EARTH RESOURCES

A Continuing Bibliography With Indexes Issue 20

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced between October 1, 1978 and December 31, 1978

- Scientific and Technical Aerospace Reports (STAR)
- International Aerospace Abstracts (IAA).

This Supplement is available from the National Technical Information Service (NTIS), Springfield, Virginia 22161, at the price code E05 (\$9.00 domestic; \$18.00 foreign).

INTRODUCTION

The technical literature described in this continuing bibliography may be helpful to researchers in numerous disciplines such as agriculture and forestry, geography and cartography, geology and mining, oceanography and fishing, environmental control, and many others. Until recently it was impossible for anyone to examine more than a minute fraction of the earth's surface continuously. Now vast areas can be observed synoptically, and changes noted in both the earth's lands and waters, by sensing instrumention on orbiting spacecraft or on aircraft.

This literature survey lists 273 reports, articles, and other documents announced between October 1 and December 31, 1978 in Scientific and Technical Aerospace Reports (STAR), and International Aerospace Abstracts (IAA).

The coverage includes documents related to the identification and evaluation by means of sensors in spacecraft and aircraft of vegetation, minerals, and other natural resources, and the techniques and potentialities of surveying and keeping up-to-date inventories of such riches. It encompasses studies of such natural phenomena as earthquakes, volcanoes, ocean currents, and magnetic fields; and such cultural phenomena as cities, transportation networks, and irrigation systems. Descriptions of the components and use of remote sensing and geophysical instrumentation, their subsystems, observational procedures, signature and analyses and interpretive techniques for gathering data are also included. All reports generated under NASA's Earth Resources Survey Program for the time period covered in this bibliography will also be included. The bibliography does not contain citations to documents dealing mainly with satellites or satellite equipment used in navigation or communication systems, nor with instrumentation not used aboard aerospace vehicles.

The selected items are grouped in nine categories. These are listed in the Table of Contents with notes regarding the scope of each category. These categories were especially chosen for this publication, and differ from those found in STAR and IAA.

Each entry consists of a standard bibliographic citation accompanied by an abstract. The citations and abstracts are reproduced exactly as they appeared originally in STAR, or IAA, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the variation in citation appearance.

Under each of the nine categories, the entries are presented in one of two groups that appear in the following order:

IAA entries identified by accession number series A78-10,000 in ascending accession number order;

STAR entries identified by accession number series N78-10,000 in ascending accession number order.

After the abstract section, there are five indexes:

subject, personal author, corporate source, contract number and report/accession number.

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A78-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies of accessions are available at \$6.00 per document up to a maximum of 20 pages. The charge for each additional page is \$0.25. Microfiche ⁽¹⁾ of documents announced in *IAA* are available at the rate of \$2.50 per microfiche on demand, and at the rate of \$1.10 per microfiche for standing orders for all *IAA* microfiche. The price for the *IAA* microfiche by category is available at the rate of \$1.25 per microfiche plus a \$1.00 service charge per category per issue. Microfiche of all the current AIAA Meeting Papers are available on a standing order basis at the rate of \$1.35 per microfiche.

Minimum air-mail postage to foreign countries is \$1.00 and all foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to AIAA Technical Information Service. Please refer to the accession number when requesting publications.

STAR ENTRIES (N78-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code followed by the letters HC or MF in the STAR citation. Current values for the price codes are given in the tables on page vii.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard \$3.00 price, for those documents identified by a # symbol.)

⁽¹⁾ A microfiche is a transparent sheet of film, 105 by 148 mm in size, containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

- Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.
- Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.
- Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.
- Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.
- Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.
- Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)
- Avail: ZLDI. Sold by the Zentralstelle für Luftfahrtdokumentation und -Information, Munich, Federal Republic of Germany, at the price shown in deutschmarks (DM).
- Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.
- Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.
- Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

SUBSCRIPTION AVAILABILITY

This publication is available on subscription from the National Technical Information Service (NTIS). The annual subscription rate for the quarterly supplements is \$30.00 domestic; \$60.00 foreign. All questions relating to the subscription should be referred to NTIS, Attn: Subscriptions, 5285 Port Royal Road, Springfield, Virginia 22161.

TABLE OF CONTENTS

Subject Categories

Abs	tracts in this Bibliography are grouped under the following categories:	page:
01	AGRICULTURE AND FORESTRY Includes crop forecasts, crop signature analysis, soil identification, disease detection, harvest estimates, range resources, timber inventory, forest fire detection, and wildlife migration patterns.	229
02	ENVIRONMENTAL CHANGES AND CULTURAL RESOURCES Includes land use analysis, urban and metropolitan studies, environmental impact, air and water pollution, geographic information systems, and geographic analysis.	235
03	GEODESY AND CARTOGRAPHY Includes mapping and topography.	237
04	GEOLOGY AND MINERAL RESOURCES Includes mineral deposits, petroleum deposits, spectral properties of rocks, geological exploration, and lithology.	239
05	OCEANOGRAPHY AND MARINE RESOURCES Includes sea-surface temperature, ocean bottom surveying imagery, drift rates, sea ice and icebergs, sea state, fish location.	245
06	HYDROLOGY AND WATER MANAGEMENT Includes snow cover and water runoff in rivers and glaciers, saline intrusion, drainage analysis, geomorphology of river basins, land uses, and estuarine studies.	253
07	DATA PROCESSING AND DISTRIBUTION SYSTEMS Includes film processing, computer technology, satellite and aircraft hardware, and imagery.	257
80	INSTRUMENTATION AND SENSORS Includes data acquisition and camera systems and remote sensors.	263
09	GENERAL Includes economic analysis.	267

EARTH RESOURCES

A Continuing Bibliography (Issue 20)

JANUARY 1979

01 AGRICULTURE AND FORESTRY

Include crop forecasts, crop signature analysis, soil identification, disease detection, harvest estimates, range resources, timber inventory, forest fire detection, and wildlife migration patterns.

A78-43304 # Remote sensing in agronomy and pedology - In search of a methodology (La télédétection en agronomie et pédologie - A la recherche d'une méthodologie). M. C. Girard and C. M. Girard (Institut National Agronomique Paris-Grignon, Thiverval-Grignon, Yvelines, France). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings.

Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 1-7. 5 refs. In French.

The application of remote sensing technology in agronomy and pedology is discussed in terms of data collection and data interpretation. With reference to data collection, attention is given to wavelength-band selection as determined by the subject under study, and altitude selection as determined by the dimensions of the plot under study. Methods for data interpretation are outlined including analytical, statistical, and cartographic techniques. S.C.S.

A78-43305 # Global agricultural productivity estimation from Landsat data. A. R. Mack (Agriculture Canada, Soil Research Institute, Ottawa, Canada), J. Schubert, C. Goodfellow, P. Chagarlamudi, and H. Moore (Gregory Geoscience, Ltd., Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 8-18. 5 refs.

Landsat data have been computer processed in order to determine indices of growing conditions for general vegetation, cultivated areas, and specific crops such as spring wheat. Individual pixels are classified as to vegetation density and the biomass is calculated. Regression equations (obtained from biomass indices from various sites) are used to calculate predicted crop yields in terms of bushels per acre. A comparison is made between the actual distribution of classified pixels in spring wheat yields and the predicted distribution. It is found that the predicted values for final yield are within plus or minus 10 percent of the actual yields for ten out of eleven estimates made for various regions of Canada. S.C.S.

A78-43308 # Computer-assisted forest land classification by means of several classification methods on the CCRS Image-100. Y. J. Lee (Pacific Forest Research Centre, Victoria, British Columbia, Canada), F. Towler, H. Bradatsch, and S. Finding (British Columbia Forest Service, Victoria, British Columbia, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 37-46. 9 refs.

Results are reported for computer-assisted forest-land classification using the CCRS Image-100 supervised classification technique. The study was conducted at three Canadian test sites. The results from principal-components color enhancement revealed that logged-over, urban, power-line, and cultivated areas were easily distinguishable and that vegetation could be mapped. Poor results were obtained from unsupervised classification on the five identifiable forest-land classes with the exception of water. Computer-assisted classification using supervised classification algorithms was found to identify broad forest-land classes which may be subsequently used for further sampling by small-scale aerial photographs and ground surveys.

A78-43312 # A basis for multistage forest inventory in the Boreal forest region. C. L. Kirby and P. I. van Eck (Environment Canada, Northern Forest Research Centre, Edmonton, Alberta, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings.

Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 71-94. 29 refs.

Consideration is given to the interpretation of Landsat imagery and ultra-small and large-scale aerial photography with reference to a multistage sampling design for forest regions. It is found that: (1) a multistage design incorporating sampling units based on variable probability is applicable to large-area inventories, (2) ultra-small, infrared, color aerial photographs may be used to estimate stand volumes for preparing forest cover and soil maps, and (3) large-scale photo sampling may partially replace extensive ground sampling when estimating timber volume, cut-over land, and habitat types.

S.C.S.

A78-43314 # Quantitative predictions of chemical soil conditions from multispectral airborne ground and laboratory measurements. H. Schreier (British Columbia, University, Vancouver, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 106-112. 20 refs.

Multispectral reflectance measurements are used to make quantitative predictions of chemical soil conditions. Data are collected from five parent materials from the air, on the ground, and in the laboratory. Spectral reflection curves are determined over the 400-1000 nm range and mean and range values are found. It is noted that percent carbon, iron, and exchangeable magnesium are most correlated with the spectral measurements. A curvilinear regression fitting an exponential function satisfactorily predicts carbon and exchangeable magnesium values whereas a straight linear function satisfactorily predicts iron values. The airborne, ground, and laboratory analyses are found to yield similar results.

S.C.S.

A78-43321 # Remote sensing of the thermal characteristics of ground surfaces covered with vegetation - Trial interpretation key (Télédétection des caractéristiques thermiques des surfaces terrestres végétalisées - Essai de clef d'interprétation). F. Bonn, R. Brochu, and M. Lajeunesse (Sherbrooke, Université, Sherbrooke, Quebec, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 180-188. 18 refs. In French.

01 AGRICULTURE AND FORESTRY

Remote sensing techniques used to evaluate ground-level energy exchanges and the thermal characteristics of the ground cover are reviewed. Studies conducted at ground level, using an airborne PRT5 radiometer, and using a Daedalus scanner are described. The soil parameters which may be monitored are presented along with a thermal classification of the primary types of ground cover. Seasonal variations are described and a synoptic table is proposed for data interpretation.

S.C.S.

A78-43336 # Specific study of rice cultivation by remote sensing - Cartography and production evaluation (Etude spécifique d'une culture /riz/ par télédetection - Cartographie et évaluation de production). T. Le Toan (Centre d'Etudes Spatiales des Rayonnements, Toulouse, France). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings.

Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 355-364. In French.

Landsat data have been used in conjunction with aerial photography and field data to evaluate the rice-growing areas in the Camargue region of southern France. The data were collected from eight Landsat passages made in 1975 and aerial photographs taken at 1500 and 7000 m. It is found that optimal results are obtained using supervised classification techniques, multidate observations, and methods employing linear discriminant functions.

S.C.S.

A78-43342 # Vegetation classification with digital X-band and L-band dual polarized SAR imagery. R. Shuchman (Michigan, Environmental Research Institute, Ann Arbor, Mich.) and R. T. Lowry (Canada Centre for Remote Sensing, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 444-458. 10 refs.

Digital multispectral and multipolarization synthetic aperture radar have been used for vegetation classification in coastal wetlands regions. The basic components of the X-L radar system are the two-channel X-band (3.2 cm) and L-band (25.0 cm) radars. The two radar parameters are varied in the multiplexed system. The data are digitized by the ERIM hybrid optical-digital processor and seven classes are identified: inland H2O, coniferous trees, palmettoes and palm/secondary story, marsh grass, coastal marsh grass, sand and shell fragments, and dry grass and palmettoes.

A78-43347 # Study of alfalfa survival in Quebec by color and infrared photography at scales of 1:6000 to 1:40,000 (Etude sur la survie de la luzerne au Québec au moyen de photos couleurs et infra-rouges à des echelles de 1:6000 à 1:40000). R. Paquin (Agriculture Canada, Station de Recherche, Sainte-Foy, Quebec, Canada), G. Ladouceur, R. Desrosiers (Université Laval, Sainte-Foy, Quebec, Canada), and A. Mack (Agriculture Canada, Institut de Recherches sur les Sols, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 506-515. In French.

A78-44801 Application of multispectral aerial photographs to soil surveys in New Zealand. W. C. Rijkse (Department of Scientific and Industrial Research, Soil Bureau, Rotorua, New Zealand). New Zealand Journal of Science, vol. 20, Dec. 1977, p. 363-370.

Multispectral aerial photographs of two river valleys near Tolaga Bay and Ruatoria, East Coast, North Island showed much better definition of soil boundaries of alluvial soils than conventional panchromatic photographs. The photographs were in four wavelength bands that approximate Landsat satellite passbands. They showed differences between parent materials and erosion patterns of hill country. Black and white prints of the infrared range produced more information on soil type separation than panchromatic photos, but they were inferior in erosion pattern detection. (Author)

A78-47320 * Plant canopy light absorption model with application to wheat. J. E. Chance and E. W. LeMaster (Pan American University, Edinburg, Tex.). *Applied Optics*, vol. 17, Aug. 15, 1978, p. 2629-2636, 14 refs. Grant No. NsG-9033.

A light absorption model (LAM) for vegetative plant canopies has been derived from the Suits reflectance model. From the LAM the absorption of light in the photosynthetically active region of the spectrum (400-700 nm) has been calculated for a Penjamo wheat crop for several situations including (a) the percent absorption of the incident radiation by a canopy of LAI 3.1 having a four-layer structure, (b) the percent absorption of light by the individual layers within a four-layer canopy and by the underlying soil, (c) the percent absorption of light by each vegetative canopy layer for variable sun angle, and (d) the cumulative solar energy absorbed by the developing wheat canopy as it progresses from a single layer through its growth stages to a three-layer canopy. This calculation is also presented as a function of the leaf area index and is shown to be in agreement with experimental data reported by Kanemasu on Plainsman V wheat.

A78-48005 * Area estimation of crops by digital analysis of Landsat data. M. E. Bauer, M. M. Hixson, and B. J. Davis (Purdue University, West Lafayette, Ind.). *Photogrammetric Engineering and Remote Sensing*, vol. 44, Aug. 1978, p. 1033-1043. 18 refs. Contract No. NAS5-20793.

The study for which the results are presented had these objectives: (1) to use Landsat data and computer-implemented pattern recognition to classify the major crops from regions encompassing different climates, soils, and crops; (2) to estimate crop areas for counties and states by using crop identification data obtained from the Landsat identifications; and (3) to evaluate the accuracy, precision, and timeliness of crop area estimates obtained from Landsat data. The paper describes the method of developing the training statistics and evaluating the classification accuracy. Landsat MSS data were adequate to accurately identify wheat in Kansas; corn and soybean estimates for Indiana were less accurate. Systematic sampling of entire counties made possible by computer classification methods resulted in very precise area estimates at county, district, and state levels.

A78-51618 # Simultaneous microwave and optical wavelength observations of agricultural targets. F. J. Ahern, D. G. Goodenough, A. L. Grey, R. A. Ryerson, R. J. Vilbikaitis (Department of Energy, Mines and Resources, Canada Centre for Remote Sensing, Ottawa, Canada), and M. Goldberg (Ottawa, University, Ottawa, Canada). Canadian Journal of Remote Sensing, vol. 4, Aug. 1978, p. 127-142. 11 refs.

A 13.3 GHz scatterometer and a nadir-viewing radiometermeasuring reflected radiance in the Landsat bands were flown simultaneously over a number of fields near Ottawa containing eleven different forage crops. The purpose of the experiments was to compare the relative ability of the optical and microwave sensors to differentiate the various crop types, and to investigate the advantages of combining optical and microwave measurements for crop discrimination. Confusion matrices were calculated for both the optical and the microwave data. Microwave and optical sensors provide complementary information which, when combined, permit the most accurate classifications to be achieved. The better single sensor based on classification accuracy is a multispectral optical sensor. It was found that the most significant features derivable from the scatterometer data were the dual-polarized scattering coefficients at nadir and the linear slopes of the scattering coefficients as a function of observation angle. (Author)

A78-51619 # Feature subset selection in remote sensing. D. G. Goodenough, P. M. Narendra, and K. O'Neill (Department of Energy, Mines and Resources, Canada Centre for Remote Sensing, Ottawa, Canada; Honeywell, Inc., Minneapolis, Minn.). Canadian Journal of Remote Sensing, vol. 4, Aug. 1978, p. 143-148. 5 refs.

Consideration is given to the feature subset selection system as part of the interactive image analysis-display system of the Canada

Centre for Remote Sensing. The branch and bound algorithm for feature subset selection and the feature selection criteria are described. Experimental results are given for applying the algorithm to 12-channel airborne multispectral-scanner data from LARS C-1 flight-line and Landsat data. It is found that multitemporal Landsat imagery yields higher classification accuracies for agricultural crop identification.

A78-53649 Crop discriminability in the visible and near infrared regions, V. R. Rao (Indian Space Research Organization, Bangalore, India), E. J. Brach, and A. R. Mack (Agriculture Canada, Research Branch, Ottawa, Canada). Photogrammetric Engineering and Remote Sensing, vol. 44, Sept. 1978, p. 1179-1184, 9 refs.

Field spectroradiometer data at 10-nm intervals in the region of 350 to 1840 nm, from 1976 experimental field plots of wheat, oats, barley, fababean, soybean, and rapeseed, were analyzed statistically to assess discriminability among the crops. At early stages of plant growth, interference from soil reflectance was dominant. Analysis of the data obtained between early heading and early seed development showed similar spectral patterns among the crops and their cultivars. Unique differences were obtained among them at certain narrow bands in relation to the over-all mean radiance based on coefficients of variation. An index of discriminability, determined to assess separability of crops throughout the spectrum, was used to distinguish between two wheat cultivars at 950 and 1400 nm which corresponds to the water absorption region for leaves.

N78-28558 State Univ. of New York, Buffalo. A PHOTOGRAPHIC REMOTE SENSING SYSTEM FOR THE DETECTION AND QUANTIFICATION OF URBAN TREE STRESS Ph.D. Thesis

Bov Bang Eav 1977 207 p

Avail: Univ. Microfilms Order No. 78-06180

A statistical model was developed to permit quantitative prediction of urban tree stress levels based on spot microdensitometric measurements. Multidate, large scale, 70 mm color and color infrared photography was acquired simultaneously with ground data for 1156 maple trees at four study sites in Syracuse. New York. Results indicated that: (1) broad band microdensitometric data extracted from color infrared photography can be used in some cases to previsually detect the presence of urban tree stress, (2) the multiple regression model developed permitted accurate prediction of quantitative tree stress indices for drought-induced stress, (3) an index expressing tree foliage symptoms was most accurately predicted from the aerial photographic data, (4) color infrared film proved to be superior to normal color film in predicting tree stress symptoms, (5) multiple stress symptom parameters measured on the ground can be combined into a small number of composite stress indices through factor analysis, and, (6) the timing of aerial photography with respect to rainfall and development of stress manifestation accrued on the ability of aerial data to predict drought-related stress.

LANDSAT DIGITAL DATA APPLICATION TO FOREST VEGETATION AND LAND-USE CLASSIFICATION IN MINNESOTA Ph.D. Thesis Roy Alan Mead 1977 112 p

Avail: Univ. Microfilms Order No. 78-09702

Three methods of accuracy verification were applied to eleven land cover categories mapped from LANDSAT data. As a result, it was quite apparent that the accuracy of mapping land cover on large blocks of land, including transition zones and vegetation type mixtures, gave lower estimates of accuracy than was realized on either training sets or test sets. Evaluation of the various map solutions by experienced field resource management cooperators resulted in the judgment that the classification accuracies were so low as to preclude practical use for their purposes at this time. Dissert. Abstr.

SOIL RESOURCES AND POTENTIAL FOR AGRICULTURAL DEVELOPMENT IN BAHR EL JEBEL IN SOUTHERN SUDAN, JONGLEI CANAL PROJECT AREA

Victor I. Myers, Donald G. Moore, M. A. Abdel-Hady, A. G. Abdel-Samie, E. M. ElShazly, Principal Investigators, Hussein Youvis, B. K. Worcester, A. A. Klingebiel, M. M. ElShazly, M. A. Hamad et al Apr. 1978 189 p refs Sponsored by NASA Original contains imagery. Original photography may be purchased from the EROS Data Center, Sioux Falls, S. D. 57198 ERTS (E78-10161; NASA-CR-157279) HC A09/MF A01 CSCL 02C

The author has identified the following significant results. Fourteen LANDSAT scenes were used to produce mosaics of the 167, 474 sq km study area. These were black and white MSS 7 images and false color composite images. Five major soil-landscape units were delineated on the mosaics, and these were subdivided into a total of 40 soil mapping units. Aerial reconnaissance was useful in defining boundaries between mapping units and in estimating the proportion of the various soils which composed each mapping unit. Ground surveying permitted first-hand observation of major soils and sampling for quantitative laboratory analysis. Soil interpretations were made. including properties, potentials, and limitations.

(FCT-492) Avail: British Library Lending Div, Boston Spa,

Large scale 70 mm picture format photogrammetry of forests in northern Germany were obtained by using two stereocameras in an aluminum housing installed 4 to 5 m apart on the wing struts of a light aircraft, and a motor-driven small image camera for taking series photographs with stereo overlap. The two cameras were synchronously operated by means of a cable with a simultaneous triggering instrument actuated by the photographer in the aircraft. Measurement data based on the photogrammetric evaluation of the aerial photos are compared with ground data measured on the same sample plots using 35 mm wide angle overview photos. Standard errors in tree height measurement, stem diameters, crown diameters and volume estimates are discussed as well as methods for photointerpretation and data processing. A.R.H.

EVALUATION OF WAVELENGTH GROUPS FOR DISCRIMINATION OF AGRICULTURAL COVER TYPES

Ravindra Kumar Apr. 1978 13 p refs Submitted for publication

(Grant NGL-15-005-112)

(NASA-CR-157393; INPE-1210-PE/120) Avail: NTIS HC A03/MF A01 CSCL 02C

Multispectral scanner data in twelve spectral channels, in the wavelength range 0.46 to 11.7 mm, acquired in July 1971 for three flightlines, were analyzed by applying automatic pattern recognition techniques. These twelve spectral channels were divided into four wavelength groups (W1, W2, W3 and W4), each consisting of three wavelength channels -- with respect to their estimated probability of correct classification (P sub c) in discriminating agricultural cover types. The same analysis was also done for the data acquired in August, to investigate the effect of time on these results. The effect of deletion of each of the wavelength groups on P sub C in the subsets of one to nine channels, is given. Values of P sub C for all possible combinations of wavelength groups, in the subsets of one to eleven channels are also given.

EFFECTS OF SYSTEMIC AND NON-SYSTEMIC STRESSES ON THE THERMAL CHARACTERISTICS OF CORN

Ravindra Kumar, L. F. Silva, and M. E. Baer (Purdue Univ.) Jun. 1978 33 p refs Submitted for publication (Grant NGL-15-005-112)

(NASA-CR-157391; INPE-1282-PE/138) Avail: NTIS HC A03/MF A01 CSCL 02C

Experiments were conducted on corn plants using a calibrated spectroradiometer under field conditions in the indium antimonide channel (InSb. 2.8 to 5.6 mm) and the mercury cadmium telluride channel (HgCdTe, 7 to 14 mm). A ground cover experiment, an experiment on nonsystemic corn plants, and an experiment on systemic-stressed corn plants were included. The average spectral radiance temperature of corn plant populations was found (1) to be statistically significantly different for four healthy corn plant populations, (2) to increase with increased blight severity, and (3) to be statistically significantly different for varying rates of nitrogen applications.

GLOBAL CROP PRODUCTION FORECASTING: AN

ANALYSIS OF THE DATA SYSTEM PROBLEMS AND THEIR SOLUTIONS

J. Neiers and H. Graf May 1978 83 p refs (Contract NAS8-32491)

(NASA-CR-150749; Rept-78HV031) Avail: NTIS HC A05/MF A01 CSCL 02C

Data related problems in the acquisition and use of satellite data necessary for operational forecasting of global crop production are considered for the purpose of establishing a measurable baseline. For data acquisition the world was divided into 37 crop regions in 22 countries. These regions represent approximately 95 percent of the total world production of the selected crops of interest, i.e., wheat, corn, soybeans, and rice. Targets were assigned to each region. Limited time periods during which data could be taken (windows) were assigned to each target. Each target was assigned to a cloud region. The DSDS was used to measure the success of obtaining data for each target during the specified windows for the regional cloud conditions and the specific alternatives being analyzed. The results of this study suggest several approaches for an operational system that will perform satisfactorily with two LANDSAT type satellites

AUTOMATIC CLASSIFICATION OF REFORESTED PINUS SPP AND EUCALYPTUS SPP IN MOGI-GUACU, SP, BRAZIL, USING LANDSAT DATA

Nelson deJesus Parada, Principal Investigator, Y. E. Shimabukuro, P. E. Hernandez, N. F. Koffler, and S. C. Chen Apr. 1978 15 p refs Presented at 12th Intern. Symp. of Remote Sensing of Environment, Malina, Philippines, Apr. 1978 Sponsored by NASA ERTS

(E78-10182; NASA-CR-157372; INPE-1223-PE/125) Avail: NTIS HC A02/MF A01 CSCL 02F

The author has identified the following significant results. Single date LANDSAT CCTs were processed, by Image-100 to classify Pinus and Eucalyptus species and their age groups. The study area Mogi-Guacu was located in the humid subtropical climate zone of Sao Paulo. The study was divided into ten preliminary classes and featured selection algorithms were used to calculate Bhattacharyya distance between all possible pairs of these classes in the four available channels. Classes having B-distance values less than 1.30 were grouped in four classes: (1) class PE - P. elliottii, (2) class PO - Pinus species other than P. elliotii, (3) class EY - Eucalyptus spp. under two years, and (4) class EO - Eucalyptus spp. more than two years old. The percentages of correct classification ranged from 70.9% to 94.12%. Comparisons of acreage estimated from the Image-100 with ground truth data showed agreement. The Image-100 percent recognition values for the above four classes were 91.62%, 87.80%, 89.89%, and 103.30%, respectively.

USE OF LANDSAT DATA TO MONITOR PASTURE PROJECT IN AMAZONIA

Nelson deJesusParada, Principal Investigator, Armando Pacheco dosSantos, and Evlyn Marcia Leao de Moraes Novo Apr. 1977

17 p refs Sponsored by NASA ERTS (E78-10192; NASA-CR-157382; INPE-1009-NTE/079) Avail: NTIS HC A02/MF A01 CSCL 02C

The author has identified the following significant results. No differences were found between acreage evaluation by visual and automatic interpretation of LANDSAT images. It was necessary to interpret both channels 5 and 7 to exactly outline the deforested areas. Channel 7 was necessary for the identification of deforested areas in the presence of recently grown natural vegetation, and channel 5 was necessary to identify the deforested areas in the cerrado regions. Automatic interpretation permitted the discrimination between areas with predominant grass coverage and recently grown natural vegetation.

The author has identified the following significant results. Recognition of rice varieties at the flowering stage by using airborne scanner data at low altitude (1500 m) seems to be feasible. The accuracies obtained on a reduced test area (3 sq km) range from 65% to 83%. Variations of a single cultural factor, such as nitrogen fertilization, induce variations of the total rice biomass at harvest, which can be correlated closely to the values of the reflectance ratio at earing. When grain production is correlated to total biomass, prediction of yield can be achieved based on reflectance data measured two months before harvest.

The author has identified the following significant results. The concept of average mutual information in the received spectral random process about the spectral scene was developed. Techniques amenable to implementation on a digital computer were also developed to make the required average mutual information calculations. These techniques required identification of models for the spectral response process of scenes. Stochastic modeling techniques were adapted for use. These techniques were demonstrated on empirical data from wheat and vegetation scenes.

RED AND PHOTOGRAPHIC INFRARED LINEAR COMBINA-TIONS FOR MONITORING VEGETATION

Compton J. Tucker May 1978 37 p refs Submitted for publication

(NASA-TM-79620) Avail: NTIS HC A03/MF A01 CSCL 08F In situ collected spectrometer data were used to evaluate and quantify the relationships between various linear combinations of red and photographic infrared radiances and experimental plot biomass, leaf water content, and chlorophyll content. The radiance variables evaluated included the red and photographic infrared (IR) radiance and the linear combinations of the IP/red ratio. the square root of th IR/red difference, the vegetation index, and the transformed vegetation index. In addition, the corresponding green and red linear combinations were evaluated for comparative purposes. Three data sets were used from June, September, and October sampling periods. Regression analysis showed the increase utility of the IR and red linear combinations vis-a-vis the same green and red linear combinations. The red and IR linear combinations had 7% and 14% greater regression significance than the green and red linear combinations for the June and September sampling periods, respectively. The VI, TVI, and square root of the IR/red ration were the most significant followed closely by the IR/red ratio. Less than 6% difference separated the highest and lowest of these four IR and red linear combinations. The use of these linear combinations was shown to be sensitive primarily to the green leaf area or green leaf biomass

Landsat data collected during 1975-1976 have been used in ecological studies conducted in southern Tunisia. Information has been gathered on major surface features, vegetation, and surface soil characteristics. Color-treated imagery has been used to create a zoning system based on homogeneous ecological parameters. S.C.S.

A78-44235 The use of Landsat imagery in a land system classification of Jordan. C. W. Mitchell (Reading, University, Reading, Berks., England). British Interplanetary Society, Journal (Remote Sensing), vol. 31, Aug. 1978, p. 283-292. 39 refs.

The natural environment of the Hashemite Kingdom of Jordan is discussed in terms of remote sensing observations. Landsat data was used for most of the imaging, whereby information was compiled on a scale of 1:250,000, and published on a scale of 1:1,000,000. Landsat pictures, i.e., color composites, were classified into a system of discrete boundaries with the aid of a Zeiss Jena Interpretoscope. The data (encompassing geology, hydrology, soils, vegetation, and conservation) were checked by on-site ground observations. Attention is given to the morphology and location of the various geological regions, e.g., desert sandstone, upland limestone, lava flows, etc.

A78-44236 A methodology for employing Landsat data for rural land use surveys in developing countries. B. F. Lock (Salisbury College of Advanced Education, Adelaide, Australia) and J. L. van Genderen (Fairey Surveys, Ltd., Maidenhead, Berks., England). British Interplanetary Society, Journal (Remote Sensing), vol. 31, Aug. 1978, p. 293-304. 18 refs. Research supported by the University of Sheffield.

A Landsat MSS 1:250,000 survey of Murcia Province, Spain, is presented as an illustration of the usefulness of Landsat data for the mapping of semi-arid regions of developing countries, in general. The methodology of the survey is divided into two parts: pre-operational and operational. The pre-operational phase consists of a formulation of objectives and techniques, with special attention to the development of the classification scheme to be used. The operational phase involves the interpretation of specific data. After Ground Truth has been established, a final map can be produced.

GUIDANCE FOR APPLICATION OF REMOTE SENSING TO

ENVIRONMENTAL MANAGEMENT. APPENDIX A: SOURCES OF AVAILABLE REMOTE SENSOR IMAGERY John R. May Mar. 1978 69 p

(DA Proj. 4A7-62720-A-896)

(AD-A053673; WES-INSTR-M-78-2-App-A) Avail: NTIS HC A04/MF A01 CSCL 14/5

Results are presented of a survey conducted to determine the sources, characteristics, and availability of remotely sensed imagery held by various Federal and state governmental organizations. Data presented were collected primarily by direct contact with Federal and state agencies and through extensive examination of published documents. The remote sensor data identified as a result of the survey comprises two principal categories of data: aircraft and satellite imagery. Data collected during the survey is presented and tabulated under eight general headings: agency or organization (sources), type of imagery, range of scales, coverage areas, coverage period and frequency, availability and characteristics of imagery, products available and cost, and procedures for obtaining imagery. Information concerning sources and availability of remote imagery held by commercial, private, and academic organizations is not presented.

METHODOLOGY FOR ASSESSING THE POTENTIAL IMPACT ON AIR QUALITY RESULTING FROM GEOTHER-MAL RESOURCE DEVELOPMENT IN THE IMPERIAL VALLEY

P. H. Gudiksen, M. C. Axelrod, D. L. Ermak, K. C. Lamson, and R. Lange 17 Oct. 1977 17 p. refs Presented at the Intern. Clean Air Conf., Brisbane, Australia, 15-19 May 1978 (Contract W-7405-eng-48)

(UCRL-79388; Conf-780504-1) Avail: NTIS HC A02/MF A01

The installation of a network of air quality stations for characterizing the air quality and atmospheric transport properties in the valley prior to development is discussed. Analyses of geothermal fluids for various gases were performed to evaluate the potential emission rates from future geothermal power plants. The principal pollutant of concern was H2S because of its noxious odor and potential release rate. These estimated source emission rates and the appropriate meteorological measurements were used as input to a three dimensional, atmospheric transport code to estimate the potential changes in air quality that result from various scenarios for development of geothermal power.

REMOTE SENSING OF ATMOSPHERIC POLLUTION FROM SPACE

A brief review is presented of techniques and instruments

J. E. Harries Apr. 1978 47 p refs (NPL-QU-44) Avail: NTIS HC A03/MF A01

for remotely sensing pollution in the lowest layers of the earth's atmosphere from an orbiting spacecraft. The associated difficulties and problems including the weakness of pollutant signals; the high intensity of background radiation; scattering and attenuation due to clouds, aerosols and particulate matter; and atmospheric temperature structure anomalies are discussed. Four basic techniques which should be investigated further are discussed. These are laser absorption spectrometer; microwave absorption spectrometer: gas correlation radiometer; and correlation spectrometer. It is concluded that a combination of several sensors may eventually be used in an operational mode

and that further studies of these selected areas should be carried out leading to test flights possibly utilizing platforms such as Spacelab and the space shuttle.

The author has identified the following significant results. Two sets of urban test sites, one with 35 cities and one with 70 cities, were selected in the State, Sao Paulo. A high degree of colinearity (0.96) was found between urban and areal measurements taken from aerial photographs and LANDSAT MSS imagery. High coefficients were observed when census data were regressed against aerial information (0.95) and LANDSAT data (0.92). The validity of population estimations was tested by regressing three urban variables, against three classes of cities. Results supported the effectiveness of LANDSAT to estimate large city populations with diminishing effectiveness as urban areas decrease in size.

QUANTITATIVE MAPPING BY REMOTE SENSING OF AN OCEAN ACID-WASTE DUMP

Craig W. Ohlhorst Oct. 1978 27 p refs

(NASA-TP-1275; L-11927) Avail: NTIS HC A02/MF A01 CSCL 13B

Results from quantitative analysis show that airplane remotely sensed spectral data can be used to quantify and map an acid-waste dump in terms of its particulate iron concentration. These same data, however, could not be used to map the dump in terms of total suspended solids, organic suspended solids, or inorganic suspended solids concentrations. A single-variable equation using the ratio of band 2 (440 to 490 nm) radiance to band 4 (540 to 580 nm) radiance was used to quantify the iron concentration in the acid-waste dump. The acid waste that was mapped varied in age from freshly dumped to 31/2 hr. Particulate iron concentrations in the acid waste were estimated to range up to 1.1 mg/l at a depth of 0.46 m. A classification technique was developed to identify pixels in the data set affected by sun glitter.

03GEODESY AND CARTOGRAPHY

Includes mapping and topography.

A78-43306 # Digital processing of Landsat data for cartography (Le traitement numérique des données de Landsat pour la cartographie). J. Beaubien (Ministère des Pêches et de l'Environnement, Centre de Recherches Forestières des Laurentides, Sainte-Foy, Quebec, Canada) and S. J. Daus (California, University, Berkeley, Calif.). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings.

Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 19-26.

A study has been made to determine the applicability of using Landsat data for the mapping of the forest cover in Quebec, Canada. The two-site study (Anticosti Island and the Laurentian Plateau) was based on photographic records and a mixed classification technique. The Anticosti Island study indicates that various types of forest cover, reforested and nonforested areas, and damaged forest land may be identified. The Laurentian Plateau study indicates that deciduous and coniferous areas may be distinguished along with post-damage stages of development. Factors influencing reflectance are identified as atmospheric conditions (such as the amount of water vapor) and conditions inherent to the ground surface (such as the slope exposure).

A78-43311 # Evaluation of a semiautomatic interpretation method for the cartography of clearcut zones in the southern James Bay area (Evaluation d'une méthode d'interprétation semiautomatique pour la cartographie des zones de coupe dans le sud du territoire de la Baie James). P. Laframboise and P. Bedard (Société de Développement de la Baie James, Montreal, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings.

Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 67-70. In French.

A semiautomatic interpretation method for Landsat data has been used to establish land-occupation and land-use maps in the southern James Bay area. The data included Landsat imagery, aerial photographs, and maps on various scales. Based on the multispectral analyzer display system, which utilizes the maximum likelihood algorithm and the unsupervised classification method, information categories were identified including clearcut zones, upgrowth zones, hardwood regions, resinous regions, peat bogs, and infrastructures.

A78-43319 # Use of topographic data for land-use land-cover identification by Landsat imagery. S. I. Solomon (Waterloo, University, Waterloo, Ontario, Canada), A. S. Aggarwal, T. Nazar (Environment Canada, Water Resources Branch, Ottawa, Canada), and T. Chadwick (Ontario Ministry of the Environment, Toronto, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 158-162. 9 refs.

Landsat imagery has been used along with topographic data for land-use and land-cover identification. Based on the WATMAP software system, slope and slope-orientation data for square grid elements approximately corresponding to pixels are given. The WATMAP data is then superimposed on the Landsat data using an affine transformation. For maize, a distinct correlation is found between reflectance and slope and slope orientation. The technique yields accuracy to within 75-85% for samples of 100 field data per class.

A78-45924 * Detection of crustal motion using spaceborne laser ranging systems. M. Kumar and I. I. Mueller (Ohio State University, Columbus, Ohio). (International Association of Geodesy, International Symposium on Recent Crustal Movements, Palo Alto, Calit., July 25-30, 1977.) Bulletin Géodésique, vol. 52, no. 2, 1978, p. 115-130. 13 refs. Grant No. NGR-36-008-204.

Laser ranging systems operated from space are capable of detecting motions on earth in the 2-5 cm range. Attention is given to the detection of crustal motion, specifically along the San Andreas fault, and a mathematical model is presented for a geometric mode system consisting of at least five grid and three distant (fundamental) stations to be operated with airborne and spaceborne lasers. The ground stations are designed to operate unattended, and to work in conjunction with Shuttle-based hardware to become operational in 1982. The Shuttle laser ranging system is expected to provide survey data within a period from one to two weeks, with a resurvey capability to be used as required.

DETERMINATION OF VARIOUS TOPOGRAPHIES USING PHOTOGRAPHIC TEXTURE A NALYSIS OF LANDSAT IMAGES [DETERMINACAO DE VARIACOES TOPOGRAFICAS ATRAVES DA ANALISE DE TEXTURA FOTOGRAFICA DE IMAGENS LANDSAT]

Evlyn Marcia Leao DeMoraesNovo and Armando Pacheco DosSantos Jul. 1977 31 p refs in PORTUGUESE; ENGLISH summary

(INPE-1077-NTE/103) Avail: NTIS HC A03/MF A01

The relationship between the texture of LANDSAT images and topographic variation was studied. Topographic data were collected from LANDSAT images and topographic maps. A roughness index was used to represent image texture. This index represents the tonal variation within a 0.5 cm x 0.5 cm grid. Declivity data were collected from topographic maps at different scales to correlate with the roughness index. The obtained results showed the possibility of characterizing topographic conditions by analyzing the texture of LANDSAT images.

NEAR REAL TIME APPLICATION OF DIGITAL TERRAIN DATA IN A MINICOMPUTER ENVIRONMENT

James R. Jancaitis and William R. Moore Apr. 1978 30 p (AD-A054008; ETL-0142) Avail: NTIS HC A03/MF A01 CSCL 08/2

Two developments have combined to significantly impact the growing number of applications dependent upon digital terrain elevation data, mathematical terrain modeling, and minicomputer growth. Digital representation of terrain form has previously required vast amounts of mass storage with the relatively slow speed data access associated with large databases. A technique has been developed for compact digital storage of elevation data which also decreases the data access times significantly, a polynomial terrain model. Also, the minicomputer industry has been experiencing dramatic increases in the processing speeds and digital storage capabilities along with steadily declining costs. Preliminary results of a recently initiated study into the impact of these developments on utilization of digital terrain elevation data is presented.

DETERMINING CRUSTAL STRAIN RATES WITH SPACE-BORNE GEODYNAMICS RANGING SYSTEM DATA. 1: BASELINE ANALYSIS

Steven C. Cohen and Glenn R. Cook Jun. 1978 28 p refs (NASA-TM-79565) Avail: NTIS HC A03/MF A01 CSCL 08G

A satellite-borne laser ranging system is proposed that is capable of making highly precise geodetic measurements over baselines ranging from a few tens of kilometers to several hundred kilometers. The precision with which crustal strain rates are derived from measurements made with this system is analyzed by using simple site configurations, intersite distances of about 25-70 kilometers, and measurement programs ranging from a few years to fifteen years. It is concluded that precisions of several parts in 10 to the 9th power per year are achievable. Compared to the expected shear strain rates of about 7 x 10 to the minus 7th power yr/1, this produces very favorable signal-to-noise ratios.

TOPOGRAPHIC STUDIES THROUGH TEXTURE IMAGE ANALYSIS OF LANDSAT DATA

Nelson deJesusParada, Principal Investigator, Armando Pacheco dosSantos, and Evlyn Marcia Leao de Moraes Novo Apr. 1977 24 p refs Sponsored by NASA ERTS (E78-10190; NASA-CR-157380; INPE-1011-NTE/081) Avail: NTIS HC A02/MF A01 CSCL 08B

N78-33503 Kansas Univ., Lawrence. ECOSYSTEM MAPPING BY INTERPRETATION OF LAND-SCAPES FROM SATELLITE IMAGERY Ph.D. Thesis

Donald Lee Williams 1977 221 p Avail: Univ. Microfilms Order No. 77-28925

Images produced by LANDSAT-1 were interpreted for five test sites. These sites, located in Kansas, Tennessee, Uganda, Western Australia, and Papua, New Guinea, were selected to include a wide range of vegetation and landform types in areas where either direct observations or previously published landscape maps were available. Interpretation techniques employed were adapted from techniques used by human interpreters of conventional aerial photography. A four-point methodology for preparing landscape maps from satellite imagery is proposed. This methodology covers (1) criteria for selection of suitable imagery and procedure for collection of supporting data, (2) consideration of image interpretation techniques most appropriate to this type of mapping, (3) the field survey program, and (4) procedures in the preparation of a finished landscape map. Dissert. Abstr.

N78-33645* Jet Propulsion Lab., Calif. Inst. of Tech., Pasadena. RADAR OBSERVATIONS OF A VOLCANIC TERRAIN: ASKJA CALDERA, ICELAND

D. L. Evans 1 Oct. 1978 46 p refs (Contract NAS7-100)

(NASA-CR-157765;

JPL-Pub-78-81) NTIS Avail: HC A03/MF A01 CSCL 08F

Surface roughness spectra of nine radar backscatter units in the Askja caldera region of Iceland were predicted from computer-enhanced like- and cross-polarized radar images. A field survey of the caldera was then undertaken to check the accuracy of the preliminary analysis. There was good agreement between predicted surface roughness of backscatter units and surface roughness observed in the field. In some cases, variations in surface roughness could be correlated with previously mapped geologic units.

Includes mineral deposits, petroleum deposits, spectral properties of rocks, geological exploration, and lithology.

A78-43310 # Surficial geology in the Pas area of Manitoba-An application of digital Landsat data. V. Singhroy (Department of Mines, Resources and Environmental Management, Mineral Resources Div., Winnipeg, Manitoba, Canada) and B. Bruce (Canada Centre for Remote Sensing, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings.

Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 57-66. 6 refs.

The CCRS-100 system was used to distinguish six large-scale biophysical land categories in the Pas region of Manitoba, Canada: ablation till, black spruce bogs, alluvial deposits, fens, water bodies having a high suspended-sediment content, and shallow marsh and bog lakes. Both supervised and unsupervised techniques were employed. An extensive field program evaluated the Landsat data in order to perform superficial geological mapping. S.C.S.

