ABSTRACT

Tests were conducted in the NASA/LARC 8 Foot Transonic Wind Tunnel from March 26 through 31, 1976. The model was a Langley built 0.015 scale SSV Orbiter with forebody modifications to simulate slight reductions in the reusable surface insulation (RSI) thickness.

Six component aerodynamic force and moment data were obtained at Mach numbers from 0.35 to 1.20 over an angle of attack range from  $-2^\circ$  to  $20^\circ$  at sideslip angles of  $0^\circ$  and  $5^\circ$ .

## INTRODUCTION

The National Aeronautics and Space Administration is conducting studies to determine if any adverse aerodynamic effects would be produced by slight reductions in the thickness of the reusable surface insulation (RSI) located along the sides of the Space Shuttle Orbiter fuselage forebody. The reductions of interest (a maximum of 2 inches full scale) would allow weight savings in the nose region while still providing sufficient thermal protective margins for anticipated missions. The potential aerodynamic issues which need evaluation are: the forward pitch control boundary at  $M \approx 5.0$  and the longitudinal and lateral-directional stability characteristics at  $0.2 \leq M \leq 5.0$ .

To obtain data over the required speed range, tests have also been conducted in the LaRC Low Turbulence Pressure Tunnel (LA73) to obtain subsonic data and in both legs of the LaRC Unitary Plan Wind Tunnel (LA71 A/B) to obtain supersonic data. The model used throughout these tests was a Langley built 0.015 scale SSV Orbiter with forebody modifications to simulate slight reductions in the reusable surface insulation (RSI) thickness.

In order to determine the transonic aerodynamic effects of the aforementioned forebody RSI thickness reductions, tests were run in the Langley 8-ft Transonic Pressure Tunnel at Mach numbers from 0.35 to 1.20. The test angle of attack range was from  $-2^\circ$  to  $20^\circ$  at sideslip angles of  $0^\circ$  and  $5^\circ$ .

The purpose of the present report is to release data obtained during the transonic phase of the testing.

### CONFIGURATIONS INVESTIGATED

The test model was a 0.015 scale model of the Space Shuttle Orbiter constructed at the Langley Research Center from Rockwell-furnished model 49-0 line details. The model designation is 69-0.

For this test the Orbiter Forebody contours were modified (See Figure 2) to simulate a reduction in the thermal protective shield area.

The configuration is summarized as follows:

$$W_1 V S_0^{EF} = \text{Baseline} = W C_9 E_{43} F_8 M_{16} N_{28} R_5 V_8 S_0$$

A complete description of model dimensional data is given in Table III.

## TEST CONDITIONS

The tunnel conditions existing during the test are summarized in Table I and the configurations tested are shown in Table II. The model was sting supported, and the aerodynamic forces and moments were measured by an internally mounted six-component strain gage balance. Model angle of attack was varied from about  $-2^\circ$  to  $20^\circ$  for angles of sideslip of  $0^\circ$  and  $5^\circ$ . Angles of attack and sideslip have been corrected for the effects of sting deflection under load.

## TEST FACILITY DESCRIPTION

NASA/Langley Research Center 8-foot Transonic Pressure Tunnel is an air-medium facility capable of attaining continuously variable Mach numbers from 0.20 to 1.30. It is a single-return, closed-circuit tunnel, having controlled stagnation temperature, total pressure, and dew-point temperature. The test section is 7.1 square feet. Reynolds numbers are variable from  $0.30 \times 10^6/\text{foot}$  to  $7.00 \times 10^6/\text{foot}$ , depending on Mach number and tunnel total-pressure limitations. Models are supported in the test section by a sting-sector system, but wall-mounting is possible. Schlieren photography is available for flow and shock-wave studies.

## DATA REDUCTION

LaRC 839 six-component strain gage balance was used to measure model forces and moments. All final data were presented along a set of body and stability axes (Figure 1) through the nominal center of gravity located at F.S. 1076.7 and FRL 375.0. Drag data presented represent gross drag in that no corrections to free-stream conditions in the base regions have been made. Model data were converted to standard NASA coefficients using the following constants:

Reference Area	$S_{\text{ref}} = 0.605 \text{ ft.}^2$
Reference Length	$l_{\text{ref}} = 7.122 \text{ in.}$
Reference Span	$b_{\text{ref}} = 14.05 \text{ in.}$
Total base area excluding sting cavity	$A_{\text{b}} = 0.0615 \text{ ft.}^2$
Sting cavity area	$A_{\text{sc}} = 0.03409 \text{ ft.}^2$
