THERMODYNAMIC PROPERTIES OF GASEOUS FLUOROCARBONS AND
ISENTROPIC EQUILIBRIUM EXPANSIONS OF TWO BINARY MIXTURES
OF FLUOROCARBONS AND ARGON

Noel A. Talcott, Jr.
April 1977

The chemical formula for one of the fluorocarbons is given incorrectly. Please change $\text{CCl}_2\text{F}-\text{CCl}_2\text{F}$ to $\text{CCl}_2\text{F}-\text{CClF}_2$ in the following places:

ABSTRACT in line 6 ✓

SUMMARY (page 1) in line 6 ✓

INTRODUCTION (page 1) in line 11 ✓

Page 4 in 8th column heading of the table ✓

Page 49 in 7th column heading of table B1 and in 7th column heading of table B2 ✓

Page 50 in 7th column heading of table B3 ✓

Two of the thermodynamic constants for fluorocarbon CCl_2F_2 are in error. Please make the following changes on page 49:

Table B1: In column 3, change the value for A_2 from -1.9×10^2 to -9.16×10^1 ✓

Table B2: In column 2, change the value for c_4 from -2.84×10^{-4} to -3.27×10^{-4} ✓

An error has been found in the computer code which caused erroneous values to be added to the output in table IV for fluorocarbon C_4F_8 on page 104. Please replace pages ~~18~~, ~~22~~, ~~24~~, and ~~104~~ with the attached corrected pages.

THERMODYNAMIC PROPERTIES OF GASEOUS FLUOROCARBONS AND ISENTROPIC EQUILIBRIUM EXPANSIONS OF TWO BINARY MIXTURES OF FLUOROCARBONS AND ARGON

Noel A. Talcott, Jr.

April 1977

An error has been found in the computer code which caused the tabulated fluorocarbon values of h/RT , c_p/R , and s/R to be in error by a constant multiplier. The molecular weight of CF_4 was erroneously used in conjunction with the universal gas constant, R , and the ice point of water, $T(273.15^\circ K)$, in converting the fluorocarbon values from U.S. Customary Units to the tabulated S.I. Units. The values in tables I, II, III, V, and VI are still usable, but conversion back to dimensional values will be in error unless multiplied by the molecular weight of the fluorocarbon in question divided by the molecular weight of CF_4 .

Example: In table II convert $s/R = 7.50$ to dimensional units:

$$R = \frac{\tilde{R}}{M}$$

where

\tilde{R} universal gas constant

M molecular weight of CCl_2F_2

However, the molecular weight of CF_4 was incorrectly used to obtain $s/R = 7.50$. Therefore this value must be multiplied by $\frac{M_{CCl_2F_2}}{M_{CF_4}}$ to obtain the correct value for s/R :

$$\frac{s}{R} = 7.5 \left(\frac{120.92}{88} \right) = 10.3057$$

The dimensional value of s is obtained as follows:

$$s = 10.3057 \left(\frac{8314}{120.92} \right) = 708.58 \quad J/(kg-K)$$

The following corrections to the computer code will correct the error:

Page 21: Change line 375 from

SUMMARY

Equations and computer code are given for the thermodynamic properties of gaseous fluorocarbons in chemical equilibrium. In addition, the thermodynamic properties of several binary mixtures of fluorocarbons and argon are included. The computer code calculates the thermodynamic properties and, in some cases, the transport properties for the following fluorocarbons: CCl_3F , CCl_2F_2 , CBrF_3 , CF_4 , CHCl_2F , CHF_3 , $\text{CCl}_2\text{F}-\text{CClF}_3$, $\text{CClF}_2-\text{CClF}_2$, CF_3-CF_3 , and C_4F_8 .

Equilibrium thermodynamic properties are tabulated for six of the fluorocarbons (CCl_3F , CCl_2F_2 , CBrF_3 , CF_4 , CF_3-CF_3 , and C_4F_8) for constant values of a dimensionless entropy s/R in increments of 0.5 and up to 588 K. Pressure-enthalpy diagrams containing lines of constant entropy, temperature, volume, and compressibility factor can be generated by the computer program. An example of these plots has been included for CBrF_3 .

The thermodynamic properties are also tabulated for two equilibrium isentropic expansions for binary mixtures of CBrF_3 -argon and CCl_2F_2 -argon.