A78-43331 # Mapping mine wastes with Landsat images. H. D. Moore, J. H. Adams, and A. F. Gregory (Gregory Geoscience, Ltd., Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings.

Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 294-304. 23 refs.

Landsat imagery has been used for mapping mine wastes in Canada including tailings, spoil or transported overburden, slag, and waste rock. The Landsat imagery provides information on the location and area of mine dumps, the percent of vegetative cover, the location and size of mine-related water bodies, the location of deciduous and coniferous cover, and environmental changes with time. The study indicates a total area of mine wastes of 47,233 acres which represents 0.004% of the surface area of Canada. Of this area 46.8% is overburden, 37.3% is tailings, 15.3% is waste rock, and 0.6% is slag. Approximately 14.8% of the wastes have vegetative cover.

A78-43348 # The use of remote sensing /infrared thermal profiles and photofacsimiles/ for the geological reconnaissance of dam sites - Four specific cases (Emploi de la télédétection - thermographies et photographies en couleurs infrarouges - dans les reconnaissances géologiques de site de barrages: Exemple de quatre cas précis). L. Caillon, J. C. Gros, Ch. Beliard, and P. Ch. Levêque (Bordeaux I, Université, Talence, Gironde, France). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 516-531. 8 refs. In French.

A78-43639 The geological interpretation of the Tibesti from Landsat-1 imagery /Republic of Chad/ - Explanations regarding the map Tibesti 1:1,000,000 (Geologische Interpretation des Tibesti nach Aufnahmen von Landsat-1 /Republik Tschad/ - Erläuterungen zur Karte Tibesti 1:1,000,000). F. K. List, D. Helmcke, B. Meissner (Berlin, Freie Universität, Berlin, West Germany), G. Pöhlmann (Berlin, Technische Fachhochschule, Berlin, West Germany), and N. W. Roland (Bundesanstalt für Geowissenschaften und Rohstoffe, Hanover, West Germany). Bildmessung und Luftbildwesen, vol. 46, July 1, 1978, p. 139-145. 40 refs. In German.

The launching of the Landsat-1 satellite in July 1972 made it for the first time possible to obtain on a routine basis repeatable small-scale multispectral pictures of the entire surface of the earth. The great number of geomorphological and photogeological studies conducted in the central part of the Tibesti mountains since 1964 provided an opportunity to use this arid region as a test area for a study concerning the applicability of satellite picture mapping. The objectives of the reported investigation are related to a study of the information provided by a geological satellite picture interpretation involving a scale of 1:1,000,000, taking into account for a comparison aerial-photograph evaluations involving a scale of 1:50,000 and ground-based terrain studies.

A78-53376 Remote-sensing applications for mineral exploration. Edited by W. L. Smith (Michigan, Environmental Research Institute, Arlington, Va.). Stroudsburg, Pa., Dowden, Hutchinson and Ross, Inc., 1977, 404 p. \$50.

Consideration is given to mineral exploration on the basis of remotely sensed data. Landsat applications are reviewed and the exploration for fossil and nuclear fuels from orbital altitudes is explored. Remote sensing projects for energy development are outlined along with geochemical mapping by spectral rationing methods. Remote sensing projects in Brazil and India are noted.

S.C.S.

A78-53377 Foreseeable energy and mineral resource problems. W. L. Smith (Michigan, Environmental Research Institute, Arlington, Va.). In: Remote-sensing applications for mineral exploration.

Stroudsburg, Pa., Dowden, Hutchinson and Ross, Inc., 1977, p. 9-27. 27 refs.

The paper surveys present and anticipated mineral resource requirements noting the U.S. dependence on foreign sources. Projected energy resources are discussed with reference to oil and gas liquids, coal, natural gas, nuclear energy, and geothermal power. Landsat projects in monitoring surface water, soil moisture, snow-pack, and for resource mapping are discussed. Remote sensing for nonfuel minerals such as beryllium, cobalt, molybdenum, tungsten, and zinc is considered. S.C.S.

A78-53378 Gap between raw remote-sensor data and resources and environmental information. B. F. Grossling and J. E. Johnston (U.S. Geological Survey, Reston, Va.). In: Remote-sensing applications for mineral exploration. Stroudsburg, Pa., Dowden, Hutchinson and Ross, Inc., 1977, p. 28-41.

Attention is given to the economic resources necessary for developing remote sensing projects. Institutional funding for the collection of resource information is discussed. The interpretation of raw remote-sensor data is discussed from the point of view of user orientation. Geological mapping is reviewed noting the choice of map scale and two- versus three-dimensional geology. Oil exploration on the basis of remotely sensed data is considered along with a steel-mill project and an agrarian reform project.

S.C.S.

A78-53379 * Summary of Landsat applications and results. E. P. Mercanti (NASA, Goddard Space Flight Center, Communications and Navigation Div., Greenbelt, Md.). In: Remote-sensing applications for mineral exploration. Stroudsburg, Pa., Dowden, Hutchinson and Ross, Inc., 1977, p. 42-72.

A review of applications and results of Landsat projects is presented. Attention is given to the MSS bands, band ratios, and $\frac{1}{2} \frac{1}{2} \frac{1}{2$

color composites noting the applications of each in agriculture, forestry and range, water resources, geology, land use, and marine resources. A series of Landsat images is presented noting forest regions, burn scars, vegetated areas, and flood regions. A geological map compiled from an analysis of Landsat imagery is presented along with a strip-mine map also constructed from the data of Landsat images. Landsat data is further discussed with reference to mineral exploration, earthquake-zone investigations, and geothermal surveys.

A78-53380 Remote-sensing applications for mineral resources. W. L. Smith (Michigan, Environmental Research Institute, Arlington, Va.). In: Remote-sensing applications for mineral exploration. Stroudsburg, Pa., Dowden, Hutchinson and Ross, Inc., 1977, p. 73-98. 44 refs.

Five categories have been identified as surficial indicators of possible mineral resources: topography, igneous and volcanic features, lineaments and geological structure, mineralogical-lithological association, and stratigraphic sequence. The characteristics of obscured deposits are discussed noting blind, leached, zoned, and truncated orebodies and ores obscured by post-ore concealment. Remote-sensor data are discussed in terms of the analysis of surface characteristics and the analysis of data products.

S.C.S.

A78-53381 * Earth observations from remote-sensing platforms - Outlook. R. S. Houston, R. W. Marrs (Wyoming, University, Laramie, Wyo.), N. M. Short, and P. D. Lowman, Jr. (NASA, Goddard Space Flight Center, Greenbelt, Md.). In: Remote-sensing applications for mineral exploration. Stroudsburg, Pa., Dowden, Hutchinson and Ross, Inc., 1977, p. 99-156. 61

Observations of the earth from remote-sensing platforms are discussed noting the NASA Earth Resources Aircraft Program, Earth Resources Technology Satellite program, and the Earth Resources Experiments Package. Techniques for geological mapping are described including automatic mapping, visual interpretation, band selection, radar, band combination, and image enhancement. S.C.S.

A78-53382 * Exploration for fossil and nuclear fuels from orbital altitudes. N. M. Short (NASA, Goddard Space Flight Center, Earth Resources Branch, Greenbelt, Md.). In: Remote-sensing applications for mineral exploration. Stroudsburg, Pa., Dowden, Hutchinson and Ross, Inc., 1977, p. 157-198.

The paper discusses the application of remotely sensed data from orbital satellites to the exploration for fossil and nuclear fuels. Geological applications of Landsat data are described including map editing, lithologic identification, structural geology, and mineral exploration. Specific results in fuel exploration are reviewed and a series of related Landsat images is included. S.C.S.

A78-53383 The role of remote sensing for energy development. J. E. Johnston (U.S. Geological Survey, Office of Energy, Reston, Va.) and F. J. Janza (California State University, Sacramento, Calif.). In: Remote-sensing applications for mineral exploration.

Stroudsburg, Pa., Dowden, Hutchinson and Ross, Inc., 1977, p. 199-234. 20 refs.

The application of remote sensing techniques to energy development projects is considered noting the nature of the data collected and the various types of remote sensors available, such as photography devices, infrared scanners, radiometers, and radar systems. Processes for converting sensor data into the necessary form are described including magnification, restoration, image transfer, enhancement, and image coding. Several types of static hardware and image data processors are listed.

S.C.S.

A78-53384 Digital enhancement of Landsat MSS data for mineral exploration. R. M. Hord (Institute for Advanced Computation, Falls Church, Va.). In: Remote-sensing applications for mineral exploration. Stroudsburg, Pa., Dowden, Hutchinson and Ross, Inc., 1977, p. 235-250.

The procedure for the digital enhancement of Landsat MSS data for mineral exploration is outlined. Computer-compatible tapes are discussed noting their dynamic range, precision, repeatability, and resolution. Several digital image processing operations are described by means of actual images. They include contrast enhancement, density slicing, digital photomosaic, and logarithmic ratioing. S.C.S.

A78-53385 Geochemical mapping by spectral ratioing methods. R. K. Vincent (Geospectra Corp., Ann Arbor, Mich.). In: Remote-sensing applications for mineral exploration.

Stroudsburg, Pa., Dowden, Hutchinson and Ross, Inc., 1977, p. 251-278. 31 refs.

The paper discusses the application of spectral ratioing techniques to geochemical mapping. It is noted that multispectral scanners collecting data in the 0.4-2.5-micron range are particularly important for studying transition-metal ions and that the 8-14-micron region yields information on silicate rock types. Compositional information in image form may be mapped from spectral ratio images from aircraft and satellite scanners.

S.C.S.

Landsat applications in the less-developed areas. W. L. Smith (Michigan, Environmental Research Institute, Arlington, Va.). In: Remote-sensing applications for mineral exploration.

Stroudsburg, Pa., Dowden, Hutchinson and Ross, Inc., 1977, p. 279-291. 23 refs.

The impact of Landsat programs in less-developed areas is discussed with reference to the preparation of base maps and computer-compatible tapes. A potential exploration procedure is outlined noting the selection of areas for exploration, surveys of geological data, reconnaissance, geological mapping, test drilling, and subsurface exploration.

S.C.S.

A78-53387 Analysis of geological structures based on Landsat-1 images. C. E. Brockmann, A. Fernandez, R. Ballón, and H. Claure (Servício Geológico de Bolivia, La Paz, Bolivia). In: Remotesensing applications for mineral exploration.

Stroudsburg, Pa., Dowden, Hutchinson and Ross Inc., 1977, p.

Stroudsburg, Pa., Dowden, Hutchinson and Ross, Inc., 1977, p. 292-317. 16 refs.

Landsat imagery has been used for the analysis of geological structures including anticlinal and synclinal folds, lineaments, fractures, and faults. Structural data may be applied for mineral exploration, the study of thermal springs, and the identification of regions of hydrothermal alteration.

A78-53388 The geological application of Landsat imagery in Brazil. A. C. Correa, F. de Mendonça, and C. C. Liu (Instituto de Pesquisas Espaciais, São José dos Campos, São Paulo, Brazil). In: Remote-sensing applications for mineral exploration.

Stroudsburg, Pa., Dowden, Hutchinson and Ross, Inc., 1977, p. 318-333. 33 refs.

Three areas of Brazil have been chosen for the application of Landsat imagery in geological studies: the Sao Domingos Range, the Pocos de Caldas region, and the area of the Middle Araguaia and Tocantins Rivers. Structural information extracted from the data has been used to evaluate the geological evolution of north-central Brazil and the physical properties of the lithosphere. S.C.S.

A78-53389 Studies utilizing orbital imagery of India for geology and land use. R. D. Sharma (Indian Space Research Organization, Bangalore, India), B. N. Raina (Indian Photo Interpretation Institute, Dehra Dun, India), and M. S. Dhanju (Indian Space Research Organization, Space Applications Center, Ahmedabad, India). In: Remote-sensing applications for mineral exploration. Stroudsburg, Pa., Dowden, Hutchinson and Ross, Inc., 1977, p. 334-362. 11 refs.

Landsat orbital imagery has been used in geological and land-use studies in India. Data have been gathered on drainage patterns, rainfall and water bodies, and drainage density. A land-use classification in the Punjab has been conducted using single-band Landsat images and their quantitative analysis employing electronic image

data. A series of Landsat images and corresponding geological maps is presented.

A78-53390 Environmental monitoring of mineral-related industries. S. S. Verner (U.S. Environmental Protection Agency, Office of Monitoring and Technical Support, Washington, D.C.). In: Remote-sensing applications for mineral exploration.

Stroudsburg, Pa., Dowden, Hutchinson and Ross, Inc., 1977, p. 363-388. 8 refs.

The article surveys the environmental monitoring of mineralrelated industries on the basis of remote-sensor data. Attention is given to various imaging systems including camera systems and to the characteristics of various aerial films and radiometers. The remote sensing of air, land, and water quality is discussed. A series of images is presented including those depicting strip mining, oil seepage, thermal and infrared images, radiometric images, and associated thermal contour maps. S.C.S

COMPUTER IMAGE PROCESSING: GEOLOGIC APPLICATIONS

Michael J. Abrams 1 Jun. 1978 36 p refs (Contract NAS7-100)

(NASA-CR-157347; JPL-Pub-78-34) Avail: NTIS HC A03/MF A01 CSCL 08G

Computer image processing of digital data was performed to support several geological studies. The specific goals were to: (1) relate the mineral content to the spectral reflectance of certain geologic materials, (2) determine the influence of

environmental factors, such as atmosphere and vegetation, and (3) improve image processing techniques. For detection of spectral differences related to mineralogy, the technique of band ratioing was found to be the most useful. The influence of atmospheric scattering and methods to correct for the scattering were also studied. Two techniques were used to correct for atmospheric effects: (1) dark object subtraction, (2) normalization of use of ground spectral measurements. Of the two, the first technique proved to be the most successful for removing the effects of atmospheric scattering. A digital mosaic was produced from two side-lapping LANDSAT frames. The advantages were that the same enhancement algorithm can be applied to both frames, and there is no seam where the two images are joined. Author

GEOTHERMAL RESERVOIR CATEGORIZATION AND
STIMULATION STUDY

Harold L. Overton (CER, Inc.) and Robert J. Hanold Jul. 1977 62 p refs

(Contract W-7405-eng-36)

(LA-6889-MS) Avail: NTIS HC A04/MF A01

Analyses of the fraction of geothermal wells that are dry indicate that geothermal reservoirs can be fitted into four basic categories: (1) Quaternary to late Tertiary sediments; (2) Quaternary to late Tertiary extrusives; (3) Mesozoic or older metamorphic rocks; and (4) Precambrian or younger rocks. Failure of geothermal wells to flow economically is due mainly to low permeability formations in unfractured regions. It is the high stress/low permeability category that is most amenable to artificial stimulation by hydraulic fracturing, propellant fracturing, or chemical explosive fracturing. Category (1) geothermal fields are not recommended for artificial stimulation because these younger sediments almost always produce warm or hot water. Most geothermal fields fit into category (2) and in certain cases, possess some potential for stimulation. The Geysers is a category (3) field, and its highly stressed brittle rocks should make this site amenable to stimulation by explosive fracturing techniques. Roosevelt Springs, UT, well 9-1 is in category (4) and is a flow failure. It represents a prime candidate for stimulation by hydraulic fracturing. **ERA**

REMOTE SENSING APPLIED TO REGIONAL GEOLOGICAL MAPPING IN THE SAO FRANCISCO RIVER AREA M.S. Thesis (SENSORIAMENTO REMOTO APLICADO AO MAPFAMENTO GEOLOGICO REGIONAL: FOLHA RIO SAO FRANCISCO

Athos Ribeiro DosSantos, Paulo Roberto Meneses, and Ubiratan Porto DosSantos Sep. 1977 181 p refs In PORTUGUESE: **ENGLISH** summary

(INPE-1111-TPT/064) Avail: NTIS HC A09/MF A01

A working method that permits the integrated interpretation of various available products of remote sensing was developed for LANDSAT 1 multispectral imagery, Project RADAM's radar (SLAR) mosaics, and the black and white and colored multispectral photographs of SKYLAB for regional geological mapping. The two geological provinces considered are the southeastern part of the Parnaiba Sedimentary Basin and an area of Precambrian metamorphic rocks. In the Precambrian area the stratigraphy was changed as follows: the San Marcos formation was extended to Estreito and Boqueirao ranges; the Rio Preto group was differentiated. The existence of two members in the Ipupiara Formation was reconsidered.

HC A12/MF A01 CSCL 08G

The anomalous coloration of altered rocks associated with tabular uranium occurrences in the San Raphael Swell, Utah, and remnants of roll-front type deposits in the Powder River Basin, Wyoming was studied. Field and Laboratory spectral reflectance studies on these uranium deposits or occurrences were carried out and supplemented with mineralogical and chemical analyses to determine the origin of spectral features observed. The principal alteration products are geothite/limonite (Utah deposits) and geothite/limonite and hematite (Wyoming deposits). The principal clay mineral present in the deposits is montomorillonite. Statistical analysis of the field data was performed using a stepwise linear discriminant function analysis computer program that determines which combinations of input wavelength bands provide best separation of specified groupings of data. Altered and unaltered rocks could be repeated with 95% accuracy using spectral data including all wavelength bands. Of the satellite-simulated wavelength region tests, LANDSAT D bands gave the best classification accuracy.

The author has identified the following significant results. The proportional and linear relationship between absolute and relative thermal inertia was theoretically evaluated, and a more accurate expression for thermal inertia was proposed. Radiometric and-meteorological_data_from_three_stations in the Powder River Basin were acquired, as well as 400 miles of low altitude scanner data between July 25-28.

N78-32520*# Geological Survey, University, Ala. REMOTE SENSING OF STRIPPABLE COAL RESERVES AND MINE INVENTORY IN PART OF THE WARRIOR COAL FIELD IN ALABAMA Final Report

Thomas J. Joiner, Charles W. Copeland, Jr., Donald D. Russell, Francis E. Evans, Jr., C. Daniel Sapp, and Peter A. Boone Jul. 1978 128 p refs

(Contract NAS8-31573)

(NASA-CR-150781) Avail: NTIS HC A07/MF A01 CSCL

Methods by which estimates of the remaining reserves of strippable coal in Alabama could be made were developed. Information acquired from NASA's Earth Resources Office was used to analyze and map existing surface mines in a fourquadrangle area in west central Alabama. Using this information and traditional methods for mapping coal reserves, an estimate of remaining strippable reserves was derived. Techniques for the computer analysis of remotely sensed data and other types of available coal data were developed to produce an estimate of strippable coal reserves for a second four-quadrangle area. Both areas lie in the Warrior coal field, the most prolific and active of Alabama's coal fields. They were chosen because of the amount and type of coal mining in the area, their location relative to urban areas, and the amount and availability of base data necessary J M.S. for this type of study.

N78-33500 Oregon State Univ., Corvallis. RELATIONSHIPS OF CLAY MINERALOGY TO LANDSCAPE STABILITY IN WESTERN OREGON Ph.D. Thesis

Ronald David Taskey 1978 234 p

Avail: Univ. Microfilms Order No. 78-11993

Clay fractions of soils from a large number of sites in Oregon's Western Cascades were characterized in order to

determine the relationships of various clay materials to mass movements. Each site was either designated as stable or assigned to one or more of the following categories: debris avalanche, debris flow, slump earthflow, creep. All clay samples were analyzed by X-ray diffraction, and certain selected samples were analyzed by differential thermal analysis and/or electron microscopy. The more stable sites occur either at high elevations, with poorly formed soils having minimal clay development; or at low elevations, with relatively well drained soils containing kaolinite, dehydrated halloysite, chloritic integrades, and microaggregates bound by amorphous materials.

MAPPING ULTRAMAFIC ROCKS BY COMPUTER ANALYSIS
OF DIGITAL LANDSAT DATA Ph.D. Thesis

Gerald George Carlson 1978 277 p Avail: Univ. Microfilms Order No. 7816101

the gabbro/basalt sequence.

A new algorithm, PROBLYMAP, was developed to classify digital LANDSAT data for the purpose of mapping geology or terrain type. The algorithm assigns to each pixel a set of probabilities belonging to each terrain type. An important feature of this algorithm is that the classification of a pixel is influenced not only by its own probabilities but also by those of its eight adjacent neighbors. The main application of the algorithm was the mapping of the suite of ultramafic and mafic rocks and related sediments in the desert environment of the Oman Mountains, Sultanate of Omán. The resulting classification map shows good agreement with the best ground truth available, which includes a geology map at 1:5 JO,000 and 1:60,000 black and white air photos. Using training sites from three known copper deposits, 180 other gossan zones were identified within

A STUDY OF THE TYRONE-MOUNT UNION LINEAMENT BY REMOTE SENSING TECHNIQUES AND FIELD MET-HODS Final Report, 1 Jan. 1976 - 30 Jun. 1977

David P. Gold, Principal Investigator Dec. 1977 65 p refs Original contains imagery. Original photography may be purchased from the EROS Data Center, Sioux Falls, S. D. 57198 ERTS (Contract NAS5-22822)

(E78-10155; NASA-CR-156815) Avail: NTIS HC A04/MF A01 CSCL 08B

The author has identified the following significant results. This study has shown that subtle variations in fold axes, fold form and stratigraphic thickness can be delineated. Many of the conclusions were based on extrapolation in similitude to different scales. A conceptual model was derived for the Tyrone-Mount Union lineament. In this model, the lineament was the morphological expression of a zone of fracture concentrations which penetrated basement rocks and may have acted as a curtain to regional stresses or as a domain boundary between uncoupled adjacent crustal blocks.

