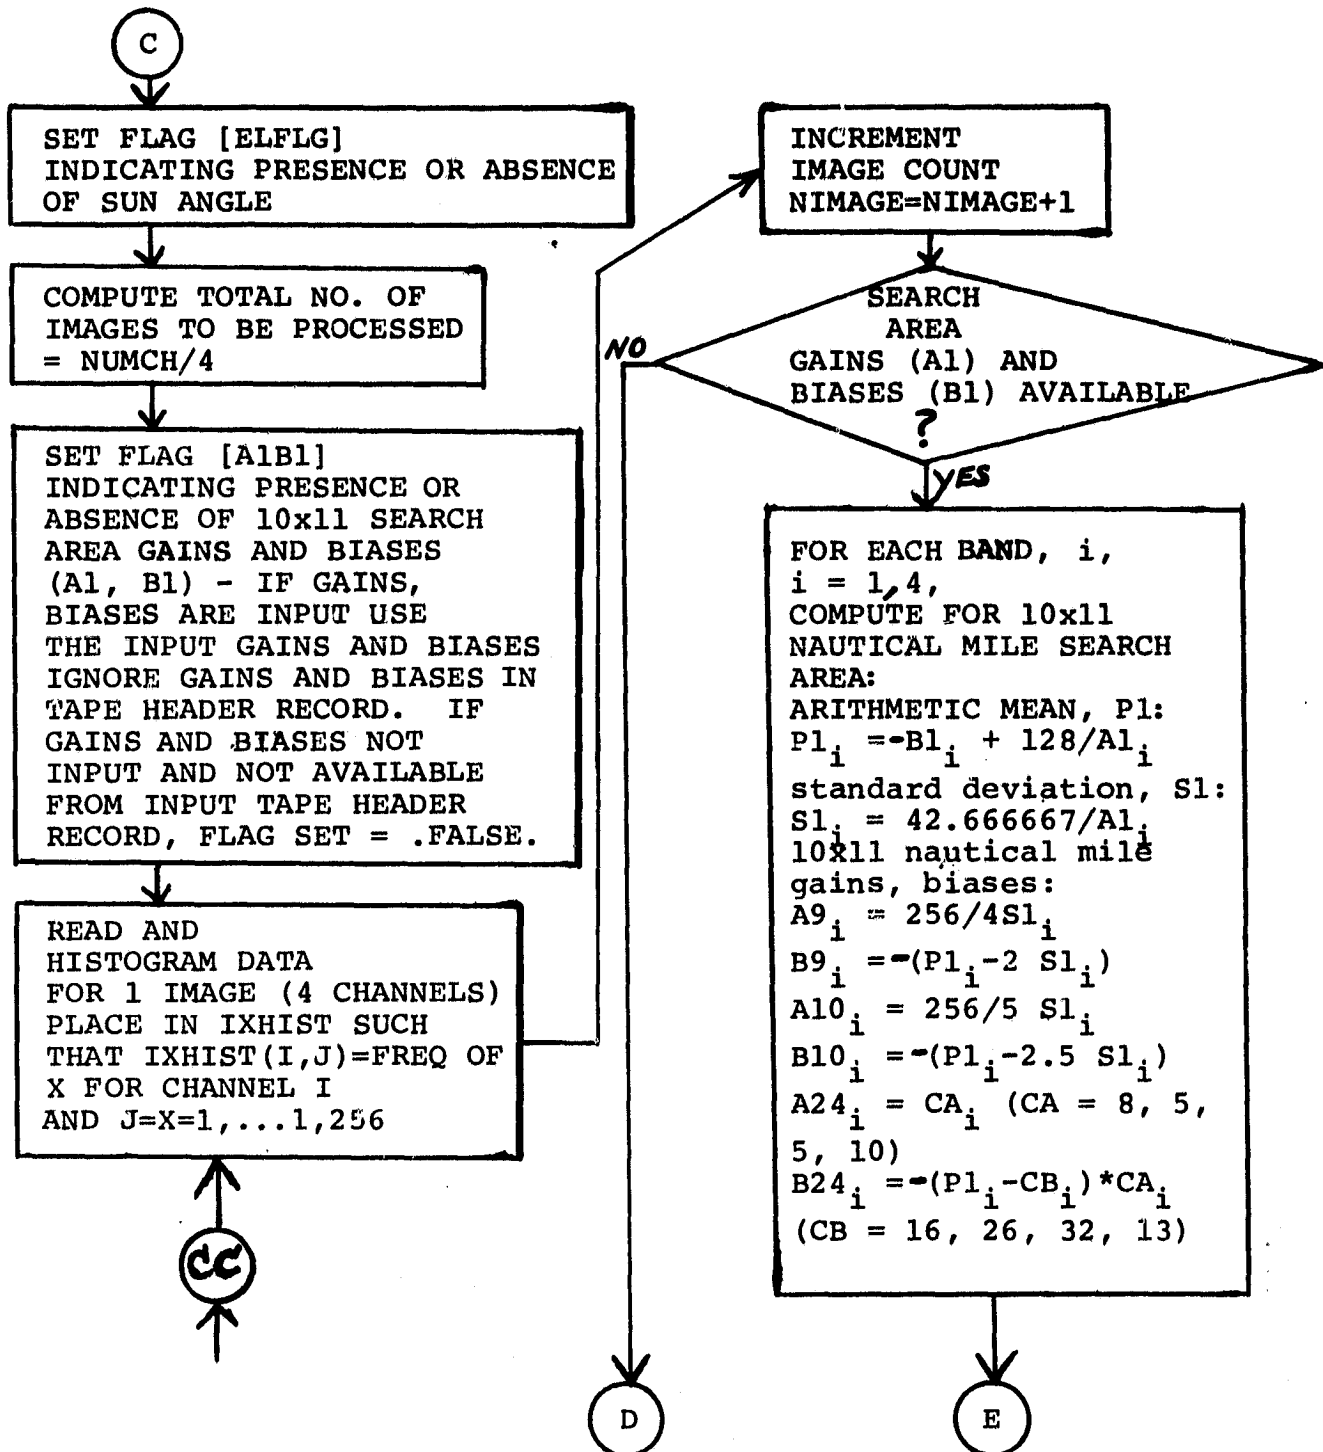

NOTE: The program is not restricted to run with a 9-track input data tape. If LACIE imagery is to be input on a 7-track tape, the only required change is in the run deck, to use the correct Univac "7/8 ASG" control card options for the type of tape (9-track or 7-track) being input.

0 ASM, BYTRAN, BYTRAN 26 OCT 76 18:50:44.94
 ASSEMBLED BY UNIVAC I108 EXEC II ASSEMBLER 2404 0000A
 THIS ASSEMBLY WAS DONE ON 26 OCT 76 AT 18:50:45

CALL BYTRAN(SBITI, SWORDI, SBSKIP, NBYTES, BYTESZ, DBITI, DWORDI, DBSKIP)

SBITI = BIT NO. OF FIRST BIT, FIRST BYTE, FIRST
 SOURCE WORD (= 1, 2, 3, ..., 36 LEFT-TO-RIGHT)
 SWORDI = FIRST SOURCE WORD ADDRESS
 SBSKIP = NO. OF BITS TO SKIP BETWEEN BYTES, IN SOURCE
 BYTE STRING
 IF = 0, BYTES ARE A CONTIGUOUS BYTE STRING
 IF .GT. 0, STARTING WITH BYTE 1 LEFT JUSTIFIED TO SBITI,
 NBYTES BYTES ARE UNPACKED EVERY SBSKIP BITS,
 WORD BOUNDARIES IGNORED IN UNPACKING SOURCE BYTE
 STRING

NBYTES = TOTAL NO. OF BYTES TO BE UNPACKED FROM SOURCE STRING
 AND PACKED INTO DESTINATION STRING

BYTESZ = BYTE SIZE (NO. OF BITS/BYTE)

