ACKNOWLEDGMENT

The assistance of Dr. James Matthews with the fracture toughness studies is gratefully acknowledged.

This report was prepared under Project 55-52100 sponsored by Marshall Space Flight Center of the National Aeronautics and Space Administration through Contract NAS8-29187. The guidance and advice of Mr. Gwyn Faile and Mr. Charles Jones is most gratefully acknowledged.

The publication of this report does not constitute approval by the National Aeronautics and Space Administration of the findings or conclusions contained herein. It is published only for the exchange and stimulation of ideas.

Structural Evaluation of Candidate Designs for the
Large Space Telescope Primary Mirror

by

Roland Grin
Keto Soosaar

and

Martin Furey
Joseph Hamilton

ABSTRACT

Structural performance analyses have been conducted on two candidate designs for the NASA Large Space Telescope three-meter mirror. In a NASA Phase "B" competition the Itek Corp. and the Perkin-Elmer Corp. have each proposed a mirror using separate design configurations and different substrate materials. The mirror designs and the finite-element models used in the analyses evaluation are described. The results of the structural analyses for several different types of loading are presented in tabular and graphic forms.

Several additional analyses are also reported herein. These include the evaluation of a new mirror design concept proposed by the Boeing Co., a study of the global effects of local cell plate deflections, and an investigation of the fracture mechanics problems likely to occur with Cervit and ULE. Also, flexibility matrices were obtained for the Itek and Perkin-Elmer mirrors to be used in active figure control studies.

Summary, conclusions and recommendations complete the report.

Chapter 1

INTRODUCTION

This report documents structural analyses that were performed to help evaluate various "Phase B" designs for the primary mirror of the NASA Large Space Telescope.

Chapters 2 and 3 of the report discuss the two competing mirror designs, both of which were of lightweighted construction. The Itek Corp. design utilizes Owens-Illinois CERVIT material with a core lightweighted into hexagonally-shaped cells and a circumferential edge band. The Perkin-Elmer Corp. design uses Corning ULE, and is assembled with a core of square cells and a circumferential edge band. Both mirrors are compared under various inertial (Chapter 2) and thermal (Chapter 3) loads.

Chapters 4 and 5 contain additional miscellaneous investigations. Found here is the analysis of a CERVIT mirror to be constructed using an alternate simpler lightweighting technique proposed by the Boeing Co. Then a study is reported that was conducted to evaluate the additional effect of local cell deflections on the total mirror performance under 1G transversely applied. Finally some preliminary investigations are performed on the fracture mechanics problems associated with the use of CERVIT and ULE.

As an aid in the investigation of the active mirror figure control concept, unit loads representing actuators moving parallel to the optical axis are placed at a number of positions on the back surface of the mirror. The resulting deflection data is then used to generate the control matrices. This is discussed in Chapter 5 and the flexibility matrices are listed in Appendix B.

Chapter 2

INERTIAL LOAD EFFECTS ON THE ITEK AND PERKIN-ELMER PRIMARY MIRRORS

2.1 Description of Mirror Designs

The properties of the Itek and Perkin-Elmer primary mirrors are listed in Table 2.1. Each mirror is made of a "glassy" low thermal expansion material and is of a composite sandwich construction. The Itek mirror is machined from a solid blank of CERVIT and has a core lightweighted with hexagonally-shaped cells. It has a circumferential edge band at both the inside and outside diameters.

The Perkin-Elmer mirror is assembled from ULE plates fused together with a lightweighted core of square-shaped cells, and continuous circumferential and internal edge bands. Both mirrors are held at their outside edge at supports 120° apart which allow expansion in the radial direction. The Itek mirror is supported at a cylindrical trunnion at the mid-height of the outside edge band in a solid area and the Perkin-Elmer mirror is supported axially at the intersection of the back plate with the outside edge and tangentially at mid-height. Both support areas are considerably reinforced.

2.2 Inertial Loads

IG loads are applied individually in the direction of each of the three principal axes; that is, parallel to the optical axis (-Z direction) and along the X and Y axes which are parallel to the plane of the mirror. While all

PROPERTIES	ITEK	PERKIN-ELMER
Outside Diameter	3.05m (120 in.)	3.05m (120 in.)
Inside Hole Diameter	.813m (32 in.)	.635m (25 in.)