MANUAL FOR THE APPLICATION OF NURE 1974-1977
AERIAL GAMMA-RAY SPECTROMETER DATA
D. F. Saunders and M. J. Potts Sep. 1977 184 p

(Contract EY-76-C-13-1664)

(GJBX-13-78) Avail: NTIS HC A09/MF A01

Instructions for the interpretation and application of highsensitivity aerial gamma-ray spectrometer data in uranium exploration are presented. Particular emphasis is on the first 10 radiometric surveys performed under the National Uranium Resource Evaluation program to map regional distributions of near-surface natural radioelements. The fundamentals of uranium geology and geochemistry along with interpretive approaches which may be used to identify statistically and geochemically significant uranium anomalies and uraniferous provinces are outlined. Follow-up prospecting methods are summarized along with guides to recent literature. Specific suggestions are made as to interpretive approaches and applicable follow-up prospecting procedures tailored to fit the data characteristics and general environment of the aerial gamma-ray spectrometer surveys. PRELIMINARY GEOLOGIC EVALUATION OF L-BAND RADAR IMAGERY: ARKANSAS TEST SITE Final Report H. MacDonald and W. P. Waite Nov. 1977 29 p Prepared for JPL

(Contracts NAS7-100; JPL-954697)

(NASA-CR-157761) Avail: NTIS HC A03/MF A01 CSCL 08G

The relatively small angles of incidence (steep depression angles) of the L-band system provide minimal shadowing on terrain back-slopes and considerable foreshortening on terrain fore-slopes which sacrifice much of the topographic enhancement afforded by a more oblique angle of illumination. In addition, the dynamic range of the return from vegetated surfaces is substantially less for the L-band system, and many surface features defined primarily by subtle changes in vegetation are lost. In areas having terrain conditions similar to those of northern Arkansas, and where LANDSAT and shorter wavelength aircraft radar data are available, the value of the JPL L-band imagery as either a complimentary or supplementary geologic data source is not obvious.

05

OCEANOGRAPHY AND MARINE RESOURCES

Includes sea-surface temperature, ocean bottom surveying imagery, drift rates, sea ice and icebergs, sea state, fish location.

A78-43315 # Ocean information and management systems. L. W. Morley, A. K. McQuillan (Canada Centre for Remote Sensing, Ottawa, Canada), and D. J. Clough (Waterloo, University, Waterloo, Ontario, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings.

Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 113-124.

Management systems for ocean surveillance are discussed with reference to satellites, aircraft, ship, data-buoy, and fixed land- and ocean-stages providing multilevel data integration. Areas requiring particular surveillance are identified as renewable resources (e.g., oil, gas, minerals), marine-environment protection, navigation control, and ocean-service activities (e.g., forecasting, rescue). Various data-generating subsystems are outlined such as sensors (including synthetic aperture radar), telemetry methods to transmit data from sensors to receivers, and commercial networks for electronic data distribution. Cost-effective aspects of mixed surveillance systems are considered along with predicted gross benefits for environmental surveillance systems to the year 2000.

A78-43320 # Thermal studies of the Grand Banks Gulf Stream slope using airborne radiation thermometers and satellite data. H. G. Ketchen (International Ice Patrol, Governors Island, N.Y.), P. E. La Violette (U.S. Navy, Naval Ocean Research and Development Activity, Bay St. Louis, Miss.), and R. D. Worsfold (Newfoundland, Memorial University, St. John's, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeron as and Space Institute, 1977, p. 163-179. 19 refs.

Stream slope are discussed: NOAA satellite data, airborne radiation thermometer data, and sea-surface temperature data as recorded by ships. Two correction techniques to account for atmospheric attenuation are evaluated: the Pickett method which uses a correction equation derived by multiple regression, and the atmospheric environment service method which of termines instrument drift, plots an environmental correction graph, and applies a correction for errors due to the water vapor mass below the aircraft. It is concluded that the correlation of the three data sources constitutes a feasible method for determining iceberg deterioration rates. S.C.S.

A78-43324 # Diurnal temperature variations and their usefulness in mapping sea ice from thermal infrared imagery. J. Cihlar and K. P. B. Thomson (Canada Centre for Remote Sensing, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec,

Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 208-219, 12 refs.

An 8-14-micron thermal infrared scanner and a PRT-5 were flown at 390 m at sunset and in the afternoon over the Beaufort Sea in order to measure ice surface temperature changes. The scanner magnetic tape was used to produce a black and white transparency of the recorded and reference signals. A gray level stepwedge was used to relate film density to voltage and surface temperature. It was found that solar radiation dominates the surface temperature distribution during the afternoon. The surface temperature patterns at sunset reflected the spatial thermal resistivity fluctuations of ice-snow thickness combinations. The difference between measured temperatures represents the combined effect of solar radiation and heat passing upward from the ice-water boundary. It is observed that daytime or nighttime surface temperature distributions may be useful in mapping from high-resolution thermal infrared imagery.

SCS

A78-43339 # Microwave sensing of sea surface which patterns. J. F. R. Gower (Institute of Ocean Sciences, Victoria, British Columbia, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings.

Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 395-406. 5 refs.

Sea-surface wave patterns in the northeast Pacific have been monitored by the GEOS-3 altimeter and airborne synthetic aperture radar. Waveheight values obtained from the altimeter are compared to surface truth measurements and weather reports. An accuracy to within plus or minus one meter is found. When the measurements are processed by a technique based on a pulse-variation model and which compensates for timing and tracking loop errors, accuracy to within 0.5 meter is found.

S.C.S.

A78-43340 # A joint topside-bottomside remote sensing experiment on Arctic sea ice. P. Wadhams (Scott Polar Research Institute, Cambridge, England) and R. T. Lowry (Canada Centre for Remote Sensing, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings.

Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 407-423. 16 refs. Contract No. N00014-76-C-0660.

The ice cover on the Arctic Ocean has been studied simultaneously from above by laser and from below by sonar in order to determine the relationship between the distributions of ridge height and keel draft. Results are presented for rms keel drafts as a function of the mean number of keels per km of track, the probability density function of ice drafts from the first 270 km of track, the probability density function of ice drafts from 90-km sections of track, and the distribution of surface ridge heights.

S.C.S.

A78-43343 # Radar techniques in the measurement of floating ice thickness. R. H. Goodman, E. Outcalt, and B. B. Narod (Innovative Ventures, Ltd., Calgary, Alberta, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 459-468. 8 refs. Research supported by the National Research Council of Canada.

Two models of airborne downward looking radars have been used to measure sea ice thicknesses. An experimental 36 cm high power directional radar developed at the University of British Columbia, and a GSSI 'ESP' radar were mounted on a Puma helicopter to measure ice thicknesses off of the Labrador coast. The capabilities of each system were investigated to measure sea ice thickness. The 36 cm radar's capabilities were studied with particular application to thick multiyear ice and iceberg measurements, while

the GSSI radar's capabilities were investigated with emphasis on the measurement of thinner ice, below the minimum range of the 36 cm radar. Typical data will be presented and analyzed. (Author)

A78-43346 # On the analysis of airborne synthetic aperture radar imagery of the ocean. R. T. Lowry, D. G. Goodenough (Canada Centre for Remote Sensing, Ottawa, Canada), J. S. Zelenka, and R. A. Shuchman (Michigan, Environmental Research Institute, Ann Arbor, Mich.). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings.

Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 480-505, 25 refs.

Using the ERIM optical/digital data correlator, synthetic aperture radar (SAR) imagery has been used for studies of the ocean. Procedures for correcting radar data for geometric distortion and radiometric nonuniformity of imagery are outlined. The influence of wave train movement on the design of a Seasat correlator is evaluated. Techniques for calculating the two-dimensional Fourier transform of an SAR image are presented along with the necessary radar parameters for specific surveillance tasks. These tasks include deep-water waves, in-shore waves and the surf zone, and ships located in at least 10 m of water. Wave-imaging mechanisms are described with reference to a velocity modulation model, radar cross-section models, and the tangent plane model.

Lecomte, and M. Viollier (Lille I, Université, Villeneuve d'Ascq, Nord, France). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings.

Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 543-548. 9 refs. In French. Research supported by the Muséum National d'Histoire Naturelle.

A radiometer has been designed for the remote sensing of ocean color in order to determine chlorophyll content. Upwellings and downwellings are simultaneously measured at 466, 525, 550, and 600 nm. Calculations of albedo differences at two wavelengths are used to relate ocean color to optical characteristics and to eliminate distortions caused by surface reflection and atmospheric disturbances. Color variations are noted to be related to the cycle of coastal upwellings. Experiments indicate that factors such as the vertical gradients of phytoplankton, water turbidity, and the discontinuity of chlorophyll content relative to depth influence the results. S.C.S.

A78-43638 The problem of remote sensing of substances in water using a multispectral scanner (Zum Problem der Fernerkundung von Substanzen im Wasser mit dem Multispektralabtaster).

R. Doerffer (Hamburg, Universität, Hamburg, West Germany). (Symposium über Flugzeugmessprogramm, Technische Universität Hannover, Hanover, West Germany, Aug. 29-31, 1977.) Bildmessung und Luftbildwesen, vol. 46, July 1, 1978, p. 133-138. 8 refs. In German

An important objective of remote sensing in the case of marine investigations is related to a mapping of substances found in the water close to the surface of the sea. The employment of the multispectral scanner as measurement device provides information regarding the type and concentration of a substance on the basis of

the spectrum of the radiation which is reflected by the water. In accordance with their optical characteristics, the substances to be studied can be divided into three groups, including dissolved organic substances, suspended matter, and phytoplankton. Attention is given to signal sources, the dependence of the wanted signal on the concentration of the substances, and the effect of disturbing signal sources.

A78-47084 Extraction of rich-plankton area off the northern Japan from Skylab multispectral pictures. K. Watanabe (Tokai University, Shimizu, Japan). In: International Symposium on Space Technology and Science, 12th, Tokyo, Japan, May 16-20, 1977, Proceedings.

Chofu, Tokyo, National Aerospace Laboratory, 1977, p. 611-616.

A78-47196 * Ice sheet topography by satellite altimetry. R. L. Brooks (EG & G Washington Analytical Services Center, Inc., Pocomoke City, Md.), W. J. Campbell (U.S. Geological Survey, Tacoma, Wash.), R. O. Ramseier (Department of the Environment, Ottawa, Canada), H. R. Stanley (NASA, Wallops Flight Center, Wallops Island, Va.), and H. J. Zwally (NASA, Goddard Space Flight Center, Greenbelt, Md.). Nature, vol. 274, Aug. 10, 1978, p. 539-543, 20 refs.

The measured time between the transmission and return of 13.9 GHz radar pulses from the GEOS 3 satellite (at a mean altitude of 844.5 km and an inclination of 114 deg 52 min) is used to determine the thickness of the Greenland ice cap, with an accuracy in surface elevation on the order of 2 m. Attention is given to changes in ice thickness as an indicator of climatic change in general, and change in mean sea level in particular. Each elevation data point obtained by the satellite represents an average along 0.67 km of ground track, and three-dimensional maps are presented to illustrate the data. D.M.W.

A78-47498 The microprocessor in measurement data acquisition (Der Mikroprozessor in der Messdatenerfassung). J. Rathlev. *Elektronik*, vol. 27, Aug. 1978, p. 53-58. 5 refs. In German.

The use of a microprocessor for data acquisition and preprocessing is described and illustrated by the example of a microprocessor-controlled shipborne ocean probe system that measures ocean depth, temperature, electrical conductivity, optical attenuation, and speed of sound. The system makes use of peripheral equipment including a digital magnetic tape unit, X-Y-plotter, numerical display, and printer. The basic hardware of the system consists of a microprocessor 8080 with 3 K PROM and 1 K RAM. The structure of the multiprobe service routine is shown, and programs for calculating polynomials, salinity, and tangents are given.

A78-48525 # Maritime geophysical exploration: Elements of the theory of electromagnetic methods (Morskaia geofizicheskaia razvedka: Elementy teorii elektromagnitnykh metodov). V. I. Gordienko. Kiev, Izdatel'stvo Naukova Dumka, 1978. 164 p. 132 refs. In Russian.

The book deals with questions associated with the development of a theory that may serve as a basis for designing maritime stations of electromagnetic geophysical exploration. A new theory, based on the consideration of the slow motion of the sea, is proposed, and its range of applicability is identified. Theories are developed from contactless magnetic-field emitters and for the contactless measurement of low-frequency electric fields. Promising system geometries are analyzed. The generalized properties of electric fields are formulated, and possible means of reproducing them are discussed.

A78-48740 Airborne remote sensing experiment /ocean temperature and color/ in the Straits of Dover (Expérience aéroportée de télédétection /température et couleur de la mer/ dans le détroit du Pas-de-Calais). M. Viollier, P. Lecomte (Lille I, Université,

Villeneuve d'Ascq, Nord, France), M. Bougard, and A. Richard (Institut de Biologie Maritime et Régionale, Wimereux, Pas-de-Calais, France). Oceanologica Acta, vol. 1, July 1978, p. 265-269. 9 refs. In French. Research supported by the Conseil Régional du Nord Pas-de-Calais and Ministère de la Culture et de l'Environnement.

Airborne remote sensing measurements were compared with sea truth measurements of water temperature, chlorophyll content, and Secchi depth in the Straits of Dover, and the two sets of measurements are found to be in good agreement. The remote sensing measurements were obtained by an aircraft flying at 150 m; infrared radiometry determined the surface temperature, and the reflectivities at 466, 525, 550, and 600 nm provided information on the presence of phytoplankton and sediments. It is concluded that aerial measurements can be used to describe the coastal gradient of hydrobiological properties in the strait.

A78-48900 Colour, ultraviolet absorbance and salinity of the surface waters off the west coast of Ireland. E. C. Monahan and M. J. Pybus (University College, Galway, Ireland). *Nature*, vol. 274, Aug. 24, 1978, p. 782-784. 9 refs.

Measurements of water color and of various chemical, biological, and physical properties were obtained at 73 hydrographic stations in Galway Bay and other waters off the west coast of Ireland during the late summer and autumn of 1977, and a strong correlation was found between color and surface salinity and also between color and the concentration of dissolved organic matter. The data were obtained in accord with a version of the 'sea-truth' protocol adopted for an earlier 'Ocean Color Scanner' experiment, and the results suggest that images transmitted by this multispectral scanner could help identify and delineate runoff-influenced waters. Techniques for determining water color are discussed, and a positive correlation between summed UV absorbance of a surface sample and the 'yellowness' (presumably representing humic materials introduced by freshwater flowoff) of the surface sample is considered.

A78-49112 Effect of sea-state on the performance of laser fluorosensors. D. M. Rayner, M. Lee, and A. G. Szabo (National Research Council, Div. of Biological Sciences, Ottawa, Canada). Applied Optics, vol. 17, Sept. 1, 1978, p. 2730-2733. 9 refs. Research supported by the Department of Energy, Mines and Resources of Canada.

A description is presented of the theoretical effect of an inclined target on the measurements made by both steady-state (spectral) and time-resolved laser fluorosensors. The considered theory is used in conjunction with existing oceanographical information on waves to estimate the extent of the sea-state error and hence to predict the restrictions placed on fluorosensing by the sea-state. In theory the sea-state will effect the performance of laser fluorosensors. However, it is found that for spectral measurements the effect is negligible for the sea-states to be expected in deep water. For temporal measurements the instrument response is distorted, but if the full width at half maximum technique is used for deconvolution no significant extra error is introduced above those already associated with the technique.

A78-49436 * # Remote sensing of sea state by analysis of backscattered microwave phase fluctuations. S. F. Clifford and D. E. Barrick (NOAA, Wave Propagation Laboratory, Boulder, Colo.). *IEEE Transactions on Antennas and Propagation*, vol. AP-26, Sept. 1978, p. 699-705. 13 refs. NASA Order P-67583-G.

The relative phase of a normally incident microwave signal

scattered off the sea surface is a random function of space and time. The statistics of these random phase fluctuations contain information about the wave-height statistics. This study demonstrates that the wave-height spectra can be deduced directly in terms of the spectra of the phase fluctuations without recourse to inversion techniques even when surface roughness exceeds many wavelengths of the incident signal. In the particular case of a nadir-directed satellite-mounted microwave source operating in the backscatter mode, the wave-height and phase spatial spectra are proportional with a constant proportionality of (2k0) squared, where k0 is the wavenumber of the scattered signal. A78-49651 Oceans '77; Annual Combined Conference, 3rd, Los Angeles, Calif., October 17-19, 1977, Conference Record. Volumes 1 & 2. Conference sponsored by the Institute of Electrical and Electronics Engineers and Marine Technology Society. New York, Institute of Electrical and Electronics Engineers, Inc.; Washington, D.C., Marine Technology Society, 1977. Vol. 1, 367 p.; vol. 2, 422 p. Price of two volumes, members, \$26.25; nonmembers, \$35.

Papers are presented on buoy systems, microprocessors for ocean-related matters, undersea vehicles, floating industrial complexes, satellite (NOAA and Landsat) imagery data acquisition and processing, applications of underwater acoustics in the ocean, port operations, diving technology and operations, underwater optics, and university programs in marine studies. Consideration is also given to environmental effects on marine biota, automated measurement techniques, technical training of marine manpower, tanker operations, cables and connectors, component reliability, marine water quality, marine navigation and control systems, ocean thermal energy conversion, environmental aspects of offshore petroleum development, and safety aspects of ship operations.

A78-49652 Remote ocean environmental data acquisition.
L. Livingston, R. Roten (NOAA, Data Buoy Office, Bay St. Louis, Miss.), G. Haas, and R. Mueller (Sperry Rand Corp., Bay St. Louis, Miss.). In: Oceans '77; Annual Combined Conference, 3rd, Los Angeles, Calif., October 17-19, 1977, Conference Record. Volume 1.

New York, Institute of Electrical and Electronics Engineers, Inc.; Washington, D.C., Marine Technology Society, 1977, p. 2A-1 to 2A-9. 8 refs.

Since the summer of 1971, the NOAA Data Buoy Office has deployed numerous environmental moored data buoys with automated data acquisition and over-the-horizon telemetry features. Initially the data link requirements were successfully met by judicious implementation of on-board HF communications and cooperative shore stations. This paper reviews the orderly transition of the data buoy system from HF to satellite communications. The various phases of satellite communications from testing to operational confidence and finally to full operational satellite mode are described. Analyses of data defining satellite communication performance in terms of link reliability and data quality are considered, and data acquisition and telemetry implementation are discussed with a view towards assisting potential satellite link subscribers in scoping out their system.

A78-49653 Survey of NOAA satellite data availability from Environmental Data Service. G. W. Hunolt (NOAA, Satellite Data Service Branch, Washington, D.C.). In: Oceans '77; Annual Combined Conference, 3rd, Los Angeles, Calif., October 17-19, 1977, Conference Record. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc.; Washington, D.C., Marine Technology Society, 1977, p. 9A-1 to 9A-4.

Descriptions are given of the major types of satellite oceanographic data available from the Satellite Data Services Branch of the Environmental Data Service's National Climatic Center, with the services available in each case noted. Consideration is given to: (1) scanning radiometer and very high resolution radiometer data from the polar-orbiting ITOS/NOAA satellites, (2) VISSR GOES products, (3) Landsat products, (4) DMSP data, and (5) Skylab products. Other major types of data to be available in the near future from TIROS-N, Seasat-A, and Nimbus-G CZCS are also described.

A78-49656 Recent progress in earth satellite data applications to marine activities. E. P. McClain (NOAA, National Environmental Satellite Service, Washington, D.C.). In: Oceans '77; Annual Combined Conference, 3rd, Los Angeles, Calif., October 17-19, 1977, Conference Record. Volume 1.

New York, Institute of Electrical and Electronics Engineers, Inc.; Washington, DC., Marine Technology Society, 1977, p. 14A-1 to 14A-8, 27 refs.

SR and VHRR data from the NOAA polar-orbiting satellites and VISSR data from GOES are being used in a variety of ocean-oriented activities, including sea surface temperature mapping, sea ice monitoring, and detection of ocean currents and upwelling. New techniques of image and digital data processing, including time-lapse methods, have been developed recently. Landsat multispectral imagery has been used to demonstrate the feasibility of detecting ocean-scene color variations associated with such factors as water depth, sediment load, and chlorophyll concentration. The next Nimbus spacecraft is to carry the Coastal Zone Color Scanner, a sensor system developed specifically for these tasks.

A78-49657 * Detection and interpretation of ocean roughness variations across the Gulf Stream inferred from radar cross section observations. D. E. Weissman (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, Calif.; Hofstra University, Hempstead, N.Y.) and T. W. Thompson (California Institute of Technology, Jet Propulsion Laboratory; Science Applications, Inc., Pasadena, Calif.). In: Oceans '77; Annual Combined Conference, 3rd, Los Angeles, Calif., October 17-19, 1977, Conference Record. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc.; Washington, D.C., Marine Technology Society, 1977, p. 148-1 to 148-10. 14 refs. Contract No. NAS7-100.

Radar cross section data shows that the Gulf Stream has a higher cross section per unit area (interpreted here as a greater roughness) than the water on the continental shelf. A steep gradient in cross section was often seen at the expected location of the western boundary. There were also longer-scale (10-20 km) gradual fluctuations within the stream of significant magnitude. These roughness variations are correlated with the surface shear stress that the local wind imposes on the sea. Using the available surface-truth information concerning the wind speed and direction, an assumed Gulf Stream velocity profile, and high-resolution ocean-surface temperature data obtained by the VHRR onboard a NOAA-NESS polar orbiting satellite, the present study demonstrates that the computed surface stress variation bears a striking resemblance to the measured radar cross-section variations.

A78-49658 Monitoring the effects of Gulf Stream meanders and eddys on the New England fishing grounds. J. L. Chamberlin (NOAA, National Marine Fisheries Service, Narragansett, R.I.). In: Oceans '77; Annual Combined Conference, 3rd, Los Angeles, Calif., October 17-19, 1977, Conference Record. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc.; Washington, D.C., Marine Technology Society, 1977, p. 14D-1 to 14D-7. 12 refs.

The effect of Gulf Stream meanders and eddies on the New

England fishing grounds include: direct warming of the bottom on the outer shelf and upper slope, injection of warm water onto the shelf, entrainment of water off the shelf, and increases in currents. This paper describes National Marine Fisheries Service program for monitoring these effects. The program has two parts: (1) the utilization of IR-radiometer imagery from NOAA satellites and weekly interpretation of this imagery in order to observe the location, movement, and size of meanders and eddies as they appear on the sea surface; and (2) since satellite imagery is limited to the sea surface, the observation of these Gulf Stream effects from aboard ship.

A78-49665 U.S. Coast Guard utilization of remote sensing techniques for ocean surveillance. J. R. White, D. R. Freezer, and R. R. Vollmers (U.S. Coast Guard, Washington, D.C.). In: Oceans '77; Annual Combined Conference, 3rd, Los Angeles, Calif., October 17-19. 1977, Conference Record. Volume 2.

New York, Institute of Electrical and Electronics Engineers, Inc.; Washington, D.C., Marine Technology Society, 1977, p. POSTER-E-1 to POSTER-E-4.

The United States Coast Guard performs a number of missions, including pollution surveillance, search and rescue, ice reconnaissance, and enforcement of laws and treaties, which require large scale ocean surveillance. This paper describes several airborne remote sensing systems used by the Coast Guard. Particular attention is given to AOSS II, a system which includes side-looking radar, IR/UV line scanner, aerial reconnaissance, and passive microwave imager, and the Aireye system which includes all the sensors of AOSS II except the passive microwave imager.

B.J.

A78-49667 Remote multispectral imaging for nearshore bathymetry. C. B. Koesy and M. T. Cooper (U.S. Navy, Naval Coastal Systems Laboratory, Panama City, Fla.). In: Oceans '77; Annual Combined Conference, 3rd, Los Angeles, Calif., October 17-19, 1977, Conference Record. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc.; Washington, D.C., Marine Technology Society, 1977, p. POSTER-H-1 to POSTER-H-4, 5 refs.

Simultaneous signatures of nearshore bottoms have been obtained using multispectral scanning sensors in a low altitude aircraft and in the Landsat 2 Satellite. The signatures were taken in nearshore environments ranging from an ocean front to the shallow waters of an enclosed bay. The water turbidity had absorption coefficients ranging from 0.15 to 1.60 and scattering coefficients ranging from 0.07 to 0.87. Using points of known depth the signatures have been analyzed by means of a simple algorithm to establish depth at a large number of other points in the scene. Lines of these points have been compared to transects obtained by a precision acoustic fathometer. The low altitude aircraft results demonstrate potential capability for accurate mapping of nearshore bottoms where the bottom reflectances are reasonably consistent. The technique is also useful on multispectral signatures obtained from Landsat satellites although the areal resolution is less by a factor of approximately 700 and the mapping results are more subject to degradation by cloud cover.

A78-49759 # Estimate of suspension and chlorophyll concentrations in the sea from the spectrum of the emerging radiation measured from a helicopter (Otsenka kontsentratsii vzvesi i khlorofilla v more po izmeriaemomu s vertoleta spektru vykhodiashchego izlucheniia). V. N. Pelevin (Akademiia Nauk SSSR, Institut Okeanologii, Moscow, USSR). Okeanologiia, vol. 18, May-June 1978, p. 428-434. 16 refs. In Russian.

A78-51544 # A multifrequency radiometer system. N. Skou (Danmarks Tekniske Hojskole, Lyngby, Denmark). In: European Microwave Conference, 7th, Copenhagen, Denmark, September 5-8, 1977, Proceedings. Sevenoaks, Kent, England, Microwave Exhibitions and Publishers, Ltd., 1978, p. 419-423.

A radiometer system having four channels, 5 GHz, 17 GHz, 34 GHz, all vertical polarization, and a 34-GHz sky horn, is described. The system, which is designed for collecting glaciological and oceanographic data, is intended for airborne use, and imaging is achieved by means of a multifrequency conically scanning antenna. Implementation of the noise-injection technique ensures the high absolute accuracy needed for oceanographic purposes. The collected data can be preprocessed in a microcomputer system and displayed in real time. Simultaneously, the data are recorded digitally on tape for more elaborate processing later, using ground facilities. In conjunction with a side-looking radar which is under development at present, the radiometers are intended as the remote-sensing basis for an all-weather ice reconnaissance service in the Greenland seas.

A78-51620 # An interactive correction and analysis system for air-borne laser profiles of sea ice. R. T. Lowry (Department of Energy, Mines and Resources, Canada Centre for Remote Sensing, Ottawa, Canada) and C. J. Brochu (Defence Research Establishment, Ottawa, Canada). Canadian Journal of Remote Sensing, vol. 4, Aug. 1978, p. 149-160. 14 refs.

A78-52151 Chapman Conference on Oceanic Fronts, New Orleans, La., October 11-14, 1977, Proceedings. Conference sponsored by AGU, AMS, and U.S. Navy. *Journal of Geophysical Research*, vol. 83, Sept. 20, 1978. 222 p.

A study is made of sea-surface temperature fronts by means of environmental satellites with particular attention to the winter cycle in the northeastern Gulf of Mexico. Climatic features of the Antarctic Polar Front Zone are considered along with front overlaying of the continental slope in the eastern Bering Sea and scales of motion in the subtropical convergence zone. Fronts on the continental shelf are evaluated and tidal fronts on the shelf seas around the British Isles are examined. Papers are presented on wind effects on the surface to bottom fronts, a model of narrow jets in a zonal ocean, and asymmetric disturbances in the frontal zone of a Gulf Stream ring. Heat and mass transport processes in subsea permafrost are outlined and short-term variability in the bottom boundary layer of the deep ocean is reported.

S.C.S.

A78-52152 # A survey of worldwide sea surface temperature fronts detected by environmental satellites. R. Legeckis (NOAA, National Environmental Satellite Service, Washington, D.C.). (AGU, AMS, and U.S. Navy, Chapman Conference on Oceanic Fronts, New Orleans, La., Oct. 11-14, 1977.) Journal of Geophysical Research, vol. 83, Sept. 20, 1978, p. 4501-4522. 55 refs.

Data from environmental satellites have been used to evaluate worldwide sea-surface temperature fronts. The VHRR images from the NOAA polar-orbiting satellites are described with reference to the dates and location of data collection. The data are discussed in terms of the effects of noise in the infrared images, limitations to data collection due to seasonal variability, cloud cover, and atmospheric attenuation. Procedures for image enhancement and geometric corrections are outlined. Images are presented and discussed for a series of specific geographical locations.

S.C.S.

A78-52153 Winter cycle of sea surface thermal patterns, northeastern Gulf of Mexico. O. K. Huh, W. J. Wiseman, Jr., and L. J. Rouse, Jr. (Louisiana State University, Baton Rouge, La.). (AGU,

AMS, and U.S. Navy, Chapman Conference on Oceanic Fronts, New Orleans, La., Oct. 11-14, 1977.) Journal of Geophysical Research, vol. 83, Sept. 20, 1978, p. 4523-4529. 8 refs. Navy-sponsored research.

During the winter of 1976-1977 a time series of NOAA satellite data was obtained which documented the seasonal cycle of sea surface temperatures. Data were obtained as both marine-enhanced images and computer compatible tapes. Fall cooling initially affected only the lakes and estuaries. A band of cold inner shelf waters then formed along the coast. This expanded seaward to the shelf break as the winter season progressed. At the extreme of winter cooling, two major thermal fronts remained: one near the shelf edge, separating the shelf from deep gulf surface waters, and the other the cyclonic boundary of the Loop Current. The onset of spring warming was indicated by an increase in surface temperatures in the shallow inshore areas. The seasonal cycle was completed with the formation of nearly isothermal surface waters throughout the region, a condition characteristic of the summer season. (Author)

A78-52155 Estimation of rates of frontogenesis and frontolysis in the North Pacific Ocean using satellite and surface meteorological data from January 1977. G. I. Roden (Washington, University, Seattle, Wash.) and D. F. Paskausky (U.S. Navy, Office of Naval Research, NSTL Station, Miss.). (AGU, AMS, and U.S. Navy, Chapman Conference on Oceanic Fronts, New Orleans, La., Oct. 11-14, 1977.) Journal of Geophysical Research, vol. 83, Sept. 20, 1978. p., 4545-4550. 11 refs. Contract No. N00014-75-C-0502.

A simple prognostic model based on Ekman dynamics and available satellite sea surface temperature and wind data is used to estimate rates of frontogenesis and frontolysis in the central North Pacific in the winter of 1977. The computed patterns and rates are compared to those sensed by satellite, and reasonable agreement is found. In the subtropical region, frontogenetic and frontolytic bands tend to occur in pairs, an occurrence which is attributed to a wind stress maximum over the area. Typical observed frontogenetic rates are 0.5-1 deg C/100 km per week. The computed rates underestimate the observed ones. (Author)

A78-52158 Scales of motion in the subtropical convergence zone. A. Leetmaa (NOAA, Atlantic Oceanographic and Meteorological Laboratories, Miami, Fla.) and A. D. Voorhis (Woods Hole Oceanographic Institution, Woods Hole, Mass.). (AGU, AMS, and U.S. Navy, Chapman Conference on Oceanic Fronts, New Orleans, La., Oct. 11-14, 1977.) Journal of Geophysical Research, vol. 83, Sept. 20, 1978, p. 4589-4592. 8 refs. Contract No. N00014-74-C-0262. NR Project 083-004.

Satellite infrared data show that the sea surface temperature pattern in the subtropical convergence consists of meridionally oriented alternating warm and cold plumes with a wavelength of about 200 km. In 1973, shipboard measurements during the Mid-Ocean Dynamics Experiment (Mode) revealed that the cold plumes resulted from southward advection of the surface water on the eastern flank of the Mode eddy and that the warm plumes were a result of northward advection on the western side. Along the edges of the plumes, small-scale frontogenesis was observed but was not resolved by the sampling scheme. Detailed measurements were made in March 1977 of the frontal structure at the southern end of a cold plume. These revealed the presence of smaller-scale motions with wavelengths of the order of 50 km. Temporal evolution of surface features in the vicinity and along the front occurred extremely rapidly and was barely resolved by surveys spaced 3-5 days apart.

(Author)

A78-52159 # Recent observations of the Alboran Sea frontal system: R. E. Cheney (U.S. Naval Oceanographic Office, Washington, D.C.). (AGU, AMS, and U.S. Navy, Chapman Confer-

ence on Oceanic Fronts, New Orleans, La., Oct. 11-14, 1977.) Journal of Geophysical Research, vol. 83, Sept. 20, 1978, p. 4593-4597, 13 refs.

Observations in the Alboran Sea during fall and winter are reported. The data suggest that the Alboran Sea Front (located in the upper 200 m and having an average width of 35 km) persists throughout the year, moving from Gibraltar eastward through the basin. At times it establishes alternating cyclonic and anticyclonic gyres. The anticyclonic gyre is bounded on the north by the Atlantic water jet and has a diameter of 75-100 km. The features of the Alboran Sea circulation are enhanced when cold surface water along the southern coast of Spain is entrained into the gyre.

A78-52161 Fronts on the continental shelf, J. H. Simpson. C. M. Allen, and N. C. G. Morris (North Wales, University College, Bangor, Wales). (AGU, AMS, and U.S. Navy, Chapman Conference on Oceanic Fronts, New Orleans, La., Oct. 11-14, 1977.) Journal of Geophysical Research, vol. 83, Sept. 20, 1978, p. 4607-4614. 8 refs.

On the basis of NOAA 5 images, radio-tracked drogues, and conventional ship techniques, a study is made of fronts occurring in the shelf seas around the UK. Consideration is also given to a model of stratification and mixing in shallow waters (Simpson and Hunter, 1974) extended to include the influence of wind mixing.

A78-52162 Tidal fronts on the shelf seas around the British Isles. R. D. Pingree (Institute of Oceanographic Sciences, Wormley, England) and D. K. Griffiths (Marine Biological Association of the United Kingdom, Plymouth, England). (AGU, AMS, and U.S. Navy, Chapman Conference on Oceanic Fronts, New Orleans, La., Oct. 11-14, 1977.) Journal of Geophysical Research, vol. 83, Sept. 20, 1978, p. 4615-4622. 9 refs.

A numerical model is used to derive the Simpson-Hunter stratification parameter on the shelf seas surrounding the British Isles. Positions of predicted fronts are compared with structures observed in infrared satellite images and the measurements of sea surface temperature recorded on a cruise around the British Isles. The numerical model predicts the stability of the frontal systems, and baroclinic instability is suggested as the main candidate for (Author) cross-frontal mixing.

A78-52164 * Large-scale Gulf Stream frontal study using GEOS 3 radar altimeter data. N. E. Huang, C. D. Leitao (NASA, Wallops Flight Center, Wallops Island, Va.), and C. G. Parra (EG & G Washington Analytical Service Center, Inc., Pocomoke City, Md.). (AGU, AMS, and U.S. Navy, Chapman Conference on Oceanic Fronts, New Orleans, La., Oct. 11-14, 1977.) Journal of Geophysical Research, vol. 83, Sept. 20, 1978, p. 4673-4682. 12 refs.

From data obtained by the GEOS 3 radar altimeter, sea surface heights are found by both editing and filtering the raw sea surface height measurements and then referencing these processed data to a 5 foot by 5 foot geoid. Any trend between the processed data and the geoid is removed by subtracting out a linear fit to the residuals in the open ocean. Data from individual passes are further processed by applying a minimum variance technique at the subsatellite crossing points to produce surface topography maps for the 6 months and an overall mean map which reveal important details about the Gulf Stream system. The differences between the monthly mean and the overall mean are calculated for each of the 6 months to show the temporal and spatial changes of the Gulf Stream front and spawned eddies. The standard deviation map is even more informative and shows preferred locations of Gulf Stream meanders. (Author)

GEOS-3 OCEAN CURRENT INVESTIGATION USING RADAR ALTIMETER PROFILING Final Report

Clifford D. Leitao, Norden E. Huang, and Carlos G. Parra (EG and G Washington Anal. Serv. Center, Inc., Pocomoke City, Md.) Oct. 1978 32 p refs (Contract NAS6-2730)

(NASA-TM-73280) Avail: NTIS HC A03/MF A01 CSCL 08C Both quasi-stationary and dynamic departures from the marine geoid were successfully detected using altitude measurements from the GEOS-3 radar altimeter. The quasi-stationary departures are observed either as elevation changes in single pass profiles across the Gulf Stream or at the crowding of contour lines at the western and northern areas of topographic maps generated using altimeter data spanning one month or longer. Dynamic features such as current meandering and spawned eddies can be monitored by comparing monthly mean maps. Comparison of altimeter inferred eddies with IR detected thermal rings indicates agreement of the two techniques. Estimates of current velocity are made using derived slope estimates in conjunction with the geostrophic equation.

06 HYDROLOGY AND WATER MANAGEMENT

Includes snow cover and water runoff in rivers and glaciers, saline intrusion, drainage analysis, geomorphology of river basins, land uses, and estuarine studies.

A78-43316 # Satellite imagery analysis of snow cover in the Saint John and Souris River basins. H. L. Ferguson and S. Lapczak (Department of the Environment, Atmospheric Environment Service, Toronto, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings.

Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 126-142, 7 refs.

Satellite imagery from the NOAA-4 and Landsat 1 and 2 satellites has been used to study the snow cover in the Saint John and Souris River basins. Images of visible and infrared data were analyzed by the optical-electrical method and an interpretation systems incorporated image analyzer which evaluated shades of gray and display images on a television screen. Density-sliced satellite images were also superimposed on ground truth data and snow-depth isopleths were drawn. Consideration was also given to maps of vegetative cover, relief, cloud cover, and weather reports in order to interpret the data.

A78-43317 # A study of snowmelt progression from Winnipeg to the Arctic Islands using ERTS photographs. R. Hofer and G. Fuller (Regina, University, Regina, Saskatchewan, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings.

Aeronautics and Space Institute, 1977, p. 143-148. Research supported by the National Research Council of Canada.

Photographs from the Earth Resources Technology Satellite (ERTS) have been applied to monitoring snowmelt progression in various regions of Canada. The regions represent a potential route for natural gas pipelines. On the basis of 155 ERTS photographs, four stages of snowmelt development are identified: the disappearance of the snow cover along ridges and southward facing valley walls, the dark appearance of small lakes, the appearance of dark open river reaches, and the final disappearance of the snow cover. It is noted that the presence of cloud cover significantly influences the number of useful photographs available.

S.C.S.

A78-43318. # A key study on the interpretation of regional soil moisture on satellite imagery. S. Palabekiroglu (Ontario Centre for Remote Sensing, Toronto, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 149-157.

Landsat imagery has provided a regional representation of surface-soil moisture conditions in Canadian agricultural areas. The factors which influence the accuracy of the results are identified as: crop cover, surface dryness, and surface thaw. Comparisons have been made between images from different seasons. The study indicates a relationship between areas having soil samples with high clay content and the moisture bands of the Landsat imagery. Many fields within the moisture bands are noted to contain drainage tiles. It is concluded that if the imagery is monitored for suitable ground and weather conditions, the mapping of poorly-drained soils in agricultural regions may be effected using Landsat data. S.C.S.

A78-43332 # Water dynamics at Lac Saint-Jean, Quebec based on Landsat-1 and Landsat-2 data (Etude de la dynamique des eaux du Lac Saint-Jean au Québec, à l'aide des satellites Landsat-1 et Landsat-2). G. Jones, W. Sochanska, J.-P. Fortin (Québec, Université, Quebec, Canada), and E. J. Langham (Ministère des Pêches et de l'Environnement, Quebec, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 305-312. In French.

Water distribution has been studied in Lac Saint-Jean, Quebec on the basis of multispectral digital data from Landsat-1 and Landsat-2. Using the methods of Langham and Taylor (1975), the images are enhanced in order to determine turbid zones. Grey levels are found for each multispectral band so as to increase the signal-to-noise ratio and the precision with which water reflectance is measured.

S.C.S.

A78-43333 # An automatic system for analyzing lake characteristics by satellite (Un système automatisé d'analyse des caractéristiques des lacs par satellite). G. Rochon (Université Laval, Quebec, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings.

Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 313-324. 13 refs. In French. Research supported by the Ministère des Richesses Naturelles, National Research Council of Canada, Ministère de l'Education, Ministère de l'Environnement, and Université Laval.

It is shown that Landsat imagery may be used to evaluate lake characteristics including lake contents, water distribution, morphometric parameters, drainage, and local ground cover. Landsat imagery is also applicable to studying near-lake ecosystems and modifications occurring over extended periods of time.

S.C.S.

A78-43334 # Progress toward a Landsat water quality monitoring system. T. T. Alfoldi (Canada Centre for Remote Sensing, Ottawa, Canada) and J. C. Munday, Jr. (Virginia Institute of Marine Science, Gloucester Point, Va.). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings.

Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 325-340. 28 refs.

Chromaticity analyses of Landsat images are used for quantitative water-quality monitoring. Multispectral scanner radiances are normalized to eliminate brightness and enhance hue and saturation. Two modes of operation on the Image-100 analyzer are possible: point and area. Discrete loci are identified for bathymetry, chlorophyll, and suspended sediment. Atmospheric corrections are made for the effects of haze, air pollution, sunlight, and clouds. The results are displayed on a color television monitor and computer terminal. They may be output on a line printer or reproduced on hard copy.

S.C.S.

A78-43335 # Study of the central delta of the Niger River-Project 'Saphyr' /Satellite Project Hydrology Research/ (Etude du delta central du Fleuve Niger - Project 'Saphyr' /Satellite Project Hydrology Research/). M. Bied-Charreton, J. Cruette, G. Dandoy, G. Dubee, J. P. Lamagat, and J. Noel (Office de la Recherche Scientifique et Technique d'Outre-Mer, Paris, France). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 341-354. In French.

The central delta of the Niger River, located in the Republic of Mali, is studied with the aid of Landsat imagery. Particular attention is given to the groundwater flow systems of the flood zone and the vegetation. Data from channels 4, 5, and 7 are used to assess the changes occuring in vegetation and flooded zones over extended time periods. Estimates are made of the free water surface area and the biomass in small-surface zones.

06 HYDROLOGY AND WATER MANAGEMENT

A78-48001 Landsat as an aid in the preparation of hydrographic charts. D. K. Warne (Australian National University, Canberra, Australia). *Photogrammetric Engineering and Remote Sensing*, vol. 44, Aug. 1978, p. 1011-1016. 6 refs.

Water depth in the Torres strait was determined from Landsat MSS imagery and the results were compared with ground truth sounding data. The method consists of attempting to fit the simple optical model for the radiance passing through the water and reaching the Landsat detector to the raw Landsat data. Parameters of the model had to be recalculated for each test area. Evaluation was made difficult by the presence of broad scale and localized disturbances of the depth-radiance relationship. Other sources of errors were small features and steep gradients beyond the resolving power of the MSS system and subsequent data correction process. An accuracy of 10% of nominal depth was attainable for depth penetration to 20 m.

A78-48006 A technique for evaluating inland wetland photointerpretation - The cell analytical method /CAM/. D. L. Civco, W. C. Kennard, and M. W. Lefor (Connecticut, University, Storrs, Conn.). Photogrammetric Engineering and Remote Sensing, vol. 44, Aug. 1978, p. 1045-1052. 20 refs.

A procedure was developed to analyze quantitatively the wetland photointerpretations performed by investigators associated with a project designed to evaluate freshwater wetlands definition. The Cell Analytical Method (CAM) used for comparing wetland delineations derived from different photointerpreters and map sources permitted both graphical and statistical analyses of cell-encoded, aerial photograph- and map-derived wetland information.

A78-48067 * Differences in radar return from ice-covered North Slope Lakes. W. F. Weeks, A. G. Fountain (U.S. Army, Cold Regions Research and Engineering Laboratory, Hanover, N.H.), M. L. Bryan, and C. Elachi (California Institute of Technology, Jet Propulsion Laboratory, Pasadena, Calif.). Journal of Geophysical Research, vol. 83, Aug. 20, 1978, p. 4069-4073. 7 refs. Navy-supported research; Contract No. NAS7-100.

Comparisons are made between L and X band synthetic aperture radar images of frozen lakes on the North Slope of Alaska and ground truth observations of the nature of their ice covers. It is shown that the differences in radar backscatter observed on different areas of a lake can be correlated with whether or not the lake is frozen completely to the bottom at the site in question. This explanation is reasonable inasmuch as the reflection coefficient associated with the high-dielectric contrast ice/water interface is significantly higher than that associated with a low-contrast ice/soil interface. However, the presence of the ice/water interface cannot be the only condition required for the higher backscatter because the ice/water interface per se would be specular at X and L band frequencies, causing the energy returned from the interface to be reflected away from the radar receiver. The other principal factor contributing to the return of energy from the ice/water interface to the receiver is believed to be the presence in the ice of numerous vertically elongated air bubbles which would act as scatters.