DBITI = BIT NO. FOR FIRST BIT OF FIRST BYTE (FIRST WORD OF
 DESTINATION STRING (= 1, 2, 3, ..., 36 LEFT-TO-RIGHT)

DWORDI = FIRST DESTINATION WORD ADDRESS

DBSKIP = NO. BITS TO SKIP BETWEEN BYTES PACKED INTO DESTINATION
 BYTE STRING

IF = 0, BYTES ARE PACKED IN A CONTIGUOUS BYTE STRING
 WITH FIRST BYTE LEFT-JUSTIFIED TO DBITI OF DWORDI

IF .GT. 0, DBSKIP BITS ARE SKIPPED OVER BETWEEN BYTES
 WHEN PACKING THE BYTES IN THE DESTINATION
 STRING

NBYTES AND BYTESZ ARE COMMON TO SOURCE AND DESTINATION BYTE
 STRINGS. OTHER VARIABLES INDEPENDENT OF EACH OTHER.

NOTE: THIS VERSION OF BYTRAN TESTS FOR
 THE PACKING MODE TO BE RIGHT-JUSTIFICATION OF
 THE BYTE IN THE DESTINATION WORDS. IF
 RIGHT-JUSTIFY IS THE PACKING MODE, BYTRAN WILL
 ZERO THE DESTINATION WORD PRIOR TO PACKING.

ALSO, ONLY ASCENDING WORD ADDRESSES ARE
 ALLOWED IN THE SOURCE STRING AND
 DESTINATION STRING.

EXECUTION TIME = .075 MILLISEC PER BYTE

ERIPS "MERGE" TAPE PROCESSING

SAMPLE OUTPUT : 16-CHANNEL "MERGE" TAPE

INPUT IMAGE DATA TAPE INFORMATION:

FORMAT UNIVERSAL
 NO. OF CHANNELS 16
 NO. OF PIXELS/LINE 196

HEADER :

COMPUTING SYSTEM ID ERIPS
 LAST DIGIT OF YEAR 885
 DAY NUMBER OF YEAR 5
 DAILY TAPE SERIAL NO. ERTS MSS
 SENSOR ID 297 7776
 DATE 2 1969
 ERTS MISSION NUMBER 2
 SITE - SAMPLE NO. OF 10X11 KM SEARCH AREA COVERED BY CLOUDS
 CLOUD COVER PERCENT 17
 FLAG INDICATING WHETHER A REFERENCE SCENE HAS BEEN USED FOR REGISTRATION-----FLAG=1
 (RTS SCENE/FRAME ID NUMBER FOR NEW DATA)
 2 = ERTS MISSION NUMBER
 17 = DAY NUMBER RELATIVE TO LAUNCH AT TIME OF OBSERVATION
 38 = HOUR AT TIME OF OBSERVATION
 5 = TENS OF SECONDS AT TIME OF OBSERVATION
 DATA QUALITY CLASSIFICATION=1
 CENTER OF SAMPLE SEGMENT

LATITUDE (GEODETIC)
 DEGREES NORTH = 048
 MINUTES = 53

LONGITUDE (GEODETIC)
 DEGREES WEST = 111
 MINUTES = 47
 SUN ELEVATION (DEGREES) 45
 SUN AZIMUTH (DEGREES) 135
 BIAS FACTORS AND SCALING FACTORS - SIGNED BINARY
 FOUR BYTES PER CHANNEL, WHERE FIRST TWO BYTES = BIAS FACTOR,
 SECOND TWO BYTES = SCALING FACTOR.
 CHANNEL 1 BIAS FACTOR = 5.3
 SCALING FACTOR = -41.8
 CHANNEL 2 BIAS FACTOR = 3.8
 SCALING FACTOR = -96.6
 CHANNEL 3 BIAS FACTOR = 4.3
 SCALING FACTOR = -64.9
 CHANNEL 4 BIAS FACTOR = 9.1
 SCALING FACTOR = -370.9