INTRODUCTION

Several gaseous fluorocarbons are being or have recently been used in hypersonic wind tunnels to simulate real-gas effects on aerodynamic shapes. (See refs. 1 and 2.) Also fluorocarbon-argon mixtures are currently being examined for nozzle exhaust plume simulation at hypersonic speeds. (See refs. 3 and 4.) This research in turn has generated interest in the thermodynamic and transport properties of fluorocarbons and fluorocarbon-argon mixtures.

A previous computer code (ref. 5) was written to generate the properties for CF_4 . This report describes a more general version of that program which will provide the thermodynamic properties and, in some cases, the transport properties for the following fluorocarbons: CCl_3F , CCl_2F_2 , CBrF_3 , CF_4 , CHCl_2F , CHF_3 , $\text{CCl}_2\text{F}-\text{CClF}_3$, $\text{CClF}_2-\text{CClF}_2$, CF_3-CF_3 , and C_4F_8 .

The equations and computer code are presented for the thermodynamic properties of the fluorocarbons. These properties are tabulated for six of the fluorocarbons (CCl_3F , CCl_2F_2 , CBrF_3 , CF_4 , CF_3-CF_3 , and C_4F_8) for constant values of a dimensionless entropy s/R in increments of 0.5 and up to 588 K. Pressure-enthalpy diagrams containing lines of constant entropy, temperature, volume, and

compressibility factor can be generated by the program. Because of the current interest in using CBrF_3 -argon mixtures in simulating scramjet exhaust flows, plots for CBrF_3 are included to demonstrate this capability.

Appendix A presents the computer code for calculating thermodynamic properties of selected fluorocarbons. The constants for the thermodynamic equations for the 10 fluorocarbons are given in appendix B. Through the use of an available computer code (ref. 6), the thermodynamic properties for two equilibrium expansions of binary mixtures for CBrF_3 -argon and CCl_2F_2 -argon are given in appendix C.

SYMBOLS

- 0 stagnation

PHYSICAL CHARACTERISTICS

Fluorocarbons are organic compounds containing one or more carbon atoms and fluorine. Chlorine, bromine, and hydrogen atoms also may be present. Their principal characteristics include nonflammability, low toxicity, excellent thermal and chemical stability, high density coupled with low boiling point, low viscosity, and low surface tension. (See ref. 7.) Physical properties of fluorocarbon compounds of interest herein are contained in the following table:

Characteristic	Value for fluorocarbon -									
	CCl ₃ F	CCl ₂ F ₂	CBrF ₃	CF ₄	CHCl ₂ F	CHF ₃	CCl ₂ F-CF ₃	CClF ₂ -CClF ₂	CF ₃ -CF ₃	C ₄ F ₈

THERMODYNAMIC PROPERTIES OF GASEOUS FLUOROCARBONS

The following equations were provided by E. I. du Pont de Nemours & Co. (ref. 8) and can be applied to all the fluorocarbons of interest herein (see previous section) except CBrF₃ and CF₃-CF₃ which will be handled separately. All the coefficients can be found listed by fluorocarbon in appendix B. (The coefficients were supplied in U.S. Customary Units and have been converted to SI Units.)

The equation of state is

$$p = \frac{RT}{V-b} + \frac{A_2 + B_2T + C_2e^{-KT}}{(V-b)^2} + \frac{A_3 + B_3T + C_3e^{-KT}}{(V-b)^3} + \frac{A_4 + B_4T}{(V-b)^4} + \frac{A_5 + B_5T + C_5e^{-KT}}{(V-b)^5} + (A_6 + B_6T)e^{\alpha V} \quad (1)$$

where p is given in Pa, V in $m^3\text{-kg}^{-1}$, and T in K.

The specific heat at constant volume is given by

$$c_v = a_4 + b_4T + c_4T^2 + d_4T^3 + \frac{f_4}{T^2} - TK^2e^{-KT} \left[\frac{C_2}{V-b} + \frac{C_3}{2(V-b)^2} + \frac{C_5}{4(V-b)^4} \right] \quad (2)$$

where c_v is in $J\text{-kg}^{-1}\text{-K}^{-1}$.

The equation for entropy is

$$s = a_4 \log_e T + b_4T + \frac{c_4T^2}{2} + \frac{d_4T^3}{3} - \frac{f_4}{2T^2} + R \log_e (V-b) - \left[\frac{B_2}{V-b} + \frac{B_3}{2(V-b)^2} + \frac{B_4}{3(V-b)^3} + \frac{B_5}{4(V-b)^4} - \frac{B_6}{\alpha} e^{\alpha V} \right] + Ke^{-KT} \left[\frac{C_2}{V-b} + \frac{C_3}{2(V-b)^2} + \frac{C_5}{4(V-b)^4} \right] + Y \quad (3)$$

where s is given in $J\text{-kg}^{-1}\text{-K}^{-1}$.

The enthalpy is given by a similar expression

$$h = a_4T + \frac{b_4T^2}{2} + \frac{c_4T^3}{3} + \frac{d_4T^4}{4} - 1.8 \frac{f_4}{T} + pV + \left[\frac{A_2}{V-b} + \frac{A_3}{2(V-b)^2} + \frac{A_4}{3(V-b)^3} + \frac{A_5}{4(V-b)^4} - \frac{A_6}{\alpha} e^{\alpha V} \right] + e^{-KT}(1 + KT) \left[\frac{C_2}{V-b} + \frac{C_3}{2(V-b)^2} + \frac{C_5}{4(V-b)^4} \right] + X \quad (4)$$

where h is given in $J\text{-kg}^{-1}$.

A general computer code was developed by using an existing code for CF_4 and it will compute all the thermodynamic variables, the coefficients for a

specific fluorocarbon being given. In addition, the program also calculates the specific heat at constant pressure c_p , ratio of specific heats γ , isentropic exponent γ_e , speed of sound a , and compressibility factor Z at the same thermodynamic point. The equations for these additional thermodynamic properties are

Specific heat at constant pressure:

$$c_p = c_v - T \frac{\left[\left(\frac{\partial p}{\partial T} \right)_V \right]^2}{\left(\frac{\partial p}{\partial V} \right)_T} \quad (5)$$

Specific heat ratio:

$$\gamma = \frac{c_p}{c_v} = 1 - T \frac{\left[\left(\frac{\partial p}{\partial T} \right)_V \right]^2}{c_v \left(\frac{\partial p}{\partial V} \right)_T} \quad (6)$$

Speed of sound:

$$a = \left[\left(\frac{\partial p}{\partial \rho} \right)_s \right]^{1/2} = \left[\gamma \left(\frac{\partial p}{\partial \rho} \right)_T \right]^{1/2} = \left[-\gamma V^2 \left(\frac{\partial p}{\partial V} \right)_T \right]^{1/2} = \left\{ \frac{V^2 T}{c_v} \left[\left(\frac{\partial p}{\partial T} \right)_V \right]^2 - V^2 \left(\frac{\partial p}{\partial V} \right)_T \right\}^{1/2} \quad (7)$$

Isentropic exponent:

$$\gamma_e = \left(\frac{d \log p}{d \log \rho} \right)_s = \frac{\rho}{p} \left(\frac{dp}{d\rho} \right)_s = \frac{a^2}{pV} \quad (8)$$

Compressibility factor:

$$Z = \frac{pV}{RT} \quad (9)$$

where the partial derivatives in c_p , γ , and a are

$$\left(\frac{\partial p}{\partial T} \right)_V = \frac{R}{V-b} + \frac{B_2 - KC_2 e^{-KT}}{(V-b)^2} + \frac{B_3 - KC_3 e^{-KT}}{(V-b)^3} + \frac{B_4}{(V-b)^4} + \frac{B_5 - KC_5 e^{-KT}}{(V-b)^5} + B_6 e^{\alpha V} \quad (10)$$

$$\begin{aligned} \left(\frac{\partial p}{\partial V} \right)_T = & -\frac{RT}{(V-b)^2} - \frac{2(A_2 + B_2 T + C_2 e^{-KT})}{(V-b)^3} - \frac{3(A_3 + B_3 T + C_3 e^{-KT})}{(V-b)^4} - \frac{4(A_4 + B_4 T)}{(V-b)^5} \\ & - \frac{5(A_5 + B_5 T + C_5 e^{-KT})}{(V-b)^6} + \alpha(A_6 + B_6 T) e^{\alpha V} \end{aligned} \quad (11)$$

These expressions are limited to temperatures above the saturated vapor line. The saturation pressure in Pa as a function of saturation temperature in degrees kelvin is

$$\log_e p = A + \frac{B}{T} + C \log_e [T(1.8)] + DT + E \left(\frac{F - T}{T} \right) \log_e [F - T(1.8)] + GT^2 + LT^3 \quad (12)$$

Equations (1) to (12) are also limited to temperatures below those at which dissociation occurs.