A78-49531 Rain estimation from geosynchronous satellite imagery - Visible and infrared studies. C. G. Griffith, W. L. Woodley, P. G. Grube (NOAA, National Hurricane and Experimental Meteorology Laboratory, Coral Gables, Fla.), D. W. Martin, J. Stout (Space Science and Engineering Center, Madison, Wis.), and D. N. Sikdar (Wisconsin, University, Milwaukee, Wis.). *Monthly Weather Review,* vol. 106, Aug. 1978, p. 1153-1171. 38 refs. NOAA-supported research.

The paper reports on the first results of an empirical technique which estimates convective rainfall using geosynchronous visible and infrared satellite imagery. The technique is based on brightness (reflected radiance) or temperature (emitted radiance) as parameters for identifying raining clouds, cloud area as a measure of the extent of the rain area, and stage of development as an indicator of rain intensity. To verify the derived relationships, satellite rain estimations are compared to rain-gage and/or radar data for two areas in south Florida, for an area in Venezuela, and for several hurricanes. It is shown that real-time application of the method through computerization has promise for pinpointing flash-flood situations, such as the Big Thompson flood. The accuracy of future results is expected to increase with the use of digital data.

A78-53648 Application of Landsat imagery to shoreline erosion. C. W. Welby (North Carolina State University, Raleigh, N.C.). Photogrammetric Engineering and Remote Sensing, vol. 44, Sept. 1978, p. 1173-1177, 9 refs.

Landsat imagery from a 5-year time span has been used to study water circulation patterns on Croatan Sound and Pamlico Sound, North Carolina, as the patterns relate to erosion of the mainland shoreline. Evidence of probable attack by the sound waters on the shoreline has been correlated with a recent aerial photographic study of shoreline erosion. Approximately one-half of the Landsat images used in the study showed evidence of attack upon each of the several points studied. Landsat imagery, with its repetitive nature together with the accumulated images, provides a relatively inexpensive tool for rapid evaluation of potential for erosion along mainland shores of estuaries. RESEARCH OF MICROWAVE SCATTERING PROPERTIES OF SNOW FIELDS Final Technical Report, 1 Feb. 1976 31 Jul. 1978

D. J. Angelakos Aug. 1978 32 p refs (Grant NsG-5093)

(NASA-CR-157472) Avail: NTIS HC A03/MF A01 CSCI 20N

The results obtained in the research program of microwave scattering properties of snow fields are presented. Experimental results are presented showing backscatter dependence on frequency (5.8-8.0 GHz), angle of incidence (0-60 degrees), snow wetness (time of day), and frequency modulation (0-500 MHz). Theoretical studies are being made of the inverse scattering problem yielding some preliminary results concerning the determination of the dielectric constant of the snow layer. The experimental results lead to the following conclusions: snow layering affects backscatter, layer response is significant up to 45 degrees of incidence, wetness modifies snow layer effects, frequency modulation masks the layer response, and for the proper choice of probing frequency and for nominal snow depths, it appears to be possible to measure the effective dielectric constant and the corresponding water content of a snow pack. MEASUREMENT OF SOIL MOISTURE TRENDS WITH AIRBORNE SCATTEROMETERS Progress Report, 1 Apr. 1977 - 1 Jun. 1978

Bruce J. Blanchard, Principal Investigator 1 Jun. 1978 110 p ERTS

(Grant NsG-5134)

(E78-10176; NASA-CR-157271; RSC-3458-2) Avail: NTIS HC A06/MF A01 CSCL 08M

The author has identified the following significant results. Repeated looks at surfaces that maintain constant roughness can provide an estimate of soil moisture in the surface, when appropriate radar look angles are used. Significant influence due to differences in soil moisture can be detected in the 13.3 GHz and 1.6 GHz scatterometer returns. Effects of normal crop densities have little influence on the surface soil moisture estimate, when appropriate look angles are used. It appears that different look angles are optimum for different frequencies to avoid effects from vegetation. Considering the frequency and look angles used on the Seasat-A imaging radar, differences in soil moisture should produce as much as 9 db difference in return on that system.

COMPUTER PROCESSING OF LANDSAT DIGITAL DATA AND SENSOR INTERFACE DEVELOPMENT FOR USE IN **NEW ENGLAND RESERVOIR MANAGEMENT**

Carolyn J. Merry and Harlan L. McKim Apr. 1978 68 p refs (AD-A055762; (AD-A055762; CRREL-SR-HC A04/MF A01 CSCL 08/6 CRREL-SR-78-6) Avail:

A preliminary analysis of LANDSAT digital data using the NASA GISS computer algorithms for an 11 February scene of the upper St. John River Basin, Maine, showed that the total radiance of pixels contained in three snow courses varied from 5.34 to 7.74 mW/sq cm sr for a water equivalent of approximately 24.1 cm (9.5 in.) of water. This correlation between radiance values and water equivalent of the snowpack still needs to be tested. A multispectral signature was developed with an accuracy of 75% for a wetlands category in the Merrimack River estuary. Low-water reservoir and flood water stages were mapped from grayscale printouts of MSS band 7 for 27 October 1972 and 7 July 1973, respectively, for the Franklin Falls reservoir area, New Hampshire. Two snow pillow transducer systems for measuring the water equivalent of the snowpack in northern Maine were interfaced and field tested. Temperature data from the surface to a depth of 30 m (100 ft) were transmitted through the LANDSAT DCS. Also, a tensiometer/transducer system to measure moisture tension and soil volumetric moisture content was successfully interfaced to the LANDSAT DCS.

The transfer of LANDSAT remote sensing technology from the research sector to user operational applications requires demonstration of the utility and accuracy of LANDSAT data in solving real problems. This report describes such a demonstration project in the area of water resources, specifically the estimation of non-point source pollutant loads. Non-point source pollutants were estimated from land cover data from LANDSAT images. Classification accuracies for three small watersheds were above 95%. Land cover was converted to pollutant loads for a fourth watershed through the use of coefficients relating significant pollutants to land use and storm runoff volume. These data were input into a simulator model which simulated runoff from average rainfall. The result was the estimation of monthly expected pollutant loads for the 17 subbasins comprising the Magothy watershed.

RADAR TARGET REMOTELY SENSING HYDROLOGICAL PHENOMENA Patent Application

Wilford E. Sivertson, Jr., inventor (to NASA) Filed 22 Sep. 1978 18 p

(NASA-Case-LAR-12344-1, US-Patent-Appl-SN-945041) Avail: NTIS HC A02/MF A01 CSCL 08H

Apparatus for remotely measuring and accessing water status at selected locations on the surface of the earth is disclosed. A radar target whose radar cross-section varies as a function of the height of the water level within the target is described. The target consists essentially of a right circular cylinder with its central axis perpendicular to the ground level, a flat circular plate symmetrically attached to the lower end of the cylinder and parallel to the ground level surface, and a catch basin including said circular cylinder and said circular plate for catching and retaining water. The circular cylinder and the flat circular plate are made from a material (electrical conductor) that reflects radar signals such as aluminum, copper, and stainless steel. The brightness of the image taken by a radar from a satellite or an airplane decreases as the level of the water increases. The level of water in a radar target is indicative of the water status at the location of that particular radar target. NASA

Stream samples were collected at a density of one per 13 square kilometers in crystalline rock areas and 25 square kilometers in sedimentary rock areas. Stream sediment was taken at each site, and stream water was concentrated on ion exchange resin in some areas. Ground water samples were collected at an average density of about one site per 20 square kilometers. Measurements made at each site included alkalinity, pH, and conductivity of water. Measurements of the radon and helium contents of ground water samples were made on a semiregional scale in pilot studies. Samples were analyzed by neutron activation techniques. Concentrations of uranium and about 20 other elements were determined in concentrated water samples. Results from several studies are discussed including a Triassic Basin area near Sanford, North Carolina; the North and South Carolina Coastal Plain; and from reconnaissance studies in the Carolinas-Virginia Piedmont and Blue Ridge areas.

LABORATORY AND FIELD MEASUREMENTS OF UP-WELLED RADIANCE AND REFLECTANCE SPECTRA OF SUSPENDED JAMES RIVER SEDIMENTS NEAR HOPE-WELL VIRGINIA

Charles H. Whilock, William G. Witte, E. A. Gurganus, and J. W. Usry Oct. 1978 30 p refs (NASA-TP-1292; L-12298) Avail: NTIS HC A03/MF A01

CSCL 13B

Spectral reflectance characteristics of suspended Bermuda Hundred and Bailey Bay bottom sediments taken from the Hopewell, Va., area were measured in the laboratory for water mixture total suspended solids concentrations between 4 and 173 parts per million. Field spectral reflectance measurements were made of the James River waters near Bermuda Hundred on two occasions. The results of these tests indicate that both Bermuda Hundred and Bailey Bay suspended sediments produce their strongest reflectance in the green and red regions of the spectrum. Author

07 DATA PROCESSING AND DISTRIBUTION SYSTEMS

Includes film processing, computer technology, satellite and aircraft hardware, and imagery.

A78-43307 # Biophysical mapping in northwestern Ontario from aircraft and satellite remote sensing data. N. J. Kozlovic and P. J. Howarth (McMaster University, Hamilton, Ontario, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings.

Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 27-36. 16 refs. Research supported by the National Research Council of Canada and McMaster University.

Aircraft and satellite remote sensing data have been used for biophysical mapping in northwestern Ontario. Data were collected from field studies, aerial photography, and the Landsat multispectral scanner. The Landsat data were analyzed visually, by digital means, and using a signature-file extension.

S.C.S.

A78-43323 # Interpretation and planning of thermal IR imagery. J. Vleck (Toronto, University, Toronto, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 200-207. 6 refs.

Various heat-transfer models used in the interpretation of thermal infrared imagery are discussed. An energy balance equation at the terrain surface, in terms of the net radiation flux representing the difference between incident solar flux and the reflected and emitted radiation components, is presented. Heat transfer at the atmospheric boundary layer is noted to be a function of wind profile, temperature gradients, and the three-dimensional surface configuration. Two sources of thermal radiation detected by the sensor are identified: the radiant power emitted by the surface, and the reflection of the atmosphere by surface features which are not perfect absorbers. Sample thermal images are presented for a bare field in the spring, a winter wheat field, a surface-drainage channel scar, a newly cultivated field, and forestland.

A78-43326 # The Canada Centre for Remote Sensing's image analysis system /CIAS/. D. G. Goodenough (Canada Centre for Remote Sensing, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings.

Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 227-244. 19 refs.

Attention is given to the image analysis system developed by the Canada Centre for Remote Sensing. The system consists of a modified Image-100 device and a PDS color microdensitometer. The system makes it possible to classify a full Landsat frame into 93 distinct classes with maximum likelihood discrimination. The entire process takes less than 14 minutes. Three parallel data paths are provided: the UNIBUS, the RH70/DWR70 bus, and the IAP-supported path, Images are stored in 44-megaword disks. A graphics tablet is employed for limited map-information digitization, map-information selection, the selection of test sites, and map overlay. Output consists of single-class plots matching map scales from 1:50,000 to 1:1,000,000 color photographs.

A78-43352 # Computer processing of remotely-sensed data and automatic cartography (Le traitement par ordinateur des données de télédétection et leur cartographie automatique). D.-J. David (Paris I, Université, Paris, France), G. Joly (CNRS, Laboratoire d'Information et de Documentation en Géographie, Paris, France), and F. Verger (Ecole Normale Supérieure, Montrouge, Hauts-de-Seine, France). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings.

Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 558-564. 5 refs. In French. Centre National d'Etudes Spatiales Contract No. 75-322.

Techniques for automatic cartography on the basis of computerprocessed remotely sensed data are outlined. Several correction and classification programs are described, including the FRACORCA, FRALISSE, FRACARTO, and FRACAM programs. Applications to studies of mud-flat geomorphology and marine turbidity are noted. S.C.S.

A78-43353 # Computerized generation of control points on Landsat imagery (Génération automatisée de points de contrôle sur les images Landsat). A. Scott (CDC System, Ottawa, Canada) and G. Rochon (Université Laval, Quebec, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 565-572. In French.

07 DATA PROCESSING AND DISTRIBUTION SYSTEMS

A new procedure for generating control points on Landsat imagery with a view to subsequent geometric correction has been designed and tested. The procedure is based on locating by computer the mass centres of the lakes appearing on the Landsat images. The lakes which are located and identified and whose morphometric characteristics remain largely unchanged from one image to the next are retained as control points. An affine transformation using these control points and applied to an image of 500 pixels per side gave a residual error of less than 0.5 RMS pixels. (Author)

A78-43355 # Landsat atmospheric corrections at CCRS. F. J. Ahern, D. G. Goodenough, S. C. Jain, V. R. Rao (Canada Centre for Remote Sensing, Ottawa, Canada), and G. Rochon (Université Laval, Quebec, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 583-594. 15 refs.

Methods used to correct Landsat data for atmospheric variability are discussed. Attention is given to the Multiplicative and Additive Scene Correction (MASC) algorithm (Henderson, 1975) which assumes that certain types of ground cover have stable spectral reflectances. Atmospheric corrections utilizing oligotrophic lakes as standard reflectors (Ahern, et al., 1977) are described. The methods are evaluated for ground and aircraft measurements made with Landsat passes over Canadian lake regions. It is found that when using oligotrophic lakes as standard reflectance targets, atmospheric variability is removed to within plus or minus one grey level on a 128-grey-level scale.

A78-43356 # Diffuse backscatter of solar radiation. E. J. Langham (Department of Fisheries and Environment Canada, Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 595-601.

A method for using cloud shadows in order to correct satellite images for the effects of backscattered solar radiation is proposed. The technique is evaluated for an area south of Lake St. Clair near Detroit. A similar method for using cloud shadows for image corrections (Piech and Schott, 1974) is noted.

S.C.S.

A78-43619 # Application of space-borne photography to mapping and investigation of earth resources (Ob ispol'zovanii materialov kosmicheskikh s'emok pri kartografirovanii i izuchenii prirodnykh resursov). Iu. P. Kienko, L. I. Zlobin, V. I. Bumblis, Iu. G. Kel'ner, V. V. Kiselev, V. V. Kozlov, and M. E. Solomatin. Geodeziia i Kartografiia, Apr. 1978, p. 20-29. In Russian.

In the present paper, potential uses of remote sensing are examined, with particular reference to the study of earth resources and the preparation of respective maps. The principles and possibilities of satellite photography are discussed, along with photogrammetric processing and digitizing.

V.P.

A78-43967 # Use of a remote computer terminal during field checking of Landsat digital maps. C. J. Robinove and C. F. Hutchinson. U.S. Geological Survey, Journal of Research, vol. 6, July-Aug. 1978, p. 511-514.

Small-scale, land-classification maps digitally produced from Landsat data have been field checked using a remote portable teletypewriter linked to the Interactive Digital Image Manipulation System. The terminal provided image classification, statistical manipulation, class grouping, and map printout in alphanumeric form. The process is observed to make field checking faster, to provide statistical data integration, and to reduce the required time and costs.

Some difficulties were encountered with the telephone lines. It is suggested that the original computer-produced maps taken to the field contain more classes than are expected to be mapped because in the field it is easier to group classes than to reclassify or separate classes when only the remote terminal is available for display. S.C.S.

A78-44237 Methods and accuracy of location of Landsat MSS points on maps. J. R. Hardy (Reading, University, Reading, Berks., England). *British Interplanetary Society, Journal (Remote Sensing)*, vol. 31, Aug. 1978, p. 305-311. 7 refs.

The linear least squares method of transformation of coordinates from Landsat MSS to map systems and vice versa is described and illustrated, with reference to Landsat and map geometry. It is shown that, for a whole Landsat scene, map points can be matched with a standard deviation of about plus or minus 200 metres, while for small areas this figure can be improved to about plus or minus 50 metres. It is shown that eight to ten pairs of homologous points are sufficient to achieve this accuracy and that little or no improvement is achieved by using more. The implications for mapping scales are discussed. (Author)

A78-47081 Digital processing of meteorological satellite /NOAA/ images. M. Takagi and K. Tamura (Tokyo, University, Tokyo, Japan). In: International Symposium on Space Technology and Science, 12th, Tokyo, Japan, May 16-20, 1977, Proceedings. Chofu, Tokyo, National Aerospace Laboratory, 1977, p. 593-598. 6 refs.

A small digital processing system has been applied to NOAA images. Image enhancement of these images improves contrast. An interpolation method was used to study the conversion of the NOAA data to a mapping system such as Mercator or polar stereo. A grey level histogram technique is used to extract the sea area from the IR image, and the temperature distribution of the sea surface is displayed. Interpolation of picture elements is discussed, and image magnification with boundary smoothing is considered.

A78-47082 Image processing in remote sensing. A. K. S. Gopalan, D. S. Kamat, K. L. Majumder, C. V. S. Prakash, and V. L. Swaminathan (Indian Space Research Organization, Space Applications Centre, Ahmedabad, India). In: International Symposium on Space Technology and Science, 12th, Tokyo, Japan, May 16-20, 1977, Proceedings.

Chofu, Tokyo, National Aerospace Laboratory, 1977, p. 599-604. 11 refs.

Certain aspects of image processing in remote sensing is reviewed with reference to extraction of information on earth resources from Landsat and aircraft pictures. Attention is given to agricultural land use using supervised and unsupervised classification, and to the study of forest cover. Digital processing techniques are applied to photogeology, and water turbidity and quality studies. Analog processing is also discussed.

B.J.

A78-47083

Standard Mesh compatible Landsat mapping.
S. Tanaka, H. Kano (Remote Sensing Technology Center of Japan, Tokyo, Japan), and Y. Suga (Hosei University, Koganei, Tokyo, Japan). In: International Symposium on Space Technology and Science, 12th, Tokyo, Japan, May 16-20, 1977, Proceedings.

Chofu, Tokyo, National Aerospace Laboratory, 1977, p. 605-610.

A procedure is described for rendering Landsat MSS data for Japan compatible with the Standard Areal Mesh established by the Japanese Statistics Bureau. The basic features of this Standard-Mesh-compatible Landsat map are that (1) the pixel feature is almost square, (2) the pixel number corresponding to the Mesh is the same in every image, and (3) the radiometric value of MSS data is sufficiently preserved.

B.J.

A78-47085 The analyses of multispectral data obtained from space. K. Tsuchiya, T. Iwata, H. Nakamura (National Space Development Agency of Japan, Tokyo, Japan), H. Ochiai (Toba National Merchant Marine College, Toba, Japan), and K. Takeda (Science and Technology Agency, Tokyo, Japan). In: International Symposium on Space Technology and Science, 12th, Tokyo, Japan, May 16-20, 1977, Proceedings.

Chofu, Tokyo, National Aerospace Laboratory, 1977, p. 617-622. 12 refs.

Two Landsat MSS images of four areas in Japan - a farming area, a city, a mountain area, and a bay - are examined in an effort to compare radiance values. The radiance value of Band 4 (0.5-0.6 micron) taken in October 1972 is greater than that of Band 4 taken in September 1975 for all the areas, while the reverse is true for Band 6 (0.7-0.8 micron). The differences in radiance are apparently due to the effects of weather and vegetation. Using the same images, four different methods of ground control point matching are tested. Landsat data is then applied to the detection of red tide off Japan.

A78-48003 * Photographic contrast enhancement of Landsat imagery. R. G. Best and J. R. Smith (South Dakota State University, Brookings, S. Dak.). Photogrammetric Engineering and Remote Sensing, vol. 44, Aug. 1978, p. 1023-1026. Grant No. NGL-42-003-007.

The effect of increased contrast of Landsat imagery is to stretch the informational content over a much greater density range. This results in greater density differences among scene features and provides a more interpretable image. The stretch required for MSS 5 and 7 is in the gamma range of 1.5 to 3.0. Several different film types, developers, and development times were used to reprocess Landsat images in a range of gammas from 1.0 to above 4.0. The gamma value to which the imagery was processed depended on the densitometric range of scene features in the image relative to the gray scale. An example of a photographically enhanced MSS 4 image is shown, in which the standard 0.94 density units was increased to 2.19 density units. The results are similar to those obtained in a computerized contrast stretch of digital CCT data, but are obtained at a far lesser cost.

A78-48007 * Use of manual densitometry in land cover classification. D. C. Jordan, D. H. Graves, and M. C. Hammetter (Kentucky, University, Lexington, Ky.). *Photogrammetric Engineering and Remote Sensing*, vol. 44, Aug. 1978, p. 1053-1059. 13 refs. Research sponsored by the University of Kentucky Research Foundation; Contract No. NAS8-31006.

Through use of manual spot densitometry values derived from multitemporal 1:24,000 color infrared aircraft photography, areas as small as one hectare in the Cumberland Plateau in Kentucky were accurately classified into one of eight ground cover groups. If distinguishing between undisturbed and disturbed forest areas is the sole criterion of interest, classification results are highly accurate if based on imagery taken during foliated ground cover conditions. Multiseasonal imagery analysis was superior to single data analysis, and transparencies from prefoliated conditions gave better separation of conifers and hardwoods than did those from foliated conditions.

A78-49654

Landsat data availability from the EROS data center and status of future plans. R. A. Pohl and G. G. Metz (U.S. Geological Survey, EROS Data Center, Sioux Falls, S. Dak.). In: Oceans '77; Annual Combined Conference, 3rd, Los Angeles, Calif., October 17-19, 1977, Conference Record. Volume 1.

New York, Institute of Electrical and Electronics Engineers, Inc.; Washington, D.C., Marine Technology Society, 1977, p. 9D-1 to 9D-4.

The Department of Interior's EROS Data Center was established in 1972 in Sioux Falls, South Dakota to serve as a principal dissemination facility for Landsat and other remotely sensed data. Through mid-1977, the Center had supplied about 1.7 million copies of images from the more than five-million images of the earth surface archived at the Center. Landsat accounted for nearly half of these images, and approximately \$800 computer-compatible tapes of Landsat data were also supplied to users. New methods for processing data products to make them more useful are being developed, and new accession aids for determining data availability are being placed in operation.

A78-50226 Interpretation of aerial photographs /3rd edition/. T. E. Avery. Minneapolis, Minn., Burgess Publishing Co., 1977. 400 p. 200 refs. \$16.95.