Bottom Plate Hole Diameter	8.255cm (3.25 in.)	None
Edge Band Thickness	1.016cm (.40 in.)	.635cm (.25 in.)
Cell Wall Thickness	.508cm (.20 in.)	.508cm (.20 in.)
Percent Light Weighting	91.6%	90%
Total Weight Mirror	1847kg (4071#)	1723kg (3800#)
Material	CERVIT	ULE
Density	2491 Kg/m ³ (.09 lb/in. ³)	2214 Kg/m ³ (.08 lb/in. ³)
E (Young's Modulus)	9.24 x 10 ¹⁰ N/m ² (13.4 x 10 ⁶ PSI)	6.76 x 10 ¹⁰ N/m ² (9.8 x 10 ⁶ PSI)
Poisson Ratio	.252	.170
Nominal Temperature Coefficient	.05 cm/cm/°C x 10 ⁻⁶ (.277 x 10 ⁻⁷ in/in/°F)	.03 cm/cm/°C x 10 ⁻⁶ (.167 x 10 ⁻⁷ in/in/°F)

Table 2.1 Properties of the Itek and Perkin-Elmer Primary Mirrors

three loading directions are important in evaluating dynamic effects, the optical axis direction is most significant in the manufacturing and, hence, the zero-g release problem. The response along the X and Y axes is important in launch evaluation.

2.3 Structural Models

Since the time available to evaluate the competing Phase B designs was limited to about seven weeks, the modeling was necessarily approximate, and the "Trade-off Model," as described in Ref. 1,* had to be used. Within this type, two sizes of finite element models were used. In analyzing for a 1G load parallel to the optical axis (-Z direction) a 60° segment was modeled. Roller supports were provided along the radial edges. In the analysis for the 1G loads perpendicular to the optical axes (X and Y directions) the entire mirror was modeled. The Itek 60° model is shown in Figure 2.1 and the full 360° model in Figure 2.3. The Perkin-Elmer 60° model is shown in Figure 2.2 and the full 360° model is shown in Figure 2.4. The supports at the circumference for the 360° models are shown in Figures 2.5 and 2.6. The mirror lightweighted cores were idealized as a solid continuum and were modeled using isoparametric 3D solid finite elements. The top and bottom plates and circumferential edge bands were modeled using plate elements. ICES-STRUDL II was used for all finite element computations.

2.4 Results of Analyses

2.4.1 1G Load Parallel to The Optical Axis (-Z)

A comparison of the deflections of the Itek versus

* See Bibliography

the Perkin-Elmer mirror under a 1G load parallel to the optical axis is given in Table 2.2. Z-contour deformations of the mirror top surfaces are shown in the Appendix in Figures A-1 and A-2. Maximum stresses at the front and back surfaces of the mirrors are shown in Figures 2.7 and 2.8 for the Itek mirror, and Figures 2.9 and 2.10 for the Perkin-Elmer mirror.

2.4.2 1G Loads in The Lateral (+X and +Y) Directions

The deformations shown in Figures 2.11 and 2.12 for the Itek mirror under 1G loads in the X and the Y directions are primarily rigid body displacements due to deflections in the mounts. The maximum stresses in the front plate of the mirror are shown in Figures 2.13 and 2.14, and in the rear plate in Figures 2.15 and 2.16.

The displacements at the mounts for the Perkin-Elmer mirror under a 1G load in the +X direction and a 1G load in the +Y direction are given in Tables 2.3 and 2.4. The coordinate system and the node numbers are shown in Figure 2.6. The maximum stresses in the front plate of the Perkin-Elmer mirror are given in Figures 2.17 and 2.18, and in the rear plate in Figures 2.19 and 2.20.

2.4.3 Remarks on Units

As all of the mirror drawings and material properties were provided to CSDL in the English system, the finite element modelling was performed using inches and pounds. It later developed that the optical surface displacements were desired in SI units. The results were then converted to that system, although for convenience, most of the summary tables use both sets of units. The "unit" thermal studies were performed with 1°F changes and gradients. These were not converted to °C changes since that can be readily performed when the actual temperatures are known, by inserting an additional factor of 1.8.

Designer	Material	Structural Type	Direction of 1G Gravity Load	Maximum Deflection Z-Direction 10^{-8} M (10^{-6} in)		
				Δ	Peak to Peak	RMS
ITEK	CERVIT	60° Segment equivalent solid core	-Z (transverse)	922 (363)	712 (281)	154 (61)
PERKIN-ELMER	ULE	60° Segment equivalent solid core	-Z (transverse)	1181 (465)	820 (323)	185 (73)

Chapter 3

THERMAL LOAD EFFECTS ON THE ITEK AND PERKIN-ELMER MIRRORS

3.1 Thermal Loads

For the Itek CERVIT design four different sets of thermal expansion coefficients were used. The "nominal" coefficient ($\alpha = .05 \times 10^{-6} \text{M/M/}^{\circ}\text{C.}$) and those obtained at 10°C. , 15°C. and 25°C. for the particular blank available. Three different thermal loadings were imposed: a 1°F. uniform soak, a 1°F. axial gradient and a 1°F. radial gradient. This yielded twelve cases to be investigated.

For the Perkin-Elmer ULE design two sets of thermal expansion coefficients were used. The nominal coefficient ($\alpha = .03 \times 10^{-6} \text{M/M/}^{\circ}\text{C.}$) and those resulting from the radial variation of α as shown in Figure 3.1. The same three thermal loadings described above were applied. This yielded six additional cases.

3.2 Structural Models

The structural models used in this analysis are the same 60° segment models with equivalent solid cores that are described in Section 2.3. The variation of the thermal coefficient α with temperature for the material CERVIT for use in the analysis of the Itek mirror is shown in Figure 3.2. From that the values of α were derived and used to compute surface displacements. These values of α are given in Table 3.1.

Distribution of "α" in CERVIT Extreme Values*

	10 ⁰ C. Operation	15 ⁰ C. Operation	20 ⁰ C. Operation
Top Face	+6x10 ⁻⁸ M/M- ⁰ C	+2.0x10 ⁻⁸ M/M- ⁰ C	-1.5x10 ⁻⁸ M/M- ⁰ C

* Information from NASA/MSFC Memo dated May 2, 1974
See Fig. 3.2

Table 3.1

A typical variation of α in a fabricated ULE light-weight mirror is given in Figure 3.1. Figure 3.3 shows a distribution of α that was used to compute a "worst case" condition for the Perkin-Elmer mirror.

3.3 Results

The peak deflections of the mirror surface, resulting from the 18 loading cases described in Section 3.1, are given in Table 3.2. Additionally, the contours of the deflected mirror surface for each case are shown in Appendix Figures A-3 through A-20.

STRUCTURAL EVALUATION OF THE BOEING MIRROR LIGHTWEIGHTING CONCEPT

4.1 Description of Mirror Design

The properties of the Boeing mirror that were analyzed are listed in Table 4.1:

Outside Diameter	122" (3.099m)
Inside Diameter	23.5" (.597m)
Spherical Radius of Curvature	525" (13.335m)
Radial Thickness	17.38" (.442m)
Cell Shape	Hexagonal
Cell Pitch	4.8" (.122m)
Top Plate Thickness	1.83" (.047m)
Bottom Plate Thickness	1.64" (.042m)
Bottom Plate Hole Diameter	3.25" ϕ (.083m)
Edge Band Thickness	.40" (.0102m)
Cell Wall Thickness	.20" (.0051m)
Material	CERVIT 101
Total Weight Mirror	4500 lbs. (2045 Kg)

Table 4.1

Properties of Boeing Mirror

The "Boeing" mirror in nearly all ways resembles the Itek mirror. It is machined from a solid blank of CERVIT and has a hexagonally-lightweighted core. It differs from the Itek design in that additional lightweighting has been provided by machining away the inner and outer circumferential edge bands and lightweighting those partial cells from the edge. Thus all cells in the mirror are uniform. This supposedly reduces the cost and risk of normal light-weighting.

During operation the mirror is again held at three cylindrical trunnions, 120° apart, at the mid-height of the outside edge with supports allowing expansion in the radial direction.

4.2 Gravity Load

A gravity load was applied in the direction of the optical axis (-Z direction).

4.3 Structural Model

The structural model was similar to the Itek Phase A "exact" model. That is, both the top and bottom plates and the hexagonally-shaped cells of the core were modeled with plate elements and the support areas with three-dimensional solids. A 60° segment of the mirror, including part of one support on the outside circumference was modeled. Roller supports were provided along the radial edges. The model is shown in Figure 4.1.

4.4 Results

A comparison of the deflection of the Boeing mirror with various other very similar design concepts that were

evaluated in Phase A is shown in Table 4.2. Optical surface deformations are presented in Figure A-21. The tensile stresses in the top plate, the bottom plate and the lightweighted cell webs are shown in Figures 4.2, 4.3 and 4.4.

COMPARISON OF DISPLACEMENTS

Model	Gravity Load			Thermal Load		
	Max	Peak to Peak	RMS	1°F Rad.	1°F Axial	1°F Soak

ADDITIONAL STUDIES

5.1 Study to Determine The Effect of Cell Plate Deflection

The deflection at the center of a hexagonal light-weighting cell plate relative to the edges has usually been considered to be of second order. In any case the model to evaluate this in one step is likely to be prohibitive in cost. A study was conducted to determine whether the assumption that this deflection is of second order was justifiable.

Using the results of the Itek Phase A exact mirror analysis for the case a 1G load parallel to the optical axis, the nodal deflections at the six corners of each hexagonal cell were averaged at the center. The deflection at the center of a thick hexagonal plate under a 1G load was calculated and added to the averaged deflections, thus obtaining a corrected deformation of the optical surface. The results of the study are shown in Table 5.1.

MODEL	MAX Δ	Peak to Peak	RMS
Itek Phase A "Exact"	813 (320)	754 (297)	168 (66)
Itek Phase A "Exact" plus Cell Deflection	818 (322)	757 (298)	170 (67)

5.2 Fracture Toughness in CERVIT and ULE

The basic fracture toughness equations for Mode I and Mode II loading are given and comparisons are made between the expected performance of ULE and CERVIT.

In the manufacture of lightweight large optical mirrors, it is likely that there will be regions of separation between the core and the front face plate of the mirror as well as cracks caused by the machining of the material. In order to estimate the critical separation or crack length (l_c), which could propagate under stress and destroy the mirror, one must consider linear elastic fracture mechanics. For the Mode I fracture mode (Figure 5.1) the specimen is assumed to be in a state of plane stress, with the loading perpendicular to the length of the crack. For a given crack length (c), the crack will propagate when

$\sigma_F = \frac{K_{Ic}}{\sqrt{\pi c}}$, where σ_F = fracture stress. The same expression

is true for the Mode II fracture mode with τ_F replacing σ_F and K_{IIc} replacing K_{Ic} , where τ_F is the fracture shear stress. K_{Ic} and K_{IIc} are the stress intensity factors for Mode I and Mode II fracture proposed originally by Irwin.

Some data appears to be available on K_{Ic} for ULE and CERVIT but not on K_{IIc} . K_{Ic} for ULE is approximately 640 psi $\sqrt{\text{in}}$ (Corning data). Since the critical problem seems to be the lack of bonding between the core matrix and front face of the mirror, where there is low normal stress and high shear stress, Mode II fracture will prove particularly critical for ULE. An approximate rule of thumb is that K_{IIc} is twice K_{Ic} .

Assuming this relationship for K_{II_C} and that the debond surface between center matrix and mirror face experiences only shear stress, the curve in Figure 5.2 was generated.

The probability of failure in a brittle material subjected to a given stress is

$$\phi = 1 - \exp(-A \int_0^{S_D} g(s) ds) \quad (5.1)$$

where A = Area of part under stress

S_D = Design stress

$g(s)$ = Flaw density function

$g(s)$ is assumed independent of surface area, but is strongly dependent on surface preparation:

$$g(s) = \frac{1}{A} \frac{d\phi}{ds} \left(\frac{1}{1-\phi(s)} \right) \quad (5.2)$$

Generating $\phi(s)$ and $\frac{d\phi}{ds}$ from Figure 5.3 at $S = 5500$ psi, one obtains $g(s) = 1.681 \times 10^{-5}$. Assuming a linear relation for $g(s)$ between $S = 0$ and 5500 psi, one obtains $g(s) = .306 \times 10^{-5}$ for $S = 1000$ psi. Again using a linear variation for $g(s)$ between 0 and 1000 psi, a probability of failure of .015 is obtained for a design stress of 1000 psi and an area of 10 in.² Using $S = 200$ psi gives $g(s) = .06 \times 10^{-5}$ and $\phi = 6.11 \times 10^{-4}$ for an area of 10 in.²

Unfortunately, the paucity of data for CERVIT makes it impossible to extrapolate the $g(s)$ curve back to zero stress. This is needed to generate a probability of failure for CERVIT at a shear stress of either 200 or 1000 psi. Figure 5.4 is enclosed to illustrate this.

It is recommended that four point bend tests be run for both ULE and CERVIT, but in particular for CERVIT, to generate the flaw density curve ($g(s)$) around 1000 psi. Much larger samples ($> 10 \text{ in.}^2$) should be tested to determine this part of the curve. Also, K_{II_C} tests for both CERVIT and ULE should be done.

5.3 Flexibility Matrices for the Itek and Perkin-Elmer Mirror for Use in The Study of Active Figure Control

The flexibility matrix is defined by

$$\{u\} = [C] \{P\} \quad (5.3)$$

where C_{ij} \equiv Flexibility matrix
 P_j \equiv Forces vector
 u_i \equiv Displacement vector

The flexibility matrix defines a displacement at i due to a unit load at j . Flexibility matrices for both the Itek and Perkin-Elmer mirrors were obtained by applying unit loads parallel to the optical axis (+Z direction) at each node on the back surface of the mirrors. The finite element models that were used were the 360° structural models described in Section 2.3. The flexibility matrices are given in Appendix B.

Mode I Loading

$$c_c = \frac{1}{\pi} \left(\frac{K_{Ic}}{\sigma} \right)^2$$

CERVIT: $K_{Ic} = 850 \text{psi} \sqrt{\text{in.}}$

ULE: $K_{Ic} = 640 \text{psi} \sqrt{\text{in.}}$

Mode II Loading

"Rule of Thumb"

$$K_{IIc} = 2 \times K_{Ic}$$

$$c_c = \frac{1}{\pi} \left(\frac{K_{IIc}}{\tau} \right)^2$$

Figure 5.1 Critical Stress Intensity Factors: K_{Ic} , K_{IIc}

Applied Shear Loading (τ) and Critical Crack Length (Debond) (ℓ_c)

In Current Design $\tau \approx 200\text{PSI}$

$\ell_c \approx 10''$

CHAPTER 6

SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

A summary of the findings of this investigation is as follows:

1. Of the two mirrors, the CERVIT mirror is heavier by about 7%.
2. The CERVIT mirror, mainly because of its 35% higher modulus of elasticity, is stiffer with respect to unit transverse inertial loads.
3. The stresses in the ULE mirror are less under unit transverse inertial loads.
4. Using nominal as well as "real" thermal expansion coefficients, the ULE mirror generally experiences smaller distortions under unit thermal loads.

It is tempting to ask the following question, "Which mirror performs better?" It is not a question that has a realistic answer, however, given the bounds of this study. If the mirrors had been designed to absolutely the same dimensional and mechanical specifications, and then subjected to the same operational environments, then a statement could be made. Otherwise, it is only reasonable to compare the relative performance of the overall systems, of which the primary mirror is one component. If that is not feasible, then a measure of merit could be the performance of the mirror relative to the error budget allocated to it by the optical systems engineering.

It must be remembered that these mirrors are components of two highly complex and substantially different astronomical telescope satellite systems, and in each case the mirror has been designed to fulfill the needs of quite separate concepts of optical systems engineering. For those reasons, the curvatures of these mirrors differ slightly, the central hole size is different, and the thermal and mechanical environments that each experiences will be determined by system parameters not included in this analysis. These considerations have substantially greater impact on the mirror performance than the differences between the ULE and CERVIT designs determined here.

The recommendations that will be made here refer mainly to the reliability of the performance predictions. To date there has been no significant comparison of measured and predicted mirror displacement and stress performance for either a CERVIT or ULE mirror. This is of vital importance since some unknowns still exist in the modelling. In the ULE mirrors this includes the degree of fusion of ribs to flanges, the dimensions after slump, and the effects of posts and holes in the webs. With CERVIT the uncertainties include the stiffening effects of fillets, "wedge" and the rather variable nature of the thermal expansion coefficient.

The paucity of fracture mechanics data for either CERVIT or ULE makes it impossible to assign tensile working stress values. It is highly recommended that additional tests with appropriately sized samples be performed.

APPENDIX B

The flexibility matrices of the Itek and Perkin-Elmer mirrors have been computed and are listed below. Refer to Figures 2.3 and 2.4 for topology and joint numbering.

While it is of interest to know the mirror displacements everywhere on the reflecting surface, it is not possible to place actuators at all locations on the back surface. (Note that with these thick mirrors, the concept of a neutral surface as in a plate or shell does not apply.) Thus actuator positions are not considered at the inner and outer peripheries of the mirror, or at the immediate support locations. Therefore, displacements are obtained at 120 nodes, but actuators are located at 69 nodes.

The listing on the following pages have nine columns in three groups of three. In each group:

- 1st column is the displacement location
- 2nd column is the actuator location
- 3rd column is the element of the flexibility matrix

The magnitude of the flexibility elements are:

- a. to get inches/pound multiply element listed by 10^{-6}
- b. to get meters/Newton multiply element listed by 5.71×10^{-9}

Both flexibility matrices (Itek and Perkin-Elmer) are also available in form of punched cards and may be obtained upon request from Charles Stark Draper Lab., Inc., in Cambridge, Massachusetts 02139.