THERMODYNAMIC PROPERTIES OF CBrF_3 AND $\text{CF}_3\text{-CF}_3$

CBrF_3

The following equations provide the thermodynamic properties for CBrF_3 (ref. 9):

Equation of state:

$$p = \frac{A_2' + B_2'T - C_2'/T^3}{V^2} + \frac{A_3' + B_3'T}{V^2} + \frac{A_4' + B_4'T - C_4'/T^3}{V^4} + \frac{D_4'T}{V} \quad (13)$$

where p is given in Pa, V in m^3/kg , and T in K and where

$$A_2' = -6.70681 \times 10^1$$

$$B_2' = 1.06221 \times 10^{-1}$$

$$C_2' = 2.707789 \times 10^7$$

$$A_3' = 4.6056 \times 10^{-2}$$

$$B_3' = -7.484318 \times 10^{-5}$$

$$A_4' = -1.873886 \times 10^{-5}$$

$$B_4' = 4.052713 \times 10^{-8}$$

$$C_4' = -3.891135 \times 10^1$$

$$D_4' = 5.581949 \times 10^1$$

Specific heat at constant volume:

$$c_v = a' + b'T + c' + \frac{d'}{VT^4} + \frac{e'}{V^3T^4} \quad (14)$$

where c_v is in J/kg-K and T in K and where

$$\begin{aligned} a' &= 7.322 \times 10^1 \\ b' &= 1.461053 \times 10^2 \\ c' &= -1.1313381 \times 10^{-3} \\ d' &= 2.209712 \times 10^9 \\ e' &= -8.358194 \times 10^7 \end{aligned}$$

Entropy:

$$s = A' \log_e T + B'T + C'T^2 + \frac{D'}{VT^4} + \frac{E'}{V^3T^4} + F' \log_e V + \frac{G'}{V} + \frac{H'}{V^2} + \frac{I'}{V^3} + J' \quad (15)$$

where s is in J/kg-K and where

$$\begin{aligned} A' &= 7.32682 \times 10^1 \\ B' &= 1.462016 \\ C' &= -5.663429 \times 10^{-4} \\ D' &= -8.123486 \times 10^7 \\ E' &= 4.699288 \times 10^1 \\ F' &= 5.582002 \times 10^1 \\ G' &= -1.062235 \times 10^{-1} \\ H' &= 3.7422337 \times 10^{-5} \\ I' &= -1.3540801 \times 10^{-8} \\ J' &= -2.6025689 \times 10^2 \end{aligned}$$

Enthalpy:

$$\begin{aligned} h = a'T + \frac{b'}{2} T^2 + \frac{c'}{3} T^3 + \frac{K'}{VT^3} + \frac{L'}{V^3T^3} - \frac{(M' + B_2')T}{V} + \frac{(N' - B_3')T}{V^2} \\ - \frac{(F'/3 + B_4')T}{V^3} + P' \end{aligned} \quad (16)$$

where h is in J/kg and where

$$K' = -1.353914 \times 10^8$$

$$L' = 1.096500 \times 10^2$$

$$M' = 1.341382 \times 10^2$$

$$N' = 6.908596 \times 10^{-2}$$

$$P' = 4.9827721$$

Saturation pressure:

$$\log_e p_s = \frac{A_s}{T^2} + \frac{B_s}{T} + C_s + D_s T + E_s T^2 \quad (17)$$

where p_s is in Pa and where

$$A_s = -1.367130 \times 10^4$$

$$B_s = -9.975989 \times 10^2$$

$$C_s = 1.1161025 \times 10^1$$

$$D_s = -7.89102 \times 10^{-3}$$

$$E_s = 1.012772 \times 10^{-5}$$

The following expressions give the thermodynamic properties of $\text{CF}_3\text{-CF}_3$ (ref. 10):