Photography, films, and filters are considered along with questions related to orientation and study of aerial photographs, photoscale and stereoscopic parallax, stereogram, shadow heights, flight planning, planimetric and topographic mapping, nonphotographic imaging systems, land information systems and land-cover mapping, prehistoric and historic archeology, agriculture and soils, forestry applications, landforms and physiographic features, engineering applications and mining patterns, urban-industrial patterns, and air intelligence and military target analysis. Attention is given to remote sensing and interpretation, relative apertures, camera viewing angles, photographic film, developing and printing, resolution and spectral sensitivity, infrared color or camouflage-detection film, the development of photogrammetry, principles of object recognition, three-dimensional photography, the precision of height determinations, topographic maps from paper prints, the nature of infrared radiation, radar image interpretation, the significance of land use patterns, site evaluations, land and crop classifications, water erosion, the classification of vegetation, applications of photogeology, and nonphotographic imagery.

A78-51617 # Exploiting spectral, spatial and semantic constraints in the segmentation of Landsat images. D. W. Starr and A. K. Mackworth (British Columbia, University, Vancouver, Canada). (Remote Sensing Science and Technology Symposium, Ottawa, Canada, Feb. 21-23, 1977.) Canadian Journal of Remote Sensing, vol. 4, Aug. 1978, p. 101-107. 17 refs. Research supported by the National Research Council of Canada.

A critique of traditional classification techniques for Landsat images and consideration of some scene analysis techniques, exploiting spatial organization and meaning, lead to a new approach to computer programs for Landsat image understanding. To justify this approach, a program that combines modified maximum likelihood techniques with interpretation-controlled region merging methods to interpret forest cover in Landsat images is described. For comparison purposes, a pure supervised classifier using the same data made 43% more errors and produced a segmentation twice as complex. (Author)

A78-53650 Enhancement of linear features by rotational exposure. D. L. Lawton and D. F. Palmer (Kent State University, Kent, Ohio). *Photogrammetric Engineering and Remote Sensing*, vol. 44, Sept. 1978, p. 1185-1189. 8 refs. Research supported by the AMAX Foundation.

The described method for the photographic enhancement of linear features involves the use of overlaid positive and negative transparencies maintained in perfect registration to eliminate the bias due to offsetting. By placing the transparences so that the emulsion is up on the top film and down on the bottom film, almost all light in the normal direction is blocked, so that only a small amount of light will pass through by means of oblique illumination and reach the unexposed negative film placed below the positive and negative pair. Since light will pass through only at the boundaries of light and dark areas, linear features are enhanced for both man-made and geologic features on satellite-acquired images.

THE USE OF SATELLITE IMAGERY FOR LAKE CLASSIFICA-TION IN WISCONSIN

K. W. Holmquist and F. L. Scarpace 1977 41 p ref (Contract DI-14-34-0001-6052; DI-14-34-0001-5050; OWRT Proj. A-062-WIS(1))

(PB-279628/2; WIS-WRC-77-08; W78-05935) Avail: NTIS HC A03/MF A01 CSCL 08H

The trophic status of inland lakes in the State of Wisconsin was assessed from LANDSAT data. The feasibility of using both the photographic representation of the LANDSAT imagery as well as the digital representation of the LANDSAT imagery to classify lakes was investigated. It was determined that LANDSAT imagery can be used to predict lake water parameters or trophic classification. Time series data analyses indicated the necessity of a periodic rather than a one-time data extraction process.

DESCRIPTION OF A SIMULATION MODEL OF SYNTHETIC APERTURE RADAR SYSTEMS. VOLUME 1: SUMMARY R. Sellars Paris ESA Jul. 1977 72 p refs 2 Vol.

(Contract ESTEC-2567/75-HP) (Rept-2831-Vol-1; ESA-CR(P)-1059-Vol-1) Avail: NTIS HC A04/MF A01

The development of a digital computer simulation model for a satellite-borne Synthetic Aperture Radar (SAR) system is reported. Requirements of earth remote sensing are outlined, showing how a synthetic aperture radar can satisfy these requirements. The development of a simulation program to study SAR processing operations is discussed, based on a broad type of SAR system. The program design philosophy and the most important program segments are dealt with. A few examples are given of results from the program, and the use of the model by an SA systems designer is shown. Recommendations are given for future work.

SOME OBSERVATIONS ABOUT LANDSAT DIGITAL ANALYSIS

Robert R. Jayroe, Jr. Aug. 1978 40 p (NASA-TM-78184) Avail: NTIS HC A03/MF A01 CSCL 05B

Several hypotheses concerning LANDSAT data are analyzed. These hypotheses are: (1) LANDSAT does not discriminate vegetation types, but mostly sees chlorophyl and canopy cover. (2) A majority of the features in the ground scene possess linearly proportional amounts of color from each spectral band. (3) The data are continuous and as a result there is no true separability

of ground scene features in the data, but some features possess an excess of color in a particular band pair. (4) There are relatively few features present in the spectral data, and these do not correspond to the conventional definitions that are used. (5) Aside from seasonal effects, in a distributional sense all LANDSAT data are essentially the same. The only difference is the way the data are spatially arranged in the image.

Side-Looking Airborne Radar (SLAR) images, acquired by JPL and Strategic Air Command Systems, and visible and near-infrared LANDSAT imagery were applied to studies of the Quaterary alluvial and evaporite deposits in Death Valley, California. Unprocessed radar imagery revealed considerable variation in microwave backscatter, generally correlated with surface roughness. For Death Valley, LANDSAT imagery is of limited value in discriminating the Quaternary units except for alluvial units distinguishable by presence or absence of desert varnish or evaporite units whose extremely rough surfaces are strongly shadowed. In contrast, radar returns are most strongly dependent on surface roughness, a property more strongly correlated with surficial geology than is surface chemistry.

SOME NEW MAP DATA ENCODING SCHEMES terim Report

Herbert Freeman 1978 11 p refs

(Grant AF-AFOSR-2937-76)

(AD-A054853; Avail: AFOSR-78-0946TR)

HC A02/MF A01 CSCL 09/4

Some new schemes for encoding map data are introduced. The schemes can be regarded as generalizations of the well known 8-direction chain coding scheme. Instead of being limited to 8 types of links for approximating a curve, the new schemes possess 16, 24, 32, 48, or even more link types. The new schemes permit increased smoothness of representation, exhibit greater precision, and require less processing time for comparable resolution than present methods.

DETECTION OF IMAGE BOUNDARIES: MATHEMATICAL FORMULAS [DETECCAO DE BORDAS EM IMAGENS: FORMULAÇÃO ESTATISTICA]

Nelson Delfino Davila Mascarenhas and Lucila Olivia da Costa Prado Jul. 1977 44 p refs in PORTUGUESE; ENGLISH summary

(INPE-1058-NTE/094) Avail: NTIS HC A03/MF A01

New statistical techniques for the boundary detection problem in earth resources imagery are developed. The image is modeled by signal and noise which are additive, independent, gaussian and autorregressive in two dimensions. The parameters of the model are determined by correlation measurements. The optimal solution, in terms of signal detection theory, leads to a test which takes a decision among seven overlapping hypothesis. A computationally attractive suboptimal test, involving nonoverlapping hypothesis is developed. Simulation results of the algorithm, when applied to groups of four pixels of the image, are presented.

N78-31306# Plessey Radar Ltd., Havant (England). A CCD DIGITAL IMAGE STORE

D. M. Balston and P. R. Samways In AGARD Impact of Charge Coupled Devices and Surface Acoustic Wave Devices on Signal Process, and Imagery in Advanced Systems Jun. 1978 9 p refs (For primary document see N78-31279 22-31) Avail: NTIS HC A21/MF A01

A digital image store, based on CCD technology designed for an image processing system is described. The processing system, termed IDP 3000, was introduced to fulfill a requirement in the field of Earth Resource Surveying and the design of the store reflects the requirements of the specific area application. The requirements were introduced and the specific solution adopted is described. Particular attention is paid to the relationship with a standard 625 line TV signal. Each function available in the store is discussed and the method of implementation is summarized. An indication of the reliability of the store was given as well as a description of its application to simulator development.

SHADED PERSPECTIVE IMAGE OF TERRAIN

Thomas M. Strat Mar. 1978 39 p refs (Contract N00014-75-C-0643)

(AD-A055070; AI-M-463) Avail: NTIS HC A03/MF A01 CSCL

In order to perform image analysis, one must have a thorough understanding of how images are formed. This memo presents an algorithm that produces shaded perspective images of terrain as a vehicle to understanding the fundamentals of image formation. The image is constructed using standard projection equations along with an efficient hidden-surface removal technique. The image intensity is calculated using the reflectance map, a convenient way of describing the surface reflection as a function of surface gradient. Aside from its use as a tool toward understanding image analysis, the algorithm has several applications of its own, including providing video input to a flight simulator.

INSTRUMENTATION AND SENSORS

Includes data acquisition and camera systems and remote sensors.

A78-43327 # The activities of the Groupement pour le Développement de la Télédétection Aérospatiale /GDTA/ (Activités du Groupement pour le Développement de la Télédétection Aérospatiale /G.D.T.A./). H. Guichard, M. Guy, L. Laidet, and Y. Vuillaume (Groupement pour le Développement de la Télédétection Aérospatiale, Toulouse, France). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 245-253. In French.

The article surveys French remote sensing projects. Devices including visible and infrared cameras and multispectral scanners, thermal infrared scanners, and microwave multifrequency radar are described. Methods for data processing and interpretation are presented noting multipath numbering techniques, interactive digital viewing systems, and digital-data printing systems. Target projects are discussed with reference to resource and water monitoring, vegetation and forestland mapping, and pollution studies. Projects incorporating side-looking airborne radar, thermal detectors, and Landsat data are reviewed.

A78-43338 # Interpretation techniques for X-band SLAR. J. T. Parry (McGill University, Montreal, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 376-394. 22 refs.

The operation and interpretation of X-ray side-looking airborne radar (SLAR) are discussed with reference to both real aperture and synthetic aperture configurations. Operational parameters associated with the aircraft flight and the radar equipment are reviewed. Limits to SLAR performance are identified, including range display, swath width, scale, and resolution. The terrain features which influence radar return are considered, noting the conductivity and dielectric constant of the ground, surface geometry, local surface roughness, relief, and slope. Procedures for SLAR imagery interpretation, considering tone, speckle, texture, size, shape, shadow, and association, are outlined.

A78-43344 # A synthetic aperture radar /SAR/ program for environmental and resource management in Canada. R. Inkster and M. Kirby (INTERA Environmental Consultants, Ltd., Ottawa, Canada). In: Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Ottawa, Canadian Aeronautics and Space Institute, 1977, p. 469-473. 7 refs.

Canadian environmental and resource management using synthetic aperture radar (SAR) systems is outlined. The program is designed to identify cost-effective potential applications for radar remote sensing. The ERIM X-L SAR system, consisting of imaging sensors transmitting in the X- and L-bands, is described. Attention is given to hybrid optical-digital signal processing. This procedure consists of an optical processor interfaced to an image dissector, a computer program providing digitization, and recording and display apparatus.

S.C.S.

A78-43637 An experimental radar device for the observation of the earth from an aircraft (Ein Experimental-Radargerät zur Erdbeobachtung vom Flugzeug aus). F. Schlude (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Flugfunk und Mikrowellen, Oberpfaffenhofen, West Germany). Bildmessung und Luftbildwesen, vol. 46, July 1, 1978, p. 123-131. In German.

Remote sensing data in the optical, infrared, and microwave range have become indispensible for a number of scientific investigations. The importance of the microwave sensor has increased in recent years in connection with its all-weather capability, which is vital for the geographical latitudes of Central Europe. Current limitations regarding the use of the microwave sensor are related to technological problems. In connection with the clearly recognized European need for a suitable microwave sensor, West Germany wants to improve the technology related to the microwave remote sensing of the earth. It is planned to provide for the users an operational satellite sensor system during the mid-1980s. A program for implementing this objective is being prepared. The first step taken in this connection was the design of a cost-efficient experimental radar device for the observation of the earth from an aircraft. Basic information regarding the observation of the earth with radar is considered and a survey is provided regarding the performance of the new device, taking into account the first results.

A78-43640 The remote sensing experiments of the first Spacelab mission (Die Fernerkundungs-Experimente der ersten Spacelab-Mission). J. Albertz (Darmstadt, Technische Hochschule, Darmstadt, West Germany). Bildmessung und Luftbildwesen, vol. 46, July 1, 1978, p. 147-151. In German.

It is intended to employ two remote sensing systems built in West Germany during the first Spacelab mission. The systems include a photogrammetric camera and a microwave remote sensing instrument. The microwave instrument can be used as a two-frequency scatterometer for sea-state measurements, as a radiometer providing brightness temperatures, or as an imaging synthetic aperture radar system. The basis for the Spacelab program is an agreement between NASA and the European Space Agency. The remote sensing experiments of the first Spacelab mission can be considered as preliminary stages concerning the development of a European satellite for remote-sensing applications. The sensors employed during the first Spacelab mission are subsequently to be modified for additional experiments which are to be conducted during a later Spacelab mission.

A78-44828 The NRC camera calibrator. P. D. Carman and H. Brown (National Research Council, Div. of Physics, Ottawa, Canada). *Photogrammetria*, vol. 34, July 1978, p. 147-165. 7 refs.

Equipment and techniques for the calibration of aerial survey cameras have been developed progressively at the National Research Council of Canada with the goals of providing a high level of real accuracy, versatility to accomodate a variety of camera, filters, and emulsions, and an economy of operation which permits recalibration at yearly intervals. Present apparatus and methods are described, and reasons for their construction and choice are explained. Results of three calibrations, made at different times, of two test cameras are given. They illustrate the degree to which cameras change with time and use. (Author)

A78-45023 # A case study comparison of microwave radiometer measurements over bare and vegetated surfaces. I. J. Barton (Commonwealth Scientific and Industrial Research Organization, Div. of Atmospheric Physics, Mordialloc, Victoria, Australia). *Journal of Geophysical Research*, vol. 83, July 10, 1978, p. 3513-3517. 14 refs.

Airborne microwave measurements with a nadir-viewing X band radiometer operating at a wavelength of 2.65 cm are described. The measurements over adjacent bare and vegetated surfaces are compared with ground truth samples of soil moisture content (SMC). For the bare surface the emissivity is highly correlated (r = 0.97) with the SMC of the top 0.5 cm, with an antenna temperature dependence

08 INSTRUMENTATION AND SENSORS

of -2.1 K/(percent SMC). In contrast, the correlation over vegetated surfaces is very poor (-0.25). Thus it cannot be expected that the technique at this wavelength would be generally useful as a measure of SMC, and this is borne out by comparison with the Nimbus 5 electrically scanned microwave radiometer data. If aircraft or satellite radiometers are to measure SMC under vegetated conditions, it will be necessary to increase their wavelengths well beyond the X-band.

A78-45687 # A distortion-free map projection for analysis of satellite remote sensing. J. L. Junkins and J. D. Turner (Virginia Polytechnic Institute and State University, Blacksburg, Va.). American Institute of Aeronautics and Astronautics and American Astronautical Society, Astrodynamics Conference, Palo Alto, Calif., Aug. 7-9, 1978, AIAA Paper 78-1425. 12 p. Grant No. DAAG53-76-C-0067.

A dynamic map projection is formulated and tested numerically. In contrast to classical static map projections, the invariant line (projected free of length and normal-view curvature distortions) is not restricted to be an equator, a meridian, or a parallel; rather the satellite's subpoint trace (groundtrack) on the reference ellipsoid is the invariant line. Since the projection is dynamic, a local sensing time is associated with each (phi, lambda) in the satellite sensors' field of view (assumed to be a Landsat-type scanner/electro-optical detector). Length and angle distortions are rigorously zero along the groundtrack projection; the largest distortions within the finite sensed strip of the earth's surface are a few parts per 10,000 for most applications. The formulation is valid for any continuous satellite orbit or orbit segment (interfacing with state-of-the-art orbit integration software is straightforward).

A78.45750 * Central swath mapping by a future satelliteborne fan-beam microwave scatterometer for inferring global ocean wind fields. K. Tomiyasu (General Electric Co., Valley Forge Space Center, Philadelphia, Pa.). *IEEE Journal of Oceanic Engineering*, vol. OE-3, July 1978, p. 70-72. 6 refs. Contract No. NAS1-14173.

The Seasat-A satellite scatterometer is a microwave sensor designed to provide a capability for mapping the global ocean surface wind speed and direction. Four fan beams whose major axes are oriented at + or - 45 deg and + or - 135 deg to the flight vector cover a swath width of 1900 km, but a central region remains that is inadequately mapped. In this paper, two additional fan beams for a future scatterometer are suggested which provide more complete coverage of the central region. (Author)

A78-48514 # Practical work in the study of aerial photocameras (Praktikum po issledovaniiu aerofotoapparatury). E. P. Arzhanov; R. T. Vasil'ev, and V. B. Il'in. Moscow, Izdatel'stvo Nedra, 1977. 136 p. 12 refs. In Russian.

The book deals with laboratory investigations of aerial cameras, including cameras used for topographic purposes and for studying natural resources. Practical recommendations are given for checking optical systems, shutters, cassettes, time-lag devices for obtaining longitudinal overlaps, gyrostabilizers, statoscopes, and radio altimeters. Review questions at the end of each chapter make the volume well suited as a textbook.

A78-49440 Estimates of brightness temperatures from scanning radiometer data. A. Stogryn (Aerojet ElectroSystems Co., Azusa, Calif.). *IEEE Transactions on Antennas and Propagation*, vol. AP-26, Sept. 1978, p. 720-726. 9 refs.

In the analysis of antenna temperature maps of the earth obtained by satellite-borne microwave radiometers, estimates of brightness temperatures or averages of brightness temperatures over areas considerably smaller than the region sensed at a given position of the radiometer antenna are often needed. An application of the

Backus-Gilbert methodology is made to obtain an objective criterion of the best resolution (in a least squares sense) obtainable from a given system and to investigate the trade-off between resolution and noise in the derived average brightness temperatures. The mathematically related problem of simultaneously analyzing antenna temperature measurements made at different frequencies by antennas with noncoincident antenna patterns is also considered. (Author)

A78-49765 # Experience in operational processing of geophysical data with the aid of the DGU-2 plotter (Opyt operativnoi obrabotki geofizicheskoi informatsii s ispol'zovaniem grafopostroitelia DGU-2). A. E. Suziumov (Akademiia Nauk SSSR, Institut Okeanologii, Moscow, USSR) and M. B. Leibov (Moskovskii Gosudarstvennyi Universitet, Moscow, USSR). Okeanologiia, vol. 18, May-June 1978, p. 542-545. In Russian.

A78-53732 # Determination of earth soil moisture by means of microwave radiometry /Review/ (Opredelenie vlazhnosti zemnykh pokrovov metodami SVCh-radiometrii /Obzor/). A. E. Basharinov and A. M. Shutko. *Radiotekhnika i Elektronika*, vol. 23, Sept. 1978, p. 1778-1791. 60 refs. In Russian.

The paper is a survey of theoretical and experimental studies of the microwave radiometry of soil moisture. Consideration is given to the physics of moisture-radiation relationships, the radiation properties of nonuniformly moist soils, and the screening effect of vegetation.

A PARAMETRIC MULTICLASS BAYES ERROR ESTIMATOR FOR THE MULTISPECTRAL SCANNER SPATIAL MODEL PERFORMANCE EVALUATION

B. G. Mobasseri, C. D. McGillern, and P. E. Anuta, Principal Investigators 1978 294 p refs EREP (Contracts NAS9-14016; NAS9-14970; NAS9-15466) (E78-10171; NASA-CR-151745; LARS-TR-061578; TR-EE-78-22) Avail: NTIS HC A13/MF A01 CSCL 05B

The author has identified the following significant results. The probability of correct classification of various populations in data was defined as the primary performance index. The multispectral data being of multiclass nature as well, required a Bayes error estimation procedure that was dependent on a set of class statistics alone. The classification error was expressed in terms of an N dimensional integral, where N was the dimensionality of the feature space. The multispectral scanner spatial model was represented by a linear shift, invariant multiple, port system where the N spectral bands comprised the input processes. The scanner characteristic function, the relationship governing the transformation of the input spatial, and hence, spectral correlation matrices through the systems, was developed.

THE TIROS N POLAR ORBITING ENVIRONMENTAL SATELLITE SYSTEM

W. John Hussey Oct. 1977 32 p Presented at the 10th Session of the ESCAP/WMO Typhoon Committee, Tokyo, Japan, 28 Oct. 1977

(PB-280743/6; NOAA-78041213) Avail: NTIS HC A03/MF A01 CSCL 22B

The TIROS operational satellite (ITOS); launched in its current configuration with radiometers as NOAA-2 in October 1972, is the present type of NOAA polar orbiting operational satellite. Satellite and ground system capabilities of interest to the users of direct readout services from the system were examined in detail.

N78-29424*# Barnes Engineering Co., Waltham, Mass. ADVANCED MULTISPECTRAL SCANNER (AMS) STUDY Final Report

30 Jun. 1978 217 p refs (Contract NAS9-15323; Proj. 2738) (NASA-CR-151753; MA-183T) Avail: NTIS HC A10/MF A01 CSCL 14B

The status of aircraft multispectral scanner technology was accessed in order to develop preliminary design specifications for an advanced instrument to be used for remote sensing data collection by aircraft in the 1980 time frame. The system designed provides a no-moving parts multispectral scanning capability through the exploitation of linear array charge coupled device technology and advanced electronic signal processing techniques. Major advantages include: 10:1 V/H rate capability; 120 deg FOV at V/H = 0.25 rad/sec; 1 to 2 rad resolution; high sensitivity; large dynamic range capability; geometric fidelity; roll compensation; modularity; long life; and 24 channel data acquisition capability. The field flattening techniques of the optical design allow wide field view to be achieved at fast f/nos for both the long and short wavelength regions. The digital signal averaging technique permits maximization of signal to noise performance over the entire V/H rate range.

A SPECTRAL METHOD FOR DETERMINING THE PER-CENTAGE OF LIVE HERBAGE MATERIAL IN CLIPPED SAM-PLES

Compton J. Tucker Nov. 1977 24 p refs Submitted for publication

(NASA-TM-78019) Avail: NTIS HC A02/MF A01 CSCL 20F A laboratory spectroradiometric method for the rapid determination of live/dead vegetation percentages from clipped grass samples has been developed and preliminarily tested. The method utilizes the red and photographic infrared reflectance or radiance differences between green vegetation and that of dead vegetation. Mixtures of green and dead material were found to have reflectances or radiances proportional to the percentage of green material present. This method offers the possibility that rapid live/dead spectroradiometric determinations may replace the tedious hand-sorting now generally in use for many situations.

AN EVALUATION OF THE FIRST FOUR LANDSAT-D THEMATIC MAPPER REFLECTIVE SENSORS FOR MONI-TORING VEGETATION: A COMPARISON WITH OTHER SATELLITE SENSOR SYSTEMS

Compton J. Tucker May 1978 53 p refs

(NASA-TM-79617) Avail: NTIS HC A04/MF A01 CSCL 08F The first four LANDSAT-D thematic mapper sensors were evaluated and compared to: the return beam vidicon (RBV) and multispectral scanners (MSS) sensors from LANDSATS 1, 2, and 3: Colvocoresses' proposed 'operational LANDSAT' three band system; and the French SPOT three band system using simulation/intergration techniques and in situ collected spectral reflectance data. Sensors were evaluated by their ability to discriminate vegetation biomass, chlorophyll concentration, and leaf water content. The thematic mapper and SPOT bands were found to be superior in a spectral resolution context to the other three sensor systems for vegetational applications. Significant improvements are expected for most vegetational analyses from LANDSAT-D thematic mapper and SPOT imagery over MSS and RBV imagery. Author

US-Patent-Appl-SN-668771; US-Patent-Class-324-249;

US-Patent-Appl-SN-547072) Avail: US Patent Office CSCL 14B

The magnetometer is based on the time variation of the magnetic permeability in the magnetic material of its transducer; however, its operation is substantially different from the ordinary flux-gate magnetometer. The transducer uses 0.05 mm diameter plated magnetic wire and is made flat enabling it to make measurements of transverse magnetic fields as close as 0.08 mm from the surface, and it has very good spatial resolution because of its small active region of approximately 0.64 mm by 0.76 mm. The magnetometer uses an inexpensive clip-on millimeter for driving and processing the electrical signals and readout. It also utilizes an automatic scanning technique which is made possible by a specially designed transducer holding mechanism that replaces the ink pen on an X-Y recorder.

VISIBLE AND INFRARED POLARIZATION RATIO SPECTRO-REFLECTOMETER Patent Application

Carmen E. Batten, inventor (to NASA) Filed 28 Jul. 1978 19 p

(NASA-Case-LAR-12285-1; US-Patent-Appl-SN-929087) Avail: NTIS HC A02/MF A01 CSCL 14B

The invention relates to an instrument for determining the optical constants of a sample material by causing light of various angles of polarization to impinge upon the sample at various angles of incidence and measuring the intersity of the reflected light at various wavelength. The ratio of the intensity of the reflected light for parallel polarized light to that for perpendicular polarized light at two different angles of incidence can be used to determine the optical constants of the sample. The novel feature of the invention appears to reside in a spectroreflectometer employing coordinated rotating platforms which enable the automatic alignment of the instrument at a wide variety of angles of incidence.

DETECTION AND LOCATION OF RESEAUX USING PICTORIAL PATTERN RECOGNITION Ph.D. Thesis

James Hiram Aylor 1977 133 p

Avail: Univ. Microfilms Order No. 7812135

An automatic system to locate plus-like images called reseaux on aerial photographs is presented. A minicomputer system and microdensitometer is used for accurate location of these images

within a photograph. A model was generated from the statistics of actual reseaux samples to create a test vehicle for the performance of various picture processing algorithms. A method of including various photographic effects into the model is presented. Various combinations of scene analysis schemes are presented with results for the center location problem. Preprocessing techniques for noise removal are described. Also developed is a scheme for noise removal. Two methods of center location are described and comparative speed and accuracy results presented. The operation of the final system is also described.

REMOTE SENSING OF ATMOSPHERIC WATER VAPOR, LIQUID WATER AND WIND SPEED AT THE OCEAN SURFACE BY PASSIVE MICROWAVE TECHNIQUES FROM THE NIMBUS-5 SATELLITE

A. T. C. Chang and T. T. Wilheit Jun. 1977 33 p refs (NASA-TM-79568) Avail: NTIS HC A03/MF A01 CSCL 04A

The microwave brightness temperature measurements for Nimbus-5 electrically scanned microwave radiometer and Nimbus E microwave spectrometer are used to retrieve the atmospheric water vapor, liquid water and wind speed by a quasi-statistical retrieval technique. It is shown that the brightness temperature can be utilized to yield these parameters under various weather conditions. Observations at 19.35 GHz, 22.235 GHz and 31.4 GHz were input to the regression equations. The retrieved values of these parameters for portions of two Nimbus-5 orbits are presented. Then comparison between the retrieved parameters and the available observations on the total water vapor content and the surface wind speed are made. The estimated errors for retrieval are approximately 0.15 g/sq cm for water vapor content, 6.5 mg/sq cm for liquid water content and 6.6 m/sec for surface wind speed. Author

OPTICAL CHARACTERISTICS OF THE EARTH'S SURFACE AND ATMOSPHERE FROM THE POINT OF VIEW OF THE REMOTE SENSING OF NATURAL RESOURCES: REVIEW OF THE CONTEMPORARY STATUS OF THE PROBLEM

V. I. Tarnopolskiy Oct. 1978 73 p refs Transl. into ENGLISH of "Opticheskiye Kharakteristiki Poverkhnosti i Atmosfery Zemli s Tochki Zreniya Distantsionnogo Issledovaniya Prirodnykh Resursov", Rept. Pr-287 Acad. of Sci. USSR. Inst. of Space Res., Moscow, 1976 73 p Transl. by Kanner (Leo) Associates, Redwood City, Calif.

(Contract NASw-3199)

(NASA-TM-75548; Pr-287) Avail: NTIS HC A04/MF A01 CSCL 04A

Widely used remote probing methods, and especially the multispectral method, for studying the earth from aerospace platforms necessitate the systematization and accumulation of data on the relationships between remote observations and measured parameters and characteristic properties and conditions of phenomena on the earth's surface. Data were presented on the optical characteristics of natural objects which arise during observations of these objects over a wide spectral interval which encompasses solar radiation reflected by the object as well as the object's inherent thermal radiation. The influence of the earth's atmosphere on remote measurements and several problems in simulation and calculation are discussed.

09 GENERAL

Includes economic analysis.

A78-43303 Canadian Symposium on Remote Sensing, 4th, Quebec, Canada, May 16-18, 1977, Proceedings. Symposium sponsored by the Canadian Remote Sensing Society, Department of Fisheries and the Environment Canada, Canada Centre for Remote Sensing, I'Association Québécoise de Télédétection, and Canadian Institute of Surveying. Ottawa, Canadian Aeronautics and Space Institute, 1977. 626 p. In English and French. \$40.

Primary applications of remote sensing technology are discussed, including agronomy, agriculture, and cartography. Attention is given to the machine-assisted classification of remote sensing data with reference to biophysical mapping and forest-land classification. Applications of satellite imagery to hydrology are outlined along with techniques for thermal infrared imagery (noting ground surfaces covered with vegetation, sea and ice mapping, and building heat-loss). Various world-wide Landsat applications are discussed and processes for the interpretation of microwave data are outlined. Multispectral studies utilizing remote sensing data are described including the geological reconnaissance of dam sites, the measurement of the vertical distribution of phytoplankton in sea-water, and the remote sensing of chlorophyll. Procedures for making geometric and radiometric adjustments are presented.

A78-43636 Possible applications of Meteosat for remote sensing (Mögliche Anwendungen von Meteosat für die Fernerkundung). K. G. Lenhart (ESA, European Space Operation Centre, Darmstadt, West Germany). Bildmessung und Luftbildwesen, vol. 46, July 1, 1978, p. 113-122. In German.

Meteosat, the first European weather satellite, was successfully launched on November 23, 1977. The first pictures of the terrestrial disk were provided on December 9, 1977. The Meteosat project was conducted by the European Space Agency. Pictures of the terrestrial surface and the cloud cover in the visible and infrared region are obtained as a basis for the derivation of meteorological information. In a discussion of the possibilities for the application of Meteosat data, attention is given to the measurement of sea surface temperatures, the measurement of ground humidity, applications for agriculture, the administration and surveillance of water resources, the distribution of vegetation zones and their seasonal and climate-related changes, and geologic investigations for the identification of large-scale structures.

A78-45887 # The Earthnet Programme. L. Marelli (ESA, Directorate of Planning and Future Programmes, Paris, France). ESA Bulletin, no. 13, May 1978, p. 41-46.

The objectives, structure, interfaces, planning, and prospects of the Earthnet Program for the acquisition, preprocessing, archiving, and distribution of remote-sensing satellite data are described. The Earthnet Program, organized February 1977, is a first step towards the establishing of a European remote-sensing program. The achievements of the Earthnet Program are considered, dates for the start of operations of participating Landsat stations are listed, and the number of Landsat orbits performed and images obtained are reported.

A78-45888 # LEDA - An ESA data bank dedicated to images of earth seen from space (LEDA - Une Banque de Données de l'ESA consacrée aux images de la Terre vue de l'espace). G. A. Proca (ESA, Space Documentation Service, Frascati, Italy). ESA Bulletin, no. 13, May 1978, p. 47-51. In French.

The Line Earthnet Data Availability (LEDA) system created by the Space Documentation Service of the ESA is described. LEDA is a data bank which can be interrogated in real time and in conversational mode by means of terminals connected to the SDS computer. The data acquired can be applied to the interpretation of space images. The scope of data and operations available is explained. M.L.

A MANUAL FOR INEXPENSIVE METHODS OF ANALYZING AND UTILIZING REMOTE SENSOR DATA

C. Dale Elifrits and David J. Barr Jul. 1978 32 p refs (Contract NASS-31767)

(NASA-CR-150731) Avail: NTIS HC A03/MF A01 CSCL 05B

Instructions are provided for inexpensive methods of using remote sensor data to assist in the completion of the need to observe the earth's surface. When possible, relative costs were included. Equipment need for analysis of remote sensor data is described, and methods of use of these equipment items are included, as well as advantages and disadvantages of the use of individual items. Interpretation and analysis of stereo photos and the interpretation of typical patterns such as tone and texture, fandcover, drainage, and erosional form are described. Similar treatment is given to monoscopic image interpretation, including LANDSAT MSS data. Enhancement techniques are detailed with respect to their application and simple techniques of creating an enhanced data item. Techniques described include additive and subtractive (Diazo processes) color techniques and enlargement of photos or images. Applications of these processes, including mappings of land resources, engineering soils, geology, water resources, environmental conditions, and crops and/or vegetation, are outlined. G.G.

Applications of space technology methods in geology, oceanography, hydrology, geobotany, soil science, agrobiology, and forestry are reviewed. The problem of finding various natural resources on earth and of studying phenomena occurring in nature is considered. The basic material for spacebased research of earth resources is either black and white or colored photographs. However, if photographs in the visible part of the spectrum and in the light from infrared radiation are made at the same time, the properties of the objects observed can be better investigated. Irradiation measurements of other wavelengths are also important. By determining the radio temperature of various sectors of the earth's surface, deep-lying layers of the earth's crust may be observed. A.R.H.

Typical Subject Index Listing

The subject heading is a key to the subject content of the document. The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, the title extension is added, separated from the title by three hyphens. The (NASA or AIAA) accession number and the page number are included in each entry to assist the user in locating the abstract in the abstract section (of this supplement). If applicable, a report number is also included as an aid in identifying the document. Under any one subject heading, the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

Groundwater studies in arid areas in Egypt using LANDSAT satellite images [E78-10165]

p0254 N78-28570 ARKANSAS

Preliminary geologic evaluation of L-band radar imagery: Arkansas test NASA-CR-157761] p0244 N78-33644

ASIA

Geological and environmental resources investigations in Egypt using LANDSAT images DO241 N78-28568 [E78-10163]

ATLANTIC OCEAN SUBJECT INDEX

Adamsia, observatio sector by sampless analysis of disiral	Personal consider control to revise at application magning	Commission anniated former land alongification by many
Mapping ultramafic rocks by computer analysis of digital LANDSAT data p0244 N78-33504	Remote sensing applied to regional geological mapping in the Sao Francisco river area	Computer-assisted forest land classification by means of several classification methods on the CCRS Image-100
ATLANTIC OCEAN	[INPE-1111-TPT/064] p0243 N78-30638	p0229 A78-43308
Thermal studies of the Grand Banks Gulf Stream slope	INPE LANDSAT system	Evaluation of a semiautomatic interpretation method for
using airborne radiation thermometers and satellite data	[E78-10180] p0261 N78-31479	the cartography of clearcut zones in the southern James
p0245 A78-43320	Study of geometric distortions of LANDSAT images	Bay area p0237 A78-43311
Large-scale Gulf Stream frontal study using GEOS 3 radar	[E78-10181] p0261 N78-31480	A basis for multistage forest inventory in the Boreal forest
altimeter data p0250 A78-52164	Automatic classification of reforested Pinus SPP and	region p0229 A78-43312
ATMOSPHERIC MOISTURE	Eucalyptus SPP in Mogi-Guacu, SP, Brazil, using LANDSAT	Ocean information and management systems
Remote sensing of atmospheric water vapor, liquid water	data	p0245 A78-43315
and wind speed at the ocean surface by passive microwave	[E78-10182] p0232 N78-31481	Satellite imagery analysis of snow cover in the Saint
techniques from the Nimbus-5 satellite [NASA-TM-79568] p0266 N78-33512	LANDSAT (MSS): Image demographic estimations	John and Souris River basins p0253 A78-43316 A study of snowmelt progression from Winnipeg to the
ATMOSPHERIC OPTICS	[E78-10183] p0236 N78-31482	Arctic Islands using ERTS photographs
Landsat atmospheric corrections at CCRS	INPE's crop survey program using combined LANDSAT	p0253 A78-43317
p0258 A78-43355	and aircraft data	Computer processing of Landsat data as a means of
Diffuse backscatter of solar radiation	[E78-10184] p0233 N78-31483	mapping land use for the Canada land inventory
p0258 A78-43356	Geological mapping of regional drainage network in Brazil	p0257 A78-43329
ATMOSPHERIC TEMPERATURE	using LANDSAT images	Mapping mine wastes with Landsat images
Retransmission of hydrometric data in Canada	[E78-10185] p0255 N78-31484	p0239 A78-43331
[E78-10179] p0255 N78-32513	Use of LANDSAT data to identify and evaluate areas	A synthetic aperture radar /SAR/ program for
AUSTRALIA	of sugar cane	environmental and resource management in Canada
Ecosystem mapping by interpretation of landscapes from satellite imagery p0238 N78-33503	[E78-10186] p0233 N78-31485	p0263 A78-43344 Study of alfalfa survival in Quebec by color and infrared
AUTOMATIC CONTROL	Evaluation of orbital images as a basis for land	photography at scales of 1:6000 to 1:40,000
Translations on USSR science and technology: Physical	utilization [E78-10187] p0236 N78-31486	. p0230 A78-43347
sciences and technology, no. 41		Landsat atmospheric corrections at CCRS
[JPRS-71512] p0267 N78-29032	Surface hydrodynamical models through synoptic interpretation of LANDSAT MSS images in lagoonal and	p0258 A78-43355
	coastal waters	Exploiting spectral, spatial and semantic constraints in
В	[E78-10188] p0255 N78-31487	the segmentation of Landsat images p0259 A78-51617
Ď	Use of LANDSAT imagery for soil survey	Retransmission of hydrometric data in Canada

LANDSAT digital data application to forest vegetation and land-use classification in Minnesota

nO231 N78-28559

Procedures for gathering ground truth information for a supervised approach to a computer implemented land cover classification of LANDSAT acquired multispectral scanner data --- Mississippi [E78-10198] p0236 N78-31496

MISSOURI

Remote sensing applications to Missouri environmental asources information system

[E78-10209] n0236 N78-31507 Application transfer activity in Misso:

p0269 N78-32519 [NASA-CR-150805]

MODELS

Surface hydrodynamical models through synoptic interpretation of LANDSAT MSS images in lagoonal and coastal waters p0255 N78-31487

MONTANA

Geologic application of thermal-inertia mapping from atellite --- Powder River Basin in Wyoming and Montana oming and Montana p0243 N78-32517 [E78-10212]

MOUNTAINS The analyses of multispectral data obtained from space - Landsat imagery p0259 A78-47085

Mapping ultramafic rocks by computer analysis of digital LANDSAT data p0244 N78-33504 p0244 N78-33504

MULTICHANNEL COMMUNICATION

A multifrequency radiometer system application p0249 A78-51544

MULTISPECTRAL BAND SCANNERS

Quantitative predictions of chemical soil conditions from multispectral airborne ground p0229 A78-43314 measurements

Water dynamics at Lac Saint-Jean Quebec based on andsat-1 and Landsat-2 data p0253 A78-43332 The problem of remote sensing of substances in wate p0246 A78-43638 multispectral scanner Methods and accuracy of location of Landsat MSS po nO258 A78-44237

Standard Mesh compatible Landsat mapp mapping p0258 A78-47083 The analyses of multispectral data

obtained from space p0259 A78-47085 Landsat imagery Landsat as an aid in the prepara ion of hydrographic Remote multispectral imaging for nearshore bathymetry

p0248 A78-49667 Summary of Landsat applications p0239 A78-53379

Geochemical mapping by spectral rati atioing methods p0240 A78-53385 parametric multiclass Bayes error

multispectral scanner spatial model performance p0264 N78-28576

Advanced Multispectral Scanner (AMS) study --- aircraft remote sensing [NASA-CR-151753] pO265 N78-29424

Evaluation of wavelength groups for discrimination of agricultural cover types --- remote sensing of environment n INDIANA

[NASA-CR-157393] p0232 N78-29 LANDSAT (MSS): Image demographic estimati p0232 N78-29536 [E78-10183] DO236 N78-31482 Use of LANDSAT imagery for soil survey [E78-10189] n0233 N78-31488

Analytical techniques for the study of some parameters of multispectral scanner systems for remote sensing

p0233 N78-31498 [E78-10200]

MULTISPECTRAL PHOTOGRAPHY Application of multispectral aerial nhotographs to soi

eys in New Zealand Extraction of rich-plankton area off the northern Japan p0246 A78-47084 from Skylab multispectral pictures Use of manual densitometry in land cover classification p0259 A78-48007 Multispectral data restoration study digital correction

of LANDSAT geographic data [NASA-CR-156790] p0260 N78-28585

Introduction to a multispectral data analysis system p0260 N78-29541 Some observation [NASA-TM-78184] observations about LANDSAT p0260 N78-30634 Monitoring corn and soybean crop development by

remote sensing techniques [NASA-TM-79607] p0232 N78-30639 N

NASA PROGRAMS

High altitude perspective --- cost-reimbursable services using NASA U-2 aircraft [NASA-SP-427] p0261 N78-31508 LANDSAT policy issues still unresolved p0268 N78-31517

NATURAL GAS

LANDSAT satellite mapping in Egypt and its possible applications in petroleum and natural gas explorat

NEARSHORE WATER

Remote multispectral imaging for nearshore bathymetry n0248 A78-49667 NEW ENGLAND (US)

Monitoring the effects of Gulf Stream meanders and eddys on the New England fishing grounds DO248 A78-49658

NEW GUINEA

Ecosystem mapping by interpretation of landscr p0238 N78-33503 satellite imagery

NEW HAMPSHIRE

Computer processing of LANDSAT digital data and sensor interface development for use in New England reservoir

[AD-A055762] n0255 N78.31513

NEW YORK

A photographic remote sensing system for the detection and quantification of urban tree stress

NEW ZEALAND

Application of multispectral aerial ph photographs to soil p0230 A78-44801

surveys in New Zealand

NIMBUS 5 SATELLITE

Remote sensing of atmospheric water vapor, liquid water and wind speed at the ocean surface by passive microwave techniques from the Nimbus-5 satellite

nO266 N78-33512

PERSONAL AUTHOR INDEX

Earth Resources/A Continuing Bibliography (Issue 20)

JANUARY 1979

Typical Personal Author Index Listing

Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title, e.g., p 0102 N78-15142. Under any one author's name the accession numbers are arranged in sequence with the AIAA accession numbers appearing

Geology of Kharga-Dakhla Oases area, western desert, Egypt, from LANDSAT-1 satellite images [E78-10158] p0241 N78-28563

Geologic interpretation of LANDSAT satellite images for the Qattara Depression area, Egypt

p0241 N78-28564 [E78-10159] Satellite mapping: Regional geology, geomorphology, structure, drainage and hydrology of Bahr El Jebel area,

Jonglei Canal project area, southern Sudan p0241 N78-28565 Soil resources and potential for agricultural development

in Bahr El Jebel in southern Sudan, Jonglei Canal project [E78-10161] p0231 N78-28566

Geological and environmental resources investigations Egypt using LANDSAT images

CONTRACT NUMBER INDEX

Earth Resources/A Continuing Bibliography (Issue 20)

JANUARY 1979

Typical Contract Number Index Listing

Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the AIAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

REPORT/ACCESSION NUMBER INDEX

Earth Resources/A Continuing Bibliography (Issue 20)

JANUARY 1979

Typical Report/Accession Number Index Listing

Listings in this index are arranged alphanumerically by report number. The page number indicates the page on which the citation is located. The accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC

NASA distributes its technical documents and bibliographic tools to ten special libraries located in the organizations listed below. Each library is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

CALIFORNIA

University of California, Berkeley

COLORADO

University of Colorado, Boulder

DISTRICT OF COLUMBIA

Library of Congress

GEORGIA

Georgia Institute of Technology, Atlanta

ILLINOIS

The John Crerar Library, Chicago

MASSACHUSETTS

Massachusetts Institute of Technology, Cambridge

MISSOURI

Linda Hall Library, Kansas City

NEW YORK

Columbia University, New York

PENNSYLVANIA

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 750 Third Avenue, New York, New York, 10017.

EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division. Boston Spa, Wetherby, Yorkshire, England. By virtue of arrangements other than with NASA, the British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols "#" and "*", from: ESRO/ELDO Space Documentation Service, European Space Research Organization, 114, av. Charles de Gaulle, 92-Neuilly-sur-Seine, France.
