1. SCOPE

1.1 GENERAL

This specification establishes the design of a computer program which converts an ERIPS (Earth Resources Interactive Processing System) Fields Data Base (FDB) update card deck to a card deck compatible with input requirements of the Univac 1108 EOD-LARSYS system.

The Requirement Specifications for the program were provided by the Research, Test, and Evaluation (RT&E) Branch of the Earth Observations Division (EOD) of the National Aeronautics and Space Administration, Lyndon B. Johnson Space Center (NASA/JSC).

2. APPLICABLE DOCUMENTS

The following documents, of exact issue shown, form a part of the specification to the extent herein specified.

- Requirements Specification: REF: Interdepartmental Communication 643-2042.
- IDSD CATEGORY 1 Job Order 81-127, Task Agreement 77-1.
- Section 11, Large Area Crop Inventory Experiment (LACIE) ERIPS User's Guide, Volume 1.

3. SYSTEM DESCRIPTION

3.1 HARDWARE DESCRIPTION

Not applicable

3.2 SOFTWARE DESCRIPTION

The purpose of the program is to input the ERIPS (Earth Resources Interactive Processing System) Fields Data Base (FDB) update card deck and to output (punch) a field definition card deck in the format compatible with the input requirements of the Univac 1108 EOD-LARSYS system of image data processors.

The program is coded in the IBM 360 Fortran IV language, and is executable from the LARS/Purdue (Laboratory for Application of Remote Sensing) terminal in JSC Building 17.

3.2.1 SOFTWARE COMPONENT NO. 1 (FDBCVT)

FDBCVT is the main program. The function of FDBCVT is to read the ERIPS Fields Data Base update card deck and to punch an EOD-LARSYS compatible field definition deck for each field defined in the ERIPS card deck. FDBCVT allows for an optional user-input line and/or sample bias to be applied to the input vertex coordinates of each field of a given sample segment in the ERIPS deck, before punching the output EOD-LARSYS field definition deck(s) for the given sample segment.

3.2.1.1 Linkages

FDBCVT calls three subprograms - FIND, NXTCHR, and FIXNUM - to decode the keywords and parameters of the input ERIPS deck.

3.2.1.2 Interfaces

The program is accessed via the LARS/Purdue terminal in JSC Building 17. The interface between the program and the user is

the LARS/Purdue IBM 360-67 Control Program (CP) and an associated operating system, the Cambridge Monitor System (CMS). The program-user will utilize the terminal keyboard in Building 17 to communicate the appropriate commands to initiate program execution. Operational instructions are provided in section 4.0 of the Final Design Specifications.

The card reader/punch adjacent to the terminal in Building 17 is the program's primary input/output interface.

3.2.1.3 Inputs

The inputs to the Fields Data Base Deck Conversion program, FDBCVT, consist of an optional BIAS card for each sample segment and an ERIPS Fields Data Base update card deck. The format of the ERIPS deck is given in Section 11, ERIPS User's Guide, Volume 1.

The format of the optional BIAS card is:

<u>CC1</u>	<u>CC11</u>	
BIAS	S=XX	L=YY

The parameters "S=XX" and "L=YY" on the BIAS card contain the user-supplied integers, "XX" and/or "YY," which are additive sample (S) and/or line (L) bias values to be applied to the input ERIPS deck field coordinates.

The BIAS card is optional. If not input, the defaults used by the program are S=0, L=0. Either S or L or both may be input on the BIAS card.

The input ERIPS FDB update deck is the card deck which normally is output (punched) at the LARS/Purdue terminal in Building 17 using the Del-Foster "DEAF" deck as input to a LARS/Purdue program which provides the ERIPS FDB deck as output.

The key words in the ERIPS FDB deck which are expected and responded to by the conversion program, FDBCVT, are:

- SEGSTART - marks the beginning of a set of inputs to be associated with the current sample segment.
- FLDSTART - marks the beginning of a field definition card
- FIELD - contains the parameters that define the current field
- CLASS - identifies the category/class/subclass for the current field
- LINEXX (where XX are numeric) - defines the line coordinate of the field's vertex
- PIXELXX (where XY are numeric) - defines the pixel coordinate of the field's vertex
- FLDEND - marks the end of a set of field definition cards
- SEGEND - marks the end of the input cards for the current sample segment

Any other key words present in the ERIPS deck are ignored by FDBCVT.

3.2.1.4 Outputs

The FDB deck conversion program, FDBCVT, provides both line printer and card punch output.

Primary output is the punched cards in a format compatible with the Univac 1108 EOD-LARSYS input requirements. The punched card output consist of cards in the following formats:

<u>Card type</u>	<u>CC1</u>	<u>CC11</u>
Comment card	COMMENT	SAMPLE SEGMENT ICCCC
Class name card	CLASSNAME	CNAME
Field definition card	FNAME	(1,1), (XXX,YYY), (XXX,YYY), (XXX,YYY), (XXX,YYY), *
Field definition continuation card		, (XXX,YYY), (XXX,YYY), ...

FNAME is the field name (1-6 alphanumeric characters - first character must be alphabetic) read from the input FLDSTART card. Printer output provided by the program is as follows:

1. An optional print-out of the input deck.
2. An optional print-out of the output (punched) deck with possible error messages.
3. The error messages are as follows:
 - a. If an input SEGSTART card cannot be paired with a SEGEND card, the message is:

"ERROR--A VALID SEGSTART (SEGEND) CARD BEFORE SEGSTART ID=ICCCC IS MISSING."
 - b. If the input SEGSTART card is incorrectly formatted (does not have the "=" following "ID") the message is:

"ERROR--THE SEGSTART CARD (CURRENT SEGSTART CARD) IS MISSING AN EQUALS SIGN--LOOK FOR THE NEXT SEGSTART OR EOF."
 - c. If an input FLDSTART card cannot be paired with a FLDEND card, the message is:

"ERROR--A VALID FLDSTART (FLDEND) CARD BEFORE FLDSTART NAME=CCCCC IS MISSING."
 - d. If an input FLDSTART card is incorrectly formatted (does not have the "=" following "NAME" the message is:

"ERROR--THE FLDSTART CARD (CURRENT FLDSTART CARD) IS MISSING AN EQUALS SIGN--LOOK FOR THE NEXT FLDSTART OR SEGEND CARD."
 - e. If, on the input FIELD cards, each pixel coordinate cannot be paired with its correct line coordinate or vice versa, the message is:

"ERROR--FOR FIELD CCCCC THE NUMBER OF PIXELS DOES NOT MATCH WITH THE NUMBER OF LINES."
 - f. If, on the input BIAS card, an "=" is not found following either "S" or "L," the message is:

"ERROR IN BIAS CARD--THE EQUALS SIGN IS MISSING FOR EITHER THE SAMPLE AND/OR LINE INCREMENT."

- g. When reading the line/pixel coordinates from the FIELD cards, if a non-numeric is encountered in a position where a numeric digit is expected (i.e., in the positions occupied by XX or YY in LINEXX = YY or PIXELXX = YY) the message is:

***CARD IN ERROR IS - FIELD LINEXX = YY
PIXELXX = YY..."

3.2.1.5 Storage Requirement

The program requires 8080 bytes of storage.

3.2.1.6 Description

The program reads the ERIPS Fields Data Base update deck, card-by-card. The deck may include a user-supplied BIAS card preceding a SEGSTART card. The sample (S) and/or line (L) bias value following the "=" will be added to each input sample and/or line coordinate given on the FIELD card(s) for the given sample segment. The sample/line bias is initialized to zero (0) at the beginning of the program, and at each SEGEND card encountered in the input ERIPS deck. This requires the BIAS card to be present, preceding a SEGSTART card, in order for bias values to be applied to the input field coordinates for a given sample segment. The values input on a BIAS card are added to each of the sample and line coordinates for all fields defined between a SEGSTART card and the associated SEGEND card.

For each "SEGSTART ID=ICCCC" card read, the program punches a LARSYS comment card, "COMMENT SAMPLE SEGMENT ICCCC."

For each "FLDSTART NAME=FNAMEX" card read, the field name following "NAME=" will be the name placed in columns 1-6 of the output definition cards.

For each set of "FIELD CLASS=CNAMEA LINE01=XX PIXEL01=YY LINE02=XX PIXEL02=YY..." cards read following the "FLDSTART" card and preceding a "FLDEND" card, the program outputs a LARSYS "CLASSNAME CNAMEA" card, followed by EOD-LARSYS field definition cards with the field name (columns 1-6) from the input FLDSTART card. The output field coordinates include the bias value(s) from the BIAS card, if input. The format of the output field definition cards is given in Section 3.2.1.4.

The program continues to read cards from an input ERIPS deck until an end-of-file is encountered.

The punched cards output by the program are in the Univac FIELDATA character set (i.e., any necessary conversion of punched card codes for characters from IBM EBCDIC to Univac FIELDATA is provided by the program).

The format of the input ERIPS deck is expected to be in the format described in the ERIPS User's Guide, Volume 1, Section 11. The program provides error messages if problems are encountered in interpreting the keywords, separators, or parameters on the input cards. The error conditions and resulting printed messages are described in Section 3.2.1.4.

3.2.1.7 Flowcharts

Not applicable.

3.2.1.8 Program Listing

See Appendix A.

3.2.2 SOFTWARE COMPONENT NO. 2 (FIND)

The purpose of the subprogram, Function FIND, is to perform a search for a specific character.

3.2.2.1 Linkages

Function FIND is called by the main program, FDBCVT. Function FIND does not reference any other subprograms.

3.2.2.2 Interfaces

Function FIND interfaces with the calling program via three calling arguments and the function value, which is set within Function FIND.

The function value is set = 1, if a successful character search is completed.

The function value is set = -1 if the character search is unsuccessful.

The calling arguments for FUNCTION FIND are:

<u>ARGUMENT</u>	<u>DIMENSION</u>	<u>TYPE</u>	<u>IN/OUT</u>	<u>DESCRIPTION</u>
CARD	68	A	IN	The input array of 68 words which is assumed to have one character per word, left-justified, blank-filled.
COL	1	I	IN/OUT	On input, the location (word) in CARD, preceding the location at which the search is to begin. On output, the location in CARD at which the character was found. If the character is not found in CARD, COL = initial input value.
VECTOR	1	A	IN	Contains the character to be searched for, left-justified blank-filled in the word.

3.2.2.3 Inputs

The inputs to Function FIND are three calling arguments - CARD, COL, VECTOR - described in Section 3.2.2.2.

3.2.2.4 Outputs

Output from Function FIND is via one calling argument, COL, and the function value which is set within the subprogram (see section 3.2.2.2).

3.2.2.5 Storage Requirements

Function FIND requires 514 bytes of storage.

3.2.2.6 Description

Function Find performs a search of an input (argument) array, CARD, for the alphanumeric character given in the input argument VECTOR. The search in CARD will begin at the next location in CARD following the location specified in the input argument, COL. When the specified character is located in CARD, the function value is set equal to 1, and the location of the character position in CARD is returned in COL. If the search for the specified character is unsuccessful, the function value is set equal to -1, and COL is returned containing the value it had on entry to Function Find.

3.2.2.7 Flowcharts

Not applicable.

3.2.2.8 Program Listing

See Appendix A.

3.2.3 SOFTWARE COMPONENT NO. 3 (NXTCHR)

The purpose of the subprogram, FUNCTION NXTCHR, is to scan a given vector for a non-blank alphanumeric character.

3.2.3.1 Linkages

The subprogram, Function NXTCHR, is referenced by the main program, FDBCVT. The subprogram does not reference any other subprograms.

3.2.3.2 Interfaces

Function NXTCHR interfaces with the calling program via two calling arguments and the function value, which is set within the subprogram.

The function value returned is an alphanumeric character. The character returned is either the first non-blank character found in the input array, CARD, or a "blank" if a non-blank character is not located in CARD.

The calling arguments for Function NXTCHR are:

<u>Argument</u>	<u>Dimension</u>	<u>Type</u>	<u>In/out</u>	<u>Description</u>
CARD	68	A	In	An input array of characters, one character per word, left-justified and blank-filled in each word.
COL	1	I	In/out	On input, COL = the location in CARD preceding the location at which the search for the next non-blank character is to begin. On output, either COL = the location in CARD at which a non-blank character was found, or COL = 67 (the maximum size -1 of CARD) if CARD was all blanks.

3.2.3.3 Inputs

The inputs to Function NXTCHR are two calling arguments - CARD and COL - described in Section 3.2.3.2.

3.2.3.4 Outputs

The output from Function NXTCHR is via the function value and one calling argument, COL (see Section 3.2.3.2).

3.2.3.5 Storage Requirements

Function NXTCHR requires 478 bytes of storage.

3.2.3.6 Description

Function NXTCHR performs a search of an input (argument) array, CARD, for a non-blank alphanumeric character. The search in CARD will begin at the next location in CARD following the location specified in the input argument, COL. When a non-blank alphanumeric character is found in CARD, the function value is set equal to the character found, and the location (in CARD) of the character is returned in COL. If a non-blank character is not located in CARD, the function value returned is "blank," and COL = 67 (the maximum size -1 of CARD).

3.2.3.7 Flowcharts

Not applicable.

3.2.3.8 Program Listing

See Appendix A.

3.2.4 SOFTWARE COMPONENT NO. 4 (FIXNUM)

The purpose of the subprogram, Function FIXNUM, is to convert an EBCDIC numeric character to an integer digit.

ORIGINAL PAGE IS
OF POOR QUALITY

~~3-10~~
12

3.2.4.1 Linkages

Function FIXNUM is called by the main program, FDBCVT. Function FIXNUM does not reference any other subprograms.

3.2.4.2 Interfaces

Function FIXNUM interfaces with the calling program via two calling arguments and the function value, which is set within Function FIXNUM.

The function value returned is the integer resulting from the conversion of the EBCDIC character.

The calling arguments for Function FIXNUM are:

<u>Argument</u>	<u>Dimension</u>	<u>Type</u>	<u>In/out</u>	<u>Description</u>
NUM	1	A	IN	NUM contains the EBCDIC character, left-justified in the word.
MASK	1	A	IN	MASK contains the EBCDIC numeric character "0" (zero), right justified and sign-filled.

3.2.4.3 Inputs

The inputs to Function FIXNUM are two calling arguments - NUM and MASK - described in Section 3.2.4.2, above.

3.2.4.4 Outputs

The only output of Function FIXNUM is via the function value that is set within FIXNUM. The function value returned to the calling program is the integer which results from the conversion of an EBCDIC numeric character.

3.2.4.5 Storage Requirements

Function FIXNUM requires 584 bytes of storage.

3.2.4.6 Description

Function FIXNUM converts one EBCDIC numeric character input in the calling argument NUM. The conversion of the EBCDIC character to an integer digit is as follows:

1. The input character in NUM is shifted to the right 24 binary positions, resulting in the character being right-justified and the remainder of the word sign-filled (all binary 1's).
2. The right-justified, sign-filled value in MASK (an EBCDIC zero) is subtracted from the right-justified, sign-filled value in NUM.

The result of the subtraction is an integer, in the range 0-9, if the EBCDIC character in NUM is one of the set, "0", "1", "2", ..., "9".

3. The result of the subtraction is returned as the function value.

If the result of the subtraction is not an integer in the range 0-9, FIXNUM also outputs a printed message

"*** ERROR - NUMERIC CHARACTER EXPECTED AND NOT FOUND!"

3.2.4.7 Flowcharts

Not applicable.

3.2.4.8 Program Listing

See Appendix A.

4. OPERATION

FDBCVT is executed on the LARS/PURDUE IBM 360/67 computer using the remote terminal facilities in JSC Building 17. Program operation is described in terms of the terminal operations necessary to execute the program from Building 17.

4.1 USER DOCUMENTATION

The main Fortran IV Program, FDBCVT, along with the subroutines FIND, NXTCHR, and FIXNUM have been placed in a permanent disk file which is referenced by an ID and password provided by the Research, Test, and Evaluation Branch (RT&E). The program can be called from the Hazeltine 2000 terminal or from the 2741 Typewriter terminal by typing in the name of the main program, "FDBCVT".

The following capabilities are provided to the user after the data deck is read in via the card reader and referenced to the program, FDBCVT:

1. Obtain a listing of the 'FDBCVT' input data deck,
2. Obtain a listing of the punched output card deck along with any error messages pertaining to the input data deck,
3. The punched cards output by FDBCVT, via the card punch adjacent to the terminal, formatted for input to the Univac 1108 EOD-LARSYS program.

Program set-up and use instructions are provided below.

~~4-1~~
15

4.1.1 PROGRAM SET-UP AND EXECUTION

The input cards [an ERIPS Fields Data Base Update deck] must include an additional card, supplied by the user. The required first card of the input deck is of the format:

<u>CC1</u>	<u>CC10</u>	(RT&E account ID at LARS/PURDUE)
<u>ID</u>	<u>JSC200</u>	

The "ID" card is a LARS/Purdue system requirements, to associate the input with the correct terminal user.

The order of activities for program executions are:

1. Terminal sign-on (LOG IN), and acquire temporary file space for program execution.
2. Transmit input card deck to Purdue.
3. Execute FDBCVT.
4. Initiate print-out (if needed).
5. Initiate card punch output.
6. Retrieve print-out and punched cards.
7. Log out, on the terminal.
8. Interpret the punched cards (on 026 keypunch machine).

The sequence of terminal activities below are for the Hazeltine 2000 terminal.

NOTE (1) In the sequence of terminal commands and responses given below, the caret (">") indicates the required user-type in, the brackets "[]" indicate system response. The ">" is displayed by the system, to elicit user-input. The brackets are for documentation convenience only.

NOTE (2) On the Hazeltine 2000 terminal, the user-command is transmitted by depressing the carriage return ("CR") key.

On the 2741 terminal, the user-command is transmitted by "RETURN" key.

NOTE (3) On the Hazeltine 2000 terminal, to erase a typed-in character, the "@" key is depressed.

To erase an entire typed-in line, the "[" key is depressed.

NOTE (4) On the 2741 terminal, to erase a typed-in character the "@" key is depressed.

To erase an entire typed-in line, the "¢" key is depressed.

4.1.1.1 Terminal Set-Up

On the Hazeltine 2000 terminal, make sure that the green box closest to your terminal is switched to 'LARS'.

User: Depress 'CR' (on the 2741 terminal, depress "ATTN"). If the terminal does not respond back with 'RESTART', type in 'L JSC200', depress 'CR'.

Terminal: [RESTART]

User: >L JSC200
depress 'CR'

Terminal: [ENTER PASSWORD]

User: > "ABC" (NOTE: The actual password to be used in place of "ABC" is the password allocated to RT&E associated with the account ID, "JSC200".)
depress 'CR'

Terminal: [ENTER NAME]
> (TYPE IN YOUR INITIALS OR NAME)
depress 'CR'
[YOUR OPERATORS ARE ...]

```
[CP]
> I CMS
[CMS READY]
> DISK SET S (request for small ("S") temporary file)
[LINE AND CHARACTER SET TO 1]
[YOU ARE LINKED TO TEMP DISK XX]
[P(192): XX FILES; YYY REC IN USE, ZZ LEFT (OF 296),
XY% FULL (X CYL)]
```

The status of the disk's storage space is obtained as follows:

```
> LISTF
depress 'CR'
[FILENAME FILETYPE MODE ...]
```

If more storage space is needed than is currently available on the temporary disk file, the temporary file may be "cleaned up". To erase files in order to increase the amount of storage space, type in:

```
> ERASE (type in one of the listed filename) (type in the file-
name's filetype)
depress 'CR'
```

Continue the above process of erasing files from the temporary disk until enough storage space is available on the disk to handle the execution of FDBCVT. All printer output of the program is stored on this file.

4.1.1.2 Data Deck Input

1. Proceed to the card reader, adjacent to the terminal.
2. If any reading, printing, or punching is in progress, wait until the operation is completed.
3. On the card reader/punch control panel, depress the 'NPRO' button.

4. Put the "ID JSC200" card on top of the data deck.
5. Place the input cards in the card-hopper FACE DOWN, "9-edge leading" - i.e.,) with the top edge of the cards facing outward.
6. Place the card weight on top of the DECK.
7. a. On the card reader/punch control panel, turn the knob to 'TSM TRSP'.
b. Depress the 'EOF' button
c. Depress the 'START' button, hold until the 'READY' light goes on.
8. After all of the cards have been read in, an audible beeping sound will be generated, signifying that the transmission is complete.
9. Depress the 'NPRO' button.
10. Turn the knob to 'OFF-LINE'
11. Remove the input card deck from the card reader hopper.
12. Return to the terminal console - the input deck is now available to program FDBCVT.

4.1.1.3 Printer and Punched Card Output

After a few seconds, depress 'CR'.

```
[** CARDS XFERED BY HOUSTON ...]
```

```
>0 READ FDBCVT DATA
```

```
depress 'CR'
```

```
[R, T = ...]
```

```
>FDBCVT
```

```
depress 'CR'
```

```
[XX.YY.ZZ FILEDEF 5 DSK-P1 ...]
```

If an off-line copy of printer output is needed (with possible error messages), type in:

>0 PRINT PRINT LISTING

NOTE (A): Do NOT depress 'CR' if any card reading, card punching, or printing is taking place at this time, by other terminal facility users. Wait until the terminal input/output activities (card reader and printer) are not being used, then depress 'CR' to send the "PRINT" request. When an audible beeping sound is generated, LARS is attempting to transmit the requested printout.

1. Proceed to the printer and turn the knob to 'PRINT'
2. Depress the 'START' key on the printer control panel
3. When the printing has stopped, depress 'CARRIAGE STOP' then 'CARRIAGE RESTORE' (= paper feed)

If a printer listing of the input data cards is needed, type in:

>0 PRINT FDBCVT DATA

See NOTE (A), before depressing 'CR'

To get the output cards punched, type in:

>0 PUNCH PUNCH OUTPUT

See NOTE (A), before depressing 'CR'

Proceed to the card reader:

1. Wait for a beeping sound to be generated.
2. Turn the knob to 'PUNCH', on the card reader control panel.
3. Place blank cards in the card reader, "9-edge leading".
4. a. Depress the 'START' button, hold until the 'READY' light goes on.
b. Card punching should begin when the 'READY' light goes on.

~~4-6~~
20

5. When the beeping sound is generated, remove the unused blank cards from the card reader hopper.
6. Depress the 'NPRO' button.
7. Turn the knob to 'OFF-LINE'.
8. Remove the punched cards from the card hopper and strip out any leading or trailing blank cards.
9. Interpret the punched deck on the '026' keypunch machine.

4.1.1.4 Terminal Sign-Off

User: Depress the 'BREAK' key (to get from CMS to CP)

Terminal: [CP]

User: >Logout

[CONNECT = XX:YY:ZZ VIRTCPU = XXX:YY.ZZ

TOPCPU = XXX:YY.ZZ]

[LOGOUT AT XX.YY.ZZ ON MM/DD/YY]

[CP-67 ONLINE]

5. TEST PROCEDURE

5.1 DESCRIPTION OF TEST

Using representative input cards from an ERIPS FDB deck, the program was executed from the terminal in JSC Building 17. The input deck also included simulated ERIPS FDB cards with erroneous parameters, in order to test the diagnostic error messages incorporated in the program. The run was executed to verify

- a. The punched card output, in EOD-LARSYS input format.
- b. The optional print-out of input cards and any error diagnostics.

The input and output of the verification run of the program is in Appendix B of this document.

TEST VERIFICATION

For ERIPS FIELDS DATA BASE DECK CONVERSION

This verification is being conducted to insure that the delivered program products satisfy the requirements as originally stated by the requesting organization.
