OFFICE OF RESEARCH ADMINISTRATION ANN ARBOR

May 1973

ACKNOWLEDGEMENTS

This tabulation is issued as a technical report under contract with the National Aeronautics and Space Administration. It represents the result of efforts spread out over several years under this contract and preceding contracts with NASA, and also with the National Environmental Satellite Service, NOAA. The author gratefully acknowledges the continued support of these agencies.

ABSTRACT

A listing is given of the wavenumber, intensities at 300, 275, 250, 225, 200 and 175 K and energy of the lower state of CO₂ absorption lines between 12 and 20μm. They are ordered by wavenumber and include 19 bands of ¹²C ¹⁶O₂, 4 bands of ¹³C ¹⁶O₂, 2 bands of ¹²C ¹⁶O ¹⁸O and 1 band of ¹²C ¹⁶O ¹⁷O. The vibrational and rotational constants and the band intensities used to calculate the line parameters are tabulated.

The bands of carbon dioxide between 12 and 18 μm are important in the earth's atmosphere because of their influence on the radiative heat budget and also for applications of remote soundings experiments from satellites. Carbon dioxide is the most abundant gas in the atmospheres of Mars and Venus and these bands assume a dominant role in infrared radiative transfer. To understand the details of the radiative processes it is necessary to know the parameters of each individual absorption line. A listing of the parameters was published some years ago (Drayson and Young 1967) but we now have better estimates of some of the constants required to compute them, mostly obtained from laboratory spectra described by Chaney (1971). It seemed appropriate to issue a revised listing of the parameter to supercede the previous listing.

The main differences between this and the previous listing are:

- 1) Revised wavenumber of nearly all lines. In most cases the differences are small (less than 0.05 cm^{-1})
- 2) Revised intensities
- 3) Inclusion of additional bands (16-19).

Only bands which were observed in the laboratory spectra are included in the listing. (see Table 1) This excludes many of the very hot bands whose intensities and line positions have never been observed. It also excludes many of the isotopic bands. For most applications their contribution to the absorption is negligible, as they are either extremely weak bands or the lines lie in regions dominated by much more intense lines. An absolute cut-off of line intensity at 300 K of $1 \times 10^{-6} \text{ cm}^{-1} (\text{atm. cm})_{300K}^{-1}$ has been employed.

The vibrational and rotational constants used in the calculation of the line parameters are shown in Table 2. The partition functions were obtained by interpolation on the values of Gray and Young (1969) for each of the isotopes included. The intensities of isotopic molecular lines were multiplied by the isotopic abundance relative to $^{12}\text{C}^{16}\text{O}_2$ in air (Table 3).

Table 4 constitutes the bulk of this report and lists the lines parameters ordered by wavenumber. In this and other tables the units are cm^{-1} for wavenumbers and energies, while the intensities are in $\text{cm}^{-1}(\text{atm cm})^{-1}_{300\text{K}}$ for all six temperatures. The intensities may be converted to units $\text{cm}^{-1} / (\text{mol cm}^{-2})$ by dividing by 2.4465×10^{19} . The energy is that of the lower state of the transition and may be used to compute the temperature dependence of line intensities. The band code gives the isotope (left blank for the most abundant isotope), the band number from Table 1, the branch and rotational quantum number of the line. For example line 1069 at 622.375 cm^{-1} is P34 line of the (010:1) - (000:0) band of $^{13}\text{C}^{16}\text{O}_2$. The Lorentz half-width of the lines is not included in Table 4 since they will depend on the broadening gases. For self-broadening and nitrogen-broadening the values calculated by Yamamoto et. al. (1969) are recommended.

Details of the methods of calculation, derivation of the constants and discussion of estimates of errors are not shown here but will be given in a separate report (Drayson, 1973) and later submitted for journal publication.