Equation of state:

$$p = \frac{RT}{V - \beta'} - \frac{\alpha T^{-1/2}}{V(V + \beta')} \quad (18)$$

where p is given in Pa, V in m^3/kg , and T in K, and where

$$R = 60.24225 \text{ J/kg-K}$$

$$\beta' = 0.0005133877 \text{ m}^3/\text{kg}$$

$$\alpha = 0.07657512 \text{ Jm}^3\text{-K}^{1/2}/\text{kg}^2$$

Specific heat at constant volume:

$$c_v = a_1 + b_1T + c_1T^2 + d_1T^3 + \frac{f_1}{T^2} + \frac{3\alpha T^{-3/2}}{4\beta'} \log_e \left(\frac{V + \beta'}{V} \right) \quad (19)$$

where c_v is in J/kg-K

$$a_1 = 9.952795 \times 10$$

$$b_1 = 2.608545$$

$$c_1 = -1.926454 \times 10^{-3}$$

$$d_1 = 1.857347 \times 10^{-7}$$

$$f_1 = -3.473992 \times 10^5$$

Entropy:

$$s = a_1 \log_e T + b_1T + \frac{c_1T^2}{2} + \frac{d_1T^3}{3} + -\frac{f_1}{2T^2} + R \log_e (V - \beta') - \frac{\alpha}{2\beta'} T^{-3/2} \log_e \left(\frac{V + \beta'}{V} \right) + Y' \quad (20)$$

where s is in J/kg-K and $Y' = 6.510304$ kJ/kg-K

Enthalpy:

$$h = a_1T + \frac{b_1T^2}{2} + \frac{c_1T^3}{3} + \frac{d_1T^4}{4} - \frac{f_1}{T} + pV - \frac{3\alpha T^{-1/2}}{2\beta'} \log_e \left(\frac{V - \beta'}{V} \right) + X' \quad (21)$$

where h is in J/kg and $X' = 0.3688302$ kJ/kg

Saturation pressure:

$$\log_e p_s = A_1 + \frac{B_1}{T} + C_1 \log_e T + D_1T + \frac{E_1(F_1 - T)}{T} [\log_e (F_1 - T) + 0.25527] + 0.52553 \quad (22)$$

where

$$A_1 = 0.3762282521 \times 10^2$$

$$B_1 = -1.031833 \times 10^3$$

$$C_1 = -0.1297816132 \times 10^2$$

$$D_1 = 0.01321347$$

$$E_1 = -0.537560386$$

$$F_1 = 0.297317 \times 10^3$$

where p_s is in Pa.

Transport Properties of the Gaseous Fluorocarbons

Experimental data for the viscosity and thermal conductivity of the tabulated fluorocarbons at a pressure of 1 atmosphere were curve fitted and are contained in reference 11. (Ref. 11 is currently being revised to correct typographical errors in many of the transport equations.) The temperature range of the data varies from fluorocarbon to fluorocarbon and cannot be given in general. As mentioned previously, this report does not contain transport data for all the listed fluorocarbons but this information is available in reference 11 if needed.

Viscosity.- The empirical equation is usually of the form

$$\mu^* = \frac{\sqrt{T}}{N + (P/T) + (Q/T^2)} \times 10^{-6} \quad (23)$$

where μ^* is in newton-second per square meter and the constants N , P , and Q must be determined for each fluorocarbon. To obtain the viscosity at pressures other than 1 atmosphere, the residual viscosity is expressed as a function of the density, molecular weight, and critical constants of the substance (ref. 12) through a dimensional analysis treatment, and the correct dependencies are established by the use of experimental data. The dimensional analysis treatment (ref. 11) resulted in the following expression:

$$(\mu - \mu^*)\xi = \frac{\beta}{R^{1/6}} Z_c^m \rho_R^n \quad (24)$$

Experimental high-pressure viscosities for the gaseous and liquid phases available in the literature for 14 polar substances including 5 fluorocarbons (CCl_3F , CCl_2F_2 , CHCl_2F , CHClF_2 , and $\text{C}_2\text{Cl}_3\text{F}_3$) were used (ref. 13) in conjunction with pressure-volume-temperature data to establish the constant β and the exponents m and n of equation (24). Plots of $(\mu - \mu^*)\xi$ against ρ_R (ref. 13) were found to be essentially the same for all 14 substances; therefore, it was concluded that the exponent m of Z_c in equation (24) was zero. The analytical representations of the residual viscosity correlation for the 14 polar substances (ref. 13) which should also apply to the fluorocarbons selected here are

$$\left. \begin{aligned}
 (\mu - \mu^*)\xi &= 16.56 \times 10^{-8} \rho_R^{1.111} && (\rho_R \leq 0.10) \\
 (\mu - \mu^*)\xi &= 0.607 \times 10^{-8} (9.045\rho_R + 0.63)^{1.739} && (0.10 < \rho_R < 0.90) \\
 -\log_e [(\mu - \mu^*)\xi] &= 10^{0.6439 - 0.1005\rho_R^{-\Delta}} + 3 && (0.90 < \rho_R < 2.6)
 \end{aligned} \right\} \quad (25)$$

where $\Delta = 0$ for $0.9 < \rho_R < 2.2$ and $\Delta = 4.75 \times 10^{-4} (\rho_R^3 - 10.65)$ for $2.2 < \rho_R < 2.6$ and $\xi = \frac{T^{1/6}}{M^{1/2} p_c^{2/3}}$ with μ in newton-second per square meter.

The viscosity equations for the fluorocarbons included herein are

CCl_2F_2 :

$$\mu^* = \frac{\sqrt{T}}{0.75309 + (188.969/T) - (803.786/T^2)} \times 10^{-6} \quad (26)$$

CBrF_3 :

$$\mu^* = \frac{\sqrt{T}}{0.63388 + (144.691/T) - (1087.52/T^2)} \times 10^{-6} \quad (27)$$

CF_4 :

$$\mu^* = \frac{\sqrt{T}}{0.64625 + (103.0/T) - (3.42714/T^2)} \times 10^{-6} \quad (28)$$

$\text{CF}_3\text{-CF}_3$:

$$\mu^* = (12.778\sqrt{T} - 78.8) \times 10^{-7} \quad (29)$$

Thermal conductivity.- The empirical equation cannot be given in general for the fluorocarbons at a pressure of 1 atmosphere. However, the thermal conductivity relationship can be extended to pressures other than 1 atmosphere in the same manner as the viscosity was. Residual thermal conductivities $k - k^*$ for CF_4 were obtained from experimental data and correlated with the corresponding reduced densities (ref. 14) to produce the following expression:

$$k - k^* = 7.19 \times 10^{-3} [\exp(\rho_R) - 1] \quad (30)$$

where $k - k^*$ is in $\text{Wm}^{-1}\text{-K}^{-1}$. This equation represents the thermal conductivity of CF_4 in the dense gas region and should also be fairly representative of the thermal conductivity of the other fluorocarbons listed.

The thermal conductivity equations for the fluorocarbons included are

CCl_2F_2 :

$$k^* = \frac{2.3220 \sqrt{T}}{727.58 + (6.891667 \times 10^5/T) + (1.007883 \times 10^6/T^3)} \quad (31)$$

CBrF_3 :

$$k^* = 1.73073 \left\{ \begin{array}{l} 0.0041 + (1.6 \times 10^{-5})[T(1.8) - 459.67] \quad (T < 600 \text{ K}) \\ \frac{\sqrt{T}}{558.966 + (2.14363 \times 10^5) + (1.65119 \times 10^7) + (8.31701 \times 10^9)} \quad (T > 600 \text{ K}) \end{array} \right\} \quad (32)$$

CF_4 :

$$k^* = 1.73073 [(7.291 \times 10^{-3}) + (2.377 \times 10^{-5})(9/5T - 459.67)] \quad (33)$$

$\text{CF}_3\text{-CF}_3$:

$$k^* = (9.591 \times 10^{-5})T - 0.01163 \quad (34)$$

CALCULATION PROCEDURE

In generating the thermodynamic and transport properties of the fluorocarbons by using the computer code given in appendix A, certain boundaries were put on the thermodynamic regime of interest in terms of temperature and volume. These boundaries encompass the range of current interest for these fluorocarbons but the equations are applicable over a much broader base and their limits may be found in reference 8. The boundaries used are

(a) The saturation pressure line (eq. (12)) $p_s = f(T_s)$. The saturation volume was determined from the equation of state (eq. (1)) $p_s = f(T_s, V_s)$.

(b) The critical volume line.

(c) The constant temperature line, in this case 588 K. This could be changed if so desired to give more information on a given fluorocarbon.

(d) The constant volume line (procured from the simultaneous solution of the saturation pressure equation (eq. (12)) and the equation of state (eq. (1))). The other thermodynamic and the transport properties along the boundary are now easily calculated since they are expressed as a function of T and V.

To present the thermodynamic and transport property data in a convenient form, it is advantageous to calculate the properties at specified values of a given variable. A good example is the entropy which remains constant during a frequently occurring class of expansions in gas dynamic analysis. First, s

is determined at the critical point which gives a lower limit for the thermodynamic regime. The upper limit on s is determined by inserting the highest temperature and volume occurring on the boundaries of the specified regime into equation (3). The entropy is then divided into equal intervals between the upper and lower limits and set at the partition nearest the lower limit. The volume is set slightly above the critical value in order to avoid the large gradients and consequent convergence difficulties that occur along the critical volume line and the corresponding temperature calculated. This procedure gives an upper limit on the temperature for the specified value of the entropy. With the entropy held constant, the temperature is reduced at even intervals and the volume calculated at each temperature point until the saturated volume on the upper limit is exceeded. The transport properties and remaining thermodynamic variables which are functions of T and V are then calculated for the specified value of the entropy. This procedure is repeated at each entropy interval until the limits have been spanned.

RESULTS AND DISCUSSION

Equilibrium thermodynamic data and transport property data (when included) are presented in tables I to VI in dimensionless entropy s/R increments of 0.5 for CCl_3F , CCl_2F_2 , CBrF_3 , CF_4 , $\text{CF}_3\text{-CF}_3$, and C_4F_8 . The entropy range varies from fluorocarbon to fluorocarbon.

CF_4 (tetrafluoromethane) has been included in the tables because an error was discovered in the reference conditions (S_R and H_R) used in reference 5 which contained tabulated properties for CF_4 . The correct reference conditions should have been $S_R = 3.542 \text{ J}\cdot\text{kg}^{-1}\cdot\text{K}^{-1}$ and $H_R = 465710 \text{ J}\cdot\text{kg}^{-1}$. In addition, the enthalpy equation, equation (8), in reference 5 contains several erroneous terms and adds to the errors. A comparison was made between the two tables and an estimate of the errors in reference 5 was made. For values of specific volume V above $0.030 \text{ m}^3\cdot\text{kg}^{-1}$, it appears that the error is negligible. For values between 0.030 and $0.0055 \text{ m}^3\cdot\text{kg}^{-1}$, the errors in h and s are on the order of 0.5 percent. In the range between 0.0055 and 0.0026 , the error increases up to a maximum of 4.5 percent which occurs at $V = 0.0026 \text{ m}^3\cdot\text{kg}^{-1}$. All errors are positive (that is, values in ref. 5 are too large).

Pressure-enthalpy diagrams are presented in figures 1 and 2 for CBrF_3 to show this feature of the code. Each of the figures contain lines of constant entropy and volume. In addition to having these lines in common, figure 1 contains constant temperature lines, and figure 2 contains lines of constant compressibility factor.

Binary mixtures of fluorocarbons and argon are being used as substitute gases to simulate high-temperature air flows in the flight Mach number range between 4 and 10. The properties of these mixtures can be easily computed, if it can be shown that they are thermally perfect (compressibility effects are negligible) in the range of interest. The tabulated thermodynamic properties of both CBrF_3 and CCl_2F_2 show that over the range of the experimental tests, $T < 600 \text{ K}$ and $p < 0.5 \text{ atm}$, the compressibility factor Z remains very close to 1.00 and therefore pressure effects are small and can be neglected.

Thermally perfect species can have their thermodynamic properties, namely, s , h , and c_p , considered as functions of temperature only. By using the computer code of reference 6, the thermodynamic properties for equilibrium expansions of CBrF_3 -argon and CCl_2F_2 -argon mixtures (recommended for scramjet nozzle plume simulation (ref. 3)) were tabulated and are included in appendix C.

CONCLUDING REMARKS

Equations for the thermodynamic properties of gaseous fluorocarbons in chemical equilibrium have been generated by using as accurate an equation of state and curve fits of specific heat as are available. The equations along with available equations for the transport properties of the fluorocarbons have been built into a computer code. Thermodynamic and transport property data generated by this code are tabulated for CCl_3F , CCl_2F_2 , CBrF_3 , CF_4 , $\text{CF}_3\text{-CF}_3$, and C_4F_8 and presented in a form which lends itself to a convenient gas dynamic analysis over thermodynamic regimes not previously examined.

In addition, it is shown that binary mixtures of fluorocarbon-argon can be considered thermally perfect over their current range of application for scramjet nozzle exhaust plume simulation. This condition leads to a very quick method for calculating the thermodynamic properties of equilibrium expansions of these mixtures which, in turn, provide the chemical data for existing two- and three-dimensional flow-field computer codes.

APPENDIX A

COMPUTER CODE FOR CALCULATING THERMODYNAMIC PROPERTIES OF SELECTED FLUOROCARBONS

A Fortran IV Control Data Series 6000 computer code was developed for evaluating the thermodynamic properties of gaseous fluorocarbons in chemical equilibrium. The computer code calculates the following thermodynamic variables: entropy, temperature, volume, pressure, enthalpy, specific heat at constant pressure, specific-heat ratio, speed of sound, isentropic expansion exponent, compressibility factor, viscosity, and thermal conductivity.

The computer code itself is well documented, straightforward, and the user inputs are minimal. Provision has been included to allow the addition of other fluorocarbons governed by the same set of general equations provided the user supplies the necessary coefficients for the equations. An output option exists that allows for output of the thermodynamic properties in either SI or U.S. Customary Units. A listing of the program follows.

APPENDIX B

CONSTANTS FOR THERMODYNAMIC EQUATIONS

FOR TEN FLUOROCARBONS

The computer program listed in appendix A contains a general set of thermodynamic equations applicable to all the fluorocarbons selected except CBrF_3 and $\text{CF}_3\text{-CF}_3$ whose respective equations are given in the report along with their constants. Built into the computer code are all the thermodynamic constants and thereby the user input is minimized.

Tables B1 to B3 list the constants (converted from U.S. Customary Units to SI Units) for each equation and for each fluorocarbon (refs. 8, 9, and 10).

TABLE B1.- THERMODYNAMIC CONSTANTS FOR EQUATION OF STATE

Constant	Value of constant for fluorocarbon -

APPENDIX C

THERMODYNAMIC PROPERTIES FOR ISENTROPIC EQUILIBRIUM EXPANSIONS OF BINARY MIXTURES OF CBrF_3 -ARGON AND CCl_2F_2 -ARGON

Binary mixtures of fluorocarbons and argon are being used as substitute gases to simulate high-temperature air flows in the flight Mach number range between 4 and 10 (refs. 3 and 4). The properties of these mixtures are easily computed if it is shown that compressibility effects on the fluorocarbons in the range of interest are small.

The tabulated thermodynamic properties of both CBrF_3 and CCl_2F_2 show that in the range covered by the experimental tests ($T < 600 \text{ K}$ and $p < 0.5 \text{ atm}$), pressure effects can be neglected. Therefore, these two fluorocarbons can be considered thermally perfect over this range and their thermodynamic properties; namely s , h , and c_p may be considered as functions of temperature only. An existing computer code is available that will handle mixtures of thermally perfect species and compute equilibrium rocket expansions.

Results using the computer code of reference 6 are tabulated for two representative cases; one for the CBrF_3 -argon mixture and one for the CCl_2F_2 -argon mixture.

"The aeronautical and space activities of the United States shall be conducted so as to contribute . . . to the expansion of human knowledge of phenomena in the atmosphere and space. The Administration shall provide for the widest practicable and appropriate dissemination of information concerning its activities and the results thereof."

—NATIONAL AERONAUTICS AND SPACE ACT OF 1958

NASA SCIENTIFIC AND TECHNICAL PUBLICATIONS

TECHNICAL REPORTS: Scientific and technical information considered important, complete, and a lasting contribution to existing knowledge.

TECHNICAL NOTES: Information less broad in scope but nevertheless of importance as a contribution to existing knowledge.

TECHNICAL MEMORANDUMS: Information receiving limited distribution because of preliminary data, security classification, or other reasons. Also includes conference proceedings with either limited or unlimited distribution.

CONTRACTOR REPORTS: Scientific and technical information generated under a NASA contract or grant and considered an important contribution to existing knowledge.

TECHNICAL TRANSLATIONS: Information published in a foreign language considered to merit NASA distribution in English.

SPECIAL PUBLICATIONS: Information derived from or of value to NASA activities. Publications include final reports of major projects, monographs, data compilations, handbooks, sourcebooks, and special bibliographies.

TECHNOLOGY UTILIZATION PUBLICATIONS: Information on technology used by NASA that may be of particular interest in commercial and other non-aerospace applications. Publications include Tech Briefs, Technology Utilization Reports and Technology Surveys.

Details on the availability of these publications may be obtained from:
