PREFACE

Normal- and oblique-shock flow parameters for air in thermochemical equilibrium are tabulated as a function of shock angle for altitudes ranging from 15.24 km to 91.44 km in increments of 7.62 km at selected hypersonic speeds. Post-shock parameters tabulated include flow-deflection angle, velocity, Mach number, compressibility factor, isentropic exponent, viscosity, Reynolds number, entropy difference, and static pressure, temperature, density, and enthalpy ratios across the shock. A procedure is presented for obtaining oblique-shock flow properties in equilibrium air on surfaces at various angles of attack, sweep, and dihedral by use of the two-dimensional tabulations. Plots of the flow parameters against flow-deflection angle are presented at altitudes of 30.48, 60.96, and 91.44 km for various stream velocities.

INTRODUCTION

The advent of the space shuttle has focused attention on the entry of two-dimensional type lifting bodies into the Earth's atmosphere at moderate to high angles of attack. Even a preliminary analysis of the inviscid flow field about such vehicles requires knowledge of flow conditions behind oblique shocks where real-air effects are prevalent.

Over the last two decades, a continual updating of models of the Earth's atmosphere has occurred. (See refs. 1 to 5.) Reference 4 (1962) is the current standard atmospheric model with seasonal and latitudinal variations given in reference 5. As shown in figure 1, substantial errors in ambient temperature and pressure existed in the earlier models, particularly for the pre-1956 model. (See ref. 1.) Although a number of oblique-shock flow parameters for air in thermochemical equilibrium are available in the literature (see, for example, refs. 6 to 8), these parameters are based on pre-1957 atmospheric models and use the thermodynamic properties of argon-free air (ref. 9) in obtaining post-shock conditions. Normal-shock solutions based on the 1959 atmospheric model (ref. 3) are given in reference 10. Large deviations in atmospheric models could result in substantial differences in corresponding calculated post-shock flow parameters.

Also, heretofore, the only published procedure known to the authors for solving the attached oblique shock-wave system for surfaces at various angles of attack, sweep, and dihedral in equilibrium air is given in reference 11. (This procedure applies to any real gas in equilibrium.) This method employs effective values of the isentropic exponent to describe the density change across the shock and requires an interpolation procedure with a Mollier chart for imperfect gases.

The purpose of this report is therefore twofold: first, to present tabulated oblique- and normal-shock flow parameters based on the most accurate standard atmospheric model (ref. 4, 1962) and post-shock thermochemical equilibrium air properties (ref. 12) currently available, and second, to present a simple procedure (appendix A) for obtaining post attached-shock flow parameters on surfaces at various angles of attack, sweep, and dihedral using the two-dimensional, equilibrium air, oblique-shock tabulations. The altitude-velocity range encompassed in the post-shock flow-parameter tabulations is shown in figure 2 (15.24 km to 91.44 km and 1.828 km/sec to 11.582 km/sec). The applicability for this range is demonstrated by Apollo Earth entry and shuttle orbital entry trajectories.

SYMBOLS

Symbols enclosed in parenthesis in this list are used in the computer printout.

$\vec{A}, \vec{B}, \vec{C}, \vec{D}$ velocity projections (no dihedral, appendix A)

$\overrightarrow{AA}, \overrightarrow{BB}, \overrightarrow{CC}, \overrightarrow{DD}$ velocity projections (with dihedral, appendix A)

a speed of sound, m/sec

$h(H)$ enthalpy, kJ/kg

L/D lift-drag ratio

M Mach number

p(P) pressure, Pa

R gas constant for undissociated air, $287.288 \text{ m}^2/\text{sec}^2\text{-K}$

$R_e(Re/M)$ unit Reynolds number per meter

S/R nondimensional entropy

T temperature, K

u velocity normal to shock, km/sec

v total velocity, km/sec

v_n projection of total velocity normal to leading edge, km/sec

w velocity component parallel to shock and normal to leading edge, km/sec

x velocity component parallel to leading edge, km/sec

Z compressibility factor, $p/\rho RT$

Z^* number of moles of dissociated air to number of moles of undissociated air

α	angle of attack, deg
γ	specific heat ratio
$\gamma_e(\text{GAM})$	isentropic exponent $\left(\frac{\partial \log_e p}{\partial \log_e \rho} \right)_{S/R}$
$\delta(\Delta)$	flow-deflection angle across shock, deg
δ'	wedge half-angle (appendix A), deg
ϵ	dihedral angle (fig. 7), deg
$\theta(\text{TH})$	shock angle, deg
θ'	angle between shock and midplane of wing (appendix A), deg
Λ	sweep angle (fig. 6), deg
$\mu(\text{VIS})$	viscosity, N-sec/m ²
$\rho(\text{RHO})$	density, kg/m ³
σ	angle between velocity projection normal to leading edge V_n and the mid-plane of wing (appendix A), deg

Subscripts (Not subscripted in computer printout):

- 1 condition upstream of shock
- 2 condition downstream of shock

THERMODYNAMIC PROPERTIES FOR REAL AIR

Thermodynamic properties for real air in thermochemical equilibrium used in solving for the post-shock conditions at hypersonic speeds were obtained from a magnetic tape furnished to the Langley Research Center by the Arnold Engineering Development Center (AEDC) in late 1965. The thermodynamic properties obtained from this tape correspond to the properties tabulated in reference 12 for various values of S/R. The tem-

perature range of reference 12 and of the AEDC tape is 100 K to 15 000 K and the pressure range is 0.25 Pa to 1 GPa. A description of the properties included on the tape and the subroutine for searching the tape is given in reference 13. Specific heat data used in calculating the ambient enthalpy and entropy (table I) were obtained from references 14 and 15.

