16. ABSTRACT

The purpose of this study was to provide a quantitative cost for various Spacelab flight hardware configurations, along with varied software development options. The three major conclusions reached as a result of this study are as follows:

1. Spacelab program cost for software development and maintenance is independent of experimental hardware and software options.

2. Distributed standard computer concept simplifies software integration without a significant increase in cost.

3. Decision on flight computer hardware configuration should not be made until payload selection for a given mission and a detailed analysis of the mission requirements are completed.

This report is published in five volumes: Volume I contains the Executive Summary (Presentation); Volume II, Study Elements and Approach; Volume III, Spacelab Cost Data; Volume IV, Spacelab User Cost Data (Central Experiment Computer); and Volume V, Spacelab User Cost Data (Distributed Computer).

This is Volume V: Spacelab User Cost Data (Distributed Computer).

SPACELAB EXPERIMENT COMPUTER STUDY

Volume V: Spacelab User Cost Data (Distributed Computer)

SECTION 1 — Option IIA1 - Distributed, Non-Standard Mini Central Software Development by Central Group

1.1 Costing Method - Not included.

1.2 Cost Data - Not included.

ASSUMPTIONS

1. This option was not priced because:

   a. It is illogical for a central software development group to implement software for PI's who are otherwise procuring and developing mini computers and their support software independently.

   b. The development cost for the mini's would be exorbitant.

SECTION 2 Option IIA2A - Distributed Non-Standard Mini, Central Software Development by PI Local

2.1 Costing Method - Not included.

2.2 Cost Data - Not included.

ASSUMPTIONS

1. This option was not priced because:

   a. It was illogical for a PI to travel to a central facility to use for development of software for a mini when there is not an attempt to standardize the mini's, so that the support software for the mini is compatible with the STIL. The cost that would be incurred in developing the support software to execute on the STIL for all the different mini's would be exorbitant.

   b. The cost of developing the potentially forty-five different mini's would be exorbitant.

SECTION 3 Option IIA2B - Distributed Non-Standard Mini, Central Software Development by PI - Remote

3.1 Costing Method. - Not included.

3.2 Cost Data - Not included.

ASSUMPTIONS

1. This option was not priced because:

   a. It is illogical for a PI to use a host computer facility that is not compatible with executing the support software of the mini DEP utilized. The support software would have to be developed, at an exorbitant cost, to execute on the STIL host.

   b. The cost of developing the mini computer hardware would be exorbitant if each PI operated independently.

SECTION 4 — Option IIA3A - Distributed Non-Standard Mini, Software Development by PI at his Facility, Real-Time Simulation at Central Facility

4.1 Costing Method - Not included.

4.2 Cost Data - Not included.

ASSUMPTIONS

1. This option was not priced because:

a. If the PI's facility is compatible with STIL then an exorbitant cost would be incurred developing the DEP support software for execution on the STIL Host.

SECTION 5 Option IIA3B - Distributed Non-Standard Mini, Software Development by PI at His Facility, Real-Time Simulation Testing on RTSTS

5.1 Costing Method - Not included.

5.2 Cost Data - Not included.

ASSUMPTIONS

1. This option was not priced because:

   a. This option is identical to Option IIA4 which is priced.

SECTION 6 Option IIA4 - Distributed Non-Standard Mini Software Development by PI at His Non-Compatible Facility

6.1 Costing Method

ASSUMPTIONS

Assume PI procures a RTSTS and mini that are compatible for support software. The PI software developer would use the RTSTS for coding and real-time simulation checkout.

Assume each PI selects a different independently developed mini and RTSTS.

Each PI would independently develop an operating system.

All EAS unique software would be implemented in the mini's.

No integration PI/PI required due to no CPU resource sharing. Central computer integration is still required for the resource sharing.

DEP available at Level 4 for hardware integration.

GROUND RULES FOR DEDICATED EXPERIMENT PROCESSOR

I. Central Experiment Computer Capacity = (Speed) and (Memory)

Speed = (500K Adds per Second) X 65%

(A) = 325 KADS

500 KADS = CII Specifications

65% = 100% - (15% Overhead) - (20% Contingency)

Memory = (Total Capacity) - (Contingency) - (Operating System)

Total Capacity = 64K CII Specification

Contingency = 30% Engineering Estimate

Note: Low compared to industry (50 - 100%)
Operating System = 20K ESA Estimate

(A) = 64K - 19.2K - 20K
= 24.8K

II. When a new payload exceeds central computer capacity, a DEP will be selected for that element that has the greatest capacity requirement. Each element having this requirement will be assigned a different DEP, except the case where one DEP is used on multiple missions.

III. Assume all Spacelab's Review Item Disposition (RID's) for CDMS modifications are incorporated for mass memory, data bus, etc.

IV. *Two classes of DEP's were considered:

1) Micro Processor

2) Mini Processor

* Only 1 DEP will be specified

V. Assume any non-standard DEP's selected will have support software that is executable on STIL simulation computer.

VI. For any mission, assume that the required number of data bus RAU's can be provided.

VII. Number of processors = determined by applying "Ground Rules for DEP" to GDC provided software.

Cost/processor = determined by: processor class, configuration.

((Processor hardware) + (Qualification) + (Special I/O (RAU equivalent) + (Special Test Equipment) + (Peripherals*) + (Peripherals Qualification).

Each element will be determined according to selected processor class and configuration.

SECTION 7 · Option IIB1 - Distributed Standard Mini, Central Software Development by Central Group

7.1 Costing Method

ASSUMPTIONS

- All experiment application dependent software will be implemented in DEP's.
- STIL facility used for all EAS software development.
- DEP is available at Level 4 checkout area.
- Common library evolvement possible due to central EAS development group.
- Only one mini development/qualification required.
- Only one RTSTS required for STIL software development.
- No PI/PI integration required due to independence of EAS from resource sharing. Central computer integration testing still required.
- Fewer total mini's required due to sharing of pool of processors.
- Only one DEP operating system development is required.

GROUNDRULES FOR DEDICATED EXPERIMENT PROCESSOR

I. Central Experiment Computer Capacity = (Speed) and (Memory)

Speed = (500K Adds Per Second) (65%) 325 KADS

500 KADS = CII Specifications

65% = 100% - (15% Overhead) = (20% Contingency)

Memory = (Total Capacity) - (Contingency) - (Operating System)

Total Capacity = 64K CII Specifications

Contingency = 30% Engineering Estimate

Note: Low Compared to Industry Estimates (50% - 100%)

Operating System = 20K Memory Requirement ESA Estimate

(A) = 64K - 19.2K - 20K
= 24.8K

II. When a new payload exceeds central computer capacity, a DEP will be selected for the element that has the greatest capacity requirement. Each element having this requirement will be assigned a different DEP, except the case where one DEP is used on multiple missions.

III. Assume all Spacelab Review Item Disposition (RID's) for CDMS modifications are incorporated for mass memory, data bus, etc.

IV. Two classes of DEP's were considered:

(1) Micro Processor

(2) Mini Processor

Only 1 DEP will be specified.

V. Assume any non-standard DEP's selected will have support software that is executable on STIL host or STIL simulation computer.

VI. For any mission, assume that the required number of data bus RAU's can be provided.

VII. Number of processors is determined by applying "Groundrules for DEP" to GDC provided software requirements.

Cost/Processor is determined by: processor class and configuration.

((Processor Hardware) + (Qualification) (Special I/O (RAU Equivalent) + (Special Test Equipment) + (Peripherals*) + (Peripherals Qualification))

Each element will be determined according to selected processor class and configuration.

*For Option IA1 only applies when central computer cannot support requirements.

SECTION 8 Option IIB2A - Distributed Standard Mini Central Software Development by PI Local.

8.1 Costing Method

ASSUMPTIONS

- All experiment application dependent software will be implemented in DEP's.
- STIL facility used for all EAS software development.
- PI travels to STIL for software development.
- DEP is available at Level 4 checkout area.
- Common library evolvement is not possible due to independent PI development.
- Only one mini development/qualification required.
- Only one RTSTS required for software development.
- No PI/PI integration required due to independence of EAS from resource sharing. Central computer integration testing is still required.
- Fewer total mini's required due to sharing of pool of processors.
- Only one DEP operating system development is required.

Cost Element 4.1 Experiment Application Software Development

Cost Factors

1. Software Development
2. Common Software
3. Host Computer Time
4. Simulation Computer Time
5. Host Computer Time DEP Software
6. Simulation Computer Time DEP Software
7. Travel
8. Training

(1) Software Development

(A) = ((Number of Statements) (Cost/Statement)) Per Flight Per Yr.

Number of Statements = GDC Estimate = #3 + #4

Cost/Statement = $45 (Code and Verification)

(1) Total = ((#3 + #4) ($45)) Per Yr.

(2) Common Software

(2) Total = 0 for This Option

(3) Host Computer Time

(A) = ((Host Time) (Cost/Hr.)) Per New Flight Per Yr.

Host Time = ((# Instructions) (# Instructions/ Module)) (Hrs. /Module)

= (# of Modules) (Hrs. /Module)

Hrs. /Module = 18 Compiles/Module @ 3 Mins. / Compile + 9 Functional Simulations @ 12 Mins. / Run + Data Reduction for 75% of Simulation Runs @ 10 Mins. Each.

= (54 Mins.) + (108 Mins.) + (70 Mins.) = 3.87 Hrs.

Host Cost/Hr. = ((10% Maintenance) + (Operations) + (Consumables)) ÷ 2080 Hrs. /Shift

= $123.22/Hr.

(3) Total = ((3.87) ((#3 + #4) ÷ 100) ($123.22)) Per Yr.

(4) Simulation Computer Time

(A) = (# of Hrs. /Module) (Cost/Hr.) (# of Modules)

# of Hrs. = 4 Simulations at 60 Min. /Simulation (Includes Set Up, Runs, and Run Evaluations)

Cost/Hr. = (10% (Maintenance (CDMS, CID, SIM. COMP.)) + Consumables) + (Operations)) 2080 Hrs.

= ($8) + (0) + ((2 X $40K) ÷ 2080)

= ($8) + ($38.46).

= $46.46/Hr.

# of Modules = GDC Estimate = (#3 + #4) ÷ 100

(4) Total = (($46.46) ((#3 + #4) ÷ 100) (4 Hrs.)) Per Yr.

(5) Host Computer Time DEP Software

(5) Total = 0 for This Option

(6) Simulation Computer Time DEP Software

(6) Total = 0 for This Option

(7) Travel

(A) = (Number of Man Yrs.) (Travel Cost/Man Yr.)/Yr.

Number of Man Yrs. = Number of Man Yrs. Required as Determined by Number of New Instructions.

Travel/Man Yr. = (Number of Trips) (Cost of Ticket) + (Number of Days) (Cost Day)

Number of Trips = 4 Per Man/Yr.

Cost of Ticket = $150

Cost/Day = $12.50 Per Diem + $12.50 For Car = $25

Number of Days = 365

Travel = 4 ($150) + (365) (25)

= $600 + $9,125 = $9,725/Man Yr.

(7) Total = ((#16) ($9,725))/Yr.

(8) Training

(A) = (Number of Programmers) (Cost/Programmer)

Number of Programmers = Number of Programmers Required by Number of New Instructions

Cost of Programmer = Engineering Estimate $500/Man

(8) Total = (#16) ($500)

GROUND RULES FOR DEDICATED EXPERIMENT PROCESSOR

I. Central Experiment Computer Capacity = (Speed) and (Memory)

Speed = (500K Adds per Second) X 65%

(A) = 325 KADS

500 KADS = CII Specifications

65% = 100% - (15% Overhead) - (20% Contingency)

Memory = (Total Capacity) - (Contingency) - (Operating System)

Total Capacity = 64K CII Specification

Contingency = 30% Engineering Estimate

Note: Low compared to industry estimates of (50 - 100%)
Operating System = 20K ESA Estimate of Memory Requirement

(A) = 64K - 19.2K - 20K
= 24, 8K Available for EAS

II. When a new payload exceeds central computer capacity, a DEP will be selected for that element that has the greatest capacity requirement. Each element having this requirement will be assigned a different DEP, except the case where one DEP is used on multiple missions.

III. Assume all Spacelab's Review Item Disposition (RID's) for CDMS modifications are incorporated for mass memory, data bus, etc.

IV. Two classes of DEP's were considered:

1) Micro Processor

2) Mini Processor

Note: Only 1 DEP will be specified

V. Assume any non-standard DEP's selected will have support software that is executable on STIL simulation computer.

VI. For any mission, assume that the required number of data bus RAU's can be provided.

VII. Number of processors = determined by applying "Ground Rules for DEP" to GDC provided software.

Cost/processor = determined by: processor class, configuration.

((Processor hardware) + (Qualification) + (Special I/O (RAU equivalent) + (Special Test Equipment) + (Peripherals*) + (Peripherals Qualification).

Each element will be determined according to selected processor class and configuration.

(3) Total = Cost/Unit for Re-Furbishment = 0 Assumes DEP's will Meet Spacelab Lifetime Requirements

SECTION 9 Option IIB2B - Distributed Standard Mini, Central Software Development by PI Remote

9.1 Costing Method

ASSUMPTIONS

- All experiment application dependent software will be implemented in DEP's.
- STIL facility used for all EAS software development.
- PI develops EAS requirements analysis, coding and functional simulation through a remote terminal to the STIL.
- PI travels to STIL for real-time EAS checkout and integration.
- DEP is available at Level 4 checkout area.
- Common library evolvement is not possible due to independent PI software development.
- Only one mini development/qualification is required.
- Only one RTSTS is required and located at STIL.
- No PI/PI integration required to independence of resource sharing. Central computer integration testing is still required.
- Fewer total mini's are required due to sharing of a pool of processors.
- Only one DEP operating system development is required.

GROUND RULES FOR DEDICATED EXPERIMENT PROCESSOR

I. Central Experiment Computer Capacity = (Speed) and (Memory)

Speed = (500K Adds per Second) X 65%

(A) = 325 KADS

500 KADS = CII Specifications

65% = 100% - (15% Overhead) - (20% Contingency)

Memory = (Total Capacity) - (Contingency) - (Operating System)

Total Capacity = 64K CII Specification

Contingency = 30% Engineering Estimate

Note: Low compared to industry (50 - 100%)
Operating System = 20K ESA Estimate

(A) = 64K - 19.2K - 20K
= 24.8K

II. When a new payload exceeds central computer capacity, a DEP will be selected for that element that has the greatest capacity requirement. Each element having this requirement will be assigned a different DEP, except the case where one DEP is used on multiple missions.

III. Assume all Spacelab's Review Item Disposition (RID's) for CDMS modifications are incorporated for mass memory, data bus, etc.

IV. *Two classes of DEP's were considered:

1) Micro Processor

2) Mini Processor

* Only 1 DEP will be specified

V. Assume any non-standard DEP's selected will have support software that is executable on STIL simulation computer.

VI. For any mission, assume that the required number of data bus RAU's can be provided.

VII. Number of processors = determined by applying "Ground Rules for DEP" to GDC provided software.

Cost/processor = determined by: processor class, configuration.

((Processor hardware) + (Qualification) + (Special I/O (RAU equivalent) + (Special Test Equipment) + (Peripherals*) + (Peripherals Qualification).

Each element will be determined according to selected processor class and configuration.

SECTION 10 Option IIB3A - Distributed Standard Mini Software Development by PI at His Facility. Real-Time Simulation Testing at Central Facility

10.1 Costing Method

ASSUMPTIONS

- All experiment application dependent software will be implemented in DEP's.
- STIL facility used for all EAS software development.
- PI develops EAS requirements analysis, coding, and functional simulation checkout at his STIL compatible facility.
- PI is charged industry rate for HOST computer time.
- PI travels to STIL for real-time checkout of EAS.
- DEP is available at Level 4 for checkout of experiment hardware.
- Common library is not possible due to independent PI software development.
- Only one mini development/qualification is required.
- Only one RTSTS is required and located at STIL.
- No PI/PI integration required due to independence of resource sharing. Central computer integration testing is still required.
- Fewer total mini's are required due to sharing of a pool of processors.
- Only one DEP operating system development is required.

GROUNDRULES FOR DEDICATED EXPERIMENT PROCESSOR

I. Central Experiment Computer Capacity = (Speed) and (Memory)

Speed = (500K Adds Per Second) (65%) 325 KADS

500 KADS = CII Specifications

65% = 100% - (15% Overhead) = (20% Contingency)

Memory = (Total Capacity) - (Contingency) -(Operating System)

Total Capacity = 64K CII Specifications

Contingency = 30% Engineering Estimate

Note: Low Compared to Industry Estimates (50% - 100%)

Operating System = 20K Memory Requirement ESA Estimate

(A) = 64K - 19.2K - 20K
= 24.8K

II. When a new payload exceeds central computer capacity, a DEP will be selected for the element that has the greatest capacity requirement. Each element having this requirement will be assigned a different DEP, except the case where one DEP is used on multiple missions.

III. Assume all Spacelab Review Item Disposition (RID's) for CDMS modifications are incorporated for mass memory, data bus, etc.

IV. Two classes of DEP's were considered:

(1) Micro Processor

(2) Mini Processor

Only 1 DEP will be specified.

V. Assume any non-standard DEP's selected will have support software that is executable on STIL host or STIL simulation computer.

VI. For any mission, assume that the required number of data bus RAU's can be provided.

VII. Number of processors is determined by applying "Groundrules for DEP" to GDC provided software requirements.

Cost/Processor is determined by: processor class and configuration.

((Processor Hardware) + (Qualification) (Special I/O (RAU Equivalent) + (Special Test Equipment) + (Peripherals*) + (Peripherals Qualification))

Each element will be determined according to selected processor class and configuration.

*For Option IA1 only applies when central computer cannot support requirements.

(2) Total = ($500) (#36)

(3) Re-Furbishment

SECTION 11 Option IIB3B - Distributed Standard Mini Software Development by PI at His Facility Using RTSTS

11.1 Costing Method

ASSUMPTIONS

All experiment application dependent software will be implemented in DEP's.

PI utilizes RTSTS to develop and checkout all EAS software.

DEP is local to PI facility for all Level IV activities.

Common library is not possible due to independent PI software development.

Only one mini development/qualification is required.

No PI/PI integration is required due to independence of resource sharing. Central computer integration testing is still required.

Fewer total mini's are required due to sharing of a pool of processors.

Only one DEP operating system development is required.

SECTION 13 Option IIB3B - CDMS Simulator, Distributed Standard Mini Software Development by PI at His Compatible Facility

13.1 Costing Method - Variation I

ASSUMPTIONS

- All experiment application software implemented in DEP's.
- PI utilizes CDMSS (CDMS Simulator) and experiment hardware to checkout all EAS.
- DEP and CDMSS is local to PI facility for all Level IV activities.
- Common library is not possible due to independent PI software development.
- Only one mini development/qualification is required.
- No PI/PI integration is required due to independence of resource sharing.
- Central computer integration testing is required.
- Fewer total mini's/CDMSS's are required due to sharing of a pool of processors.
- Only one DEP operating system is required.
- .5 man years required for hardware support during EAS development.

SECTION 14 Option IIB3B - Distributed Standard Mini, Software Development by PI at His Facility Using S360 Host

14.1 Costing Method - Variation II

ASSUMPTIONS

All experiment application dependent software will be implemented in DEP's.

PI utilizes 360 Host to develop and checkout all EAS software.

DEP is local to PI facility for all Level IV activities.

Common library is not possible due to independent PI software development.

Only one mini development/qualification is required.

No PI/PI integration is required due to independence of resource sharing. Central computer integration testing is still required.

Fewer total mini's are required due to sharing of a pool of processors.

Only one DEP operating system development is required.

S360 Host is used for assembly/compile and for real time experiment simulation.

Assume PI has an S360 Host computer available for EAS development.

GROUND RULES FOR DEDICATED EXPERIMENT PROCESSOR

I. Central Experiment Computer Capacity = (Speed) and (Memory)

Speed = (500K Adds per Second) X 65%

(A) = 325 KADS

500 KADS = CII Specifications

65% = 100% - (15% Overhead) - (20% Contingency)

Memory = (Total Capacity) - (Contingency) - (Operating System)

Total Capacity = 64K CII Specification

Contingency = 30% Engineering Estimate

Note: Low compared to industry (50 - 100%)
Operating System = 20K ESA Estimate

(A) = 64K - 19.2K - 20K
= 24.8K

II. When a new payload exceeds central computer capacity, a DEP will be selected for that element that has the greatest capacity requirement. Each element having this requirement will be assigned a different DEP, except the case where one DEP is used on multiple missions.

III. Assume all Spacelab's Review Item Disposition (RID's) for CDMS modifications are incorporated for mass memory, data bus, etc.

IV. *Two classes of DEP's were considered:

1) Micro Processor

2) Mini Processor

* Only 1 DEP will be specified

V. Assume any non-standard DEP's selected will have support software that is executable on STIL simulation computer.

VI. For any mission, assume that the required number of data bus RAU's can be provided.

VII. Number of processors = determined by applying "Ground Rules for DEP" to GDC provided software.

Cost/processor = determined by: processor class, configuration.

((Processor hardware) + (Qualification) + (Special I/O (RAU equivalent) + (Special Test Equipment) + (Peripherals*) + (Peripherals Qualification).

Each element will be determined according to selected processor class and configuration.
