The automatic plotting overlay PLOTQLS in this program requires subroutines that are proprietary to The Boeing Company. Consequently, this overlay can only be accessed on the Boeing Computer.

### 1.0 SUMMARY

This document describes the analysis and use of program L221 (TEV156), a digital computer program to calculate steady state solutions for linear second-order differential equations caused by sinusoidal forcing functions. The program calculates generalized coordinate frequency responses, load frequency responses, and load power spectral density (PSD) parameters using random harmonic analysis techniques. The particular field of application of the program is the analysis of airplane response and loads caused by continuous air turbulence, both vertical and lateral gusts.

The equations of motion and load equations of the vehicle must be formulated outside L221 (TEV156) and read as program input data from either cards or magnetic files. The frequency response functions for the generalized coordinates and loads (shears, moments, accelerations, etc.) are solved at a large number of discrete frequencies. An empirical representation of the atmospheric turbulence PSD is utilized together with the load frequency response functions to obtain the load PSD parameters $\bar{A}$ and $\mathbf{N}_{0}$ (root mean square (RMS) load/root mean square gust velocity and the number of zero crossings with positive slope per unit distance, respectively).

A number of options are available within the program to produce flexibility as to the type of solution and results desired. Some of these features are:

- Equations of motion and load equation coefficient matrices may be either frequency dependent (nonconstant coefficients) or frequency independent (constant coefficients)
- User selection of gust spectra description
- User-specified scale of turbulence
- Multiple forcing function spectra description
- Static-elastic solution for quasi-steady path
- Deletion of user-specified degrees of freedom
- User-specified structural damping factor for each degree of freedom
- User-specified starting point for RMS integration
- User-specified Wagner and Küssner indicial lift growth function coefficients
- Gradual gust penetration
- Load correlation
- User input or internal generation of the array of solution frequencies

The following results can be saved on magnetic tape for automatic plotting with user-supplied interface and plotting programs:

- Frequency response functions for the generalized coordinates*
- Frequency response functions for the loads*
- Load power spectra functions*
- Real and imaginary components of the generalized coordinate frequency responses
- Real and imaginary components of the load frequency responses
- RMS loads, $\overline{\mathbf{A}}^{*}$
*These items can also be automatically plotted using the COMp80 plotter.
Limitations imposed on the equations are:
- All roots must have positive damping.

Note: A solution will occur even though the damping is negative; however, it will be in error as no steady state solution exists.

- The matrix which is the sum of the zero-, first-, and second-order coefficients must be nonsingular at all solution frequencies.

### 2.0 INTRODUCTION

The computer program L221(TEV156) may be used as either a stand-alone program or as a module of a program system called DYLOFLEX which was developed for NASA under contract NAS1-13918 (ref. 1). Because of the DYLOFLEX contract requirements developed in reference 2, a program was needed to calculate power spectral density (PSD) gust load parameters for equations of motion and load equations which have frequency-dependent coefficients. An existing program ${ }^{1}$ that calculated PSD gust load parameters for equations with constant coefficients was modified according to the DYLOFLEX specifications, ${ }^{2}$ to optionally use nonconstant coefficient matrices for the equations of motion and load equations.

[^0]
### 3.0 SYMBOLS AND ABBREVIATIONS

The following list contains items that appear in this document except section 6.3 (card input).

| Engineering notation | Definition |
| :---: | :---: |
| $\{\overline{\mathrm{A}}\}$ | Gust response factor $=\sigma_{\mathbf{r}} / \sigma_{\mathrm{g}}$, response/unit velocity. |
| [A], [B] | Real and complex coefficients of the AIC matrix. |
| [AIC] | Aerodynamic influence coefficient matrix. |
| $\mathrm{a}_{1}, \mathrm{~b}_{1}, \mathrm{c}_{1}, \mathrm{~d}_{1}$ | Wagner indicial lift growth coefficients. |
| $\mathrm{a}_{2}, \mathrm{~b}_{2}, \mathrm{c}_{2}, \mathrm{~d}_{2}$ | Küssner indicial lift growth coefficients. |
| c | Reference chord length, units of length |
| C | Scalar constant on the equations of motion forcing function when using gradual penetration. |
| $\overline{\mathbf{C}}$ | Scalar constant on the load equation forcing function when using gradual penetration. |
| $\left\{\mathrm{C}_{2}\right\},\left[\mathrm{C}_{2}\right]$ | Equations of motion forcing function coefficient matrix. |
| $\left\{\overline{\mathrm{C}}_{2}\right\},\left[\overline{\mathrm{C}}_{2}\right]$ | Load equations forcing function coefficient matrix. |
| $\left\{\mathrm{C}_{3}\right\},\left[\mathrm{C}_{3}\right]$ | Equations of motion convoluted forcing function coefficient matrix. |
| $\left\{\overline{\mathrm{C}}_{3}\right\},\left[\overline{\mathrm{C}}_{3}\right]$ | Load equations convoluted forcing function coefficient matrix. |
| \{CS0\},\{CS1\},\{CS2\} | Special feedback coefficients. |
| $\left\{\mathrm{Fa}_{\mathbf{a}}\right\}$ | Aerodynamic force. |
| $\left\{\mathrm{f}_{\ell}\right\}_{\text {or }} \mathrm{i}^{\text {l }}$ | Streamwise distance from the point first encountering gust to the points encountering the gust later, units of length |
| \{FREQM \} | Array of frequencies at which the frequency-dependent input matrices are defined. |
| $\mathrm{f}(\mathrm{s})$ | Laplace transform of the Küssner indical lift growth function. |

| Fydamp | Special feedback transfer function. |
| :---: | :---: |
| G | Feedback gain coefficient of the feedback transfer function. |
| \{gSD $\}$ | Structural damping coefficient matrix. |
| g(s) | Laplace transform of the Wagner indicial lift growth function. |
| i | $\sqrt{-1}$ |
| L | Scale of turbulence, units of length. |
| [M] | Lumped inertial data. |
| $\left[\mathrm{M}_{1}\right],\left[\mathrm{M}_{2}\right],\left[\mathrm{M}_{3}\right]$ | Equations of motion coefficient matrices for generalized coordinate displacement, rate, and acceleration, respectively. |
| $\left[\mathbf{M}_{4}\right],\left[\mathbf{M}_{\mathbf{3}}\right],\left[\mathbf{M}_{\mathbf{6}}\right]$, | Equations of motion coefficient matrices for convoluted generalized coordinate displacement, rate, and acceleration, respectively. |
| $\left[\overline{\mathbf{M}}_{1}\right],\left[\overline{\mathbf{M}}_{2}\right],\left[\overline{\mathbf{M}}_{3}\right]$ | Load equations coefficient matrices for generalized coordinate displacement, rate, and acceleration, respectively. |
| $\left[\overline{\mathbf{M}}_{4}\right],\left[\overline{\mathbf{M}}_{5}\right],\left[\overline{\mathbf{M}}_{6}\right]$ | Load equations coefficient matrices for convoluted generalized coordinate displacement, rate, and acceleration, respectively. |
| $\left\{\mathrm{N}_{0}\right\}$ | Number of zero crossings with positive slope per distance. |
| \{P\} | Coefficients of the special feedback transfer function. $\mathrm{P}(1), \mathrm{P}(2), \mathrm{P}(3)$ and $P(4), P(5), P(6), P(7)$ are the second-order functional coefficients for the numerator and denominator, respectively. |
| $\overline{\mathbf{q}}$ | Dynamic pressure, fore/unit area |
| $\{\mathrm{Q}\}$ or $\{\mathrm{q}\}$ | Generalized coordinates of the equations. |
| $\mathbf{Q M A G}_{\mathbf{L}}$ | Magnitude of the load solution at each solution frequency. |
| $\mathbf{Q M A G}_{\mathbf{R}}$ | Magnitude of the generalized coordinates at each solution frequency. |
| $\{\mathbf{R} \boldsymbol{\}}$ | Coefficients of the special feedback transfer function. $R(1), R(2), R(3)$ and $\mathbf{R}(4), \mathbf{R}(5), \mathbf{R}(6), R(7)$ are the zero-order functional coefficients for the numerator and denominator, respectively. |

8
$\left[\mathrm{s}_{1}\right],\left[\mathrm{s}_{2}\right],\left[\mathrm{s}_{3}\right]$
$\left[\mathbf{s}_{4}\right],\left[\mathbf{s}_{5}\right],\left[\mathbf{s}_{6}\right]$
$\left[\overline{\mathbf{S}}_{1}\right],\left[\overline{\mathbf{S}}_{2}\right],\left[\overline{\mathrm{S}}_{3}\right]$
$\left[\bar{S}_{4}\right],\left[\bar{S}_{5}\right],\left[\bar{S}_{6}\right]$,
[SPEC]
\{SUMC $\}$
\{ $\overline{\text { SUMC }}$ \}
[SUMM]
[SUMM]
\{T\}
\{u\}
$\mathrm{V}_{\mathrm{T}}$
$\{W\}$
$\left\{\mathrm{Wg}_{\mathrm{i}}\right.$ \}
$\mathrm{T}(\mathrm{i} \Omega)$
Z
$\alpha_{1}, \beta_{1}, \gamma_{1}$

Laplace operator $=\mathbf{i} \omega$.
Equations of motion special feedback coefficient matrices for generalized coordinate displacement, rate, and acceleration, respectively.
Equations of motion special feedback coefficient matrices for convoluted generalized coordinate displacement, rate, and acceleration, respectively.

Load equations special feedback coefficients matrices for generalized coordinate displacement, rate, and acceleration, respectively.
Load equations special feedback coefficient matrices for convoluted generalized coordinate displacement, rate, and acceleration, respectively.

Load output spectrum at each solution frequency.
Equations of motion forcing function summation matrix.
Load solutions at each solution frequency.
Generalized coordinate summation matrix.
Load equations summation matrix for generalized coordinates.
Coefficients of the special feedback transfer function. $T(1)$ and $T(2), T(3), T(4), T(5), T(6), T(7)$
are first-order functional coefficients for the numerator and denominator, respectively.
Coefficients of the special feedback transfer function. $\mathrm{U}(1), \mathrm{U}(2), \mathrm{U}(3)$, and $\mathrm{U}(4), \mathrm{U}(5), \mathrm{U}(6), \mathrm{U}(7)$ are first-order function coefficients for the numerator and denominator, respectively.
True airspeed velocity, length/sec.
Normalwash.
Normalwash caused by the gust from point i.
Complex frequency response function.
Scale factor on forcing function.
Wagner indicial lift growth coefficients.

| $\alpha_{2}, \beta_{2}, \gamma_{2}$ | Küssner indicial lift growth coefficients. |
| :---: | :---: |
| $\alpha_{\text {g }}$ | Gust angle, radians. |
| (t) | Wagner function. |
| $\psi(t)$ | Küssner function. |
| $\phi$ | Mode deflection |
| $\phi^{\prime}$ | Mode slope. |
| $\phi_{g}$ | Gust mode shape. |
| $\sigma_{r}$ | Root mean square (RMS) of response. |
| $\sigma_{\mathrm{g}}$ | Root mean square of gust velocity with zero mean. |
| $\Phi(\Omega)$ | Gust spectrum. |
| $\boldsymbol{\Omega}$ | Spatial frequency $=\omega / \mathrm{V}$, radian/unit length |
| $\omega$ | Frequency, rad/s. |
| $\boldsymbol{L}$ | Laplace transform. |
| [ $\widetilde{\phi}]$ | Equations of motion gradual penetration forcing function matrix. |
| $[\overline{\bar{\phi}}]$ | Load equations gradual penetration forcing function matrix. |
| $\zeta$ | Structural damping factor. |
| $\delta_{R}$ | Rudder angle. |
| $\delta_{\text {R1im }}$ | Rudder limit for special feedback transfer function. |
| $\kappa$ | Constant for the exponential input spectrum. |
| $\eta$ | Exponential power constant for the exponential input spectrum. |
| \J | Row matrix. |
| [] | Rectangular matrix. |
| \{\} | Column matrix. |
| $\left.{ }^{0}\right]$ | Diagonal matrix. |
| []$^{\mathbf{T}}$ | Transpose of the matrix. |
| $\stackrel{*}{*}$ | Indicates convolution. <br> Real part of complex number. |

### 4.0 ENGINEERING AND MATHEMATICAL DESCRIPTION

This program is capable of calculating steady state solutions for any linear second-order differential equations caused by sinusoidal forcing functions. Statistical characteristics of loads for the forcing function spectral shape may also be calculated using random harmonic analysis techniques.

The following engineering description is for the specific field of application: the analysis of airplane response and loads due to continuous random atmospheric turbulence.

### 4.1 EQUATIONS OF MOTION

In general, the equations of motion consist essentially of three parts:

1. Structural (generalized stiffness, inertia, and damping)
2. Aerodynamic (generalized response and excitation air forces)
3. Stability augmentation system (SAS) (equations relating system transfer functions and sensor signals)

The equations of motion can be represented in the form:
$($ Structural + SAS $)+($ Response Aerodynamics $)=($ Gust Excitation Aerodynamics $)$

$$
\begin{gather*}
\left(\left[\mathbf{M}_{1}\right]\{\mathrm{q}\}+\left[\mathrm{M}_{2}\right]\{\dot{\mathrm{q}}\}+\left[\mathbf{M}_{3}\right]\{\ddot{\mathrm{q}}\}\right)+\left(\left[\mathrm{M}_{4}\right]\{\dot{\mathrm{q}}\}^{*} \Phi+\left[\mathrm{M}_{5}\right]\{\ddot{\mathrm{q}}\}^{*} \Phi\right)  \tag{1}\\
=-\mathrm{Z}\left(\left\{\mathrm{C}_{2}\right\} \alpha_{\mathrm{g}}+\left\{\mathrm{C}_{3}\right\} \dot{\alpha}_{g^{*}} \psi\right)
\end{gather*}
$$

where:
M's, C's = Appropriate matrix coefficients
q's $\quad=$ Generalized coordinates including SAS degrees of freedom
$\alpha_{g} \quad=$ Gust angle
$\Phi \quad=$ Wagner function (equal one for no lift growth)
$\psi \quad=$ Küssner function (equal one for no lift growth)

* Indicates convolution

The composition of $\left[M_{1}\right],\left[M_{2}\right]$, and $\left[M_{3}\right]$ can be visually partitioned into the structural and SAS submatrices

$$
\begin{equation*}
\left[M_{i}\right]_{i=1,3}=\left[-\left[M_{\mathbf{i}_{\text {struct }}} M_{\mathbf{M}_{\mathbf{i}}}\right]_{\mathrm{SAS}}\right]_{\mathrm{i}=1,3} \tag{2}
\end{equation*}
$$

where:
$\left[\mathrm{M}_{1 \text { struct }}\right] \quad=$ Generalized structural stiffness
$\left[\mathrm{M}_{2_{\text {struct }}}\right] \quad=$ Generalized structural damping
$\left[\mathrm{M}_{3_{\text {struct }}}\right] \quad=$ Generalized structural inertia
The generalized structural inertia $\left[\mathrm{M}_{3}\right.$ struct $]=[\phi]^{\mathrm{T}}[\mathrm{M}][\phi]$ and the structural stiffness $\left[\mathrm{M}_{1_{\text {struct }}}\right]=\left[\dot{\omega}^{\mathbf{o}}\right][\phi]^{\mathrm{T}}[\mathrm{M}][\phi]$ are usually formed in vibration programs which require only geometric, structural stiffness, and mass data.

Generally, structural damping is assumed to be proportional to displacement but in phase with velocity. It can be written in the present notation as:

$$
\begin{equation*}
\mathbf{i}\left[\mathrm{gSD}_{\mathrm{s}}^{\circ}\right]\left[\mathbf{M}_{1}{ }_{\text {struct }}^{\circ}\right]\{\mathrm{q}\} \tag{3}
\end{equation*}
$$

where gSD $=2$ (structural damping factor, $\zeta$, on each degree of freedom).
This representation is generally associated with harmonic motion and is built into this program as an option. However, if an equivalent viscous damping representation is desired, the structural damping can be transformed into an equivalent viscous damping representation given as,

$$
\begin{equation*}
[\mathrm{gSD}]\left[\mathrm{M}_{1 \text { struct }}^{\circ}\right]^{1 / 2}\left[\mathrm{M}_{3}{ }_{\text {struct }}^{\circ}\right]^{1 / 2}\{\dot{\mathrm{q}}\} \tag{4}
\end{equation*}
$$

This representation is sometimes used with harmonic motion. However, it should be noted that when this method is used, the structural damping factor will vary with frequency and have a value of $\mathrm{gSD}^{\prime} 2$ only at the natural frequency of each mode.

The coefficients $\left[M_{i S A S}\right]_{i=1,3}$ represent the definition of the SAS equations and are not a function of the aerodynamic representation. Therefore, they are placed in the $M_{1}$ through $\mathrm{M}_{3}$ matrices.

Because this is a general-purpose program, the $\mathbf{M}_{4}$ and $\mathbf{M}_{5}$ matrices usually consist of the generalized response aerodynamic forces, with that portion of $M_{4}$ and $M_{5}$ corresponding to the SAS submatrices in $\mathrm{M}_{1}, \mathrm{M}_{2}$, and $\mathrm{M}_{3}$ equal to zero. The generalized response aerodynamic matrices are formed by the expression:

$$
[\phi]^{T}\left\{F_{a}\right\}
$$

where:
$\left\{F_{\mathbf{a}}\right\}=$ Aerodynamic force
[ $\phi$ ] = Mode deflection

In general, the aerodynamic force is given as

$$
\begin{equation*}
\left\{\mathrm{F}_{\mathbf{a}}\right\}=\overline{\mathbf{q}}[\mathbf{A I C}]\{\mathbf{W}\} \tag{5}
\end{equation*}
$$

where:
$\{\mathrm{W}\}=$ Normalwash vector

$$
=\left[\phi^{\prime}\right]\{q\}+\frac{1}{\mathbf{V}_{\mathbf{T}}}[\phi]\{\dot{\mathrm{q}}\}
$$

$\overline{\mathbf{q}} \quad=$ Dynamic pressure
$\left[\phi^{\prime}\right]=$ Mode slope
$[A I C]=[A]+i[B] ;[B]=0$ if (reduced frequency) $k=0$
Note: $M_{4}$ and $M_{5}$ are only valid for the specific $\omega$ corresponding to the reduced frequency, $k$, that was used to calculate the imaginary AIC matrix [B].

The generalized excitation matrix $\left\{C_{3}\right\}$, which is generally caused by gust, may remain complex and similarly may be written:

$$
\begin{equation*}
\left\{\mathrm{C}_{3}\right\} \alpha_{\mathrm{g}}=\overline{\mathrm{q}}[\phi]^{\mathrm{T}}[\mathrm{AIC}]\left\{\mathrm{W}_{\mathrm{g}}\right\} \tag{6}
\end{equation*}
$$

where $\left\{\mathbf{W}_{\mathrm{g}}\right\}=\left\{\phi_{\mathrm{g}}\right\} \mathrm{e}^{\mathrm{i} \omega \mathrm{t}}$ for harmonic motion,
also

$$
\begin{aligned}
W_{g i} & =e^{i \omega\left(t-\frac{\ell_{i}}{V}\right)} \\
& =e^{i \omega t} e^{-i \omega \frac{\ell_{i}}{V}}
\end{aligned}
$$

then

$$
\begin{equation*}
\left\{W_{g}\right\}=\left\{e^{-i \omega \frac{\ell \mathbf{i}}{V}}\right\} e^{i \omega t} \tag{7}
\end{equation*}
$$

so define

$$
\left\{\phi_{\mathrm{g}}\right\}=\left\{\begin{array}{l}
\mathrm{e} \omega \frac{\ell_{\mathbf{i}}}{\mathrm{V}}
\end{array}\right\}
$$

Note: If $\ell_{i}=0$ (no gust penetration), then $\left\{\phi_{g}\right\}=\{1\}$.

### 4.2 LOAD EQUATIONS

The load equations follow the same format as the equations of motion.

$$
\begin{align*}
\{\text { Load }\}= & {\left[\overline{\mathrm{M}}_{1}\right]\{\mathrm{q}\}+\left[\overline{\mathrm{M}}_{2}\right]\{\dot{\mathrm{q}}\}+\left[\overline{\mathrm{M}}_{3}\right]\{\ddot{\mathrm{q}}\} } \\
& +\left[\overline{\mathrm{M}}_{4}\right]\{\dot{\mathrm{q}}\}^{*} \Phi+\left[\overline{\mathrm{M}}_{5}\right]\{\ddot{\mathrm{q}}\}^{*} \Phi+|\mathbf{Z}|\left(\left\{\overline{\mathrm{C}}_{2}\right\} \boldsymbol{\alpha}_{\mathbf{g}}+\left\{\overline{\mathrm{C}}_{3}\right\} \dot{\alpha}_{\mathbf{g}}{ }^{*} \psi\right) \tag{9}
\end{align*}
$$

where:
$\left[\bar{M}_{1}\right],\left[\overline{\mathbf{M}}_{2}\right],\left[\overline{\mathrm{M}}_{3}\right]=$ Load matrix coefficients of the generalized coordinate displacement, rate, and acceleration, respectively
$\left[\overline{\mathbf{M}}_{4}\right],\left[\overline{\mathbf{M}}_{5}\right] \quad=$ Load matrix coefficients of the generalized coordinate rate and acceleration convoluted with the Wagner function
$\left\{\overline{\mathrm{C}}_{2}\right\} \quad=$ Load matrix coefficient of the excitation function (usually gust angle $\alpha_{g}$ )
$\left\{\overline{\mathrm{C}}_{3}\right\} \quad=$ Load matrix coefficient of the excitation function convoluted with the Küssner function
$\Phi \quad=$ Wagner function
$\psi \quad=$ Küssner function
$\mathrm{q}, \dot{\mathrm{q}}, \ddot{\mathrm{q}}, \quad=$ Generalized coordinate displacement, velocity, and acceleration responses, respectively
*
Indicates convolution
Relating these matrices in a physical sense, $\left[\bar{M}_{1}\right]$, $\left[\bar{M}_{2}\right]$, and $\left[\bar{M}_{3}\right]$ are usually associated with the load resulting from structural response; $\left[\bar{M}_{4}\right]$ and $\left[\bar{M}_{5}\right.$ ] are usually associated with the load resulting from aerodynamic response; $\left\{\bar{C}_{3}\right\}$ is usually associated with the load resulting from the gust excitation force.

### 4.3 SOLUTION TECHNIQUE

The steady state solution for the equations of motion and load equations caused by sinusoidal forcing functions is obtained by using the Laplace transform technique. Taking the Laplace transform of the equations of motion and load equations results in the form:

Equations of Motion

$$
\begin{align*}
& {\left[\mathbf{M}_{1}\right]+\left[\mathrm{igSD}^{\circ}{ }^{\circ}{ }_{1} \text { struct }\right]+\mathrm{s}\left[\mathrm{M}_{2}\right]+\mathrm{s}^{2}\left[\mathrm{M}_{3}\right]+\mathrm{g}(\mathrm{~s})\left[\mathbf{M}_{4}\right]+\mathrm{sg}(\mathrm{~s})\left[\mathrm{M}_{5}\right]\{f(\mathrm{q})\}} \\
& =-\mathrm{Z}\left[\left\{\mathrm{C}_{2}\right\}+\mathrm{f}(\mathrm{~s})\left\{\mathrm{C}_{3}\right\}\right] \mathcal{L}\left(\alpha_{\mathrm{g}}\right) \tag{10}
\end{align*}
$$

where:

$$
\begin{aligned}
& \mathrm{g}(\mathrm{~s})=\mathrm{s} \mathcal{L}[\Phi]=\mathrm{a}_{1}-\frac{\mathrm{b}_{1} \mathrm{~s}}{\mathrm{~s}+\alpha_{1}}-\frac{\mathrm{c}_{1} \mathrm{~s}}{\mathrm{~s}+\beta_{1}}-\frac{\mathrm{d}_{1} \mathrm{~s}}{\mathrm{~s}+\gamma_{1}} \\
& \mathrm{f}(\mathrm{~s}) \quad=\mathrm{s} \mathcal{L}[\psi]=\mathrm{a}_{2}-\frac{\mathrm{b}_{2} \mathrm{~s}}{\mathrm{~s}+\alpha_{2}}-\frac{\mathrm{c}_{2} \mathrm{~s}}{\mathrm{~s}+\beta_{2}}-\frac{\mathrm{d}_{2} \mathrm{~s}}{\mathrm{~s}+\gamma_{2}}
\end{aligned}
$$

gSD = Structural damping factor
Z = Scaling factor
s $\quad=$ Laplace operator $=i \omega$
and using the relationship that the Laplace transform of the convolution theorem gives Duhamel's formula:

$$
\begin{equation*}
\mathcal{L}[f(t)] \mathcal{L}[q(t)]=\mathcal{L}\left[\int_{0}^{t} f(t-\lambda) q(\lambda) d \lambda\right] \tag{11}
\end{equation*}
$$

Load Equations

$$
\begin{align*}
\text { Load }= & \left\{\left[\overline{\mathbf{M}}_{1}\right]+\mathrm{s}\left[\overline{\mathrm{M}}_{2}\right]+\mathrm{s}^{2}\left[\overline{\mathrm{M}}_{3}\right]+\mathrm{g}(\mathrm{~s})\left[\overline{\mathrm{M}}_{4}\right]+\mathrm{sg}(\mathrm{~s})\left[\overline{\mathrm{M}}_{5}\right]\right\}\{\mathcal{L}(\mathrm{q})\} \\
& +|\mathrm{Z}|\left\{\left\{\overline{\mathrm{C}}_{2}\right\}+\mathrm{f}(\mathrm{~s})\left\{\overline{\mathrm{C}}_{3}\right\}\right\} \mathcal{L}\left(\alpha_{\mathrm{g}}\right) \tag{12}
\end{align*}
$$

Thus, generalized coordinated and load frequency response functions are easily obtained by solving equations (10) and (12).

The matrix coefficients for the equations of motion and load equations may be either independent of frequency or frequency dependent. However, for the frequency-dependent matrices, a linear interpolation of the matrix coefficients is used to form additional matrices at frequencies intermediate to those formed external to this program. This interpolation process is necessary so that the equations of motion and load equations may be evaluated at a sufficient number of frequencies to adequately define the frequency response function, while generating as few input matrices as necessary. The selection of frequencies is dependent upon the damping in the system, the frequency range over which the contribution of the responses significantly affect the final RMS loads, the number of modes used, and the frequency separation between modes. For typically low-damped dynamic models, this requires the solution of the equations of motion at a large number of frequencies (on the order of 200 to 250 ). The selection of frequencies is delegated to the engineering user, and the number must be kept to a minimum to reduce costs, yet must be sufficient to adequately define the frequency response functions. This interpolation is required for only the response and gust excitation aerodynamic matrices since the structural matrices and the SAS equations remain constant with frequency.

Power spectral density (PSD) load parameters, root mean square (RMS) load/root mean square gust velocity ( $\overline{\mathrm{A}}$ ), and number of zero crossings ( $\mathrm{N}_{\mathbf{0}}$ ) can be calculated using the load frequency response functions. The equations for $\bar{A}$ and $N_{0}$ are

$$
\begin{equation*}
\bar{A}=\left[\int_{0}^{\infty}|T(i \Omega)|^{2} \Phi(\Omega) \mathrm{d} \Omega\right]^{1 / 2} \tag{13}
\end{equation*}
$$

and

$$
\begin{equation*}
\mathrm{N}_{0}=\frac{1}{2 \pi \bar{A}}\left[\int_{0}^{\infty} \Omega^{2}|T(i \Omega)|^{2} \Phi(\Omega) \mathrm{d} \Omega\right]^{1 / 2} \tag{14}
\end{equation*}
$$

where:
$T(i \Omega)=$ Load frequency response
$\boldsymbol{\Phi}(\Omega)=$ Gust spectrum
In practice, the upper limit (infinity) of the integral is replaced by the finite value of the last discrete frequency used in the solution of the transfer function.

### 5.0 PROGRAM STRUCTURE AND DESCRIPTION

Program L221 (TEV156) has been constructed as an overlay system consisting of a main overlay and three primary overlays:

| Main overlay | (L221,0,0) | L221 |
| :--- | :--- | :--- |
| Primary overlay | (L221,1,0) | FINDRMS |
| Primary overlay | (L221,2,0) | -SORTQLS |
| Primary overlay | (L221,3,0) | PLOTQLS |

The main overlay L221 simply reads cards to determine which primary overlays are to be called, calls the proper primary overlays into execution, and aids in communication between overlays through labeled common blocks.

FINDRMS performs the actual calculations of L221 (TEV156).
SORTQLS sorts the results of FINDRMS and prepares a magnetic file of data vectors suitable for plotting.

PLOTQLS sorts the results of FINDRMS and prepares a magnetic file of plot instructions for the COMp80 plotter.

A schematic of the L221 (TEV156) overlay structure is presented in figure 1. A description of each overlay follows.

### 5.1 PROGRAM L221

L221 is the program name of the (L221,0,0) overlay. This overlay repeatedly reads cards to determine the type of execution to be performed and calls primary overlays to perform the necessary operations.

The following is a list of keywords used to control the execution of the system's primary overlays.
\$FREQuency Indicates that the input data following this card is for use by L221 (TEV156).
\$TITLe Is printed and ignored.
\$FINDrms Causes the execution of program FINDRMS, (L221,1,0), which performs all of the computations of L221 (TEV156).
\$SORTqls Causes the execution of program SORTQLS, (L221,2,0), which sorts the results of FINDRMS and prepares a magnetic file of data vectors suitable for plotting.

$\overline{\mathrm{A}}$ 's and Zero Crossings

All magnetic files except "TAPE99" are written in READTPNWRTETP formats. "TAPE99" is a file written by PLOTQLS which is suitable for plotting on the COMp80.

Figure 1.-L221 (TEV156) Overlay Structure and Input/Output Files
\$PLOTqls Causes the execution of program PLOTQLS, (L221,3,0), which sorts the results of FINDRMS and prepares a magnetic file of plot instructions for the COMp80 plotter.

Causes the maximum field length limit to be changed. The field length limit default value is 200000 octal.

Triggers a special option to aid a programmer testing fatal error logic paths within L221 (TEV156). The option causes the clearing of the fatal error flag and allows execution to continue. This option is not intended for use during normal program executions.
\$QUIT

### 5.2 PROGRAM FINDRMS

Program FINDRMS, overlay (L221,1,0), performs all of the computations of L221 (TEV156). Given an input power spectrum $\Phi(\Omega)$ over a range of frequencies ( $\Omega_{1}, \Omega_{2}, \ldots, \Omega_{\text {NFREQ }}$ ), matrices of equations of motion, load equations, and excitation forces, FINDRMS will find:
$\{Q\} \quad$ Response function of the generalized coordinates at each solution frequency
\{ $\overline{\text { SUMC }}\}$ Response function of the load at each solution frequency
and integrate over the range of frequencies to find:
$\{\overline{\mathbf{A}}\} \quad$ RMS load values
$\left\{N_{0}\right\} \quad$ Number of zero crossings per unit length
The FINDRMS operations are divided into the following 10 steps to obtain the solutions of the generalized coordinates.

1. Read card input of options and constants.
2. Read card or magnetic file input of equations of motion $\left[M_{1}\right],\left[M_{2}\right], \ldots,\left[M_{6}\right]$ and $\left[S_{1}\right],\left[S_{2}\right], \ldots,\left[S_{6}\right]$ for feedback plus the excitation forces $\left\{C_{2}\right\}$ and $\left\{C_{3}\right\}$ or $\left\{f_{\ell}\right\}$ and $[\tilde{\phi}]$ for gust penetration. This includes $\{F R E Q M\}$ (frequencies associated with $k$-value aerodynamics) if NKVAL $>0$.

Note: $\left[\mathrm{M}_{6}\right],\left[\mathrm{S}_{\mathrm{i}}\right]$, and $\left\{\mathrm{C}_{2}\right\}$ are not used when using the DYLOFLEX system.
3. For each of the NFREQ frequencies, solve for $\{Q\}$ the generalized coordinates, save $\{Q\}$ on the scratch file, and optionally print $\{Q\}$. The generalized coordinates are found by solving the following equation.

$$
\begin{equation*}
[\text { SUMM }]\{Q\}=\{S U M C\} \tag{15}
\end{equation*}
$$

where:

$$
\begin{align*}
{[\text { SUMM }]=} & {\left[\mathrm{M}_{1}\right]+\mathrm{i}[\stackrel{\circ}{\mathrm{gSD}}]\left[{\left.\stackrel{\circ}{M_{1}}\right]+\mathrm{s}\left[\mathrm{M}_{2}\right]+\mathrm{s}^{2}\left[\mathrm{M}_{3}\right]}+\mathrm{g}(\mathrm{~s})\left[\mathrm{M}_{4}\right]+\mathrm{sg}(\mathrm{~s})\left[\mathrm{M}_{5}\right]+\mathrm{s}^{2} \mathrm{~g}(\mathrm{~s})\left[\mathrm{M}_{6}\right]\right.}
\end{align*}
$$

where:
s $\quad=\mathrm{i} \omega$, Laplace transform variable
$g(s)=$ Laplace transform of the Wagner function

$$
=a_{1}-\frac{b_{1} s}{s+\alpha_{1}}-\frac{c_{1} s}{s+\beta_{1}}-\frac{d_{1} s}{s+\gamma_{1}}
$$

For a solution with feedback, the following terms are also added to [SUMM].

$$
\begin{equation*}
\text { Fydamp }\left[\left[S_{1}\right]+s\left[S_{2}\right]+s^{2}\left[S_{3}\right]+g(s)\left[S_{4}\right]+s g(s)\left[S_{i j}\right]+s^{2} g(s)\left[S_{6}\right]\right] \tag{17}
\end{equation*}
$$

where:
Fydamp $=\frac{G\left(P_{1} s^{2}+U_{1} s+R_{1}\right)\left(P_{2} s^{2}+U_{2} s+R_{2}\right)\left(P_{3} s^{2}+U_{3} s+R_{3}\right)\left(T_{1} s+1\right)}{\left(P_{4} s^{2}+U_{4} s+R_{4}\right) \ldots\left(P_{7} s^{2}+U_{7} s+R_{7}\right)\left(T_{2} s+1\right) \ldots\left(T_{7} s+1\right)}$

$$
\begin{equation*}
\{\operatorname{SUMC}\}=-Z\left\{f(s)\left\{C_{3}\right\}+\left\{C_{2}\right\}\right\} \tag{18}
\end{equation*}
$$

where:
$\mathbf{f}(\mathbf{s})=$ Laplace transform of the Küssner function

$$
=a_{2}-\frac{b_{2} s}{s+\alpha_{2}}-\frac{c_{2} s}{s+\beta_{2}}-\frac{d_{2} s}{s+\gamma_{2}}
$$

When gradual penetration is requested, $\left\{C_{3}\right\}$ is frequency dependent and will be calculated as

$$
\begin{equation*}
\left\{\mathrm{C}_{3}\right\}=\mathrm{C}\left\{[\tilde{\phi}] \cos \left\{\Omega\left\{\mathrm{f}_{\ell}\right\}\right\}-\mathrm{i}[\tilde{\phi}] \sin \left\{\Omega\left\{\mathrm{f}_{\ell}\right\}\right\}\right\} \tag{19}
\end{equation*}
$$

Note: Optionally, the input matrices $\left[\mathrm{M}_{4}\right],\left[\mathrm{M}_{5}\right],\left[\mathrm{M}_{6}\right]$, and $\left\{\mathrm{C}_{3}\right\}$ or [ $\left.\tilde{\boldsymbol{\phi}}\right]$ are frequency dependent. Interpolation is required to define those matrices at each frequency (NFREQ), before calculating [SUMM], \{SUMC\}, and \{Q\}.

Optionally, the user may specify multiple forcing functions causing the matrices $\left\{C_{3}\right\}$, $\{S U M C\}$, and $\{Q\}$ to be rectangular. (See appendix $C$ for a discussion of the multiple forcing function option.)

Optionally, the user may specify certain degrees of freedom to be deleted. This is accomplished by zeroing the appropriate degrees of freedom in the [SUMM] and \{SUMC\} matrices.
4. Modify the equations of motion for a static-elastic solution and repeat step 3. Chosen columns of the matrices [ $\mathrm{M}_{2}$ ], $\left[\mathrm{M}_{3}\right],\left[\mathrm{M}_{5}\right.$ ], and [ $\mathrm{M}_{6}$ ] are set equal to zero for the static-elastic solution; optional.

The loads are solved by the following steps.
5. Read card or magnetic file input of load equations $\left[\overline{\mathrm{M}}_{1}\right],\left[\overline{\mathrm{M}}_{2}\right]_{\text {m }_{6}} \ldots,\left[\overline{\mathrm{M}}_{6}\right]$ and [ $\left.\overline{\mathrm{S}}_{1}\right]$, $\left[\overline{\mathrm{S}}_{2}\right], \ldots,\left[\overline{\mathrm{S}}_{6}\right]$ for feedback plus the matrices $\left\{\overline{\mathrm{C}}_{2}\right\}$ and $\left\{\overline{\mathrm{C}}_{3}\right\}$ or $[\phi]$.

Note: $\left[\overline{\mathrm{M}}_{6}\right],\left[\overline{\mathrm{S}}_{\mathrm{i}}\right]$, and $\left\{\overline{\mathrm{C}}_{2}\right\}$ are not used when using the DYLOFLEX system.
6. For each frequency read $\{Q\}$ (from step 3); calculate $\{\overline{S U M C}\}$, the input spectrum $\phi(\Omega)$, and the output spectrum $\{\overline{S P E C}\}$; optionally write data on magnetic files "IPLTPE" and "IRTAPE"; optionally print \{SUMC $\}$, and keep a running integration over the frequencies of $\{\bar{A}\}$ and $\left\{N_{0}\right\}$.

$$
\begin{equation*}
\{\overline{\mathrm{SUMC}}\}=[\overline{\mathrm{SUMM}}]\{\mathbf{Q}\}+|\mathrm{Z}|\left\{\mathrm{f}(\mathrm{~s})\left\{\overline{\mathrm{C}}_{\mathbf{3}}\right\}+\left\{\overline{\mathrm{C}}_{\mathbf{2}}\right\}\right\} \tag{20}
\end{equation*}
$$

where:
$[\overline{\mathrm{SUMM}}]=\left[\overline{\mathrm{M}}_{1}\right]+\mathrm{s}\left[\overline{\mathrm{M}}_{2}\right]+\mathrm{s}^{2}\left[\overline{\mathrm{M}}_{3}\right]+\mathrm{g}(\mathrm{s})\left[\overline{\mathrm{M}}_{4}\right]+\mathrm{sg}(\mathrm{s})\left[\overline{\mathrm{M}}_{5}\right]+\mathrm{s}^{2} \mathrm{~g}(\mathrm{~s})\left[\overline{\mathrm{M}}_{6}\right]$
For a solution with feedback, the following terms are also added to [ $\overline{\text { SUMM }}$ ].

$$
\begin{equation*}
\text { Fydamp }\left[\left[\bar{S}_{1}\right]+s\left[\bar{S}_{2}\right]+\mathrm{s}^{2}\left[\overline{\mathrm{~S}}_{3}\right]+\mathrm{g}(\mathrm{~s})\left[\overline{\mathrm{S}}_{4}\right]+\mathrm{sg}(\mathrm{~s})\left[\overline{\mathrm{S}}_{5}\right]+\mathrm{s}^{2} \mathrm{~g}(\mathrm{~s})\left[\overline{\mathrm{S}}_{6}\right]\right] \tag{21}
\end{equation*}
$$

When gradual penetration is requested, $\left\{\overline{\mathrm{C}}_{3}\right\}$ is frequency dependent and will be calculated as:

$$
\begin{equation*}
\left\{\overline{\mathrm{C}}_{3}\right\}=\overline{\mathrm{C}}\left\{[\overline{\bar{\phi}}] \cos \left\{\Omega\left\{\mathbf{f}_{\ell}\right\}\right\}-\mathrm{i}[\stackrel{\widetilde{\delta}}{\boldsymbol{\phi}}] \sin \left\{\Omega\left\{\mathbf{f}_{\ell}\right\}\right\}\right\} \tag{22}
\end{equation*}
$$

The integration for $\{\overline{\mathrm{A}}\}$ and $\left\{\mathrm{N}_{\mathrm{o}}\right\}$ at one load, $\ell$, is shown as:

$$
\begin{gather*}
\overline{\mathrm{A}}_{\ell}=\sqrt{\sum_{\mathrm{i}=1}^{\mathrm{NFREQ}}\left(\frac{\mathrm{SPEC}_{\ell \mathrm{i}}+\mathrm{SPEC}_{\ell \mathrm{i}-1}}{2}\right)\left(\Omega_{\mathrm{i}}-\Omega_{\mathrm{i}-1}\right)}  \tag{23}\\
\mathrm{N}_{\mathrm{o}_{\ell}}=\left(\frac{1}{2 \pi \overline{\mathrm{~A}}_{\ell}}\right) \sqrt{\sum_{\mathrm{i}=1}^{\mathrm{NFREQ}}\left(\frac{\mathrm{SPEC}_{\ell \mathrm{i}} \Omega_{\mathrm{i}}^{2}+\mathrm{SPEC}_{\ell \mathrm{i}-1} \Omega_{\mathrm{i}-1}}{2}\right)\left(\Omega_{\mathrm{i}}-\Omega_{\mathrm{i}-1}\right)} \tag{24}
\end{gather*}
$$

where $\mathrm{SPEC}_{\ell i}$ is the output spectrum calculated for load $\ell$ at frequency $i$ and is found by:

$$
\begin{equation*}
\mathrm{SPEC}_{\ell \mathbf{i}}=\phi\left(\Omega_{\mathbf{i}}\right)^{*}\left|\overline{\mathrm{SUMC}}_{\ell \mathbf{i}}\right|^{2} \tag{25}
\end{equation*}
$$

where $\left|\overline{\operatorname{SUMC}}_{\ell \mathrm{i}}\right|$ is the absolute value of the complex number $\overline{\mathrm{SUMC}}_{\ell \mathrm{i}}$.

The input spectrum value $\phi(\Omega)$ is found by the user's choice of one of the three following equations:

$$
\begin{align*}
& \phi(\Omega)=\frac{\mathrm{L}}{\pi} \frac{1+3(\mathrm{~L} \Omega)^{2}}{\left[1+(\mathrm{L} \Omega)^{2}\right]^{2}} \text { Dryden }  \tag{26}\\
& \phi(\Omega)=\frac{\mathrm{L}}{\pi} \frac{1+8 / 3(1.339 \mathrm{~L} \Omega)^{2}}{\left[1+(1.339 \mathrm{~L} \Omega)^{2}\right] \frac{11}{6}} \text { Von Karman }  \tag{27}\\
& \phi(\Omega)=\kappa(\Omega)^{-\mathrm{n}} \quad \text { Exponential }
\end{align*}
$$

or by interpolation over a user-supplied tabular spectrum.
7. Print $\{\bar{A}\}$ and $\left\{N_{o}\right\}$ and optionally punch them on cards.
8. Check the correlation between the different load responses requested by card input data; optional.

Note: Optionally, the input matrices $\left[\overline{\mathrm{M}}_{4}\right],\left[\overline{\mathrm{M}}_{5}\right],\left[\overline{\mathrm{M}}_{6}\right],\left\{\overline{\mathrm{C}}_{3}\right\}$ or [ $\left.\mathrm{F} \boldsymbol{\phi}\right]$ are frequency dependent. Interpolation is required to define these matrices at each frequency before calculating [SUMM], \{SUMC $\}$, etc., in step 6.

Optionally, the user may specify multiple forcing functions causing the matrices $\left\{\overline{\mathrm{C}}_{3}\right\}$ and $\{\overline{\mathrm{SUMC}}\}$ to be rectangular. (See appendix C for a discussion of the multiple forcing function option.)

Optionally, the user may specify certain degrees of freedom to be deleted. This is accomplished by zeroing the appropriate degrees of freedom in the [ $\overline{\text { SUMM }}$ ] matrix.
9. Modify the load equations for a static-elastic solution; set chosen columns of $\left[\overline{\mathrm{M}}_{2}\right]$, [ $\overline{\mathrm{M}}_{3}$ ], $\left[\overline{\mathrm{M}}_{5}\right.$ ] and [ $\overline{\mathrm{M}}_{6}$ ] to zero; and repeat steps 6, 7, and 8; optional.
10. For additional sets of load equations, repeat steps 5 through 9 ; optional.

### 5.3 PROGRAM SORTQLS

Program SORTQLS, overlay (L221,2,0), which sorts generalized coordinate and load responses, is called to process data written on the magnetic file "IPLTPE" by program FINDRMS and to write an output magnetic file "NEWTPE" which contains pairs of matrices, independent and dependent variables, to be plotted by a subsequent program. program.
"IPLTPE" contains one file of data (see fig. 11) for each FINDRMS solution. Each file begins with the frequency array \{FREQ\}, a $1 \times$ NFREQ matrix, and is followed by NFREQ groups of the three or four arrays below. $\{\bar{A}\}$ will be present only if IPLRMS $=1$ on FINDRMS card 4.3.

### 6.0 COMPUTER PROGRAM USAGE

The program was designed for use on the CDC 6600. The machine requirements to execute L221 (TEV156) are:

| Card reader | Read control cards and card input data. |
| :--- | :--- |
| Printer | Print standard output information, optional intermediate <br> calculations, and diagnostic messages. |
| Disk storage | All magnetic files not specifically defined as magnetic tapes are <br> assumed to be disk files. |
| Tape drive | For permanent storage of data. Magnetic files are copied to and from <br> magnetic tapes with control cards before and after program <br> execution. |
| Card punch | Punch the final $\bar{A}$ values and number of zero crossings; optional. |

Program L221 (TEV156) is written in FORTRAN and may be compiled with either the RUN or FTN compiler. L221 (TEV156) may be executed on either the KRONOS 2.1 or NOS operating system.

### 6.1 CONTROL CARDS

The following list is a typical set of control cards used to execute L221 (TEV156) using the absolute binaries from the program's master tape.

Job Card
Account Card
-

REQUEST (MASTER,F=I,LB=KL,VSN=66XXXX)

.--End-of-file
The following list is a typical set of control cards used to execute L221 (TEV156) using the relocatable binaries from the program's master tape.

### 6.2 RESOURCE ESTIMATES

The computer resources used (core requirements, tapes, printed output, time, etc.) are functions of the problem size and program options used. Table 1 contains examples of the resources used for a number of sample problems.

|  | SAMPLE PROBLEMS |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 | 2 | 3 | 4 | 5 |
| NDOF | 7 | 7 | 7 | 8 | 7 |
| NFREQ | 10 | 10 | 10 | 210 | 72 |
| NFORC | 0 | 0 | 0 | 0 | 6 |
| NKVAL | 0 | 0 | 10 | 20 | 0 |
| NLD | 6 | 6,9* | 6 | 8 | 7 |
| CPU Seconds | 2 | 25 | 2 | 15 | 10 |
| Disk Requests | 100 | 450 | 80 | 310 | 350 |
| Disk Sectors | 830 | 3500 | 350 | 1300 | 1800 |
| Lines Printed | 800 | 2000 | 200 | 2400 | 3300 |
| Required Core: (Octal) | 122000 | 122000 | 122000 | 123000 | 125000 |
| FINDRMS |  |  |  |  | 124000 |
| SORTQLS |  | 43000 |  |  |  |
| PLOTQLS |  | 66000 |  |  |  |

* The problem has two load sets.

## Wield Lemgth

The field length required by L 221 (TEV156) is dependent on the problem size and the program module(s) used. Core must be requested for the largest module to be run: either FINDRMS, SORTQLS, or PLOTQLS. The default maximum core size established in L221 (TEV156) is 200000 octal.

Field length $=\mathrm{FLp}+\mathrm{FLm}$
where FLp is the program length, and FLm is the matrix storage required.
The module(s) have the following octal values of FLp:
FINDRMS 125000
PLOTQLS 66000
SORTQLS 60000
For FINDRMS, the computed value of FLm is the larger of FLq or FL $\ell$.
FLq $=$ Core required for equations of motion
$=$ NFREQ

+ NDQF $(8$ (NFORC) +3 )
$+\mathrm{NDOF}^{2}(\mathrm{NMi}+2)$
+ NDOF; if static elastic
+ NDOFD; if deletion of freedoms
+ NDOF (2 (NPAN)) + NPAN; if gradual penetration
$+\mathrm{NDOF}^{2}(\mathrm{NSi})+3$ (NDOF); if feedback
+ NDOF $^{2}(4($ NFORC $)+6)+$ NKVAL; if NKVAL $>1$
+ NDOF(4 (NPAN)); if NKVAL $>1$ and gradual penetration
$F L \ell=$ Core required for load equations

$$
\begin{aligned}
= & \text { NFREQ }+3(\text { NDOF }) \\
& +3(\mathrm{NLD}) \\
& +\mathrm{NLD}(\mathrm{NDOF})(\mathrm{NM} \bar{M} i+2)
\end{aligned}
$$

```
+ NLD(6 (NFORC))
+NFORC(NFORC + 1)
+ NDOF; if static elastic
+ NDOFD; if deletion of freedoms
+ 32(ICORR); if correlation
+ NPAN(2 (NLD) + 1); if gradual penetration
+ NLD(NDOF)(NSi) + 3(NDOF); if feedback
+ NLD(6 (NDOF) + 2(NFORC) + NKVAL); if NKVAL > 1
+NLD(4 (NPAN)); if NKVAL > 1 and gradual penetration
```

For SORTQLS, the computed value of FLm is:
$F L m=N_{2} R E Q^{*}(N R+1)+N F R E Q * N R ;$ if pairing is to take place
where $N R$ is the larger of NDOF or NLD.

For PLOTQLS, the computed value of FLm is the same as for SORTQLS.
Note: FLm for FINDRMS, SORTQLS, and PLOTQLS must be converted to an octal base number before being added to FLp to find the required field length.

Time Estimate

The following factors will be used to calculate the CPU time in seconds for L221 (TEV156), FINDRMS, SORTQLS, and PLOTQLS.
$\mathrm{a}=1$; if IPLTPE $=0$
$=1.2$; if IPLTPE $>0$
$b=1$; if ISTATE $=0$
2 ; if ISTATE $>0$
$\mathrm{c}=1$; if IPRINT $=0$
1.5 ; if IPRINT $>0$
$\mathrm{d}=1$; if IFDBAK $=0$
1.2; if IFDBAK $>0$

$$
\begin{aligned}
& \mathrm{CP}_{\text {FINDRMS }}=\left[(\mathrm{b} * \mathrm{c} * \mathrm{~d}) * \frac{\text { NFREQ*NDOF }}{}{ }^{2}\right] \\
& \left.+\left[\frac{(a * b * c * d)}{3000} * \sum_{i=1}^{\text {NSETS }} \text { NFREQ*(NLD } D_{i} * \text { NDOF }\right)\right] \\
& \mathrm{CP}_{\text {SORTQLS }}=1 \text { second per item sorted } \\
& \text { CPPLOTQLS }=1 \text { second per item plotted } \\
& \mathrm{CP}_{\text {L221 }}=10 .+\mathrm{CP}_{\text {FINDRMS }}+\mathrm{CP}_{\text {SORTQLS }}+\mathrm{CP}_{\text {PLOTQLS }}
\end{aligned}
$$

The printed output line limit has been set to 100000 lines which should be enough for any L221 (TEV156) execution.

## Punched Output

When punched output is requested ( $\mathrm{IPUNCH}=1$ on card 4.3 of FINDRMS), the number of cards punched will be

$$
\frac{3}{7} ; \sum_{i=1}^{\text {NSETS }} \text { NLD }_{i}
$$

where:
NSETS $=$ Number of load sets
NLD $_{\mathbf{i}}=$ Number of loads in set i

### 6.3 CARTD INPUT DATA

The card input described in sections 6.3.2 to 6.3.5 is summarized in section 6.3.6. The summary is a quick reference for the necessary card input and is included for use only after familiarity with the program has been obtained.

The task(s) performed by L221 (TEV156) are broken into three subtasks, each with its own section of code known as a primary overlay. The entire set of primary overlays is driven by a small program (main overlay) named l221.

L221 reads program directive cards to:

- Assure that the data being read is intended for L221 (TEV156)
- Determine which section of code (primary overlay) of L221 is to be executed next

Each primary overlay has its own card input data sets. The primary overlays and data set numbers are listed in table 2 .

Table 2.-Primary Overlays and Data Set Numbers

| Overlay |  | Data sets | Purpose of primary overlay |
| :---: | :---: | :---: | :---: |
| Number | Name |  |  |
| 1 | FINDRMS | 2 through 49 | Calculate the generalized coordinates and loads over a range of frequencies and find the RMS values of loads, $\bar{A}$, and the' number of zero crossings, $N_{o}$. |
| 2 | SORTOLS | 50 through 61 | Sort data generated by FINDRMS and write a magnetic file containing the data in vectors (frequency dependent) suitable for plotting. |
| 3 | PLOTQLS | 62 through 79 | Sort data generated by FINDFMS and write a magnetic file containing plot instructions and data for the COMp80 plotter. |

The order in which these card sets are input (and the overlays are executed) is displayed in figure 2.

Figure 2.-Flow of L221 (TEV156) Card Input Data

## 6.s.1 FORMAT OF CARD INPUT DATA

All card data are read in fixed fields-specific columns of the cards. The required card columns are defined next to each keyword or variable on the pages that follow. Note the following conventions used throughout the program:
-. All floating point variables are read with format E10.0

- All integer variables are read with format I5.
- All hollerith variables (keywords, etc.) are read with format A10.

Therefore, all data fields end on a card column which is a multiple of five.
When the program is trying to recognize keywords, it checks only the first five characters. Any additional characters are ignored.

## Format of Matrices Input on Cards

Matrices are read from cards by rows (each row begins on a new card) with the format 7E10.0. When a matrix contains only one column, the transpose of the matrix is read from cards.

## Example:

If [ $M_{1}$ ] is to be input as a 9 by 9 matrix, 18 cards will be needed.

### 6.3.2 PROGRAM L221

The driving module of L221 (TEV156) (the main overlay is known as L221) will read and check the first five characters of the input card to determine the type of execution that is to take place.

Note: All underlined capital characters contained in the KEYWORD/VARIABLE field of the input card sets must be left justified and punched in the card columns specified in the COLS. field of the input card sets.

## Card Set 1.0-Introduce L221 (TEV156) Card Input Data

Card 1.1-Frequency Response Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT | DESCRIPTION |
| :--- | :--- | :--- | :--- |
| $1-10$ | \$FREQuency | A10 | This card must be the first card read by L221 (TEV156). It signifies <br> that the input card data is to be used by L221 (TEV156) for a Fre- <br> quency Response Analysis. |
| $11-70$ |  |  | Available for comments. |

Card 1.2-Title Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :--- | :--- | :--- | :--- |
| $1-10$ | \$TITLe | A10 | A title card that is intended to label the program's printed output <br> with miscellaneous titling information. <br> After this card is read and printed, control is returned to the <br> main overlay for the reading of the next instructional keyword card. <br> The number of \$TITLe cards is unlimited. |
| $11-70$ |  |  | Available for comments. |

Card 1.3-Core Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT | DESCRIPTION |
| :--- | :--- | :--- | :--- |
| $1-10$ | SCORE | A10 | A keyword designating a card which sets the maximum field length to <br> be used by L221 (TEV156). |
| $11-20$ | MAXCOR | 010 | The maximum field length, in octal, which L221 (TEV156) may use. <br> Default: 200000 8 |
| $21-70$ |  |  | Available for comments. |

Card 1.4-Special Programmer Checkout Option

| COLS. | $\begin{aligned} & \text { KEYWORD/ } \\ & \text { VARIABLE } \end{aligned}$ | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | SCHECK | A10 | This card is used as an aid in the checkout of fatal error diagnostics. This option will allow L221 (TEV156) to continue execution even after a fatal error has been diagnosed. |
| 11-70 |  |  | Available for comments. |

To use this option, the programmer must use the following card sets:
Card 1.1
Card 1.4
\$FREQuency
\$CHECk
.
Any card sets the programmer wishes to be tested.

Card set 80.0
\$QUIT

### 6.3.3 PROGRAM FINDRMS

The card input data for FINDRMS are divided into three main blocks:
BLOCK I Options and constant data
BLOCK II Instructions and matrices needed to calculate the generalized coordinates frequency response

BLOCK III Instructions and matrices needed to calculate the loads frequency response

The three blocks are always in this order, although BLOCK III may be repeated as many as 10 times. BLOCK I is to be input on cards, but the main parts of BLOCKS II and III-the matrices-may be input on cards or on the magnetic files "INTAPE" and "LDTAPE".

## BLOCK I-Options and Constant Data

The \$FINDRMS card (card set 2.0) introduces BLOCK I, card input data defining the necessary options and constants. The flow of BLOCKI data cards is displayed in figure 3.

Figure 3.-Flow of FINDRMS Block I Card Input Data

Figure 3.-(Continued)

Figure 3.-(Concluded)

## Card Set 2.0-Call Card for FINDRMS

| COLS. | KEYMORD/ <br> VARIABLE | FORMAT | DESCRIPTION |
| :--- | :--- | :--- | :--- |
| $1-10$ | SFINDrmS | A10 | This Card Set initializes the call to the primary overlay, FINDRMS. <br> FINDRMS will read Card Sets $3-49$ and perform the necessary calcu- <br> lations. Control will be returned to the main overlay, L221 upon <br> the reading of Card Set 49. |
| $11-70$ |  |  | Available for comments. |

Card Set 3.0-Label Card

| COLS. | KEYHORD/ <br> VARIABLE | FORMAT | DESCRIPTION |
| :--- | :--- | :--- | :--- |
| $1-70$ | LABEL | $7 A 10$ | A one card data case label which is printed above the resulting <br> output. |

Cdrd Set 4.0-0pticmes and File Names
Card 4.1-Problem Size

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-5 | NDOF | 15 | The number of degrees of freedom, i.e. the number of generalized coordinates or equations of motion. $(0<N D O F \leq 100)$ |
| 6-10 | NFREQ | 15 | The number of frequencies over which the solution will be found. (NFREQ $>2$ ) |
| 11-15 | NPAN | 15 | The number of panels for gradual penetration. If the gradual penetration option is not desired NPAN must be set to zero. When using DYLOFLEX tapes for "INTAPE" and/or "LDTAPE" the number panels must be $\geq 1$ because gradual penetration is always assued in DYLOFLX, thus no $\left\{C_{3}\right\}$. $(0 \leq \text { NPAN } \leq 100)$ |
| 16-20 | NKVAL | 15 | The number of $k$-values used in an unsteady aerodynamic analysis. If NKVAL is greater than zero, matrices will be read at the defined frequencies (Card Set 17) and Interpolation will occur to find the matrices at the solution frequencies. $\left\{C_{3}\right\}$ or $[\boldsymbol{\phi}]$ are complex with NKVAL $>0$. When NKVAL $=0$ all input matrices are real. When using DYLOFLEX tapes for "INTAPE" and/or "LDTAPE" the number of $k$ values must be $\geq 1$. <br> (NKVAL $\geq 0$ ) <br> Default: 0 |

| 21-25 | NFORC | I5 | The number of excitation forces for the handling of multiple forcing functions (see Appendix C). <br> Note: If more than one excitation force is being used the fol- <br> lowing limitations are imposed: <br> - $\operatorname{NPAN}=0$. <br> - no feedback. <br> - no loads correlation. <br> - the frequency responses and load transfer functions may be plotted for only the first excitation forces. <br> - $\left\{C_{2}\right\}$ and $\left\{\overline{C_{2}}\right\}$ are null. <br> - the loads per degree of freedom can not be printed. <br> (NFORC $\geq 1$ ) <br> Default: 1 |
| :---: | :---: | :---: | :---: |
| 26-30 | NDOFD | 15 | The number of degrees of freedom to be deleted. <br> Note: See Card 7.2 for the input of the degrees of freedom to be deleted. <br> (NDOFD < NDOF) |

Card 4.2-Optional Capabilities

| COLS. | KEYHORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-5 | IfREQ | 15 | This option chooses the type of frequency matrix input. <br> $=-1$ The frequencies will be read from cards in cycles per second, (see Card 11.1). <br> $=0$ The frequencies will be read from cards in radians per second, (see Card 11.2). <br> $=1,2,3,4,5$ The frequency matrix will be generated according to Appendix $A$, using an initial frequency, $\mathrm{FREQ}_{1}$, and an increment deltaf in cycles per second, (see Card 11.3). |
| 6-10 | ISPEC | 15 | This option specifies the type of input spectrum to be used, <br> ( $\boldsymbol{\Omega}$ is in radians per unit distance). <br> $=0$ Dryden $\phi(\Omega)=\frac{L}{\pi} \frac{1+3(L \Omega)^{2}}{\left[1+(L \Omega)^{2}\right]^{2}}$ <br> $=1$ Von Karman <br> $=2$ Exponential $\underset{\phi(\Omega)}{r \operatorname{man}}=\frac{L}{\pi} \frac{1+8 / 3(1.339 L \Omega)^{2}}{\left[1+(1.339 L \Omega)^{2}\right]^{11 / 6}}$ $\phi(\Omega)=\kappa(\Omega)^{-\eta}$ <br> Note: See card Set 6 for $L$ and Card 8.1 for $\kappa$ and $n$. $=-$ NSP <br> A tabular input spectrum defined at NSP points (see Cards 8.2, 8.3, and 8.4). |
| 11-15 | istate | 15 | This option requests a static-elastic solution. <br> $=0$ No static-elastic solution. <br> $=1$ A static-elastic solution will be found after zeroing columns 3 through NDOF of $\left[M_{2}\right],\left[M_{3}\right],\left[M_{5}\right],\left[M_{6}\right],\left[\bar{\mu}_{2}\right],\left[\bar{\mu}_{3}\right],\left[M_{5}\right]$, and $\left[\mu_{6}\right]$, implying that the rigid body degrees of freedom are in columns 1 and 2. <br> $=2$ A static-elastic solution will be found, by zeroing columns of matrices $\left[\mu_{2}\right],\left[\mu_{3}\right],\left[M_{5}\right],\left[M_{6}\right],\left[\mu_{2}\right],\left[\Pi_{3}\right],\left[\Pi_{5}\right]$, and $\left[\Pi_{6}\right]$ according to Card Set 7. |

| 16-20 | IFDBAX | 15 | ```This option requests that a feedback loop be used. = O No feedback loop used. = 1 A standard feedback loop will be used. =2 A special feedback loop will be used, (see RLIMIT of Card 10.1 and Cards 10.6, 10.7, and 10.8). Also, see Apperlix B.``` |
| :---: | :---: | :---: | :---: |
| 21-25 | IDAMP | 15 | This option specifies the number of different structural damping factors. <br> $=0$ The same factor will be used for all freedoms, (see Card 9.1). <br> $=1$ A different factor will be used for each frequency, (see Card 9.2). |
| 26-30 | INTZRO | 15 | This option chooses the starting point for the RMS integration. $=0$ The RMS integration will start at zero. The output spectrum is assumed to grow linearly between the frequencies 0 and $\mathrm{FREQ}_{1}$ (from the value 0 . to the value calculated at $\mathrm{FREQ}_{1}$ ). The area in the resulting triangle is included in the integration. <br> $=1$ The RMS integration will start at FREQ $_{1}$. The range between frequencies 0 and $\mathrm{FREQ}_{1}$ is ignored. |

Card 4.3-Output Options

| cols. | KEYHORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-5 | IPRINT | 15 | This option chooses the type of printing to take place. <br> $=0$ Print only the final $\bar{A}$ values and the number of zero crossings. <br> $=1$ Print the generalized coordinates and load transfer functions for each frequency as well as the final $\bar{A}$ and number of zero crossings. |
| 6-10 | IRMSPR | 15 | This option chooses the type of printing for the $\bar{A}$ values. <br> $=0$ Print only the final $\bar{A}$ values. <br> $>0$ Print the $\bar{A}$ values for each of the last IRMSPR frequencies. <br> (IRMSPR $\leq$ NFREQ) |
| 11-15 | IPUNCH | 15 | This option requests that the final $\bar{A}$ values and number of zero crossings be punched on cards. <br> $=0$ No punched output. <br> $=1$ Punch on cards the final $\bar{A}$ values and number of zero crossings. |
| 16-20 | ICKPRT | I5 | This option chooses the amount of checkout printout for the problem. <br> $=0$ the input matrices are not printed. <br> $=1$ The input matrices will be printed as read. <br> $=2$ The input matrices plus intermediate data for the first three frequencies will be printed. <br> $=5$ Special program checkout feature. It prints 1 and 2 above and a record of all VARDIM routines called. |
| 21-25 | IPLRMS | 15 | This option requests the writing of final $\bar{A}$ values on the plot data file "IPLTPE" <br> $=0 \overline{\mathrm{~A}}$ values not saved. <br> $=1 \bar{A}$ values will be written on "IPLTPE" for each frequency, (see Card 4.4). |

| 26-30 | LPDOF | 15 | This option requests the printing of loads per degree of freedom at certain frequencies. <br> $=0$ The loads per degree of freedom will not be found. <br> $>0$ The loads due to each degree of freedom will be found and printed for the LPDOF frequencies specified on Card 11.4. <br> (LPDOF $\leq 10$ ) |
| :---: | :---: | :---: | :---: |

Card 4.4-File Names
Note: All magnetic files not to be defined must have their appropriate fields left blank.

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | INTAPE | A10 | This option indicates the location of the input matrices. <br> - The input matrices will be read from cards if the field is left blank. <br> - The input matrices will be read from a magnetic file in READTP/ WRTETP format. The file name must be a left-justified 1 to 7 character name with the first character being alphabetic. |
| 11-20 | IPLTPE | A10 | This option indicates whether or not a plotting magnetic file will be created. <br> - The plotting information will not be written if the field is left blank. <br> - The plotting infomation will be written on a magnetic file in REATP/WRTETP format. The magnetic file name must be a leftjustified, 1 to 7 character name with the first character being alphabetic. |
| 21-30 | IRTAPE | A10 | This option indicates whether or not the generalized coordinates and the load transfer functions will be written on a magnetic file. <br> - The generalized coordinates, and the load transfer functions will not be written onto a magnetic file if left blank. <br> - The generalized coordinates, and the load transfer functions will be written on a magnetic file in READTP/WRTETP format. The magnetic file name must be a left-justified, 1 to 7 character name with the first character being alphabetic. |

| 31-40 | IFTAPE | This option indicates the location of the Tabular Input Spectra. <br> - The Tabular Input Spectra will be read from cards if the field <br> is left blank. <br> - <br> The Tabular Input Spectra will be read from a magnetic file in <br> READTP/WRTETP format. The file name must be a left justified <br> 1 to 7 character file name with the first character being <br> alphabetic. |
| :---: | :---: | :---: | :---: |

Card Set 5.0-Wagner and Küssner Indicial Lift Growth Function Coefficients
Card 5.1-Wagner Indicial Lift Growth Coefficients

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | $\mathrm{A}_{1}$ | E10.0 | The Wagner Function Coefficients. $g(s)=A_{1}-\frac{B_{1} s}{s+\alpha_{1}}-\frac{C_{1} s}{s+\beta_{1}}-\frac{D_{1} s}{s+\gamma_{1}}$ <br> where $s=i \omega$ and $\omega$ is the frequency in radians per second. <br> (Soe table 3) <br> Note: When NKVAL $>1$ of card 4.1 , set $A_{1}=1$. and all other variables to zero. |
| 11-20 | $\mathrm{B}_{1}$ | E10.0 |  |
| 21-30 | $\mathrm{C}_{1}$ | E10.0 |  |
| 31-40 | $\mathrm{D}_{1}$ | E10.0 |  |
| 41-50 | $\alpha_{1}$ | E10.0 |  |
| 51-60 | $\beta_{1}$ | E10.0 |  |
| 61-70 | $\gamma_{1}$ | E10.0 |  |

Card 5.2-Küssner Indicial Lift Growth Function Coefficients

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | $\mathrm{A}_{2}$ | E10.0 | The Kuissner Function Coefficients. $f(s)=A_{2}-\frac{B_{2} s}{s+\alpha_{2}}-\frac{C_{2} s}{s+\beta_{2}}-\frac{D_{2} s}{s+\gamma_{2}}$ <br> where $s=i \omega$ and $\omega$ is the frequency in radians per second. <br> (See table 4) <br> Note: When NFORC $>1$ or NKVAL $>1$ set $A_{2}=1$. and all other variables to zero. |
| 11-20 | $\mathrm{B}_{2}$ | E10.0 |  |
| 21-30 | $\mathrm{C}_{2}$ | E10.0 |  |
| 31-40 | $\mathrm{D}_{2}$ | E10.0 |  |
| 41-50 | $\alpha_{2}$ | E10.0 |  |
| 51-60 | $\beta_{2}$ | E10.0 |  |
| 61-70 | $r_{2}$ | E10.0 |  |

Tables 3 and 4 list the different values for the Wagner and Kussner functions as functions of aspect ratio, $A R$, at $M=0$. These values were obtained from reference 3 . The user is urged to refer to reference 3 and 4 in order to obtain a greater understanding of the derivation of these indicial functions and the theoretical aspects associated with their derivation.

Table 3.-Coefficients for the Wagner Indicial Lift Growth Function at $M=0$

| $A A$ | $A_{1}$ | $B_{1}$ | $C_{1}$ | $D_{1}$ | $\bar{\alpha}_{1}$ | $\bar{\beta}_{1}$ | $\bar{\gamma}_{1}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\infty$ | 1.0 | .165 | .335 | 0 | .045 | .30 | 0 |
| 6 | 1.0 | .361 | 0 | 0 | .381 | 0 | 0 |
| 3 | 1.0 | .283 | 0 | 0 | .540 | 0 | 0 |

Table 4.-Coefficients for the Kussner Indicial Lift Growth Function at $M=0$

| $\mu$ | $A_{2}$ | $B_{2}$ | $C_{2}$ | $D_{2}$ | $\bar{\alpha}_{2}$ | $\bar{\beta}_{2}$ | $\bar{\gamma}_{2}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\infty$ | 1.0 | .5 | .5 | 0 | .13 | 1.0 | 0 |
| 6 | 1.0 | .448 | .272 | .193 | .290 | .725 | -3.0 |
| 3 | 1.0 | .679 | .227 | 0 | .558 | 3.20 | 0 |

$\alpha_{i} \cdot \frac{2 V_{T}}{C}$
$\beta_{i}=\bar{\beta}_{i} \cdot \frac{2 V_{T}}{C}$
$\gamma_{i}=\bar{\gamma}_{i} \cdot \frac{2 V_{T}}{C}$
C= some reference chord
$i=1$ or 2

## Card Set 6.0-Input Constant

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | Z | E10.0 | The scalar constant for the equations of motion and loads equation convoluted forcing function coefficient matrices, (e.g. $\left\{C_{3}\right\}$ and $\left\{C_{3}\right\}$ ). In DYLOFLX, 2 must be input as a negative number to obtain sign compatibility for the gust forcing function generated in L217(EOM) and L213(LDADS) $(2 \neq 0)$ |
| $11-20$ | VEL | E10.0 | The velocity (true airspeed) of the frequencies are converted to radians per unit distance by the following conversion: $\Omega=\frac{\omega}{V E L}$ <br> where $\Omega$ is in radians/distance and $\omega$ is in radians per second. <br> $\Omega$ is used to determine the input spectrum.* <br> ( $\mathrm{VEL}>0$ ) |
| 21-30 | $\begin{aligned} & \mathrm{L} \\ & (\text { TSCALE }) \end{aligned}$ | E10.0 | The turbulence scalar constant. It is required when ISPEC of Card 4.2 is equal to 0 or 1. (See eqn 26 and eqn 27 of Section 5.0 for the Dryden and Von Karman input spectra). <br> Note: The unit distance must be in the same units described in VEL above. $(L>0)$ |
| $31-40$ $\vdots$ | $\begin{aligned} & \text { C } \\ & \text { (GPSCAL) } \end{aligned}$ | E10.0 | The gradual penetration scalar constant. (See eqn 19 of Section 5.0 for the calculation of gradual penetration). <br> Note: This variable is needed only when gradual penetration is requested. $(C>0)$ |
| 41-50 | TABFS | E10.0 | The scaling factor for the frequencies at which the Tabular Input Spectra are defined. <br> (See Card 8.2). <br> (Default $=1$ ) |

*For DYLOFLEX when gradual penetration is used, the length unit of VEL must be the same as the $f$ units of length established in L217 (EOM).

| 51-60 | TABS | E10.0 | The scaling factor for the Tabular Input Spectra. <br> See Card <br> 8.3 or 8.4). <br> (Default $=1$ ) |
| :---: | :---: | :---: | :---: |
| 61-70 | FDSCAL | E10.0 | The scalar constant for the frequencies contained in \{FREQM\}, the array of frequencies at which input matrices are defined. This scalar can be used only when NKVAL of Card 4.1 is greater than zero. <br> Note: If the frequencies are to be read in as radians/second, and $\{$ FREQM\} is in cycles/second, then FDSCAL must = 6.2831853, (which is $2 \pi$ ). <br> If the frequencies are to be read in as cycles/second, and \{FREQM\} is in radians/second, then FDSCAL must $=$ 1/6.2831853, (which is $1 / 2 \pi$ ). <br> (Default = 1) |

## Card Set 7.0-Deletion of Degrees of Freedom

Card 7.1-Deletion of Freedoms for a Static-Elastic Solution
Omit card 7.1 if ISTATE $\leqslant 1$ on card 4.2.

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| $1-5$ <br> $6-10$ <br> $\vdots$ | $\mathrm{NSTEL}_{1}$ | 1415 | NSTEL $_{j}, i=1$, NDOF where NDOF (Card 4.1 ) is the number of degrees of freedom. <br> NSTEL chooses the columns to be zeroed in the matrices <br> $\left[M_{2}\right],\left[M_{3}\right],\left[M_{5}\right],\left[M_{6}\right],\left[\bar{M}_{2}\right],\left[\bar{M}_{3}\right],\left[\bar{M}_{5}\right]$, and $\left[M_{6}\right]$ when performing <br> a static-elastic solution. <br> If NSTEL $;=0$, then column $\mathbf{i}$ of the above matrices will be zeroed. |
|  | $\mathrm{NSTEL}_{\text {NDOF }}$ |  | Repeat the card with 14 numbers per card until all elements are defined. |

Card 7.2-Deletion of Degrees of Freedom
Omit card 7.2 if $\mathrm{NDOFD}=0$ on card 4.1.

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-5 | $\mathrm{NDEL}_{1}$ | 14I5 | $\mathrm{NDEL}_{\mathrm{j}}, \mathbf{i}=1$, NDOFD where NDOFD (Card 4.1) is the number of degrees of freedom to be deleted. <br> NDEL; is the specified degree of freedom to be deleted. <br> ( NDEL $_{i} \leq$ NDOF $)$ <br> For the generalized coordinates, the degrees of freedom will be deleted by zeroing the appropriate rows and columns of [SUMM] and the rows of $\{S U M C\}$. Also, the diagonal elements of the appropriate rows of [SUMM] will be set equal to 1 . <br> In the loads solution the degrees of freedom will be deleted by zeroing the appropriate columns of [SUMM]. |
| 6-10 | $\mathrm{NDEL}_{2}$ |  |  |
| 11-15 | $\mathrm{NDEL}_{3}$ |  |  |
| $\bullet$ |  |  |  |
|  | $\mathrm{NDEL}_{\text {NDOFD }}$ |  | Repeat the card with 14 numbers per card until all elements are defined. |

## Card Set 8.0-Input Power Spectra

Omit card set 8.0 if ISPEC $=0$ or 1 on card 4.2.
Card 8.1-Exponential Power Spectrum Input
Read card 8.1 if ISPEC $=2$ on card 4.2.

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | (OCOEF) | E10.0 | The input power spectrum coefficients. $\phi(\Omega)=k(\Omega)^{-\eta}$ <br> (See eqn 28 of Section 5.0 for the exponential input spectrum). |
| 11-20 | $\begin{aligned} & \hline \eta \\ & (0 E X) \end{aligned}$ | E10.0 |  |

Card 8.2-Frequencies of the Tabular Input Spectrum
Omit card 8.2 if ISPEC $\geqslant 0$ on card 4.2 or if IFTAPE of card 4.4 is defined.

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | FREQS $_{1}$ | 7E10.0 | $\text { FREQS }_{i}, i=1, \text { NSP }$ <br> where NSP of Card 4.2 is the value for the Tabular Input Spectrum. <br> The Tabular Input Spectrum Frequencies in cycles per seconds. |
| 11-20 | FREQS $_{2}$ |  |  |
| $\bullet$ | - |  |  |
|  | FREQS $_{\text {NSP }}$ |  | Repeat the card with 7 numbers per card until all elements are defined. |

FREQS $_{i}$ are the frequencies at which the tabular input spectra are defined. The frequencies must cover the range of solution frequencies defined in card set 11.0 and be defined in the same units. The scalar TABFS of card set 6.0 may be used to provide compatibility. L221 (TEV156) will not extrapolate.

## Card 8.3-Single Tabular Input Spectrum

Omit card 8.3 if ISPEC $\geqslant 0$ on card 4.2, or if NFORC $>1$ on card 4.1, or if IFTAPE of card 4.4 is defined.

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | $\mathrm{PHIOS}_{1}$ | 7E10.0 | PHIOS $_{i} ; \mathbf{i}=1$, NSP <br> The value of the tabular input spectrum at FREQS $_{\mathbf{i}} ; \mathbf{i}=1$, NSP where NSP $=\mid$ ISPEC $\mid$ from Card 4.2. |
| 11-20 | $\mathrm{PHIOS}_{2}$ |  |  |
| : | : |  |  |
|  | $\mathrm{PHIOS}_{\text {NSP }}$ |  | Repeat the card with 7 numbers per card until all elements are defined. |

$\mathrm{PHIOS}_{i}$ is a real number (no imaginary part). The scalar TABS in card set 6.0 may be used to modify the units. The program will interpolate to find the spectrum value at solution frequencies.

## Card 8.4-Multiple Tabular Input Spectrum

Omit card 8.4 if ISPEC $\geqslant 0$ on card 4.2, or if NFORC $\leqslant 1$ on card 4.1, or if IFTAPE of card 4.4 is defined.

Card 8.4 must be repeated for all combinations of ( $\mathrm{I}, \mathrm{J}$ ) where $\mathrm{I}=1$, NFORC and $\mathrm{J}=\mathrm{I}$, NFORC. Because of symmetry, only the upper right triangular combinations are input. Input row 1 first ( $\mathrm{J}=1$, NFORC), then row $2(\mathrm{~J}=2$, NFORC), $\ldots$, and, finally, row NFORC ( $\mathrm{J}=\mathrm{NFORC}$ ).

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | $\begin{aligned} & \text { PHIOS }(I, J)_{1} \\ & \text { (real) } \end{aligned}$ | 7 E10.0 | $\operatorname{PHIOS}(I, J)_{k} ; k=1, N S P$ <br> The value of the $(I, J)$ tabular input spectrum at FREQS $_{k}$; $k=1$, NSP $\quad$ where NSP $=\mid$ ISPEC $\mid$ from Card 4.2. <br> Note that each element is a complex number with real and imaginary parts. |
| 11-20 | $\begin{aligned} & \text { PHIOS }(\mathrm{I}, \mathrm{~J})_{1} \\ & \text { (imaginary) } \end{aligned}$ |  |  |
| 21-30 | $\begin{aligned} & \mathrm{PH} 10 \mathrm{~S}(\mathrm{I}, \mathrm{~J})_{2} \\ & \text { (real) } \end{aligned}$ |  |  |
| 31-40 | $\begin{aligned} & \text { PHIOS }(\mathrm{I}, \mathrm{~J})_{2} \\ & \text { (imaginary) } \end{aligned}$ |  |  |
| : | : |  |  |
|  | $\begin{aligned} & \operatorname{PHIOS}(I, J)_{\mathrm{NSP}} \\ & \text { (real) } \end{aligned}$ |  | Repeat the card with 7 numbers per card until all elements are defined. |
|  | $\begin{aligned} & \text { PHIOS }(\mathrm{I}, \mathrm{~J})_{\text {NSP }} \\ & (\text { imaginary }) \end{aligned}$ |  |  |

## Card Set 9.0-Structural Damping

Card 9.1-Same Damping Factor for All Freedoms
Read card 9.1 if IDAMP $=0$ on card 4.2.

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| $1-10$ | $9_{S D}$ | E10.0 | A structural damping factor used for all degrees of freedom. |

## Card 9.2-Different Damping Factors for Each Freedom

Read card 9.2 if IDAMP $=1$ on card 4.2

| COLS. | KEYHORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | ${ }^{\mathrm{SO}}{ }_{1}$ | 7E10.0 | $g_{S D_{i}}, i=1, N D O F$ <br> where NDOF of Card 4.2 is the number of degrees of freedom. <br> The structural damping factor for each degree of freedom. |
| 11-20 | ${ }^{9} \mathrm{SD}_{2}$ |  |  |
| $:$ | - |  |  |
|  | ${ }^{9} \mathrm{SO}_{\mathrm{NDOF}}$ |  | Repeat the card with 7 numbers per card until all elements are defined. |

## Card Set 10.0-Feedback Coefficients

Omit card set $\mathbf{1 0 . 0}$ if IFDBAK $=0$ on card 4.2.

## Card 10.1-Standard Feedback Coefficients

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT | DESCRIPTION |
| :--- | :--- | :--- | :--- |
| $1-10$ | G | E10.0 | Coefficient of the feedback transfer function, FYDAMP, (see the <br> equation below). |
| $11-20$ | RLIMIT | E10.0 | The rudder limiting angle in radians. This variable is needed only <br> when IFDBAK of Card 4.2 is equal to 2. |

Card 10.2-Standard Feedback Coefficients

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :---: | :--- | :---: | :---: |
| $1-10$ | $P_{1}$ | $7 E 10.0$ |  |
| $11-20$ | $P_{2}$ |  | $P_{i}, i=1,7$ |
| $!$ | $\vdots$ |  | Coefficient of the feedback transfer function, FYDAMP, (see the <br> equation below). |
| $61-70$ | $P_{7}$ |  |  |

Card 10.3-Standard Feedback Coefficients

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | ${ }^{4}$ | 7 E 10.0 | $u_{i}, i=1,7$ <br> Coefficient of the feedback transfer function, FYDAMP, (see the equation below). |
| 11-20 | $U_{2}$ |  |  |
| : | : |  |  |
| 61-70 | $U_{7}$ |  |  |

Card 10.4-Standard Feedback Coefficients

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | $\mathrm{R}_{1}$ | 7E10.0 | $R_{f}, i=1.7$ |
| 11-20 | $\mathrm{R}_{2}$ |  | Coefficients of the feedback transfer function, FYDAMP, (see the |
| : | : |  | equation below). |
| 61-70 | $\mathrm{R}_{7}$ |  |  |

## Card 10.5-Standard Feedback Coefficients

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | $T_{1}$ | 7E10.0 | $T_{i}, i=1,7$ <br> Coefficients of the feedback transfer function, FYDAMP, (see the equation below). |
| 11-20 | $T_{2}$ |  |  |
| : | ! |  |  |
| 61-70 | $\mathrm{T}_{7}$ |  |  |

$$
\text { Fydamp }=\frac{G\left(P_{1} s^{2}+U_{1} s+R_{1}\right)\left(P_{2} s^{2}+U_{2} s+R_{2}\right)\left(P_{3} s^{2}+U_{3} s+R_{3}\right)\left(T_{1} s+1\right)}{\left(P_{3} s^{2}+U_{3} s+R_{3}\right) \ldots\left(P_{7} s^{2}+U_{7} s+R_{7}\right)\left(T_{2} s+1\right)\left(T_{3} s+1\right) \ldots\left(T_{7} s+1\right)}
$$

Omit cards 10.6 through 10.8 if the standard feedback loop is chosen (IFDBAK $\leqslant 1$ on card 4.2).

Card 10.6-Special Feedback Coefficients (see app. B for coefficient definitions)

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | $\mathrm{CS2}_{1}$ | 7E10.0 | $\operatorname{CS2}_{i}, i=1, \mathrm{NDOF}$ <br> where NDOF (Card 4.1) is the number of degrees of freedom. |
| 11-20 | $\mathrm{CS2}_{2}$ |  |  |
| : | : |  |  |
|  | $\mathrm{CS2}_{\mathrm{NDOF}}$ |  | Repeat the card with 7 numbers per card until all elements are defined. |

Card 10.7-Special Feedback Coefficients (see app. B for coefficient definitions)

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | $\mathrm{CSI}_{1}$ | 7E10.0 | $\operatorname{CS1}_{i,} i=1, \text { NDOF }$ <br> where NDOF (Card 4.1) is the number of degrees of freedom. |
| 11-20 | $\mathrm{CSI}_{2}$ |  |  |
| : | : |  |  |
|  | $\mathrm{CS1}_{\mathrm{NDOF}}$ |  | Repeat the card with 7 numbers per card until all elements are defined. |

Card 10.8-Special Feedback Coefficients (see app. B for coefficient definitions)

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | $\mathrm{CSO}_{1}$ | $7 E 10.0$ | $\operatorname{CSO}_{i}, i=1, N D O F$ <br> where NDOF (Card 4.1) is the number of degrees of freedom. |
| 11-20 | $\mathrm{CSO}_{2}$ |  |  |
| : | : |  |  |
|  | $\mathrm{CSO}_{\text {NOOF }}$ |  | Repeat the card with 7 numbers per card until all elements are defined. |

## Card Set 11.0-Frequency Array

## Card 11.1-Frequencies in Cycles per Second

Read card 11.1 if IFREQ $=-1$ on card 4.2.

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | $\mathrm{FREQ}_{1}$ | 7E10.0 | $\mathrm{FREQ}_{i}, i=1, \text { NFREQ }$ <br> where NFREQ (Card 4.1) is the number of frequencies. The input frequencies are in cycles per second. |
| 11-20 | $\mathrm{FREQ}_{2}$ |  |  |
| : | : |  |  |
|  | $\mathrm{FREQ}_{\text {NFREQ }}$ |  | Repeat the card with 7 numbers per card until all elements are defined. |

Card 11.2-Frequencies in Radians per Second
Read card 11.2 if IFREQ $=0$ on card 4.2.

| COLS. | KEYWORD/ VARIABLE | FORMAT | OESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | $\mathrm{FREQ}_{1}$ | 7E10.0 | $\mathrm{FREQ}_{i}, 1=1, \text { NFREQ }$ <br> where NFREQ (Card 4.1) is the number of frequencies. The input frequencies are in radians per second. <br> Note: Internally the input frequencies are converted from radians per second into cycles per second. |
| 11-20 | $\mathrm{FREQ}_{2}$ |  |  |
| 1 | : |  |  |
|  | $\mathrm{FREQ}_{\text {NFREQ }}$ |  | Repeat the card with 7 numbers per card until all elements are defined. |

Card 11.3-First Frequency and an Increment
Read card 11.3 if IFREQ $>0$ on card 4.2.

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :--- | :--- | :--- | :--- |
| $1-10$ | FREQ $_{1}$ | E10.0 | The first frequency (cps). |
| $11-20$ | DELTAF | E10.0 | The frequency increment in cycles/second. |

Card 11.4-Frequencies at Which the Loads per Degree of Freedom Will Be Printed Read card 11.4 if LPDOF $>0$ on card 4.3.

Note: If $\operatorname{IFREQ}=0$ on card 4.2, FREQL $\mathrm{i}_{\mathrm{i}}$ must be in radians per second.
If $\operatorname{IFREQ}=-1$ on card 4.2, $\mathrm{FREQL}_{\mathrm{i}}$ must be in cycles per second.

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | FREQL $_{1}$ | 7E10.0 | $\operatorname{FREQL}_{i}, i=1, \text { LPDOF }^{2}$ <br> where LPDOF is from Card 4.3. <br> The frequencies at which the loads per degree of freedom will be printed. |
| 11-20 | FREQL $_{2}$ |  |  |
| : | : |  |  |
|  | FREQL $_{\text {LPDOF }}$ |  | Repeat the card with 7 numbers per card until all elements are defined. |

Note: Given FREQL $_{i}$, FINDRMS will choose the element of the array $\{$ FREQ\} which is equal to or greater than $\mathrm{FREQL}_{\mathbf{i}}$.
FREQL $_{\mathrm{i}}$ must be $\leqslant$ FREQ $_{\text {NFREQ }}$.

## BLOCK II-Instructions and Matrices Needed To Find the Generalized Coordinate:

BLOCK II, card sets 12.0 through 30.0, always follows BLOCK I. The flow of BLOCK II data cards is displayed in figure 4. BLOCK II is always introduced by card set $\mathbf{1 2 . 0}$.

## Card Set 12.0-Introduce the Equations of Motion

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :--- | :--- | :--- | :--- |
| $1-10$ | SEQUALIO | A10 | This card introduces the cards defining the equations of motion. |
| $11-70$ |  |  | Available for comments. |

Figure 4.-Flow of FINDRMS Block // Card Input Data

Figure 4.-(Continued)

Figure 4.-(Concluded)

## Card Set 13.0 -Choose the Non-Null Matrices

Card set 12.0 must be followed by either card 13.1 or 13.2. Card 13.1 indicates that the equations of motion matrices are on magnetic file "INTAPE" which begins with a DYLOFLEX header array (see sec. 6.4). Card 13.2 must be used if the matrices are on cards or if "INTAPE" does not contain the DYLOFLEX header array.

Card 13.1-Signal an "INTAPE" With DYLOFLEX Header Array
Omit card 13.1 if the equations of motion are on cards or if "INTAPE" does not contain the DYLOFLEX header array.

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :--- | :--- | :--- | :--- |
| $1-10$ | DYLOFLX | A10 | Keyword indicates that "INTAPE" begins with a DYLOFLEX header array. |
| $11-70$ |  |  | Available for comments. |

INTAPE (card 4.4) must be defined in order to use card 13.1. When card 13.1 is used, all other BLOCK II cards ( 13.1 through 30.0) must be omitted. The DYLOFLEX header array and the equations of motion will be read from magnetic file "INTAPE". The header array at the beginning of "INTAPE" specifies the matrix sizes and indicates which ones are not null and appear on the file (see sec. 6.4)

Card 13.2-Choose Non-Null Equations of Motion Matrices
Omit cards 13.2 and 13.3 if card 13.1 was used.

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-5 | NMI | 15 | $N M i, 1=1,6$ <br> If NMi $=0$ the corresponding equation of motion matrix [ $M_{i}$ ] will not be read. It is assumed to be null. <br> If NMi $>0$ the matrix $\left[M_{i}\right]$ will be read. |
| 6-10 | NM2 | 15 |  |
| 11-15 | NM3 | 15 |  |
| 16-20 | NM4 | 15 |  |
| 21-25 | NM5 | 15 |  |
| 26-30 | NM6 | 15 |  |
| 31-35 | NC2 | I5 | If NC2 $=0$ the corresponding equation of motion forcing function coefficient matrix $\left\{c_{2}\right\}$ or $\left[c_{2}\right]$ will not be read. It is assumed to be null. <br> If NC2 $>0$ the matrix $\left\{C_{2}\right\}$ or $\left[C_{2}\right]$ will be read. |
| 36-40 | NC3 | 15 | If NC3 $=0$ the corresponding equation of motion convoluted forcing function coefficiet matrix $\left\{c_{3}\right\}$ or $\left[c_{3}\right]$ will not be read. It is assumed to be null. <br> If NC3 $>0$ the matrix $\left\{C_{3}\right\}$ or $\left[C_{3}\right]$ will be read. <br> Note: If the number of panels (NPAN of Card 4.1) is $>0$, then NC3 is set to zero. |
| 41-45 | NFLL | 15 | If NFLL $=0$ the corresponding matrix of the streamline distance in feet from the point first encountering gusts to the points encountering gusts later will not be read. It is assumed to be null. <br> If NFLL $=1$ the matrix $\left\{f_{\ell}\right\}$ will be read. <br> Note: If the number of panels (NPAN of Card 4.1) is $=0$ then NFLL should be zero. |

| 46-50 | NPHIT | 15 | If NPHIT $=0$ the corresponding matrix of the gust forces acting on each gradual penetration lifting panel will not be read. <br> If NPHIT $=1$ the matrix [ $\$$ ] will be read. <br> Note: If the number of panels (NPAN of Card 4.1) is $=0$, then NPHIT should be zero. |
| :---: | :---: | :---: | :---: |

Card 13.3-Choose Non-Null Feedback Matrices
Omit card 13.3 if card 13.1 was input or if IFDBAK of card $4.2=0$.

| cols. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-5 | NS 1 | I5 | NSt, $1=1,6$ |
| 6-10 | NS2 | I5 | $=0$ the corresponding coefficient of feedback for the equations |
| 11-15 | NS3 | I5 | of motion matrix, $\left[S_{i}\right]$, will not be read. It will be assumed |
| 16-20 | NS4 | 15 |  |
| 21-25 | NS5 | I5 |  |
| 26-30 | NS6 | I5 |  |

Omit card sets 14.0 through 30.0 if INTAPE of card 4.4 is defined. Instead, the matrices will be read from the magnetic file "INTAPE".

## Card Set 14.0 [ $\mathbf{M}_{1}$ ]-Generalized Stiffness Matrix

Omit card set 14.0 if $\mathrm{NM} 1=0$ on card 13.2. $\left[\mathrm{M}_{1}\right]$ is of size NDOF $\mathbf{x}$ NDOF.
Card Set 15.0 [ $\mathbf{M}_{2}$ ]-Viscous Structural Damping Matrix
Omit card set 15.0 if $\mathrm{NM} 2=0$ on card 13.2. $\left[\mathrm{M}_{2}\right]$ is of size NDOF x NDOF.

## Card Set $16.0\left[\mathbf{M}_{3}\right]$-Generalized Mass Matrix

Omit card set 16.0 if NM3 $=0$ on card 13.2. [ $\mathrm{M}_{3}$ ] is of size NDOF $\mathbf{x}$ NDOF.
Card Set 17.0 \{FREQM\}-Frequencies at Which the Aerodynamic Equations of Motion Are Defined

Omit card set 17.0 if NKVAL $=0$ on card 4.1. $\{$ FREQM $\}$ is of size $1 \times$ NKVAL.

Repeat card sets 18.0 through 30.0 NKVAL TIMES: NK $=1$, NKVAL.
Card Set $18.0\left[\mathbf{M}_{4}\right]$-Convoluted Generalized Coordinate Displacement Matrix

Omit card set 18.0 if NM4 $=0$ on card 13.2. $\left[\mathrm{M}_{4}\right]$ is of size NDOF $\times$ NDOF. Card Set 19.0 [ $\mathbf{M}_{5}$ ]-Convoluted Generalized Coordinate Rate Matrix Omit card set 19.0 if NM5 $=0$ on card 13.2. $\left[\mathrm{M}_{5}\right]$ is of size NDOF $\times$ NDOF.

Card Set 20.0 [ $\mathbf{M}_{6}$ ]-Convoluted Generalized Coordinate Acceleration Matrix
Omit card set 20.0 if $\mathrm{NM} 6=0$ on card $13.2 .\left[\mathrm{M}_{6}\right]$ is of size NDOF $\times$ NDOF.
Omit card sets 21.0 through 26.0 if IFDBAK $=0$ on card 4.2.
Card Set 21.0 [ $\left.S_{1}\right]$-Feedback Coefficient Matrix for Generalized Coordinate Displacement

Omit card set 21.0 if $\mathrm{NS} 1=0$ on card 13.3 . $\left[\mathrm{S}_{1}\right]$ is of size NDOF $\times$ NDOF.
Card Set 22.0 [ $\left.\mathbf{S}_{2}\right]$-Feedback Coefficient Matrix for Generalized Coordinate Rate
Omit card set 22.0 if NS2 $=0$ on card 13.3. $\left[\mathrm{S}_{2}\right]$ is of size NDOF $\times$ NDOF .
Card Set 23.0 [ $\mathbf{S}_{3}$ ]-Feedback Coefficient Matrix for Generalized Coordinate Acceleration

Omit card set 23.0 if NS3 $=0$ on card 13.3. $\left[\mathrm{S}_{3}\right]$ is of size NDOF $\times$ NDOF.
Card Set 24.0 [ $\left.\mathbf{S}_{4}\right]$-Feedback Coefficient Matrix for Convoluted Generalized Coordinate Displacement

Omit card set 24.0 if NS4 $=0$ on card 13.3. [ $\left.\mathrm{S}_{4}\right]$ is of size NDOF $\times$ NDOF.
Card Set 25.0 [ $\mathbf{S}_{5}$ ]-Feedback Coefficient Matrix for Convoluted Generalized Coordinate Rate

Omit card set 25.0 if NS5 $=0$ on card 13.3. [ $\mathrm{S}_{5}$ ] is of size NDOF $\times$ NDOF.
Card Set 26.0 [ $\mathbf{S}_{6}$ ]-Feedback Coefficient Matrix for Convoluted Generalized Coordinate Acceleration

Omit card set 26.0 if NS6 $=0$ on card 13.3. $\left[\mathrm{S}_{6}\right]$ is of size NDOF $\times$ NDOF.
Card Set $27.0\left\{\mathrm{C}_{\mathbf{2}}\right\}$-Forcing Function Coefficient Matrix
Omit card set 27.0 if $\mathrm{NC} 2=0$ on card 13.2. $\left\{\mathrm{C}_{2}\right\}$ is of size NDOF x 1. Input as a row.

## Card Set $28.0\left\{\mathbf{C}_{3}\right\}$-Convoluted Forcing Function Coefficient Matrix

Omit card set 28.0 if NC3 $=0$ on card 13.2 or if NPAN $>0$ on card 4.1.
If there is a single forcing function (NFORC $=0$ on card 4.1), $\left\{\mathrm{C}_{3}\right\}$ is of size NDOF $\times 1$ and is input as a row.

However, if the equations of motion are frequency dependent (NKVAL $>0$ on card 4.1), $\left\{\mathrm{C}_{3}\right\}$ is complex and must be input as a row of size $2^{*}$ NDOF with alternating real and imaginary parts.

If there are multiple forcing functions (NFORC $>0$ on card 4.1), $\left[\mathrm{C}_{3}\right]$ is of size NDOF x NFORC.

However, if in addition the equations of motion are frequency dependent (NKVAL $>0$ on card 4.1), [ $\mathrm{C}_{3}$ ] is complex and must be input by rows with $2^{*}$ NFORC numbers per row, alternating real and imaginary parts.

## Card Set $29.0\left\{f_{\ell}\right\}$-Distances Between First Panel and Other Gradual Penetration Panels

Omit card set 29.0 if NPAN $=0$ on card 4.1.
Also, card set 29.0 is input only for the first frequency. $\left\{f_{\ell}\right\}$ is of size NPAN $\times 1$. Input as a row.

## Card Set 30.0 [ $\tilde{\phi}]$-Gust Forces Acting on Each Gradual Penetration Lifting Panel

Omit card set 30.0 if NPAN $=0$ on card 4.1. [ $\tilde{\phi}]$ is of size NDOF $x$ NPAN.
$[\tilde{\phi}]$ contains real numbers if NKVAL $=0$ on card 4.1.
$[\widetilde{\phi}]$ contains complex numbers if NKVAL $>0$ indicating that the matrices are frequency dependent. When $[\widetilde{\phi}]$ is complex, it is input with alternating real and imaginary parts; $2^{*}$ NPAN numbers to a row.

## BLOCK III-Instructions and Matrices Needed for the Loads Solution

BLOCK III, card sets 31.0 through 48.0 , follows BLOCK II. BLOCK III may be repeated 10 times, once for each load set. The flow of BLOCK III data cards is displayed in figure 5. BLOCK III is always introduced by card set 31.0. The end-of-load sets and the end of FINDRMS execution are indicated by card set 48.0, \$END.

Card Set 31.0-Load Instructions

| COLS. | KEYHORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | \$LOAD | A10 | The keyword indicating that a new load set will be processed. |
| 11-15 | NLD | 15 | The number of load equations in this load set. $(\text { NLD } \leq 100)$ |
| 16-20 | ICORR | 15 | The number of loads to be correlated with other loads. If NFORC of Card $4.1>1$, loads correlation can not be used. (ICORR $\leq N L D$ ) |
| 21-30 | $\begin{array}{\|l} \bar{c} \\ \text { (GPSCLB) } \end{array}$ | E10.0 | The scaling factor which is only used for gradual penetration. See eqn 22 of Section 5.0. $(\overline{\mathrm{C}}>0)$ |
| 31-40 | LDTAPE | A10 | The magnetic file name that will contain the load equations input matrices. <br> The tape name is defined as a one to seven character name, beginning with an alphabetic character and being left justified. If LDTAPE is left blank it will default to being the same as INTAPE on Card 4.4. <br> If the load equations are to be input by cards, LDTAPE is left blank. <br> Note: Load equation matrices can only be read in by cards if the equations of motion matrices are read in by Cards, that is, if INTAPE on Card 4.4 is left blank |

Figure 5.-Flow of FINDRMS Block I/I Card Input Data

Figure 5.-(Continued)

Figure 5.-(Concluded)

## Card Set 32.0-Load Correlation Specifications

$\therefore$ Omit card set 32.0 if ICORR of card set $31.0=0$, or if NFORC of card $4.1>1$. Repeat card set 32.0 ICORR times.

| COLS. | KEYHORD/ VARIABLE | FORMAT | DESCRIPTION : |
| :---: | :---: | :---: | :---: |
| 1-5 | $L^{-10} D_{i}$ | I5 | The load number that is to be correlated with up to 10 other loads. |
| 6-10 | LOADC $_{(i, 1)}$ | I5 | The loads to be correlated with $L O A D_{i}$.$\left(L O A D_{i} \leq N L D\right)$ |
| 11-15 | ${ }^{\text {LOADC }}(\mathrm{i}, 2)$ |  |  |
| : | : |  |  |
| 51-55 | $\operatorname{LOADC}_{(i, 10)}$ |  |  |

The load number $\operatorname{LOAD}_{i}$ will be correlated with the loads numbered ${\text { ( } \operatorname{LOADC}_{(i, j)} \text {, }}$ $\mathrm{j}=1,10$ ).

## Card Set 33.0-Choose the Non-Null Matrices

Card 33.1 indicates that the load equation matrices are on magnetic file "LDTAPE" which begins with a DYLOFLEX header array (see sec. 6.4.1). Card 33.2 must be used if the matrices are on cards or if "LDTAPE" does not contain the DYLOFLEX header array.

Card 33.1-Signal "LDTAPE" With DYLOFLEX Header Array
Omit card 33.1 if the load equations are on cards or if "LDTAPE" does not contain the DYLOFLEX header array.

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :--- | :--- | :--- | :--- |
| $1-10$ | DYLOFLX | A10 | Keyword indicates that "LDTAPE" begins with a DYLOFLEX header array. |
| $11-70$ |  |  | Available for comments. |

"LDTAPE" (card set 31.0) or "INTAPE" (card 4.4) must be defined in order to use card 33.1. When card 33.1 is used, all other BLOCK III cards ( 33.2 through 48.0 ) must be omitted. The DYLOFLEX header array and the load equations will be read from magnetic file "LDTAPE". The DYLOFLEX header array at the beginning of "LDTAPE" specifies the sizes of the matrices and indicates which ones are not null and appear on the file (see sec. 6.4.1).

Card 33.2-Choose Non-Null Load Equation Matrices
Omit card 33.2 if card 33.1 was input.

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-5 | NMB1 | I5 | NMBT, $\mathbf{i}=1,6$ <br> If $\mathrm{NMBi}=0$ the corresponding load equations $\left[\bar{H}_{i}\right]$ will not be read. It is assumed to be null. <br> If $N M B i=1$ the matrix $\left[\bar{M}_{i}\right]$ will be read. |
| 6-10 | NMB2 | 15 |  |
| 11-15 | NMB3 | 15 |  |
| 16-20 | NMB4 | 15 |  |
| 21-25 | NMB5 | 15 |  |
| 26-30 | NMB6 | I5 |  |
| 31-35 | NC2B | I5 | If NC2B $=0$ the load equation forcing function coefficient matrix $\left\{\overline{\mathrm{C}}_{2}\right\}$ or $\left[\overline{\mathrm{C}}_{2}\right]$ will not be read. It is assumed to be null. <br> If $N C 2 B=1$ the matrix $\left\{\overline{\mathrm{C}}_{2}\right\}$ or $\left[\overline{\mathrm{C}}_{2}\right]$ will be read. |
| 36-40 | NC 3B | I5 | If NC3B $=0$ the load equation convoluted forcing function coefficient matrix will not be read. It is assumed to be null. <br> If NC3B $=1$ the matrix $\left\{\bar{C}_{3}\right\}$ or $\left[\bar{C}_{3}\right]$ will be read. <br> Note: If the number of panels (NPAN of Card 4.1) is $>0$, then NC3B is set to zero. |
| 41-45 | NPHITB | I5 | If NPHITB $=0$ the lifting panel contributions to the gust loads of designated gradual penetration load stations matrix <br> [ $\bar{\phi}]$ will not be read. It is assumed to be null. <br> If NPHITB $=1$ the matrix $[\bar{\phi}]$ will be read. <br> Note: If the number of panels (NPAN of Card 4.1) $=0$, then NPHITB is set to zero. |

Omit card 33.3 if card 33.1 was input or if IFDBAK $=0$ on card 4.2.

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-5 | NSB1 | I5 | NSBi, $i=1,6$ |
| 6-10 | NSB2 | 15 | If $N S B i=0$ the load equation feedback coefficient matrix |
| 11-15 | NSB3 | 15 | $\left[\bar{S}_{i}\right]$ will not be read. It is assumed to be null. |
| 16-20 | NSB4 | 15 |  |
| 21-25 | NSB5 | 15 | If $\mathrm{NSBI}=1$ the matrix $\left[\bar{S}_{i}\right]$ will be read. |
| 26-30 | NSB6 | 15 |  |

Omit card sets 34.0 through 48.0 if the matrices are to be read from magnetic file "LDTAPE" (card set 31.0).

Note: Format of matrices input on cards is detailed previously in section 6.3.1.
Card Set $34.0\left[\bar{M}_{1}\right]$-Load Equation Matrix Corresponding to Generalized Coordinate Displacement

Omit card set 34.0 if NMB1 $=0$ on card 33.2. $\left[\overline{\mathbf{M}}_{1}\right]$ is of size NLD $\times$ NDOF.
Card Set 35.0 [ $\bar{M}_{2}$ ]-Load Equation Matrix Corresponding to Generalized Coordinate Rate

Omit card set 35.0 if $\mathrm{NMB} 2=0$ on card 33.2. $\left[\overline{\mathrm{M}}_{2}\right]$ is of size NLD $\times$ NDOF.
Card Set 36.0 [ $\bar{M}_{3}$ ]-Load Equation Matrix Corresponding to Generalized Coordinate Acceleration

Omit card set 36.0 if NMB3 $=0$ on card 33.2. $\left[\overline{\mathrm{M}}_{3}\right]$ is of size NLD $\times$ NDOF.
Repeat card set 37.0 through 48.0 NKVAL times; NK $=1$, NKVAL.
Card Set 37.0 $\left[\overline{\mathbf{M}}_{4}\right]$-Load Equation Matrix Corresponding to Convoluted
Omit card set 37.0 if NMB4 $=0$ card 33.2 . $\left[\overline{\mathrm{M}}_{4}\right]$ is of size NLD $\times$ NDOF.
Card Set 38.0 [ $\overline{\mathbf{M}}_{5}$ ]-Load Equation Matrix Correaponding to Convoluted Generalized Coordinate Rate

Omit card set 38.0 if $\mathrm{NMB5}=0$ on card 33.2. $\left[\overline{\mathrm{M}}_{5}\right]$ is of size NLD $\times$ NDOF.

Card Set $39.0\left[\bar{M}_{6}\right]$-Load Equation Matrix Corresponding to Convoluted Generalized Coordinate Acceleration

Omit card set 39.0 if NMB6 $=0$ on card 33.2. $\left[\overline{\mathbf{M}}_{6}\right]$ is of size NLD $\times$ NDOF.
Omit card sets 40.0 through 45.0 if IFDBAK $=0$ on card 4.2.
Card Set 40.0 [ $\left.\overline{\mathbf{S}}_{1}\right]$-Load Equation Feedback Coefficient Matrix for Generalized Coordinate Displacement

Omit card set 40.0 if NS1 $=0$ on card 33.3. $\left[\overline{\mathrm{S}}_{1}\right]$ is of size NLD $\times$ NDOF.
Card Set $41.0\left[\overline{\mathbf{S}}_{2}\right]$-Load Equation Feedback Coefficient Matrix for General Coordinate Rate

Omit card set 41.0 if NS2 $=0$ on card 33.3. [ $\overline{\mathrm{S}}_{2}$ ] is of size NLD $\times$ NDOF.
Card Set $42.0\left[\overline{\mathbf{S}}_{3}\right]$-Load Equation Feedback Coefficient Matrix for General Coordinate Acceleration

Omit card set 42.0 if NS3 $=0$ on card 33.3. $\left[\bar{S}_{3}\right]$ is of size NLD $\times$ NDOF.
Card Set $43.0\left[\overline{\mathbf{S}}_{4}\right]$-Load Equation Feedback Coefficient Matrix for Convoluted Generalized Coordinate Displacement

Omit card set 43.0 if NS4 $=0$ on card 33.3. $\left[\bar{S}_{4}\right]$ is of size NLD $x$ NDOF.
Card Set $44.0\left[\overline{\mathbf{S}}_{5}\right]$-Load Equation Feedback Coefficient Matrix for Convoluted Generalized Coordinate Rate

Omit card set 44.0 if NS5 $=0$ on card 33.3. $\left[\bar{S}_{5}\right]$ is of size NLD $x$ NDOF.
Card Set $45.0\left[\overline{\mathbf{S}}_{\mathbf{6}}\right]$-Load Equation Feedback Coefficient Matrix for Convoluted Generalized Coordinate Acceleration

Omit card set 45.0 if NS6 $=0$ on card 33.3. $\left[\overline{\mathrm{S}}_{6}\right]$ is of size NLD $\times$ NDOF.
Card Set $46.0\left\{\overline{\mathbf{C}}_{\mathbf{2}}\right\}$-Load Equation Coefficient Matrix for the Forcing Function
Omit card set 46.0 if NC2 $=0$ on card 33.2. $\left\{\overline{\mathrm{C}}_{2}\right\}$ is of size NLD $\times 1$. Input as a row.
Card Set $47.0\left\{\overline{\mathbf{C}}_{3}\right\}$-Load Equation Coefficient Matrix for the Convoluted Forcing
Omit card set 47.0 if $\mathrm{NC3}=0$ on card 33.2 or if NPAN > 0 on card 4.1.
If there is a single forcing function (NFORC $=0$ on card 4.1), $\left\{\bar{C}_{3}\right\}$ is of size NLD $\times 1$ and is input as a row.

However, if the equations of motion are frequency dependent (NKVAL $>0$ on card 4.1), $\left\{\bar{C}_{3}\right\}$ is complex and must be input as a row of size $2^{*}$ NLD with alternating real and imaginary parts.

If there are multiple forcing functions (NFORC $>0$ on card 4.1 ), $\left[\bar{C}_{3}\right]$ is of size NLD $x$ NFORC.

However, if in addition the equations of motion are frequency dependent (NKVAL $>0$ on card 4.1), $\left[\bar{C}_{3}\right]$ is complex and must be input by rows with $2 *$ NFORC numbers per row, alternating real and imaginary parts.

## Card Set 48.0 [ $\overline{\tilde{\phi}}]$-Gradual Penetration Load Equation Coefficient Matrix for the Convoluted Forcing Function

Omit card set 48.0 if NPAN $=0$ on card 4.1. [ $\overline{\boldsymbol{\phi}}]$ is of size NLD $\times$ NPAN.
[ $\overline{\tilde{\phi}}]$ contains real numbers if NKVAL $=0$ on card 4.1 and complex numbers if NKVAL $>0$, indicating that the matrices are frequency dependent. When $[\widetilde{\phi}]$ is complex, it is input with alternating real and imaginary parts, 2*NPAN numbers to a row.

Card Set 49.0-Termination of FINDRMS

| COLS. | KEYWORD/ VARIABLE | FORMAT | OESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | SEND | A10 | This card will cause the termination of the execution of FINDRMS. After this card is read, control of the L221 (TEV156) program will be returned to the main overlay, TEVI56. |

### 6.3.4 PROGRAM SORTQLS

All of the cards read by the second primary overlay SORTQLS are identified by a code word beginning in column one and have fixed field input of the required numbers.

The recognized code words and possible parameters are shown in the following listing. The keyword parameters are underlined, and only the capital letter variables are relevant.

| Card set | Keyword | Variables |
| :---: | :---: | :---: |
| 51 | TITLE | Miscellaneous titling information |
| 52 | TAPE | Magnetic file "NEWTPE" used for output |
| 53 | RESTArt | Restart with MDOF, MFREQ, MSTATE, MPLTPE MRTAPE, NGROUP, and NSETS |
| 54 | LOAD | Load set number JSET |
| 55 | STATIC | Static-elastic solution from load set JSET |
| 56 | PAIR | Pair the standard and the static-elastic solutions |
| 57 | SEPARate | Separate standard and the static-elastic solutions |
| 58 | SCALE | Scale the axes with SCALX and SCALY |
|  |  | Sort and retain the requested item: |

$59 \underline{\underline{\text { SORT }}} \begin{cases}\underline{\underline{Q}} & \text { Generalized coordinates } \\ \underline{\mathrm{L}} & \text { Loads } \\ \underline{\mathbf{S}} & \text { Spectra } \\ \underline{\mathbf{R}} & \text { RMS values }\end{cases}$

60 SORT A All items sorted and retained
61 SEND Terminates SORTQLS execution
General information on the processing of the second primary overlay SORTQLS is presented in the following paragraphs.

Card sets 52.0 through 58.0 (TAPE, RESTA, LOAD, STATI, PAIR, SEPAR, and SCALE) simply set options or give directions to SORTQLS-no immediate action is taken.

The SORT card (card sets 59.0 and 60.0) causes SORTQLS to read the input magnetic file, sort the items specified, and write the magnetic file "NEWTPE". Therefore, all desired options must be declared before the SORT card is input.

SORTQLS will continue to process data cards and sort the specified items until it reads the $\$$ END card (card set 61.0 ) which will terminate the SORTQLS processing.

The option cards LOAD, STATI, PAIR, SEPAR, and SCALE (card sets 54.0 through 58.0) may be inserted any number of times. The last specified card set will remain in effect.

The flow of SORTQLS card input is displayed in figure 6.

Figure 6.-Flow of SORTQLS Card Input Data

Figure 6.-(Concluded)

## Card Set 50.0-SORTQLS Call Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :--- | :--- | :--- | :--- |
| $1-10$ | \$SORTqIs | A10 | This card initializes the call to the second primary overlay, <br> SORTQLS. It introduces SORTQLS data cards. SORTQLS will perform <br> the required sorting, and return control to the main overlay after <br> Card Set 61 has been read. |
| $11-70$ |  | Available for comments. |  |

## Card Set 51.0-Title Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :--- | :--- | :--- | :--- |
| $1-10$ | TITLE | A10 | A keyword indicating a title card. |
| $11-70$ | description | $6 A 10$ | Any miscellaneous titie description. <br> The card will be read, printed on the output file, and ignored. |

## Card Set 52.0-Tape Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :--- | :--- | :--- | :--- |
| $1-10$ | TAPE | A10 | A keyword indicating a tape definition card. |
| $11-20$ | NEWTPE | A10 | The sorted plot vectors will be written in READTP/WRTETP format <br> on the magnetic file "NEWTPE". |

Card set 52.0 should be input only once at the beginning of SORTQLS's execution. Magnetic file "NEWTPE" will contain the sorted plot vectors. If this option is not used, then the default of "NEWTPE" is PLTPSD.

## Card Set 53.0-Restart L221 (TEV156)

Card set 53.0 is intended to restart L221 (TEV156) to sort a FINDRMS tape from a previous run. It is needed to specify information to SORTQLS which is normally passed through labeled common from FINDRMS.

Card 53.1-Restart Card Variables

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | RESTArt | A10 | A keyword introducing a card of problem size variables. |
| 11-15 | MDOF | 15 | The number of degrees of freedom. (MDOF $\leq 100$ ) |
| 16-20 | MFREQ | 15 | The number of frequencies. (MFREQ >1) |
| 21-25 | MSTATE | I5 | ```The static-elastic solution. = O no static-elastic solution was previously found. = 1 a static-elastic solution was previously found.``` |
| 26-35 | MPLTPE | A10 | The magnetic file "IPLTPE" previously defined by FINDRMS. <br> If MPLTPE is not to be defined, then leave the variable blank, otherwise, the magnetic file name must be a left-justified, 1 to 7 character file, name with the first character being alphabetic. |
| 36-45 | MRTAPE | A10 | The magnetic file which contains the load transfer functions. <br> If MRTAPE is not to be defined, then leave the variable blank. otherwise, the magnetic file name must be a left-justified, 1 to 7 character file name, with the first character being alphabetic. |
| 46-50 | NGROUP | I5 | The number of items contained on the magnetic file defined by MPLTPE for each frequency. <br> (NGROUP $\geq 3$ ) |
| 51-55 | NSETS | I5 | The number of sets of load equations. (NSETS $\leq 10$ ) |
| 56-60 | ISET | I5 | If NSETS $=1$ the number of loads in load set 1 . If NSETS is greater than $l$ this field is to be left blank. |

Read card 53.2 to specify the number of loads in each load set if NSETS of card $53.1>1$.
Card 53.2-Number of Sets of Load Equations

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-5 | $\mathrm{ISET}_{1}$ | 1015 | $\text { ISET }_{i}, i=1, \text { NSETS }$ <br> where NSETS of Card 53.1 is the number of sets of load equations and must be $\leq 10$. <br> ISET $_{\mathbf{i}}$ contains the number of loads in the $i$ th load set. |
| 6-10 | $\mathrm{ISET}_{2}$ |  |  |
| : | : |  |  |
| 46-50 | $\mathrm{ISET}_{10}$ |  | $\left(\text { ISET }_{\mathbf{i}} \leq 100\right)$ |

## Card Set 54.0-Load Set Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT | OESCRIPTION |
| :--- | :--- | :--- | :--- |
| $1-10$ | LOAD | A10 | A keyword indicating that the Load Set to be processed follows. |
| $11-15$ | JSET | I5 | The load set number. <br> (JSET $\leq$ NSETS) |

Card set 54.0 specifies the load set from which subsequent items will be sorted. If a LOAD card is not included, JSET = 1 is assumed.

## Card Set 55.0-Static Card

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | STATIC | A10 | A keyword requesting the processing of the static-elastic solution for a particular Load Set. |
| 11-15 | JSET | 15 | The load set number. (JSET $\leq$ NSETS) |

Card set 55.0 specifies that subsequent items to be sorted will be from the static-elastic solution for the load set JSET.

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :--- | :--- | :--- | :--- |
| $1-10$ | PAIR | A10 | A keyword requesting that standard and static-elastic responses <br> be paired on the output file, "NEWTPE" |
| $\ldots .$. |  |  |  |

Card set 56.0 causes SORTQLS to sort the same specified items from both the standard and static-elastic solutions (same load set) and write them on the magnetic file defined by "NEWTPE" (card set 52.0), immediately following one another so they may easily be plotted on one frame. This feature is turned off by the SEPAR (card set 57.0) card.

Card Set 57.0-Separate Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :--- | :--- | :--- | :--- |
| $1-10$ | SEPARA te | A10 | A keyword requesting the separation of standard and static-elastic <br> responses. |

Card set 57.0 will turn off card set 56.0 and will separate the standard and the static-elastic solutions.

Card Set 58.0-Scale Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :--- | :--- | :--- | :--- |
| $1-10$ | SCALE | A10 | A keyword introducing SORTQLS Scale factors. |
| $11-20$ | SCALX | E10.0 | The frequencies will be multiplied by SCALX before being <br> written on the magnetic file "NEWTPE", (see Card Set 51) <br> (SCALX >0) |
| $21-30$ | SCALY | E10.0 | The sorted items will be multiplied by SCALY. <br> (SCALY > $>$ |
| $\vdots$ |  |  |  |

## Card Set 59.0-Sort Card

## Card 59.1-Sort Q, L, S, or R

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | SORT | A10 | A keyword requesting the sorting of item(s) from magnetic file"INTAPE" |
| 11-20 | $\begin{aligned} & \underline{Q}, \underline{L}, \underline{S}, \\ & \text { or } \underline{R} \end{aligned}$ | A10 | A variable indicating which item to sort from load set JSET. <br> Q's = sort the generalized coordinates. <br> Loads = sort the load transfer functions. <br> Spectra = sort the output spectrum. <br> Rms = sort the root mean square values. |
| 21-25 | NSORT | I5 | The number of items to be sorted. <br> (NSORT $\leq 100$ ) <br> If NSORT = 0 all available items of the type specified above will be sorted (retained) and written on file "NEWTPE". |

Card 59.1 is repeated for each variable which the user wishes to sort.
Omit card 59.2 if NSORT of card $59.1=0$.

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-5 | $\mathrm{NUM}_{1}$ | 1415 | $\operatorname{NUM}_{i} ; i=1, \operatorname{NSORT}$ <br> where NSORT is from Card 59.1. <br> The specific numbers of items that are to be sorted (retained) as specified by the item type ( $Q, L, S$, or $R$ ) on Card 59.1. |
| 6-10 | $\mathrm{NuM}_{2}$ |  |  |
| : | : |  |  |
|  | $\mathrm{NUM}_{\text {NSORT }}$ |  | Repeat the card with 14 numbers per card until all elements are defined. |

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | SORT | A10 | A keyword requesting the sorting of items from file "INTAPE". |
| $11-20$ | All | A10 | This variable indicates what type of sorting will take place. <br> All $=$ will sort all $\bar{A}$ 's, loads, and output spectra, from all load sets (both 5 tandard and static-elastic solutions if present). |

The SORTQLS magnetic output file will contain:
Q's for standard solution.

- Q's for static-elastic solution if present.

Loads for standard solution.
Loads for static-elastic solution.
Spectra for standard solution.
Spectra for static-elastic solution.
and, if IPLRMS = 1 (card 4.3 of FINDRMS)
$\bar{A}$ values for standard solution. $\overline{\mathrm{A}}$ values for static-elastic solution.

Card Set 61.0-SORTQLS End Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT | DESCRIPTION |
| :--- | :--- | :--- | :--- |
| $1-10$ | SEND | A10 | A keyword which terminates the SORTQLS processing. |

### 6.3.5 PROGRAM PLOTQLS

All of the cards read by the third primary overlay PLOTQLS are identified by a code word beginning in column one and have fixed field input of the required numbers.

The recognized code words and possible parameters are shown in the following listing in alphabetical order. The keyword parameters are underlined and only the capital letter variables are relevant.

| Card set | Keyword | Variables |
| :---: | :---: | :---: |
| 71 | DEFAUIt | Use default grid limits |
| 70 | GRID | Set grid limits to XMIN, XMAX, YMIN, and YMAX |
| 72 | LABEL | Use miscellaneous plot labeling information |
| 75 | LINEAr | Requests a linear-linear grid on the plot frame |
| 65 | LOAD | Load set number JSET |
| 76 | LOG-Log | Requests a $\log -\log$ grid on the plot frame |
| 67 | PAIR | Pairs the standard and static-elastic solutions |
|  |  | Plot the requested item: |
| 77 | PLOT | $\begin{cases}\underline{\text { Q }} & \text { Plots the generalized coordinates } \\ \underline{\mathbf{L}} & \text { Plots the load transfer function } \\ \underline{\mathbf{S}} & \text { Plots the output spectrum } \\ \underline{\mathrm{R}} & \text { Plots the RMS load values }\end{cases}$ |
| 78 | PLOT | A Plots all items |
| 64 | RESTArt | Restart with MDOF, MFREQ, MSTATE, MPLTPE, MRTAPE, NGROUP, and NSETS |
| 69 | SCALE | Scales the axes with SCALX and SCALY |
| 68 | SEPARate | Separates the standard and static-elastic solutions |
| 66 | STATIC | Plot the static-elastic solution of load set JSET |
| 63 | TITLE | Miscellaneous printout labeling information |
| 73 | X-AXIs | Set x-axis label |

General information on the processing of the third primary overlay PLOTQLS is presented in the following paragraphs.

The cards DEFAUIt, GRID, LABEL, LOAD, PAIR, RESTArt, SCALE, SEPARate, STATIc, and TITLE simply set options or give directions to PLOTQLS-no immediate action is taken.

The PLOT card (card sets 70.0 and 71.0) causes PLOTQLS to read the input magnetic file, sort the items specified, and prepare the plots. Therefore, all desired options must be declared before the PLOT card is input.

PLOTQLS will continue to process data cards and sort the specified items until it reads the $\$$ END card (card set 79.0) which will terminate the PLOTQLS processing.

The option cards DEFAUlt, GRID, LOAD, PAIR, SCALE, SEPARate, STATIc, and TITLE may be inserted any number of times. The last specified card set will remain in effect.

The flow of PLOTQLS card input data is displayed in figure 7.

Figure 7.-Flow of PLOTQLS Card Input Data

Figure 7.-(Continued)

Figure 7.-(Concluded)

Card Set 62.0-PLOTQLS Link Call Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :---: | :--- | :--- | :--- |
| $1-10$ | \$PLOTqls | A10 | This card initializes the call to the third primary overlay, <br> PLOTQLS. It introduces PLOTQLS data cards. PLOTQLS will <br> perform the required plotting and then will return control to <br> the main overlay after Card Set 79 has been read. |
| $11-60$ | description | $5 A 10$ | Miscellaneous labeling information for plot identification. It <br> should include the user's name, phone nuaber, mail stop, and organization. |

Card Set 63.0-Title Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :--- | :--- | :--- | :--- |
| $1-10$ | TITLE | A10 | A keyword indicating a TITLE card. |
| $11-70$ | description | 6A10 | Any miscellaneaus title description. |

Card set 63.0 will be read, printed on the output file, and ignored.

## Card Set 64.0-Restart L221 (TEV156)

Card set 64.0 will restart L221 (TEV156) to sort a FINDRMS tape from a previous run. It is needed to specify information to PLOTQLS which is normally passed through labeled common from FINDRMS.

## Card 64.1-Restart Card Variables

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-10 | RESTArt | A10 | A keyword introducing a card of problem size variables. |
| 11-15 | MDOF | 15 | The number of degrees of freedom. (MDOF $\leq 100$ ) |
| 16-20 | MFREQ | 15 | The number of frequencies. (MFREQ >1) |
| 21-25 | MState | 15 | The static-elastic solution. <br> $=0$ no static-elastic solution was previously found. <br> $=1$ a static-elastic solution was previously found. |
| 26-35 | MPLTPE | A10 | The magnetic file "IPLTPE" previously defined by FINDRMS. If MPLTPE is not to be defined, then leave the variable blank, otherwise, the magnetic file name must be a left-justified, 1 to 7 character file, name with the first character being alphabetic. |
| 36-45 | MRTAPE | A10 | The magnetic file which contains the load transfer functions. If MRTAPE is not to be defined, then leave the variable blank, otherwise, the magnetic file name must be a left-justified, 1 to 7 character file name, with the first character being alphabetic. |
| 46-50 | NGROUP | 15 | The number of items contained on the magnetic file defined by MPLTPE for each frequency. <br> (NGROUP $\geq 3$ ) |
| 51-55 | NSETS | 15 | The number of sets of load equations. (NSETS $\leq 10$ ) |
| 56-60 | ISET | 15 | If NSETS $=1$, the number of loads in load set 1. If NSETS is greater than 1 then this field is to be left blank. |

Read card 64.2 for the number of loads in each load set if NSETS of card $64.1>1$.
Card 64.2-Number of Loads in Each Load Set

| COLS. | KEYWORD/ VARIABLE | FORMAT | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| 1-5 | $\mathrm{ISET}_{1}$ | 1015 | $\operatorname{ISET}_{i}, i=1, \text { NSETS }$ <br> where NSETS of Card 72.1 is the number of sets of load equations and must be $\leq 10$. <br> ISET $_{i}$ contains the number of loads in the $i$ th load set. $\left(\text { ISET }_{i} \leq 100\right)$ |
| 6-10 | $\mathrm{ISET}_{2}$ |  |  |
| ! | ! |  |  |
| 46-50 | ISET $_{10}$ |  |  |

## Card Set 65.0-Load Set Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :--- | :--- | :--- | :--- |
| $1-10$ | LOAD | A10 | A keyword indicating that the Load Set to be processed follows. |
| $11-15$ | JSET | I5 | The load set number. <br> (JSET $\leq$ NSETS $)$ |

Card set 65.0 specifies the load set from which subsequent items will be plotted. If a LOAD card is not included, JSET $=1$ is assumed.

Card Set 66.0-Static Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |
| :--- | :--- | :--- | :--- |$\quad$| DESCRIPTION |
| :--- |
| $1-10$ |
| STATIC |
| $11-15$ |
| JSET |
| A10 | | A keyword requesting the processing of the static-elastic solution |
| :--- |
| for a particular load set. |

Card set 66.0 specifies that subsequent items to be plotted will be from the static-elastic solution of load set number JSET.

## Card Set 67.0-Pair Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :--- | :--- | :--- | :--- |
| $1-10$ | PAIR | AIO | A keyword requesting that standard and static-elastic responses be <br> paired on the plots. |

Card set 67.0 causes PLOTQLS to plot the same specified items from both the standard and static-elastic solutions (of the same load set) on the same frame. This feature is negated by the SEPARate card (card set 68.0).

## Card Set 68.0-Separate Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :--- | :--- | :--- | :--- |
| $1-10$ | SEPARate | A10 | A keyword requesting the separation of standard and static-elastic <br> responses. |

Card set 68.0 will negate the PAIR option of card set 67.0 , and will separate the standard and static-elastic solutions.

Card Set 69.0-Scale Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT | DESCRIPTION |
| :--- | :--- | :--- | :--- |
| $1-10$ | SCALE | A10 | A keyword introducing PLOTQLS scalars. |
| $11-20$ | SCALX | E10.0 | The frequencies will be mul tiplied by SCALX before being plotted. <br> (SCALX $>0)$ |
| $21-30$ | SCALY | E10.0 | The plot items will be multiplied by SCALY before being plotted. <br> $($ SCALY > 0$)$ |

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :--- | :--- | :--- | :--- |
| $1-10$ | GRID | Alo | A keyword introducing PLOTQLS grid limits. |
| $11-20$ | XMIN | E10.0 | The minimum x-axis grid limit. |
| $21-30$ | XMAX | E10.0 | The maximum x-axis grid limit. |
| $31-40$ | YMIN | E10.0 | The minimum y-axis grid limit. |
| $41-50$ | YMAX | E10.0 | The maximum y-axis grid limit. |

Card set 70.0 establishes the limits of the plot card. If a GRID card is not input, the grid limits will be the lowest and highest frequencies and the minimum and maximum of the curves plotted on each frame. If a negative limit is specified, the program will revert to the default for that particular limit.

## Card Set 71.0-Default Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT | DESCRIPTION |
| :--- | :--- | :--- | :--- |
| $\mathbf{1 - 1 0}$ | DEFAUIt | Al0 | The keyword indicating that PLOTQLS will find its own grid limits <br> for each frame. It also negates the GRID option of Card Set 70. |

Card Set 72.0-Label Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :--- | :--- | :--- | :--- |
| $1-10$ | LABEL | A10 | A keyword introducing a plot label. |
| $11-50$ | description | $4 A 10$ | Any miscellaneous plot frame labeling information. |

The 40 label characters will be placed in the plot frame title block below the message(s) listed. Two label cards may be used.

FROM THE STATIC-ELASTIC SOLUTION\} WITH THE STATIC-ELASTIC SOLUTION $\}$

40 characters of label card 1
40 characters of label card 2

## Card Set 73.0-X-Axis Label Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :--- | :--- | :--- | :--- |
| $1-10$ | $\underline{\text { X-AXIs }}$ | Al0 | A keyword introducing an x-axis label. |
| $11-30$ | description | $2 A 10$ | Miscellaneous information to label the x-axis of the plot frame. <br> The default x-axis label is FREQUENCY. |

Card Set 74.0-Y-Axis Label Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :--- | :--- | :--- | :--- |
| $1-10$ | Y-AXIs | A10 | A keyword introducing a y-axis label. |
| $11-50$ | description | $4 A 10$ | Miscellaneous information to label the y-axis of the plot frame. |

The $y$-axis label will serve as the first line in the title block. The default $y$-axis label and title line are:

Card Set 75.0-Linear Grid Card

| COLS. | KEYWORD/ <br> VARIABLE | FORMAT |  |
| :--- | :--- | :--- | :--- |

### 6.4 MAGNETIC FILES INPUT DATA

The input matrices to the L221 (TEV156) program can be obtained from three magnetic (tape or disk) files. These files, "INTAPE", "LDTAPE", and "IFTAPE", are discussed in sections 6.4.1, 6.4.2, and 6.4.3, respectively.

The use of these magnetic files to contain the input matrices will depend on whether or not they have been defined through the use of either the tape option card (see card 4.4 of sec.6.3) or the load instruction card (see card set 31.0 of sec.6.3). If any of the magnetic files have not been defined, then the associated input matrices will be read from input cards.

All input magnetic files are in the READTP/WRTETP format. ${ }^{1}$

### 6.4.1 "INTAPE"

By default FINDRMS will read the equations of motion matrices in card sets 14.0 through 30.0 (sec.6.3). If, however, the user specifies a file name in the variable INTAPE on card 4.4, the matrices will read from magnetic file "INTAPE" (see fig. 8) in the READTP/WRTETP format.

FINDRMS rewinds "INTAPE" before attempting to read any matrices. Several input parameters determine which matrices are contained on "INTAPE". These parameters are NDOF, NPAN, and KNVAL of card 4.1; IFDBAK of card 4.1 and the non-null matrix indicators in cards 13.2 and 13.3.

For the matrices appearing in figure 8:
\{HEADER\} Will be present only if the keyword DYLOFLEX was read in card 13.1
$\left[\mathrm{S}_{1}\right],\left[\mathrm{S}_{2}\right], \ldots,\left[\mathrm{S}_{6}\right] \quad$ Will not be present if IFDBAK $=0$ on card 4.2
$\left\{f_{\chi}\right\}$ and $[\tilde{\phi}] \quad$ Will replace $\left\{\mathrm{C}_{3}\right\}$ if NPAN $>0$ on card 4.1
$\{$ FREQM $\}$ and the frequency-dependent matrices $\left(\left[M_{4}\right],\left[M_{5}\right],\left[M_{6}\right],\left\{C_{3}\right\}\right.$, or $\left.[\tilde{\phi}]\right)$ will not be present if NKVAL $=0$.

The equations of motion are followed on "INTAPE" by an end-of-file. If LDTAPE in card set 31.0 is defined with the same name as INTAPE, FINDRMS will skip the end-of-file and read the load equations from the second file of "INTAPE". Additional load sets may appear in logical files three, four, etc.

[^1]

Figure 8.-Contents of the File "INTAPE"

The contents of the DYLOFLEX header matrix are described in the following listing.
Position Format Description

1 A10 Contains the DYLOFLEX header keyword, 7HDYLOFLX
2 A10 Program name/version number of the program that created the tape

3 A10 Date of the run that created the tape, 10 H yr/mo/da
4 I10 Contains the number of degrees of freedom, NDOF

5
110
Contains the number of load equations, NLD
I10 Contains the number of gradual penetration panels, NPAN
I10 Contains the number of k values used for the multiple frequency-dependent matrices option, NKVAL

Not used
E10.0 Contains the velocity (erve air speed), VEL
$10-20$
21
22
23
24
25
26
27
28
29
30

Not used
I10 NULMAT (1); if $>0,\left[\mathrm{M}_{1}\right]$ will be read
I10 NULMAT (2); if $>0,\left[\mathrm{M}_{2}\right]$ will be read
I10 NULMAT (3); if $>0,\left[\mathrm{M}_{3}\right]$ will be read
I10 NULMAT (4); if $>0,\left[M_{4}\right]$ will be read
I10 NULMAT (5); if $>0,\left[\mathrm{M}_{5}\right]$ will be read
I10 NULMAT (6); if $>0,\left[\mathrm{M}_{6}\right]$ will be read
I10 NULMAT (7); if $>0,\left[C_{2}\right]$ will be read
I10 NULMAT (8); if $>0,\left[\mathrm{C}_{3}\right]$ will be read
I10 NULMAT (9); if $>0,\left[f_{\ell}\right]$ will be read
Il0 NULMAT (10); if $>0$, [ $\tilde{\phi}]$ will be read
Note: The program will check the values given for NDOF, NLD, NPAN, NKVAL, and VEL in the DYLOFLEX header matrix against the same variables read from cards. All values not compatible will cause a fatal error, except VEL which causes a warning error.

### 6.4.2 "LDTAPE"

By default, FINDRMS will read the load equations in card sets 34.0 through 48.0 (sec. 6.3). If, however, the user specifies a file name in the variable LDTAPE on card set 31.0 , the matrices corresponding to those card sets will be read from magnetic file "LDTAPE" (see fig. 9) in READTP/WRTETP format.

FINDRMS will rewind "LDTAPE" if LDTAPE does not have the same name as INTAPE (card 4.4) or LDTAPE of the previous load set. Otherwise, FINDRMS will skip one end-of-file mark and try to read the set of load equation matrices from the next logical file on "LDTAPE".

Several input parameters determine which matrices are contained on LDTAPE. These parameters are NDOF, NPAN, and NKVAL of card 4.1 ; IFDBAK of card 4.2 ; and the non-null matrix indicators in cards 33.2 and 33.3.

For the matrices appearing in figure 9:
\{HEADER\} Will be present only if the DYLOFLEX keyword was encountered in card 33.1. The contents are similar to those appearing on INTAPE described in section 6.4.1
$\left[\overline{\mathrm{S}}_{1}\right],\left[\overline{\mathrm{S}}_{2}\right], \ldots,\left[\overline{\mathrm{S}}_{6}\right] \quad$ Will not be present if IFDBAK $=0$
$[\overline{\widetilde{\phi}}] \quad$ Will replace $\left\{\overline{\mathrm{C}}_{3}\right\}$ if NPAN $>0$
The frequency-dependent matrices $\left(\left[\overline{\mathrm{M}}_{4}\right],\left[\overline{\mathrm{M}}_{5}\right],\left[\overline{\mathrm{M}}_{6}\right],\left\{\overline{\mathrm{C}}_{3}\right\}\right.$, or $[\overline{\widetilde{\phi}}]$ ) will not be present If $\mathrm{NKVAL}=0$.

### 6.4.3 "IFTAPE"

When ISPEC $<0$ on card 4.2 , FINDRMS will read the tabular input spectrum(s) on card 8.3 or 8.4 (sec. 6.3). If, however, the user also specifies a file name in the variable IFTAPE on card 4.4, the tabular input spectrum(s) will be read from "IFTAPE" (see fig. 10) in the READTP/WRTETP format.

FINDRMS will rewind "IFTAPE"and then read one matrix for each spectrum required. A spectrum is needed for each combination of ( $\mathrm{I}, \mathrm{J}$ ) where $\mathrm{I}=1$, NFORC and $J=I$, NFORC. Because of symmetry, only the upper right triangular combinations are input. Input row 1 with $J=1$, NFORC; then row 2 with $J=2$, NFORC; then row 3 with $J=3$, NFORC ; ...; and finally row NFORC with $J=$ NFORC.

Each spectrum contains NSP elements, but because the elements are complex, the array must be of size 2 NSP $\times 1$.

Figure 9.-Contents of the File "LDTAPE"

Figure 10.-Contents of the File "IFTAPE"

### 6.5 OUTPUT DATA

### 6.5.1 PRINTED OUTPUT DATA

The input data for each of the L221 (TEV156) modules will be echo-printed except where noted; i.e., printing of FINDRMS input matrices is optional. Other printed output matrices will be discussed by module.

## Program FINDRMS

The RMS values and zero crossings will be printed for each FINDRMS solution. Optionally, the following can also be printed.

- Generalized coordinates, load transfer functions, and output spectrum at each frequency (see option IPRINT of card 4.3, sec. 6.3)
- Correlation between different loads (see option ICORR of card set 30.0)
- Input matrices; load equations and equations of motion (see option ICKPRT of card 4.3)
- Matrices of intermediate calculations for program checkout (see option ICKPRT of card 4.3)
- RMS load values, $\bar{A}$, for the last IRMSPR frequencies (see option IRMSPR of card 4.3)

## Program SORTQLS

After each set of card input data, SORTQLS will print one line for each item it writes on magnetic file "NEWTPE". The messages are intended to show the program's progress if a failure occurs.

## Program PLOTQLS

After each set of card input data, PLOTQLS will print a one line message for each item plotted. The messages are intended to show the program's progress if a failure occurs.

### 6.5.2 MAGNETIC FILES OUTPUT DATA

FINDRMS will write on as many as three magnetic files; "IPTLPE", "IRTAPE" (figs. 11 and 12, respectively), and "SCRATCH". SORTQLS, however, will only write on one magnetic file, "NEWTPE" (fig. 13). PLOTQLS writes on magnetic file "TAPE99".
All matrices contained on these magnetic files are written by the WRTETP subroutine. ${ }^{1}$

[^2]
## "IPLTPE"

The magnetic file "IPLTPE" is written when it is requested on card 4.4 of FINDRMS. "IPLTPE", if defined, will contain the arrays calculated in FINDRMS (fig. 11).

| Size |  | Matrix |  |
| :---: | :---: | :---: | :---: |
| (NFREQ | x 1) | \{FREQ\} | \{FREQ\} is in cycles per second |
| (NDOF | x 1) | \{QMAGR \} |  |
| (NLD | $\times 1$ ) | \{QMAGL\} | for FREQ ( 1 ) |
| (NLD | $\times 1$ ) | \{SPEC ${ }^{*}$ |  |
| (NDOF | x 1) | \{QMAGR \} |  |
| (NLD | $\times 1$ ) | \{QMAGL\} | for FREQ(2) |
| (NLD | $\times 1)$ | \{SPEC $\}^{*}$ |  |
| (NDOF | x 1) | \{QMAGR\} | for FREQ (NFREQ) |
| (NLD | $\times 1)$ | \{QMAGL\} |  |
| (NLD | $\times 1$ ) | \{SPEC \}* |  |
|  |  | End-of-File | solutions if the static elastic solution was requested with one |
|  |  |  | file created for each solution |

* If IPLRMS $=1$ on Card 4.3, $\{\bar{A}\}$ which contains the $\bar{A}$ values will be written on "IPLTPE" immediately after \{SPEC\} for each frequency.

Figure 11.-Contents of the File "IPLTPE"

The magnetic file "IRTAPE" is written when it is requested on card 4.4 of FINDRMS. "IRTAPE", if defined, will contain the arrays calculated in FINDRMS (fig. 12).

Figure 12.-Contents of the File "IRTAPE"

The magnetic file "NEWTPE" is written whenever SORTQLS is run. "NEWTPE" will contain alternating matrices of independènt and dependent variables to be plotted by another program (see fig. 13).

Figure 13.-Contents of the File "NEWTPE"

### 6.5.3 PUNCHED CARDS

There is an option in FINDRMS that will cause the program to punch on cards the RMS load values, $\{\overline{\mathrm{A}}\}$, and number of zero crossings, $\left\{\mathrm{N}_{\mathbf{0}}\right\}$, for each solution. This option is requested by IPUNCH of card 4.3 (sec. 6.3).

The matrices $\{\overline{\mathrm{A}}\}$ and $\left\{\mathrm{N}_{0}\right\}$ will be punched on cards with the format of 7 E 10.3 with each matrix starting at the beginning of a card (fig. 14).

Figure 14.-Format of $\{\bar{A}\}$ and $\left\{N_{o}\right\}$ Punched on Cards

### 6.6 RESTRICTIONS

## General:

- Maximum core size allowed for L221 (TEV156) is 2000008.
- All input variables must be within the ranges defined in the card input data (sec. 6.3)

## FINDRMS:

- A maximum of 10 loads may be correlated with any particular load
- Loads per degree of freedom may be printed at a maximum of 10 different frequencies
- A maximum of 10 load sets in one data case

Use of the multiple forcing function option (app. C) results in the following restrictions:

- No gradual penetration
- No feedback
- No loads correlation
- No static-elastic solution
- Generalized coordinates and load frequency response functions may be plotted for only the first excitation force
- $\quad\left\{\mathrm{C}_{2}\right\}$ and $\left\{\overline{\mathrm{C}}_{2}\right\}$ are null
- Loads per degree of freedom may not be printed
- Küssner lift growth function must $=1$
- Only the tabular input spectrum can be used

### 6.7 DIAGNOSTICS

All errors detected by L221 (TEV156) will result in the printing of a diagnostic error message. These messages are self-explanatory and are of the following formats:

```
******** FATAL ERROR n
    DIAGNOSED WHILE EXECUTING ROUTINE name
    other lines describing the error
********* WARNING ERROR n
    DIAGNOSED WHILE EXECUTING ROUTINE name
    other lines describing the error
```

where $n$ is the error number (from 1 to 19), and name is the name of the routine in execution when the error was detected.

All errors are fatal unless they have been diagnosed as warnings. The following list is a brief description of each error.

1. Premature end-of-file was encountered in the card input file.
2. Keyword is not appropriate.
3. Keyword is not recognizable to L221 (TEV156).
4. Tested parameter is not within its specified range or it is in conflict with other options (see the card input data, sec. 6.3).
5. Illegal magnetic file definition.
6. Required core is found to be too large.
7. READTP error (see sec. 6.7.1).
8. WRTETP error (see sec. 6.7.2).
9. PRINTM/PRNTCM error (see sec. 6.7.3).
10. Improper matrix size.
11. FSF error. The returned value i contains the number of file marks remaining to be skipped when an end-of-information was encountered. If $n$ files were to be spaced, then ( $n-i$ ) files were spaced before the error was detected.
12. [SUMM] matrix was found to be singular when routine CGLESM was called; CGLESM solves $\mathbf{A X}=\mathbf{B}$ for $\mathbf{X}$.
13. Extrapolation is required over the tabular input spectra.
14. VARDIM routine errors (see sec. 6.7.4).
15. FETEDIT errors (see sec. 6.7.5).
16. Rudder limiting (RLIMIT) did not converge. This is nonfatal error and execution will continue (see app. B).
17. Unable to sort or plot the RMS load values, $\bar{A}$, because they were not contained in file "IPLTPE". This is a nonfatal error and execution will continue.
18. Number of requested plots is incorrect. This is a nonfatal error and execution will continue.
19. Unable to plot 0 . on log grid. The current plot will be omitted. This is a nonfatal error and execution will continue.

### 6.7.1 READTP ERROR CODES

| Error code | $=$ | 0 | No errors are detected during reading. |
| :---: | :---: | :---: | :---: |
|  | = | 1000+I | A forward space file (FSF) error occurred, where I is the number of file marks remaining to be skipped when an end-of-information was encountered. |
|  | = | 2 | Number of matrices or files to be skipped, before reading starts, is less than zero. |
|  | = | 3 | Dimensioned number of rows in the matrix is less than zero. |
|  | = | $3000+\mathrm{I}$ | A forward space record (FSR) error occurred, where I is the number of records remaining to be skipped when either an end-of-file or end-of information was encountered. |
|  | $=$ | 4 | Number of rows in the matrix is greater than the dimensioned row size in the program. |
|  | = | 5 | Name check failed. |
|  | $=$ | 6 | Number of rows in the matrix (M) times the number of columns ( N ) is greater than the buffer size; or $\mathrm{M}^{*} \mathrm{~N} \leqslant 0$. |
|  | = | 7 | End-of-file was read. If it occurs while reading the matrix ID, no information is stored in the user's area. If it occurs while reading the matrix, the ID information will be stored. Note that the records will always be in pairs and an end-of-file should always be encountered with the ID record. |

### 6.7.2 WRTETP ERROR CODES

| Error code | $=$ | 0 | No errors are detected during writing. |
| :---: | :---: | :---: | :---: |
|  | = | $1000+$ I | FSF error occurred, where I is the number of file marks remaining to be skipped when an end-of-information was encountered. |
|  | = | 2 | Number of matrices or files to be skipped, before writing starts, is less than zero. |
|  | = | 3 | Dimensioned number of rows in the matrix is less than or equal to zero. |
|  | $=$ | $3000+$ I | FSR error occurred, where $I$ is the number of records remaining to be skipped when either an end of file or end-of-information was encountered. |
|  | = | 4 | Actual number of rows in the matrix is greater than the dimensioned number of rows in the matrix. |
|  | = | 6 | Number of rows in the matrix ( $M$ ) times the number of columns ( N ) is greater than the buffer size. |

### 6.7.3 PRINTM/PRNTCM ERROR CODES

Error code $=0 \quad$ No error was detected.
$=3$ Number of dimensioned rows is less than or equal to zero.
$=4$ Actual number of rows is greater than the number of dimensioned rows.
$=6$ Actual number of rows times the actual number of columns is less than or equal to zero.

### 6.7.4 VARDIM ROUTINE ERROR CODES

DELETR error code $=0$ Successful.
$=-2$ Name of the array is not contained within the VARDIM library.

INITIR error code $\quad=0$ Successful.
$=-1 \quad$ Previous array of the same name was destroyed before the new one was established.
$=1$ Maximum number of catalog entries was exceeded.
$=2$ One of the array dimensions is zero.
$=3$ Blank common storage was exceeded.
$=4$ Routine STARTR was not called beforehand.
LOCATR error code $=0$ Successful.
$=-1$ STARTR was not called beforehand.
$=-2$ Name of the array is not contained within the VARDIM library.

### 6.7.5 FETEDIT ERROR CODES

FETADD error code $=0$ Successful.
$=\quad-1 \quad$ File has been previously defined, no action taken.
$=1$ An illegal tape number.
$=2$ Length of either the buffer or array was too small.
$=3$ Maximum number of files has already been defined (49 allowed).

FETDEL error code $=0$ Successful.
$=-1$ File was not defined, no action taken.
$=1$ An illegal tape number.

### 7.0 SAMPLE PROBLEM

The sample problem shown in this section is a vertical gust analysis of a typical large subsonic jet transport airplane. The theoretical math model consists of two rigid body degrees of freedom (vertical translation and pitch) and six wing elastic normal modes. Unsteady aerodynamics was modeled only for the wing with the Doublet Lattice method. The rigid body aerodynamics representation (rigid body stability derivatives) was obtained from corrected wind tunnel data.

The load equations were generated using the force summation method.

## APPENDIX A

## FREQUENCY ARRAY FORMULATION

FINDRMS can automatically prepare five different distributions of frequencies
FREQ $_{\mathbf{i}} ; \mathbf{i}=1$, NFREQ
over which the power spectral density (PSD) solution will be found. The option ISPEC (card 4.2) chooses one of the five distributions shown below.

Given: Initial frequency, $\operatorname{FREQ}(1)$ or $\omega_{1}$
(card 11.3)
Frequency increment, DELTAF or $\Delta \omega$ (card 11.3)
Number of frequencies, NFREQ or $n$ (card 4.1)
If ISPEC=1

$$
\begin{aligned}
& \omega_{j}=\omega_{1}+j \Delta \omega \quad \text { where } j=1, \ldots,(n-5) \\
& \omega_{n-4}=\omega_{n-5}+200 \Delta \omega \\
& \omega_{n-3}=\omega_{n-4}+200 \Delta \omega \\
& \omega_{n-2}=\omega_{n-3}+1000 \Delta \omega \\
& \omega_{n-1}=\omega_{n-2}+2000 \Delta \omega \\
& \omega_{n}=\omega_{n-1}+3000 \Delta \omega
\end{aligned}
$$

If ISPEC=2

$$
\begin{aligned}
& \omega_{j}=\omega_{1}+j \Delta \omega \\
& \omega_{j}=\omega_{j-1}+2 \Delta \omega \\
& \omega_{n-4}=\omega_{n-5}+200 \Delta \omega \\
& \omega_{n-3}=\omega_{n-4}+200 \Delta \omega \\
& \omega_{n-2}=\omega_{n-3}+1000 \Delta \omega \\
& \omega_{n-1}=\omega_{n-2}+2000 \Delta \omega \\
& \omega_{n}=\omega_{n-1}+3000 \Delta \omega
\end{aligned}
$$

where $j=1, \ldots, k$, and $k=\frac{2}{3}(n-5)$, truncated
where $\mathrm{j}=\mathrm{k}+1, \ldots,(\mathrm{n}-5)$

If ISPEC=3

$$
\begin{aligned}
& \omega_{j}=\omega_{1}+j \Delta \omega \\
& \omega_{j}=\omega_{j-1}+2 \Delta \omega \\
& \omega_{j}=\omega_{j-1}+4 \Delta \omega \\
& \omega_{n-4}=\omega_{n-5}+200 \Delta \omega \\
& \omega_{n-3}=\omega_{n-4}+200 \Delta \omega \\
& \omega_{n-2}=\omega_{n-3}+1000 \Delta \omega \\
& \omega_{n-1}=\omega_{n-2}+2000 \Delta \omega \\
& \omega_{n}=\omega_{n-1}+3000 \Delta \omega
\end{aligned}
$$

If ISPEC=4

$$
\begin{aligned}
& \omega_{\mathrm{j}}=\omega_{1}+j \Delta \omega \\
& \omega_{\mathrm{j}}=\omega_{\mathrm{j}-1}+2 \Delta \omega \\
& \omega_{\mathrm{j}}=\omega_{\mathrm{j}-1}+4 \Delta \omega \\
& \omega_{\mathrm{j}}=\omega_{\mathrm{j}-1}+6 \Delta \omega \\
& \omega_{\mathrm{n}-4}=\omega_{\mathrm{n}-5}+200 \Delta \omega \\
& \omega_{\mathrm{n}-3}=\omega_{\mathrm{n}-4}+200 \Delta \omega \\
& \omega_{\mathrm{n}-2}=\omega_{\mathrm{n}-3}+1000 \Delta \omega \\
& \omega_{\mathrm{n}-1}=\omega_{\mathrm{n}-2}+2000 \Delta \omega \\
& \omega_{\mathrm{n}}=\omega_{\mathrm{n}-1}+3000 \Delta \omega
\end{aligned}
$$

where $j=1, \ldots, k$, and $k=\frac{1}{2}(n-5)$, truncated where $j=k+1, \ldots, k_{2}$, and $k_{2}=\frac{3}{4}(n-5)$, truncated where $j=k_{2}+1, \ldots,(n-5)$
where $j=1, \ldots, k$, and $k=\frac{1}{2}(n-15)$, truncated where $j=k+1, \ldots, k_{2}$, and $k_{2}=\frac{3}{4}(n-15)$, truncated where $\mathrm{j}=\mathrm{k}_{2}+1, \ldots, \mathrm{n}-15$
where $\mathrm{j}=\mathrm{n}-14, \ldots, \mathrm{n}-5$

## If IFSPEC=5

$$
\begin{array}{ll}
\omega_{j}=\omega_{1}+.5 \Delta \omega & \text { where } j=1, \ldots, 6 \\
\omega_{j}=\omega_{j-1}+\Delta \omega & \text { where } j=7, \ldots, k, \text { and } k=\frac{1}{2}(n-15) \\
\omega_{j}=\omega_{j-1}+2 \Delta \omega & \text { where } j=k, \ldots, k_{2}, \text { and } k_{2}=\frac{3}{2}(k) \\
\omega_{j}=\omega_{j-1}+4 \Delta \omega & \text { where } j=k_{2}, \ldots, k_{3}, \text { and } k_{3}=2 k \\
\omega_{j}=\omega_{j-1}+6 \Delta \omega & \text { where } j=k_{3}, \ldots, k_{4}, \text { and } k_{4}=(n-4) \\
\omega_{n-4}=\omega_{n-5}+200 \Delta \omega & \\
\omega_{n-3}=\omega_{n-4}+200 \Delta \omega & \\
\omega_{n-2}=\omega_{n-3}+1000 \Delta \omega & \\
\omega_{n-1}=\omega_{n-2}+2000 \Delta \omega & \\
\omega_{n}=\omega_{n-1}+3000 \Delta \omega &
\end{array}
$$

## APPENDIX B

## SPECIAL FEEDBACK

The special feedback option is geared to a particular problem-the physical limit on the deflection angle of a rudder used in a feedback damping system. The rudder-limiting option, when activated, inspects the magnitude of the rudder angle. When the angle is less than the limit angle (RLIMIT, $\delta_{\mathrm{R}_{\mathrm{lim}}}$, radians), the program functions in the normal fashion. At any frequency where the angle called for is greater than the limit, the program decreases the yaw damper gain to match the rudder's physical limit by using the ratio of $\delta_{\mathrm{R}}^{\mathrm{lim}}{ }^{\prime} \delta_{\mathrm{R}}$. The phase angle remains the same as that originally called for.

The option has been used to plot curves similar to curve $A$ in the following sketch.

Note: Stability augmentation system (SAS)

This information allows the engineer to determine the effect of rudder limiting on load exceedances.

The special feedback option results in the following three steps in the program's code.

1. For each frequency, the FINDRMS subroutine SOLVEQ calculates $\{Q\}$ in the same manner used for the standard feedback option.

$$
\begin{aligned}
& {[S U M M]=\left[M_{1}\right]+i[g \stackrel{\circ}{S D D}]\left[\stackrel{\circ}{M}_{1}\right]+s\left[M_{2}\right]+\ldots+s^{2} g(s)\left[\mathbf{M}_{6}\right]} \\
& + \text { Fydamp }\left[\left[S_{1}\right]+s\left[S_{2}\right]+\ldots+s^{2} g(s)\left[S_{6}\right]\right] \\
& \{\mathrm{SUMC}\}=-\mathbf{z}\left\{\mathrm{f}(\mathrm{~s})\left\{\mathrm{C}_{3}\right\}+\left\{\mathrm{C}_{2}\right\}\right\} \\
& \text { Fydamp }=\frac{G\left(P_{1} s^{2}+U_{1} s+R_{1}\right)\left(P_{2} s^{2}+U_{2} s+R_{2}\right)\left(P_{3} s^{2}+U_{3} s+R_{3}\right)\left(T_{1} s+1\right)}{\left(P_{4} s^{2}+U_{4} s+R_{4}\right) \ldots\left(P_{7} s^{2} U_{7} s+R_{7}\right)\left(T_{2} s+1\right)\left(T_{3} s+1\right) \ldots\left(T_{7} s+1\right)}
\end{aligned}
$$

2. Now SOLVEQ solves for the rudder angle, $\delta_{R}$

$$
\delta_{R}=\left\lvert\, \begin{aligned}
& \text { NDOF } \\
& \sum_{i=1}^{\sum}
\end{aligned}\right. \text { Fydamp }\left(\mathrm{Q}_{\mathbf{i}}\left(\mathrm{CS}_{\mathbf{i}} \mathrm{s}^{2}+\mathrm{CS}_{\mathrm{i}} \mathrm{~s}+\mathrm{CS}_{\mathrm{i}}\right)\right) \mid
$$

where $|a|$ is the absolute value of the complex number $a$.
3. Next, the program checks $\delta_{R}$ against $\delta_{R_{l i m}}$. If $\delta_{R} \leqslant \delta_{R_{l i m}}$, the solution is accepted. If not, the feedback transfer function is factored (multiplied by $\delta_{\mathbf{R}_{\mathrm{lim}}} / \delta_{\mathrm{R}}$ ) and steps 1 and 2 are repeated until $\delta_{\mathbf{R}}$ falls within the limits of

$$
\delta_{\mathbf{R}_{\mathrm{lim}}} \pm 0.01 \delta_{\mathbf{R}_{\mathrm{lim}}}
$$

However, if in five interations $\delta_{R}$ does not converge to $\delta_{R}$ lim , the following message is printed and the current solution is accepted.

WARNING ERROR 16
RUDDER LIMITING DID NOT CONVERGE ON RLIMIT( )
FOR FREQ( ) =
AFTER 5 TRIES AMAG =
RUN WILL PROCEED WITHOUT CONVERGING.

## APPENDIX C

## MULTIPLE EXCITATION FORCING FUNCTIONS

The analytical steps followed in section 5.0 describe the operation of FINDRMS for a system being excited by a single excitation source. FINDRMS can also be used to compute the RMS response levels and number of zero crossings for systems responding to multiple excitations. The multiple excitation mode, however, does not include all of the capabilities available during the execution of the single excitation mode. The following options are excluded when using multiple excitations:

- Feedback
- Gradual penetration
- Built-in input spectrum
- Küssner lift growth function (f(s) must = 1.)
- Load correlation
- Printing of loads per degrees of freedom
- Static-elastic solution

In addition:

- Frequency responses and load transfer functions can be plotted for only the first excitation force.
- $\quad\left\{\mathrm{C}_{2}\right\}$ and $\left\{\overline{\mathrm{C}}_{2}\right\}$ are null.

The FINDRMS analytical steps for multiple excitations are:

1. Read card input of options and constants
2. Read card or magnetic file input of equations of motion [ $\mathrm{M}_{1}$ ], $\left[\mathrm{M}_{2}\right], \ldots,\left[\mathrm{M}_{6}\right.$ ], plus the excitation forces [ $\mathrm{C}_{3}$ ].

Note: $\left[\mathrm{C}_{3}\right]$ is a rectangular matrix with NDOF (number of degrees of freedom) rows and NFORC (number of excitation force) columns. The $\mathrm{C}_{31 \mathrm{j}}$ element is the excitation scalar for the ith mode responding to the jth force.
3. For each of the NFREQ frequencies, solve for [ $Q$ ] the generalized coordinate frequency response and save [Q] on "SCRATCH" file. The generalized coordinates are found by solving the following equations.

$$
[\mathrm{SUMM}][\mathrm{Q}] \triangleq[\mathrm{SUMC}]
$$

where:
$[$ SUMM $]=\left[M_{1}\right]+i\left[\stackrel{0}{\mathrm{gSD}^{2}}\right]\left[\mathrm{M}_{1}^{0}\right]+\mathrm{s}\left[\mathrm{M}_{2}\right]+\mathrm{s}^{2}\left[\mathrm{M}_{3}\right]$

$$
+\mathrm{g}(\mathrm{~s})\left[\mathrm{M}_{4}\right]+\mathrm{sg}(\mathrm{~s})\left[\mathrm{M}_{5}\right]+\mathrm{s}^{2} \mathrm{~g}(\mathrm{~s})\left[\mathrm{M}_{6}\right]
$$

where:
s $\quad=i \omega=$ Laplace transform variable
$g(s) \quad=$ Laplace transform of the Wagner function

$$
\begin{gathered}
=a_{1}-\frac{b_{1} s}{s+\alpha_{1}}-\frac{c_{1} s}{s+\beta_{1}}-\frac{d_{1} s}{s+\gamma_{1}} \\
{[S U M C]=-2\left[C_{3}\right]}
\end{gathered}
$$

Note: Optionally, the input matrices $\left[\mathrm{M}_{4}\right],\left[\mathrm{M}_{5}\right],\left[\mathrm{M}_{6}\right]$, and $\left[\mathrm{C}_{3}\right]$ or $[\tilde{\phi}]$ are frequency dependent. Interpolation is required to define those matrices at each frequency, $\omega$, before calculating [SUMM], [SUMC], and [Q].

Optionally, the user can delete specified degrees of freedom. This is accomplished by zeroing out the appropriate degrees of freedom in the [SUMM] and [SUMC] summation matrices.
4. Read card or magnetic file input of load equations [ $\left.\overline{\mathbf{M}}_{1}\right],\left[\overline{\mathbf{M}}_{2}\right], \ldots,\left[\overline{\mathbf{M}}_{6}\right]$, and $\left[\overline{\mathbf{C}}_{3}\right]$; where [ $\overline{\mathrm{C}}_{3}$ ] is NLD (number of load equations) by NFORC (number of excitation forces).
5. For each frequency, read [Q] (from step 3), calculate [ $\overline{S U M C}$ ], calculate the input spectrum $[\phi(\Omega)]$, calculate the output spectrum SPEC, optionally write data on files "IPLTPE" and "IRTAPE", optionally print [SUMC], and keep a running integration over the frequencies of $\{\bar{A}\}$ and $\left\{N_{0}\right\}$.

$$
[\overline{\mathrm{SUMC}}]=[\overline{\mathrm{SUMM}}][\mathrm{Q}]+|z|\left[\overline{\mathbf{C}}_{3}\right]
$$

where:

$$
[\overline{\mathrm{SUMM}}]=\left[\overline{\mathbf{M}}_{1}\right]+\mathrm{s}\left[\overline{\mathrm{M}}_{2}\right]+\mathrm{s}^{2}\left[\overline{\mathbf{M}}_{3}\right]+\mathrm{g}(\mathrm{~s})\left[\overline{\mathbf{M}}_{4}\right]+\mathrm{sg}(\mathrm{~s})\left[\overline{\mathrm{M}}_{5}\right]+\mathrm{s}^{2} \mathrm{~g}(\mathrm{~s})\left[\overline{\mathrm{M}}_{6}\right]
$$

The integration for $\{\bar{A}\}$ and $\left\{N_{0}\right\}$ at one load, $\ell$, is shown as:

$$
\begin{gathered}
\overline{\mathrm{A}}_{\ell}=\sqrt{\sum_{i=1}^{\mathrm{NFREQ}}\left(\frac{\text { SPEC }_{\ell \mathrm{i}}+\mathrm{SPEC}_{\ell \mathrm{i}-1}}{2}\right)\left(\Omega_{\mathrm{i}}-\Omega_{\mathrm{i}-1}\right)} \\
\mathrm{N}_{\mathrm{O}_{\ell}}=\left(\frac{1}{2 \pi \mathrm{~A}_{\ell}}\right) \sqrt{\sum_{\mathrm{i}=1}^{\mathrm{NFREQ}}\left(\frac{\mathrm{SPEC}_{\ell \mathrm{i}} \Omega_{\mathrm{i}}{ }^{2}+\mathrm{SPEC}_{\ell \mathrm{i}-1} \Omega_{\mathrm{i}-1}{ }^{2}}{2}\right)\left(\Omega_{\mathrm{i}}-\Omega_{\mathrm{i}-1}\right)}
\end{gathered}
$$

where $\mathrm{SPEC}_{\ell}{ }_{i}$ is the output spectrum calculated for load $\ell$ at frequency i and is found by:

$$
\begin{aligned}
\operatorname{SPEC}_{\ell \mathrm{i}}= & \left.{\underset{\mathrm{k}=1}{\mathrm{NFORC}} \operatorname{SUMC}_{\mathrm{k}, \ell}(\Omega) \operatorname{SUMC}_{\mathrm{k}, \ell}^{*}\left(\Omega_{\mathrm{i}}\right) \phi_{\mathrm{k}, \mathrm{k}}\left(\Omega_{\mathrm{i}}\right)}^{\text {NORC }} \mathrm{NFORC} \operatorname{SUMC}_{\mathrm{k}, \ell}\left(\Omega_{\mathrm{i}}\right) \operatorname{SUMC}_{\mathrm{j}, \ell}^{*}\left(\Omega_{\mathrm{i}}\right) \phi_{\mathrm{k}, \mathrm{j}}\left(\Omega_{\mathrm{i}}\right)\right)
\end{aligned}
$$

where (-)* denotes complex conjugate of (-), $\phi_{\mathrm{k}, \mathrm{j}}$ is the input spectrum, and $R(-)$ denotes the real part of ( - . This equation is derived from the more general form:

$$
\operatorname{SPEC}_{\ell \mathbf{i}}=\underset{\mathrm{k}=1}{\mathrm{NFORC}} \underset{\mathrm{j}=1}{\mathrm{NFORC}} \mathrm{SUMC}_{\mathbf{k}, \ell}\left(\Omega_{\mathrm{i}}\right) \operatorname{SUMC}_{\mathbf{j}, \ell}\left(\Omega_{\mathrm{i}}\right) \phi_{\mathbf{k}, \mathrm{j}}\left(\Omega_{\mathrm{i}}\right)
$$

by utilizing the Hermitian property of $\phi_{\mathbf{k}, \mathbf{j}}$.
Note: Optionally, the input matrices $\left[\overline{\mathbf{M}}_{4}\right],\left[\overline{\mathrm{M}}_{5}\right],\left[\overline{\mathbf{M}}_{6}\right]$, [ $\left.\overline{\mathrm{C}}_{3}\right]$ or [ $\left.\overline{\boldsymbol{\phi}}\right]$ are frequency dependent (NKVAL > 1). Interpolation is required to define those matrices at each frequency, $\omega$, before calculating [ $\overline{\mathrm{SUMM}}$ ], \{SUMC $\}$, etc.

Optionally, the user can delete specified degrees of freedom. This is accomplished by the zeroing of the appropriate degrees of freedom in the summation matrix, [ $\overline{\text { SUMM }}$ ].
6. Print $[\overline{\mathrm{A}}]$ and $\left\{\mathrm{N}_{\mathbf{0}}\right\}$ and optionally punch them out on cards.
7. For additional sets of load equations, repeat steps 4 through 6 .

| 16 Absiract <br> L221 (TEV156) is a digital computer program available for execution on the CDC 6600. The program is capable of calculating steady state solutions for linear second-order differential equations due to sinusoidal forcing functions. From this steady state solution, generalized coordinates and load frequency responses may be determined. Statistical characteristics of loads for the forcing function spectral shape may also be calculated using random harmonic analysis techniques. <br> The particular field of application of the program is the analysis of airplane response and loads due to continuous random air turbulence. Optional capabilities include frequency-dependent input matrices, feedback damping, gradual gust penetration, multiple excitation forcing functions, and a static-elastic solution. <br> Program usage and a brief description of the analysis used are presented in volume I of this document. Volume II contains a description of the design and structure of the program to aid those persons who will maintain and/or modify the program in the future. |  |  |