METHOD

Basic Assumptions and Equations

Basic assumptions in the present computational procedure for determining oblique-shock flow parameters are

- (a) Aerodynamics of continuous flow apply
- (b) The atmospheric properties (1962) of reference 4 exist in front of the shock wave
- (c) The thermochemical equilibrium air properties of reference 12 exist aft of the shock wave

The fundamental two-dimensional flow relations (refs. 6 and 8) are
Continuity:

$$\rho_1 u_1 = \rho_2 u_2 \quad \text{or} \quad \frac{\rho_1}{\rho_2} = \frac{u_2}{u_1} \quad (1)$$

Normal momentum:

$$\frac{p_2}{p_1} = 1 + \gamma_1 M_1^2 \sin^2 \theta \left(1 - \frac{u_2}{u_1} \right) \quad (2)$$

Tangential momentum:

$$v_1 = v_2 \quad (3)$$

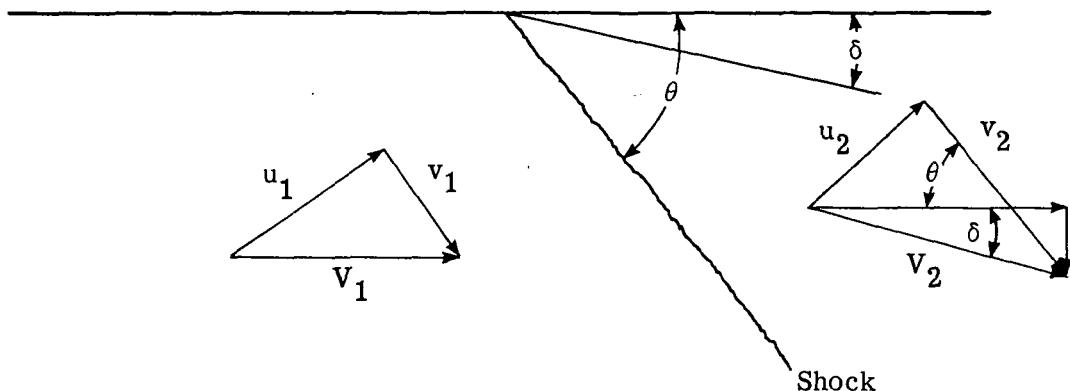

Energy:

$$\frac{h_2}{h_1} = 1 + \frac{\gamma_1 - 1}{2} M_1^2 \sin^2 \theta \left[1 - \left(\frac{u_2}{u_1} \right)^2 \right] \quad (4)$$

Oblique shock-wave geometry:

$$\frac{u_2}{u_1} = \frac{\tan(\theta - \delta)}{\tan \theta} \quad (5)$$

where the notation used is that shown in sketch (a) with $u_1 = V_1 \sin \theta$ and $v_1 = V_1 \cos \theta$. The equation of state takes the form of $\rho = \rho(h, p)$ for the AEDC real-air tape. (See ref. 13.)

Sketch (a)

Computational Procedure

The two-dimensional flow relations (eqs. (1) to (5)) and the AEDC real-air tape (ref. 13) were incorporated into a computer code (appendix B) employing the following computational procedure when the stream velocity, shock angle, and atmospheric conditions (table I) are given:

(1) The static pressure and enthalpy behind the shock (p_2 and h_2) are computed from equations (2) and (4), respectively, with $\gamma_1 = 1.40$ (used up to an altitude of 91.44 km in ref. 4, and quoted as 1.404 at 99.97 km in ref. 10) for an assumed value of u_2/u_1 (ideal gas) near the expected correct value.

(2) The AEDC real-air tape (ref. 13) is entered with p_2 and h_2 to obtain ρ_2 .

(3) The stream density ρ_1 is divided by the density behind the shock ρ_2 and the ratio ρ_1/ρ_2 is compared with the assumed velocity ratio u_2/u_1 (eq. (1)). If these ratios are not within 0.0001 (error criteria) of each other, a new value of u_2/u_1 equal to the just calculated value of ρ_1/ρ_2 is assumed, and the computational procedure is reentered at step (1).

(4) This iteration procedure containing steps (1), (2), and (3) is continued until the point where $\rho_1/\rho_2 = u_2/u_1$ (within 0.0001) is reached and gives the solution (final itera-

tion) for p_2 and h_2 (eqs. (2) and (4)) with which to enter the AEDC real-air tape. The post-shock thermodynamic properties T_2 , Z_2 , a_2 , S_2/R , and $\gamma_{e,2}$ along with ρ_2 are obtained from the tape.

(5) The post-shock velocity and Mach number are calculated as

$$V_2 = (v_2^2 + u_2^2)^{1/2} \quad (6)$$

$$M_2 = \frac{V_2}{a_2} \quad (7)$$

(6) The post-shock coefficient of viscosity is obtained from a table prepared as a function of p_2 and T_2 from reference 16 for $T \geq 1500$ K. For temperatures less than 1500 K, an expression for viscosity from Hansen (ref. 17) is used.

$$\mu = (1.462 \times 10^{-6}) \frac{T}{1 + 112/T} \quad (8)$$

(7) The post-shock unit Reynolds number per meter is calculated.

$$R_e = \frac{\rho_2 V_2}{\mu_2} \quad (9)$$

RESULTS AND DISCUSSION

The normal- and oblique-shock flow parameters for air in thermochemical equilibrium obtained with the previously described procedure have been tabulated as a function of shock angle for altitudes ranging from 15.24 km to 91.44 km and hypersonic velocities ranging from 1.83 km/sec to 11.58 km/sec. The altitudes and velocities at which the post-shock flow parameters are given are presented in table II. The tabulated parameters are presented in tables III to XIII. For a given set of free-stream conditions (altitude and velocity), the shock angle θ in tables III to XIII is increased from the limiting minimum wave angle (Mach angle, $\theta = \sin^{-1} 1/M$) to the nearest increment of 5° and then increased to 90° (normal shock) in 5° increments. Since the flow is isentropic across a Mach line (indefinitely weak shock), conditions behind the wave are equal to those of the free stream. In tables III to XIII, for the shock angle equal to the Mach angle (first entry in first column for each stream condition), the deviation of the flow parameters from the free-stream values (entropy rise from zero, static property ratios from one, etc.) is due to the fact that the speed of sound at free-stream static conditions obtained from the ther-

modynamic tape (AEDC, ref. 12) is smaller by as much as 0.7 percent than that obtained from reference 4 (1962 atmosphere). Thus the Mach angle calculated with the Mach number based on the higher speed of sound (ref. 4) is larger than that which would have been obtained had the Mach number been based on the speed of sound from the thermodynamic tape. Therefore, insofar as the thermodynamic tape is concerned, the minimum angle used in tables III to XIII (based on the speed of sound from ref. 4) is slightly higher than the Mach angle. The previous discussion applies only to the first row in table III since the shock angle θ was set and used as input (not calculated) for the remaining rows.

Variations of the oblique-shock flow parameters given as a function of flow deflection angle are shown in figures 3, 4, and 5 for altitudes of 30.48, 60.96, and 91.44 km, respectively. The deflection angle at which shock detachment occurs on a wedge is the maximum deflection angle occurring for a given altitude and velocity. (See figs. 3(a), 4(a), and 5(a).) This angle can be approximated from the tabulations of θ against δ (tables III to XIII) simply by selecting the largest δ recorded for a given set of stream conditions. The deflection angle at which shock detachment occurs increases with increasing altitude and velocity.

An interesting phenomena that is illustrated in figure 5(l) is that at high flight velocities, the shock density ratio ρ_2/ρ_1 may be lower for detached shock (including normal) than for an attached oblique shock. The fact that the density ratio may decrease with increasing normal velocity is well understood and documented (for example, see ref. 18); however, the altitude-velocity range of occurrence is worthy of note. Examination of tables III to XIII from an altitude of 60.96 km to 91.44 km indicates that flight velocities must reach between 8.53 km/sec and 9.14 km/sec before certain attached oblique-shock density ratios exceed those for all detached shocks.

The maximum error found in shock parameters calculated by use of recognized post-1955 atmospheric models compared with the present calculations based on the 1962 model was 6 percent. This error was in the static-pressure ratio (ref. 8) for an altitude of 91.44 km at a velocity of 7.925 km/sec and for a flow deflection of 58° . At 91.44 km, the error in the pressure ratio was 4 percent for a velocity of 4.877 km/sec and a flow deflection angle of 55° . As expected, comparison of the presented shock flow parameters to similar results based on pre-1956 atmospheric models revealed large differences. For example, the normal-shock pressure ratio given in reference 7 is in error by roughly 40 percent for an altitude of 60.96 km at a velocity of 6.096 km/sec. At this same altitude at a velocity of 7.925 km/sec, the static temperature ratio across the shock (ref. 7) is in error by 36 percent for a flow deflection of 60° and by 34 percent for a flow deflection of 50° .

CONCLUDING REMARKS

Normal- and oblique-shock flow parameters for air in thermochemical equilibrium are tabulated as a function of shock angle for a range of altitudes from 15.24 km to 91.44 km in increments of 7.62 km and for a range of hypersonic velocities from 1.83 km/sec to 11.58 km/sec. A simple procedure is presented for obtaining attached oblique-shock flow parameters in equilibrium air on surfaces at various angles of attack, sweep, and dihedral by use of the two-dimensional tabulations. Plots of the oblique-shock parameters are given as a function of flow-deflection angle for altitudes of 30.48, 60.96, and 91.44 km to illustrate the type of variations involved.

Shock parameters calculated by use of post-1955 atmospheric models were found to be in error by as much as 6 percent when compared with the present results. Comparison of the present shock flow parameters to similar results based on pre-1955 atmospheric models revealed large differences.

APPENDIX A

PROCEDURE FOR OBTAINING OBLIQUE-SHOCK FLOW PARAMETERS FOR SURFACES AT VARIOUS ANGLES OF ATTACK, SWEEP, AND DIHEDRAL IN EQUILIBRIUM AIR

A procedure is presented herein for obtaining oblique-shock flow parameters at hypersonic speeds for surfaces at various angles of attack, sweep, and dihedral in equilibrium air by using the two-dimensional oblique-shock flow parameters presented in tables III to XIII. Since the component of velocity perpendicular to the shock is the only component that changes across a shock and thus the only velocity component that influences the ratios of the static properties across the shock (eqs. (1) to (4)), the task is to find the resultant component of velocity in the plane perpendicular to the leading edge of the aerodynamic surface of interest with which to enter tables III to XIII in order to calculate the correct resultant post-shock velocity.

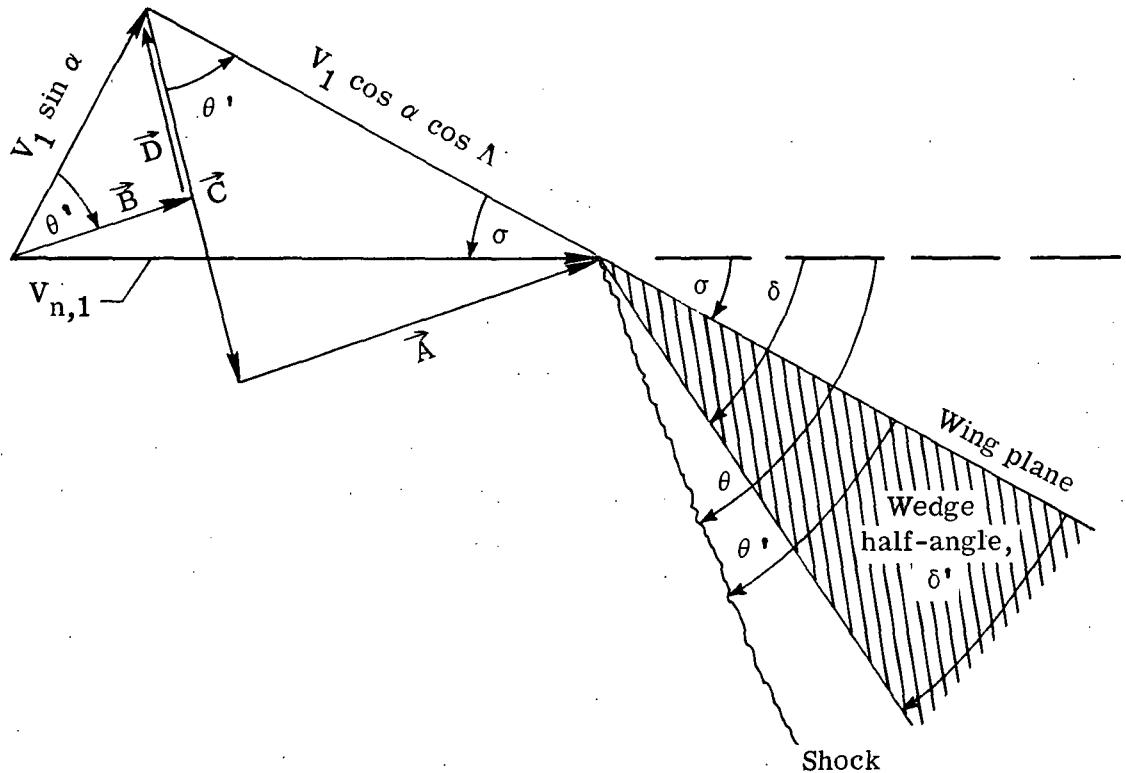

Angle of Attack and Sweep

To simplify the explanation, a wing with angle of attack and sweep (omitting dihedral) is considered first. The object is to resolve the stream velocity into (1) a vector w_1 parallel to the wing leading edge which does not change across an attached shock and thus does not influence the static properties behind the shock and (2) a vector $V_{n,1}$ that lies in a plane perpendicular to the leading edge with which to enter tables III to XIII. This can be accomplished by first resolving the stream-velocity vector into three components (see fig. 6): (a) normal to leading edge and lying in the wing plane, $V_1 \cos \alpha \cos \Lambda$, (b) normal to wing plane and thus normal to leading edge regardless of sweep, $V_1 \sin \alpha$, and (c) parallel to wing leading edge, $w_1 = V_1 \cos \alpha \sin \Lambda$. The sum of vectors (a) and (b) is the vector $(V_{n,1})$ to be used to enter table III (component of free-stream velocity in the plane perpendicular to the wing leading edge, see fig. 6)

$$V_{n,1} = V_1 \sqrt{\sin^2 \alpha + \cos^2 \alpha \cos^2 \Lambda} = V_1 \sqrt{1 - \cos^2 \alpha \sin^2 \Lambda} \quad (A1)$$

Now add a deflection angle, insert a shock, and project these components parallel and normal to the shock. Since the component parallel to the leading edge is parallel to the shock regardless of the shock angle, it will remain $w_1 = w_2 = V_1 \cos \alpha \sin \Lambda$. This equality means that the remaining projections are two-dimensional and will be in the plane of the triangle containing $V_{n,1}$ in figure 6. For velocity projection relative to shock in shaded plane (normal to leading edge) examine sketch (b):

APPENDIX A

Sketch (b)

The vector projections (normal and parallel to shock) in this sketch are defined in terms of the free-stream velocity V_1 , the angle of attack α , the sweep angle Λ , and the shock angle relative to the wing plane θ' :

$$\vec{A} = V_1 \cos \alpha \cos \Lambda \sin \theta' \quad (A2)$$

$$\vec{B} = V_1 \sin \alpha \cos \theta' \quad (A3)$$

$$\vec{C} = V_1 \cos \alpha \cos \Lambda \cos \theta' \quad (A4)$$

$$\vec{D} = V_1 \sin \alpha \sin \theta' \quad (A5)$$

Now

$$u_1 = \vec{A} + \vec{B} = V_1(\cos \alpha \cos \Lambda \sin \theta' + \sin \alpha \cos \theta') \quad (A6)$$

$$v_1 = \vec{C} - \vec{D} = V_1(\cos \alpha \cos \Lambda \cos \theta' - \sin \alpha \sin \theta') \quad (A7)$$

APPENDIX A

and

$$w_1(\text{unchanged}) = V_1(\cos \alpha \sin \Lambda) \quad (\text{A8})$$

with

$$\theta' = \theta - \sigma \quad (\text{A9})$$

$$\sigma = \tan^{-1} \left(\frac{\tan \alpha}{\cos \Lambda} \right) \quad (\text{A10})$$

$$\delta = \sigma + \delta' \quad (\text{A11})$$

The two-dimensional oblique-shock problem illustrated in sketch (b) is solved with the information presented in tables III to XIII. To obtain the post-attached shock solution for a surface at angle of attack and sweep, enter tables III to XIII at the altitude of interest and at the velocity $V_{n,1}$. The oblique-shock parameters in the row corresponding to $\delta = \sigma + \theta'$ will be those for the surface at the designated angle of attack and sweep. All parameters in the designated row will be correct except those that contain the resultant velocity (V_2 , M_2 , and $R_{e,\theta}$) which may be obtained in the following manner:

$$\frac{u_2}{u_1} = \frac{\tan(\theta - \delta)}{\tan \theta} \quad (\text{A12})$$

Since θ and δ are now known, calculate the normal velocity ratio

$$u_2 = \frac{u_2}{u_1} u_1 \quad (\text{A13})$$

Now $v_2 = v_1$ and $w_2 = w_1$; therefore

$$V_2 = \sqrt{u_2^2 + v_2^2 + w_1^2} = \sqrt{u_1^2 \frac{\tan^2(\theta - \delta)}{\tan^2 \theta} + V_1^2 + w_1^2} \quad (\text{A14})$$

with

$$M_2 = \frac{V_2}{a_2} \quad (\text{A15})$$

where

$$a_2 = \left(\frac{\gamma_2 P_2}{\rho_2} \right)^{1/2} \quad (\text{A16})$$

APPENDIX A

and

$$\frac{R_{e,2}}{m} = \frac{\rho_2 V_2}{\mu_2} \quad (A17)$$

An illustrative example is presented with the conditions:

Altitude, km	60.960
Velocity, km/sec	8.534
α , deg	30
Λ , deg	45.58
δ' , deg	9.36

To find attached oblique-shock parameters, calculate

$$V_{n,1} = 6.705 \text{ km/sec} \quad (\text{From eq. (A1)})$$

$$\sigma = 39.519^\circ \quad (\text{From eq. (A10)})$$

$$\delta = 48.882^\circ \quad (\text{From eq. (A11)})$$

Enter table IX(f) for an altitude of 60.960 km and a velocity of 6.705 km/sec. Select the oblique-shock parameters corresponding to the row containing $\delta = 48.889^\circ$ ($\theta = 55^\circ$, etc.). All parameters are correct except those that contain the resultant velocity (V_2 , M_2 , and $R_{e,2}/m$) which are obtained in the following manner:

$$\theta' = 15.481^\circ \quad (\text{From eq. (A9)})$$

$$u_1 = 5.493 \text{ km/sec} \quad (\text{From eq. (A6)})$$

$$u_2/u_1 = 0.07496 \quad (\text{From eq. (A12)})$$

$$u_2 = 0.412 \text{ km/sec} \quad (\text{From eq. (A13)})$$

$$v_2 = v_1 = 3.846 \text{ km/sec} \quad (\text{From eq. (A7)})$$

$$w_2 = w_1 = 5.279 \text{ km/sec} \quad (\text{From eq. (A8)})$$

$$V_2 = 6.545 \text{ km/sec} \quad (\text{From eq. (A14)})$$

APPENDIX A

$$a_2 = 1.536 \text{ km/sec} \quad (\text{From eq. (A16)})$$

$$M_2 = 4.260 \quad (\text{From eq. (A15)})$$

$$R_{e,2}/m = 1.084 \times 10^5 \quad (\text{From eq. (A17) and table IX(f)})$$

Angle of Attack, Sweep, and Dihedral

Again, the object is to resolve the stream velocity into (1) a vector w_1 parallel to the wing leading edge which does not change across the shock and (2) a vector $V_{n,1}$ that lies in a plane perpendicular to the leading edge with which to enter tables III to XIII. As before, this may be accomplished by first resolving the stream velocity vector into three components (see fig. 7):

- (a) Normal to the leading edge and lying in the wing plane,

$$V_1(\cos \alpha \cos \Lambda - \sin \alpha \sin \epsilon \sin \Lambda)$$

- (b) Normal to wing plane and thus normal to leading edge, $V_1 \sin \alpha \cos \epsilon$

- (c) Parallel to wing leading edge, $w_1 = V_1(\cos \alpha \sin \Lambda + \sin \alpha \sin \epsilon \cos \Lambda)$

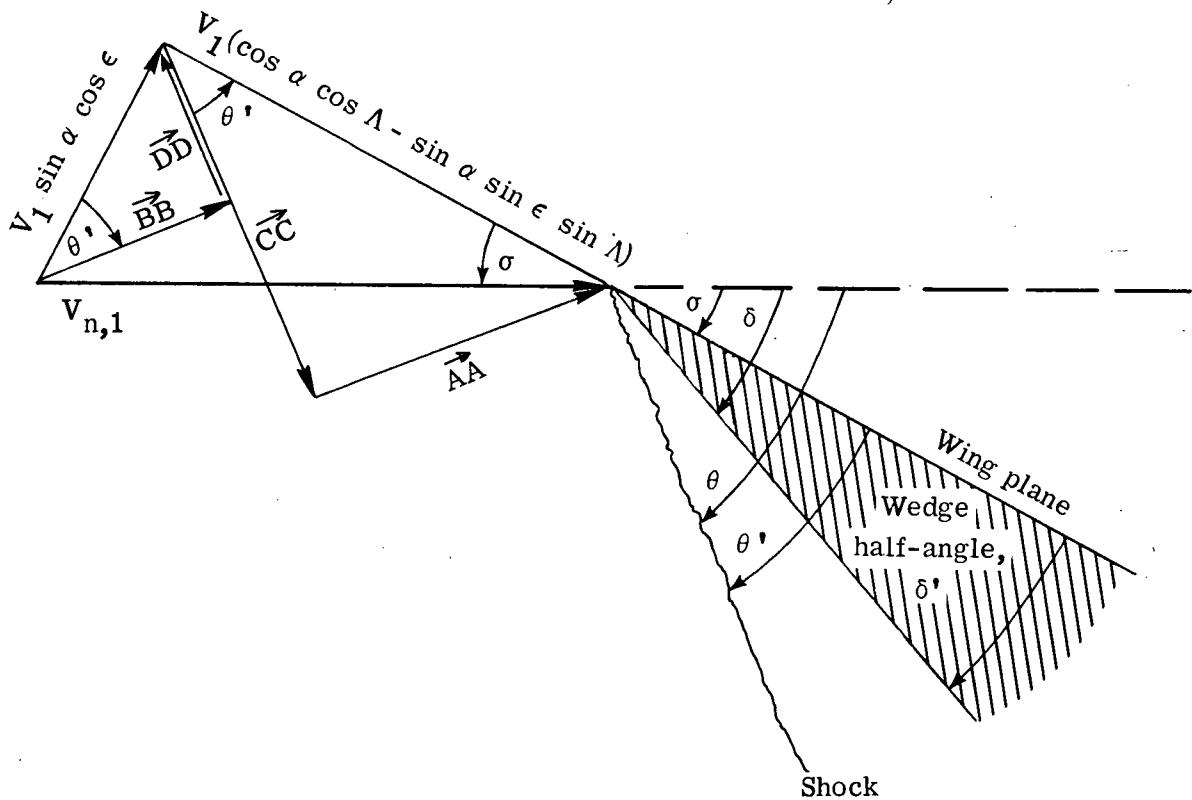

Note that in adding dihedral to a wing with angle of attack and sweep (that is, going from fig. 6 to fig. 7), the velocity projections in the x,y plane (angle of attack) and in the plane of the wing (sweep) remain unchanged; only the angle between these two triangles changes with increasing dihedral ($90^\circ - \epsilon$). Since dihedral reduces the angle (from 90°) between the angle of attack (x,y) and sweep planes (plane of wing), this condition means that $V_1 \sin \alpha$ (fig. 6) is no longer perpendicular to the wing plane. Resolve $V_1 \sin \alpha$ into a vector perpendicular to the wing plane $V_1 \sin \alpha \cos \epsilon$, and parallel to the wing plane $V_1 \sin \alpha \sin \epsilon$. The plane of the triangles formed by these components is parallel to the Z -axis. (See fig. 7.) Since $V_1 \sin \alpha \sin \epsilon$ lies in the wing plane and is parallel to the (y,z) plane, it must have projections parallel and normal to the wing leading edge with respect to the sweep angle ($V_1 \sin \alpha \sin \epsilon \cos \Lambda$ and $-V_1 \sin \alpha \sin \epsilon \sin \Lambda$, respectively). These components must be respectively added to the projection parallel and normal to the leading edge for no dihedral (fig. 6) to include dihedral effects.

The total component of velocity normal to the leading edge $V_{n,1}$ to be used to enter tables III to XIII is given by the vector sum of the component normal to the leading edge and lying in the wing plane and the component normal to the wing plane:

$$V_{n,1} = V_1 \sqrt{\sin^2 \alpha \cos^2 \epsilon + \cos^2 \alpha \cos^2 \Lambda + \sin^2 \alpha \sin^2 \epsilon \sin^2 \Lambda - 2 \cos \alpha \cos \Lambda \sin \alpha \sin \epsilon \sin \Lambda} \quad (\text{A18})$$

APPENDIX A

Entering tables III to XIII with this component of velocity will give the correct static conditions behind the shock. However, to obtain the resultant velocity and parameters that pertain thereto, the velocities normal and parallel to the shock must be found. Add a deflection angle, insert a shock, and project velocity components parallel and normal to the shock. Since the component parallel to the leading edge is parallel to the shock regardless of the shock angle, it will remain $w_1 = V_1 \cos \alpha \sin \Lambda$. This means that the remaining projections are two-dimensional and will be in the plane normal to the leading edge. For velocity projection relative to shock in the plane normal to leading edge and perpendicular to wing plane, see sketch (c):

Sketch (c)

The vector projections (normal and parallel to shock) in this sketch are defined in terms of free-stream velocity V_1 , the angle of attack α , the sweep angle Λ , the dihedral angle ϵ , and the shock angle relative to the wing plane θ' .

$$\overrightarrow{AA} = V_1(\cos \alpha \cos \Lambda - \sin \alpha \sin \epsilon \sin \Lambda) \sin \theta' \quad (A19)$$

$$\overrightarrow{BB} = V_1(\sin \alpha \cos \epsilon) \cos \theta' \quad (A20)$$

APPENDIX A

$$\overrightarrow{CC} = V_1(\cos \alpha \cos \Lambda - \sin \alpha \sin \epsilon \sin \Lambda) \cos \theta' \quad (A21)$$

$$\overrightarrow{DD} = V_1(\sin \alpha \cos \epsilon) \sin \theta' \quad (A22)$$

Now

$$u_1 = \overrightarrow{AA} + \overrightarrow{BB} = V_1(\cos \alpha \cos \Lambda \sin \theta' - \sin \alpha \sin \epsilon \sin \Lambda \sin \theta' + \sin \alpha \cos \epsilon \cos \theta') \quad (A23)$$

$$V_1 = \overrightarrow{CC} - \overrightarrow{DD} = V_1(\cos \alpha \cos \Lambda \cos \theta' - \sin \alpha \sin \epsilon \sin \Lambda \cos \theta' - \sin \alpha \cos \epsilon \sin \theta') \quad (A24)$$

and

$$w_1(\text{unchanged}) = V_1(\cos \alpha \sin \Lambda + \sin \alpha \sin \epsilon \cos \Lambda) \quad (A25)$$

with

$$\theta' = \theta - \sigma \quad (A26)$$

$$\sigma = \cot^{-1} \left(\frac{\cot \alpha \cos \Lambda}{\cos \epsilon} - \tan \epsilon \sin \Lambda \right) \quad (A27)$$

$$\delta = \sigma + \theta' \quad (A28)$$

Again, the solution to the two-dimensional oblique-shock problem illustrated in sketch (c) can be obtained with the results of tables III to XIII. To obtain a post-attached-shock solution for a surface at angle of attack, sweep, and dihedral, enter tables III to XIII at the altitude of interest and at the velocity $V_{n,1}$. The oblique-shock parameters in the row corresponding to $\delta = \sigma = \theta'$ are those for the surface at the designated angle of attack, sweep, and dihedral. All parameters in the designated row are correct except those that contain the resultant velocity (V_2 , M_2 , and $R_e, 2/m$) which may be obtained in the same manner as presented in the previous section for no dihedral, that is,

$$\frac{u_2}{u_1} = \frac{\tan (\theta - \delta)}{\tan \theta}, \text{ etc.}$$

An example of this case is presented with the following conditions:

Altitude, km 60.960

Velocity, km/sec 8.534

APPENDIX A

α , deg	25
Λ , deg	45
ϵ , deg	11.5
δ' , deg	12.88

To find attached oblique-shock parameters, calculate

$$V_{n,1} = 6.096 \text{ km/sec} \quad (\text{From eq. (A18)})$$

$$\sigma = 35.468^\circ \quad (\text{From eq. (A27)})$$

$$\delta = 48.345^\circ \quad (\text{From eq. (A28)})$$

Enter table IX(e) for an altitude of 60.960 km and a velocity of 6.096 km/sec. Select the oblique-shock parameters corresponding to the row containing $\delta = 48.345^\circ$ ($\theta = 55^\circ$, etc.). All parameters are correct except those that contain the resultant velocity (V_2 , M_2 , and $R_{e,2}/m$) which are obtained in the following manner:

$$\theta' = 19.532^\circ \quad (\text{From eq. (A26)})$$

$$u_1 = 4.9893 \text{ km/sec} \quad (\text{From eq. (A23)})$$

$$u_2/u_1 = 0.0817 \quad (\text{From eq. (A12)})$$

$$u_2 = 0.407 \text{ km/sec} \quad (\text{From eq. (A13)})$$

$$v_2 = v_1 = 3.973 \text{ km/sec} \quad (\text{From eq. (A24)})$$

$$w_2 = w_1 = 5.977 \text{ km/sec} \quad (\text{From eq. (A25)})$$

$$V_2 = 7.1888 \text{ km/sec} \quad (\text{From eq. (A14)})$$

$$a_2 = 1.457 \text{ km/sec} \quad (\text{From eq. (A16)})$$

$$M_2 = 4.935 \quad (\text{From eq. (A15)})$$

$$R_{e,2}/m = 1.809 \times 10^5 \quad (\text{From eq. (A17) and table IX(e)})$$

APPENDIX B

OBLIQUE-SHOCK COMPUTER CODE FOR AIR IN CHEMICAL EQUILIBRIUM

The oblique-shock computer code calculates the static flow properties behind oblique shocks in equilibrium air at hypersonic speeds. This code is assembled according to the calculation procedure described in the section "Method" of this report. The program input, output, and listing are as follows:

Program Input

FORTRAN IV NAMELIST with the name CASE is used to load input data. The following list contains the input variables with the dimensions used in the program:

FORTRAN variable	Symbol	Description
ALT		altitude, ft
VEL	v_1	free-stream velocity, ft/sec
VC	a	speed of sound, ft/sec
P1	p_1	ambient pressure, atm
GAM1	γ_1	specific heat ratio
RH01	ρ_1	ambient density, lbm/ft ³
H1	h_1	ambient enthalpy, Btu/lb
S/R	s_1/R	ambient entropy
K		integer designation of input into search
U2U1	u_2/u_1	estimate of shock normal-velocity ratio
T1	T_1	ambient temperature, °R

APPENDIX B

Program Output

FORTRAN name	Symbol	Description
TH	θ	shock angle, deg
M1SINTH	$M_1 \sin \theta$	normal Mach number
P2	p_2	post-shock pressure, atm
H2	h_2	post-shock enthalpy
T2	T_2	post-shock temperature, °R
Z	Z_2	post-shock compressibility factor
RH02	ρ_2	post-shock density, lbm/ft ³
DELTA	δ	flow-deflection angle, deg
SR	S_2/R	post-shock entropy
A2	a_2	post-shock speed of sound, ft/sec
M2	M_2	post-shock Mach number
N		number of iterations
S2/S1	$(S_2 - S_1)/R$	entropy difference
P2P1	p_2/p_1	pressure ratio across shock
RH02RH01	ρ_2/ρ_1	density ratio across shock
T2T1	T_2/T_1	temperature ratio across shock
H2H1	h_2/h_1	enthalpy ratio across shock

APPENDIX B

FORTRAN name	Symbol	Description
V2	v_2	post-shock velocity
R2OL		unit Reynolds number, 1/ft
VISLBFS	μ_2	post-shock viscosity, lbm/ft-sec
V2V1	v_2/v_1	velocity ratio across shock

"The aeronautical and space activities of the United States shall be conducted so as to contribute . . . to the expansion of human knowledge of phenomena in the atmosphere and space. The Administration shall provide for the widest practicable and appropriate dissemination of information concerning its activities and the results thereof."

—NATIONAL AERONAUTICS AND SPACE ACT OF 1958

NASA SCIENTIFIC AND TECHNICAL PUBLICATIONS

TECHNICAL REPORTS: Scientific and technical information considered important, complete, and a lasting contribution to existing knowledge.

TECHNICAL NOTES: Information less broad in scope but nevertheless of importance as a contribution to existing knowledge.

TECHNICAL MEMORANDUMS: Information receiving limited distribution because of preliminary data, security classification, or other reasons. Also includes conference proceedings with either limited or unlimited distribution.

CONTRACTOR REPORTS: Scientific and technical information generated under a NASA contract or grant and considered an important contribution to existing knowledge.

TECHNICAL TRANSLATIONS: Information published in a foreign language considered to merit NASA distribution in English.

SPECIAL PUBLICATIONS: Information derived from or of value to NASA activities. Publications include final reports of major projects, monographs, data compilations, handbooks, sourcebooks, and special bibliographies.

TECHNOLOGY UTILIZATION PUBLICATIONS: Information on technology used by NASA that may be of particular interest in commercial and other non-aerospace applications. Publications include Tech Briefs, Technology Utilization Reports and Technology Surveys.

Details on the availability of these publications may be obtained from:
