

The El Niño-Southern Oscillation (ENSO) from 0-2 ka

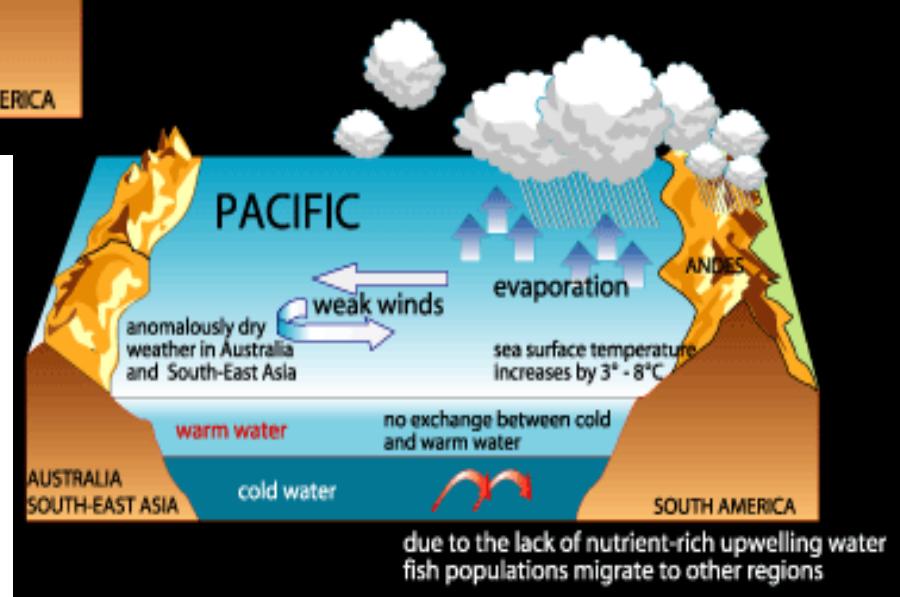

Helen McGregor, Steven Phipps,
Colin Woodroffe, Mike Gagan,
David Fink

normal weather situation

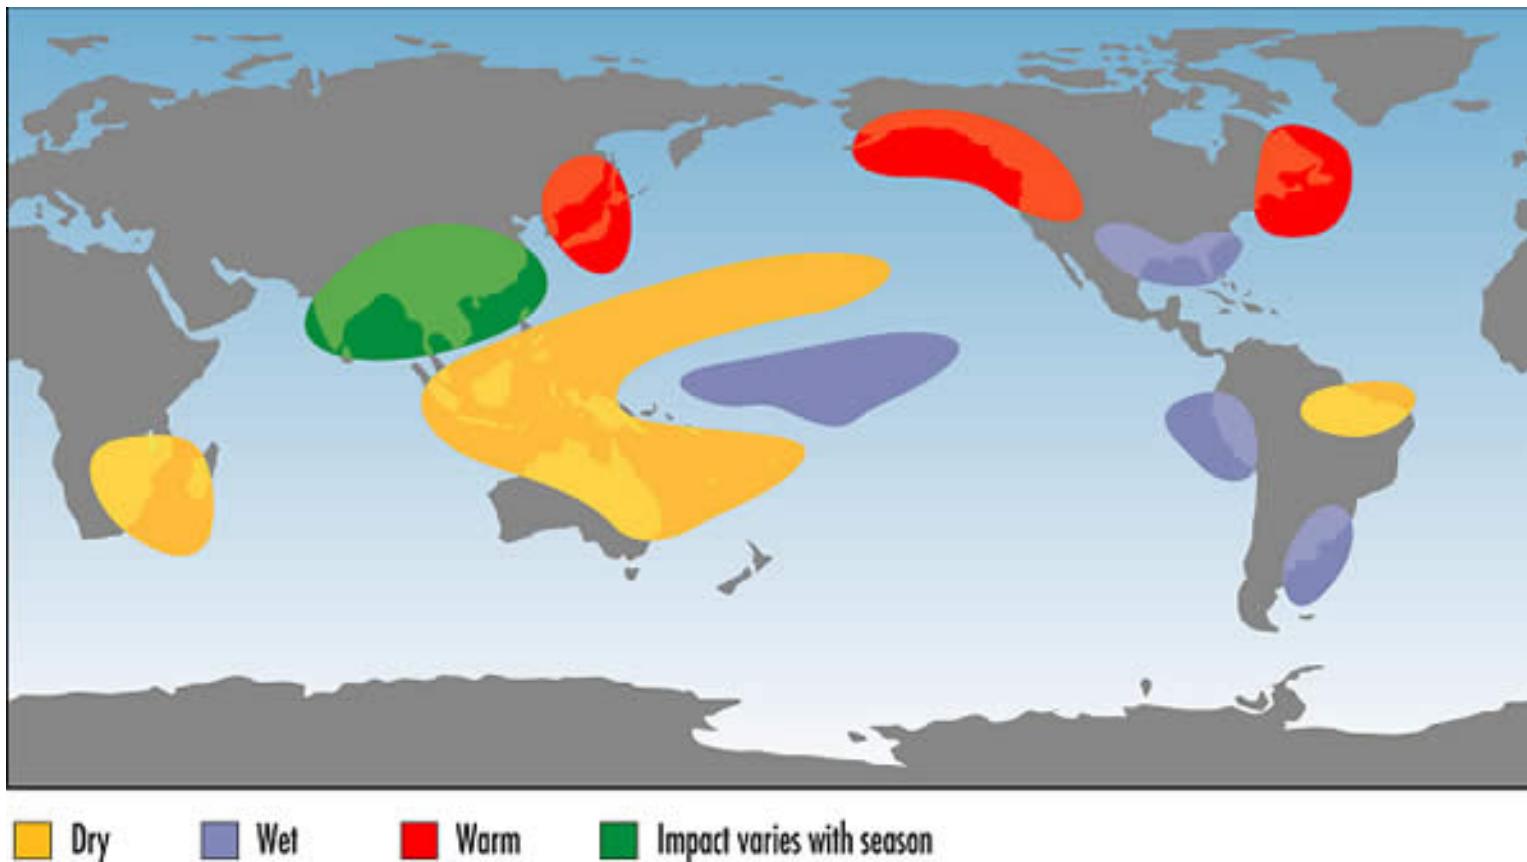

What is an El Niño event?

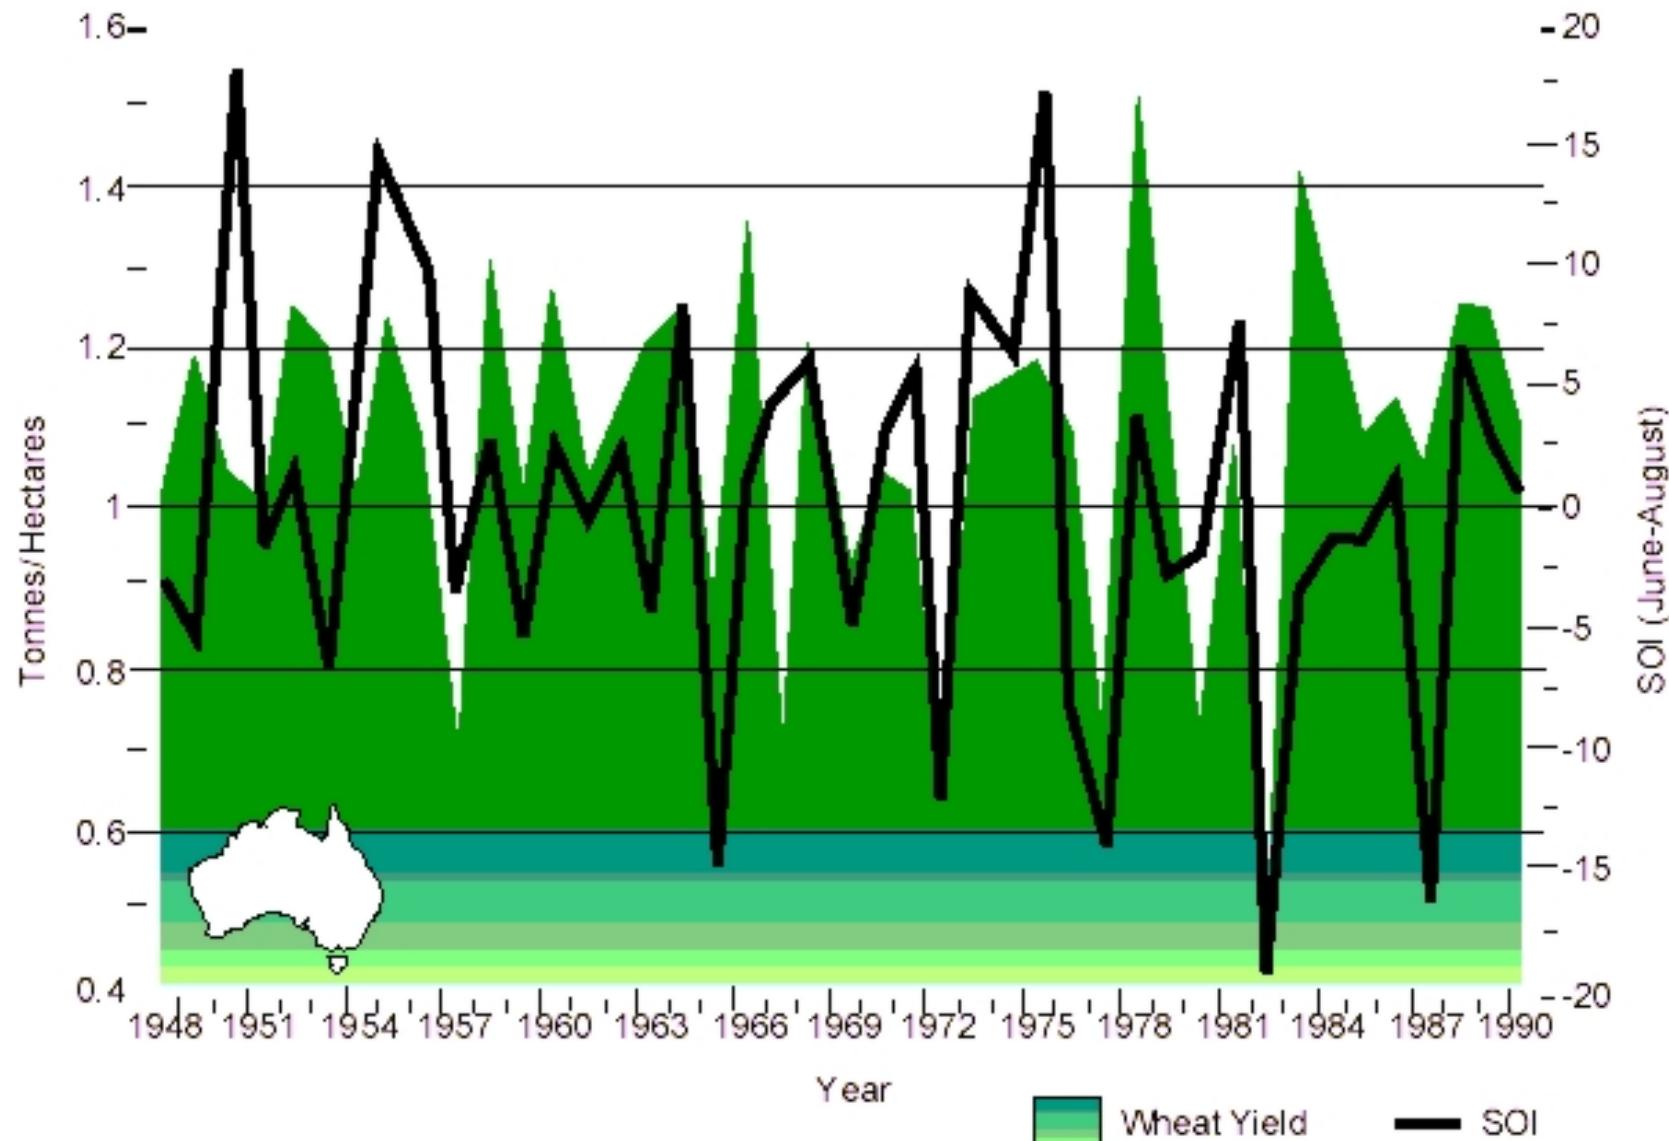

El Niño weather situation

El Niño events are associated with reduced rainfall in eastern Australia

El Niño and Australian wheat yield

Models highly variable in forecasts of future ENSO

ENSO centres of action

Normal pattern

El Niño pattern

CMAP rainfall (mm/day)

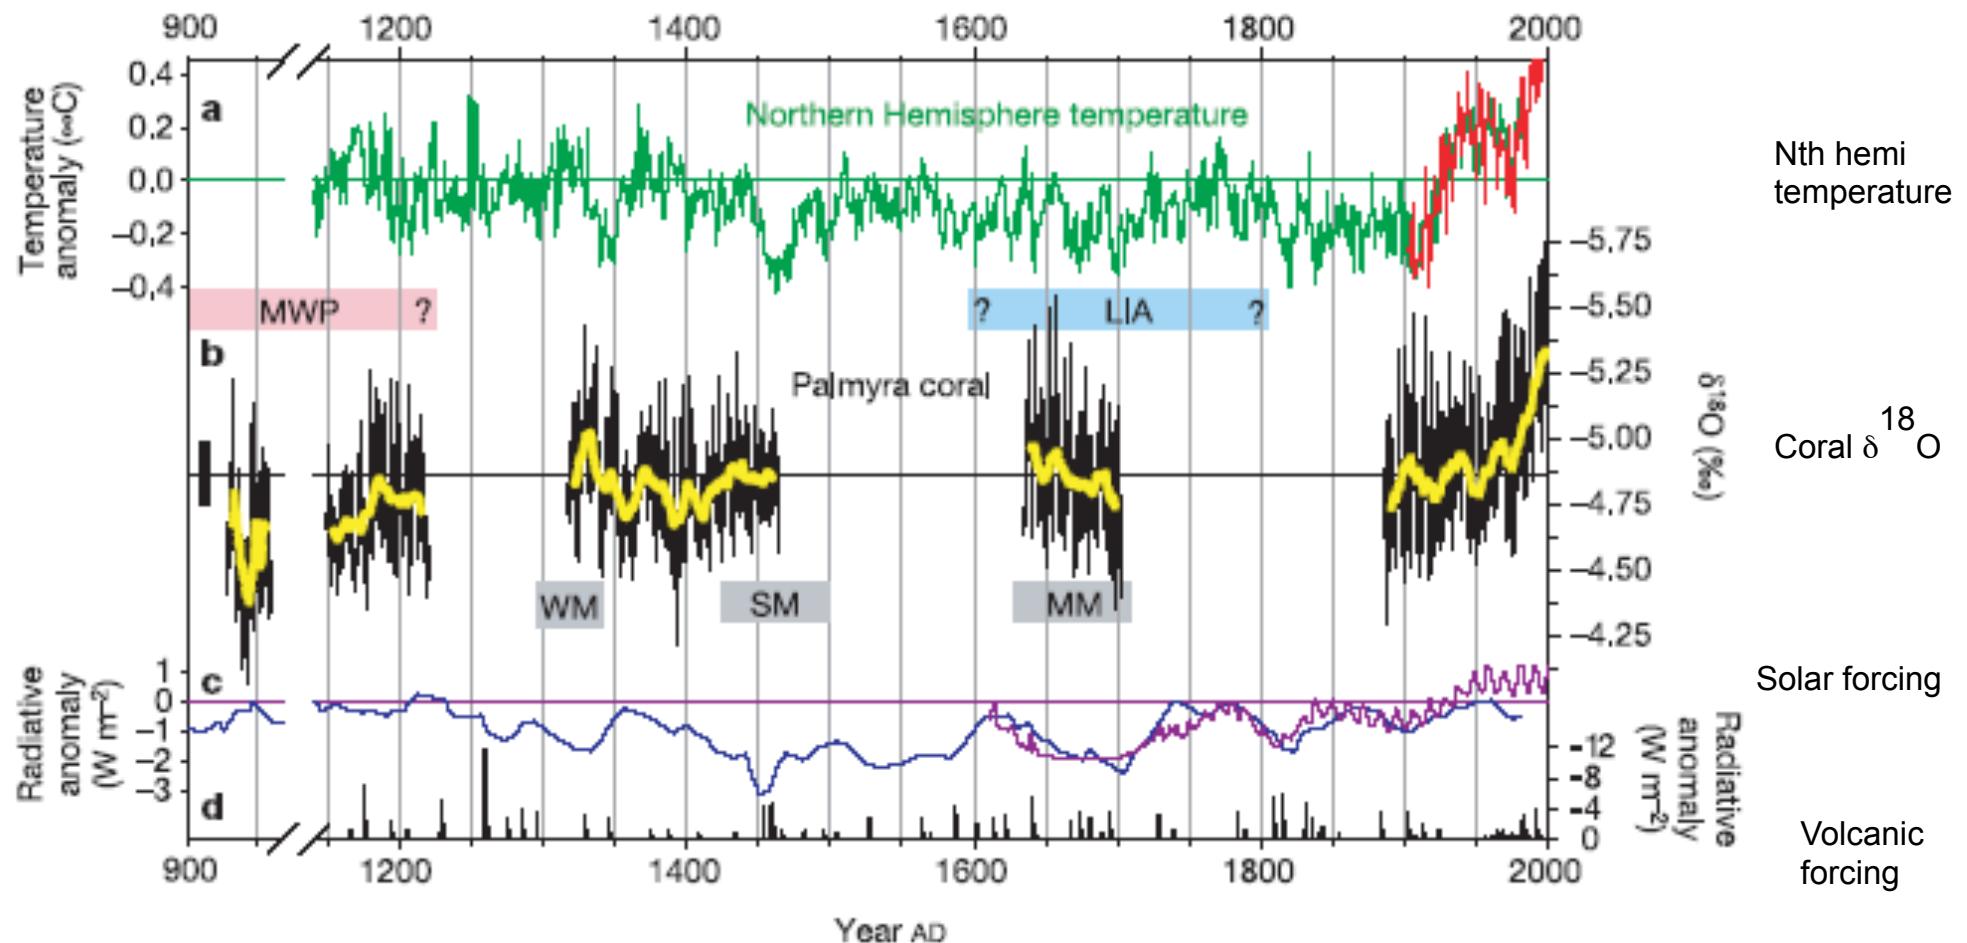

0 2 4 6 8 10 12 14 16 18 20 22
CMAP Estimated Precipitation (mm/day)

IGOSS SST anomaly (°C)

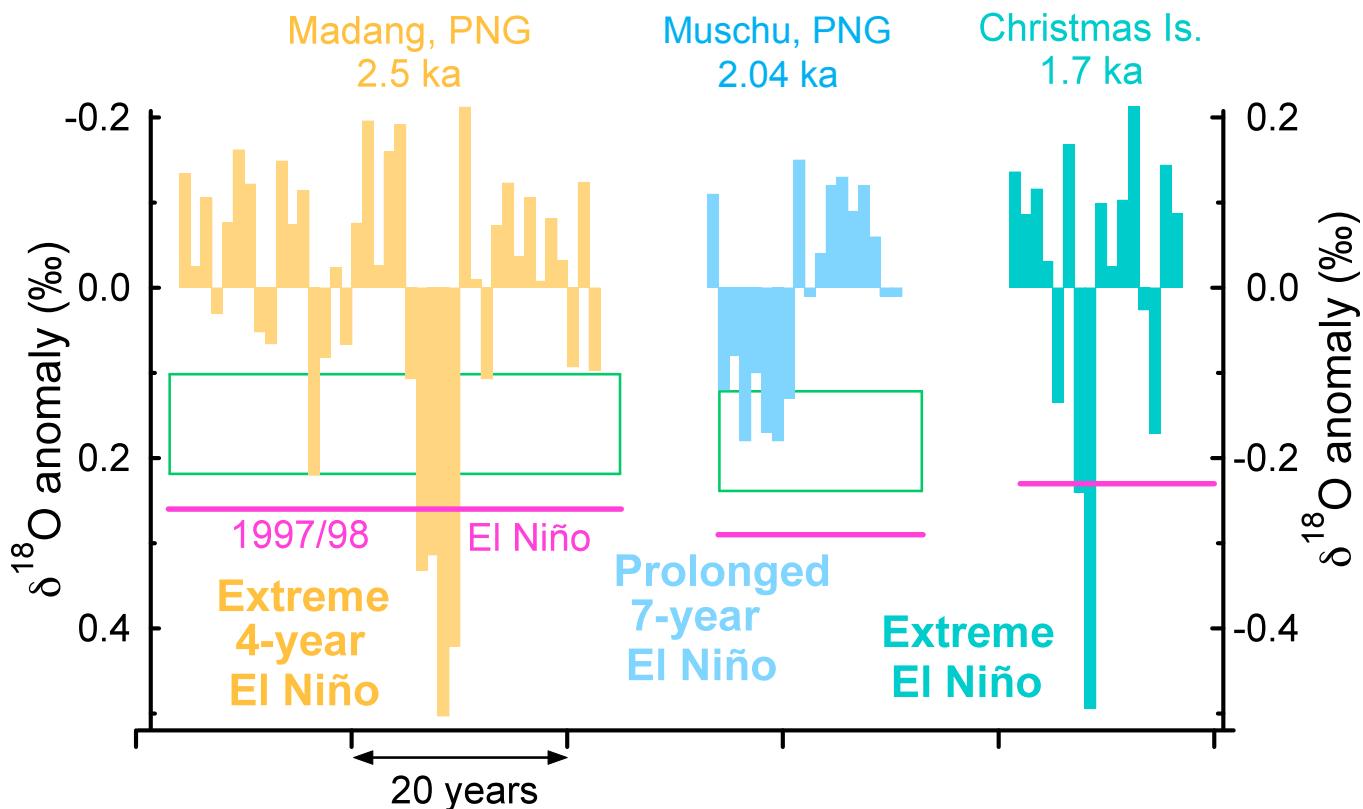

-4 -3 -2 -1 0 1 2 3 4
IGOSS SST anomaly (°C)

ENSO 0-1 ka (Palmyra Is)

ENSO ~2 ka (Kiritimati & PNG) - Severe El Niños?

Filling in the gaps: Kiritimati Microatolls

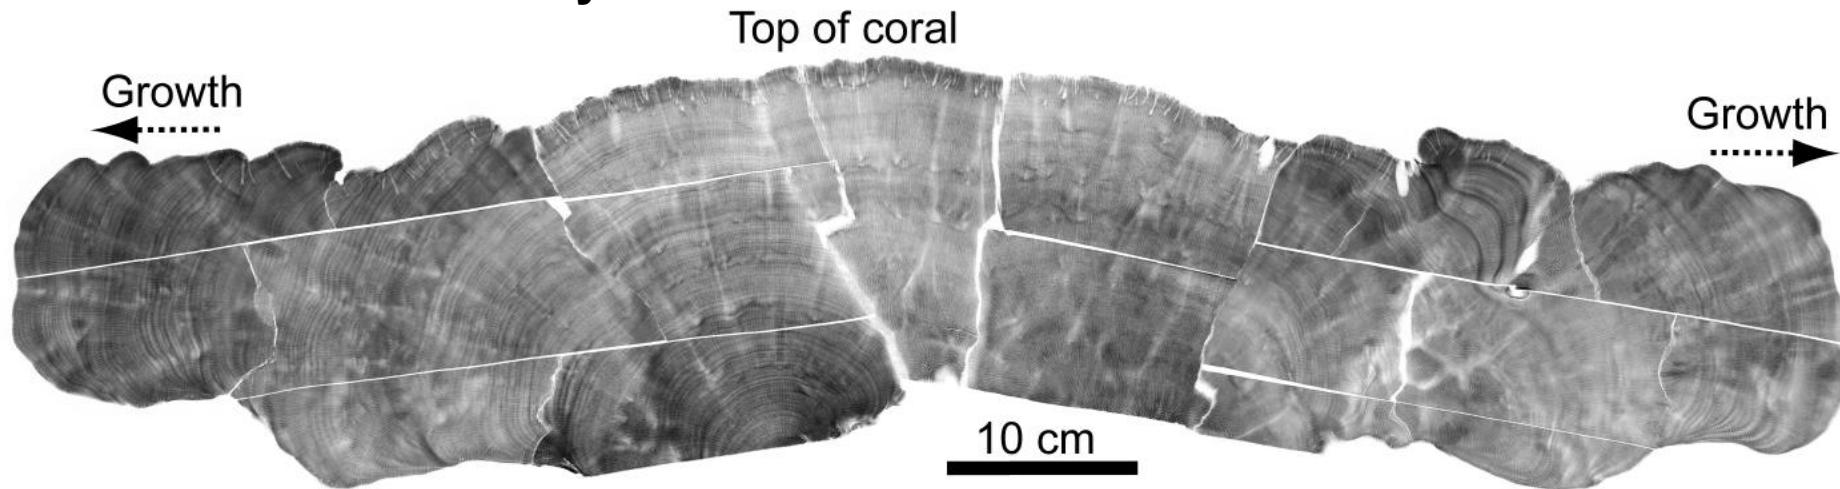

Porites head coral

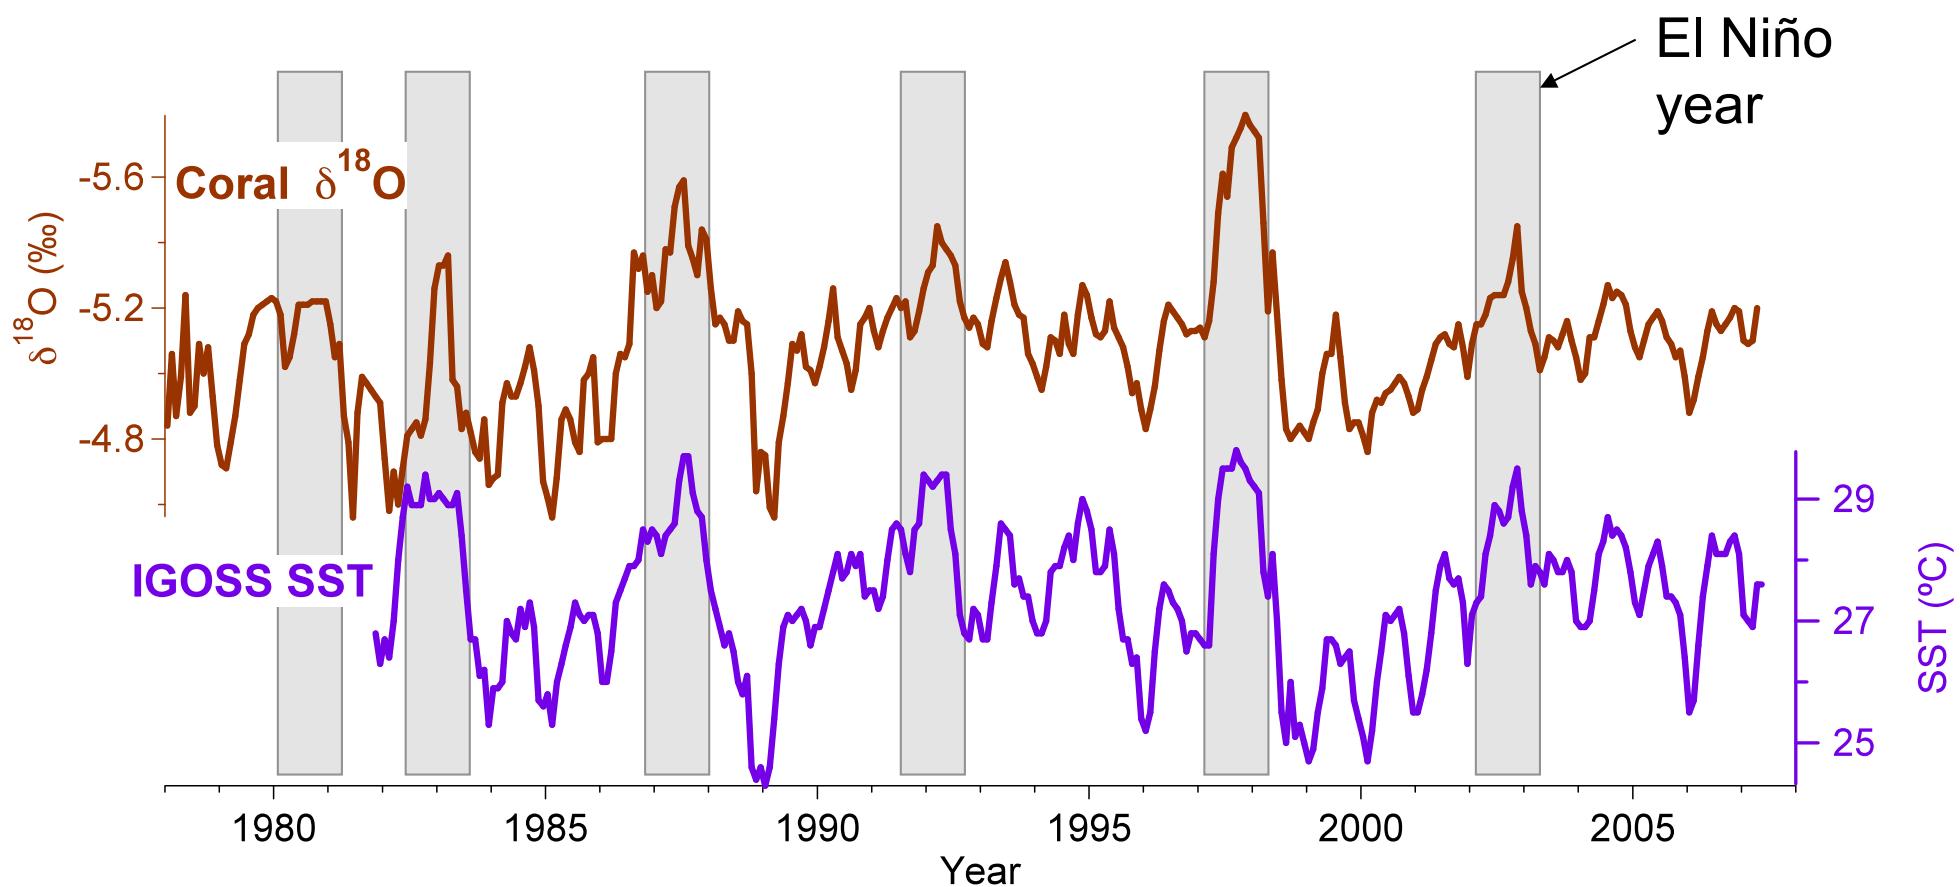

Porites microatoll

Porites microatoll X-ray

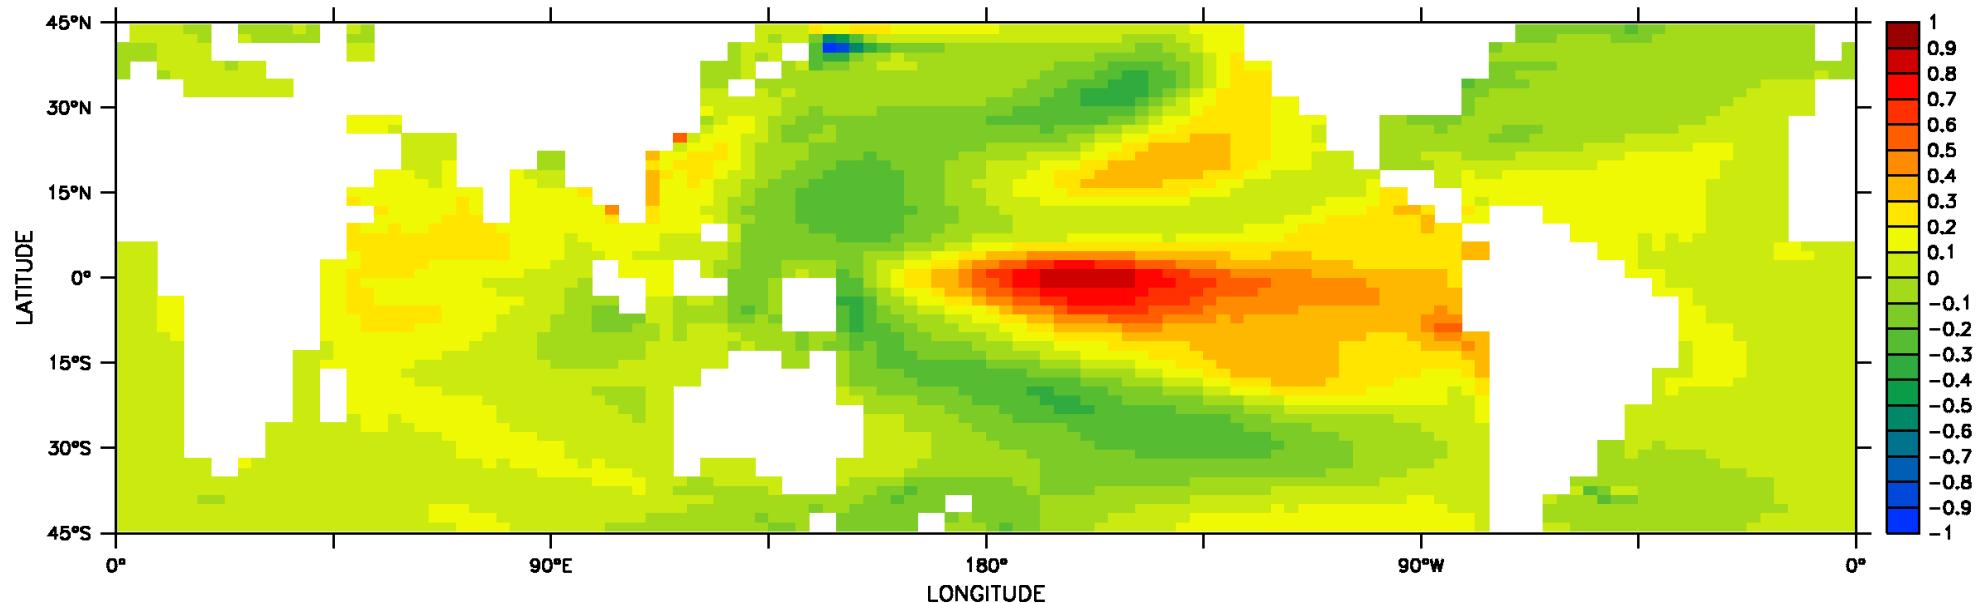

Modern coral $\delta^{18}\text{O}$ data from Kiritimati compared to satellite sea surface temperature (SST)

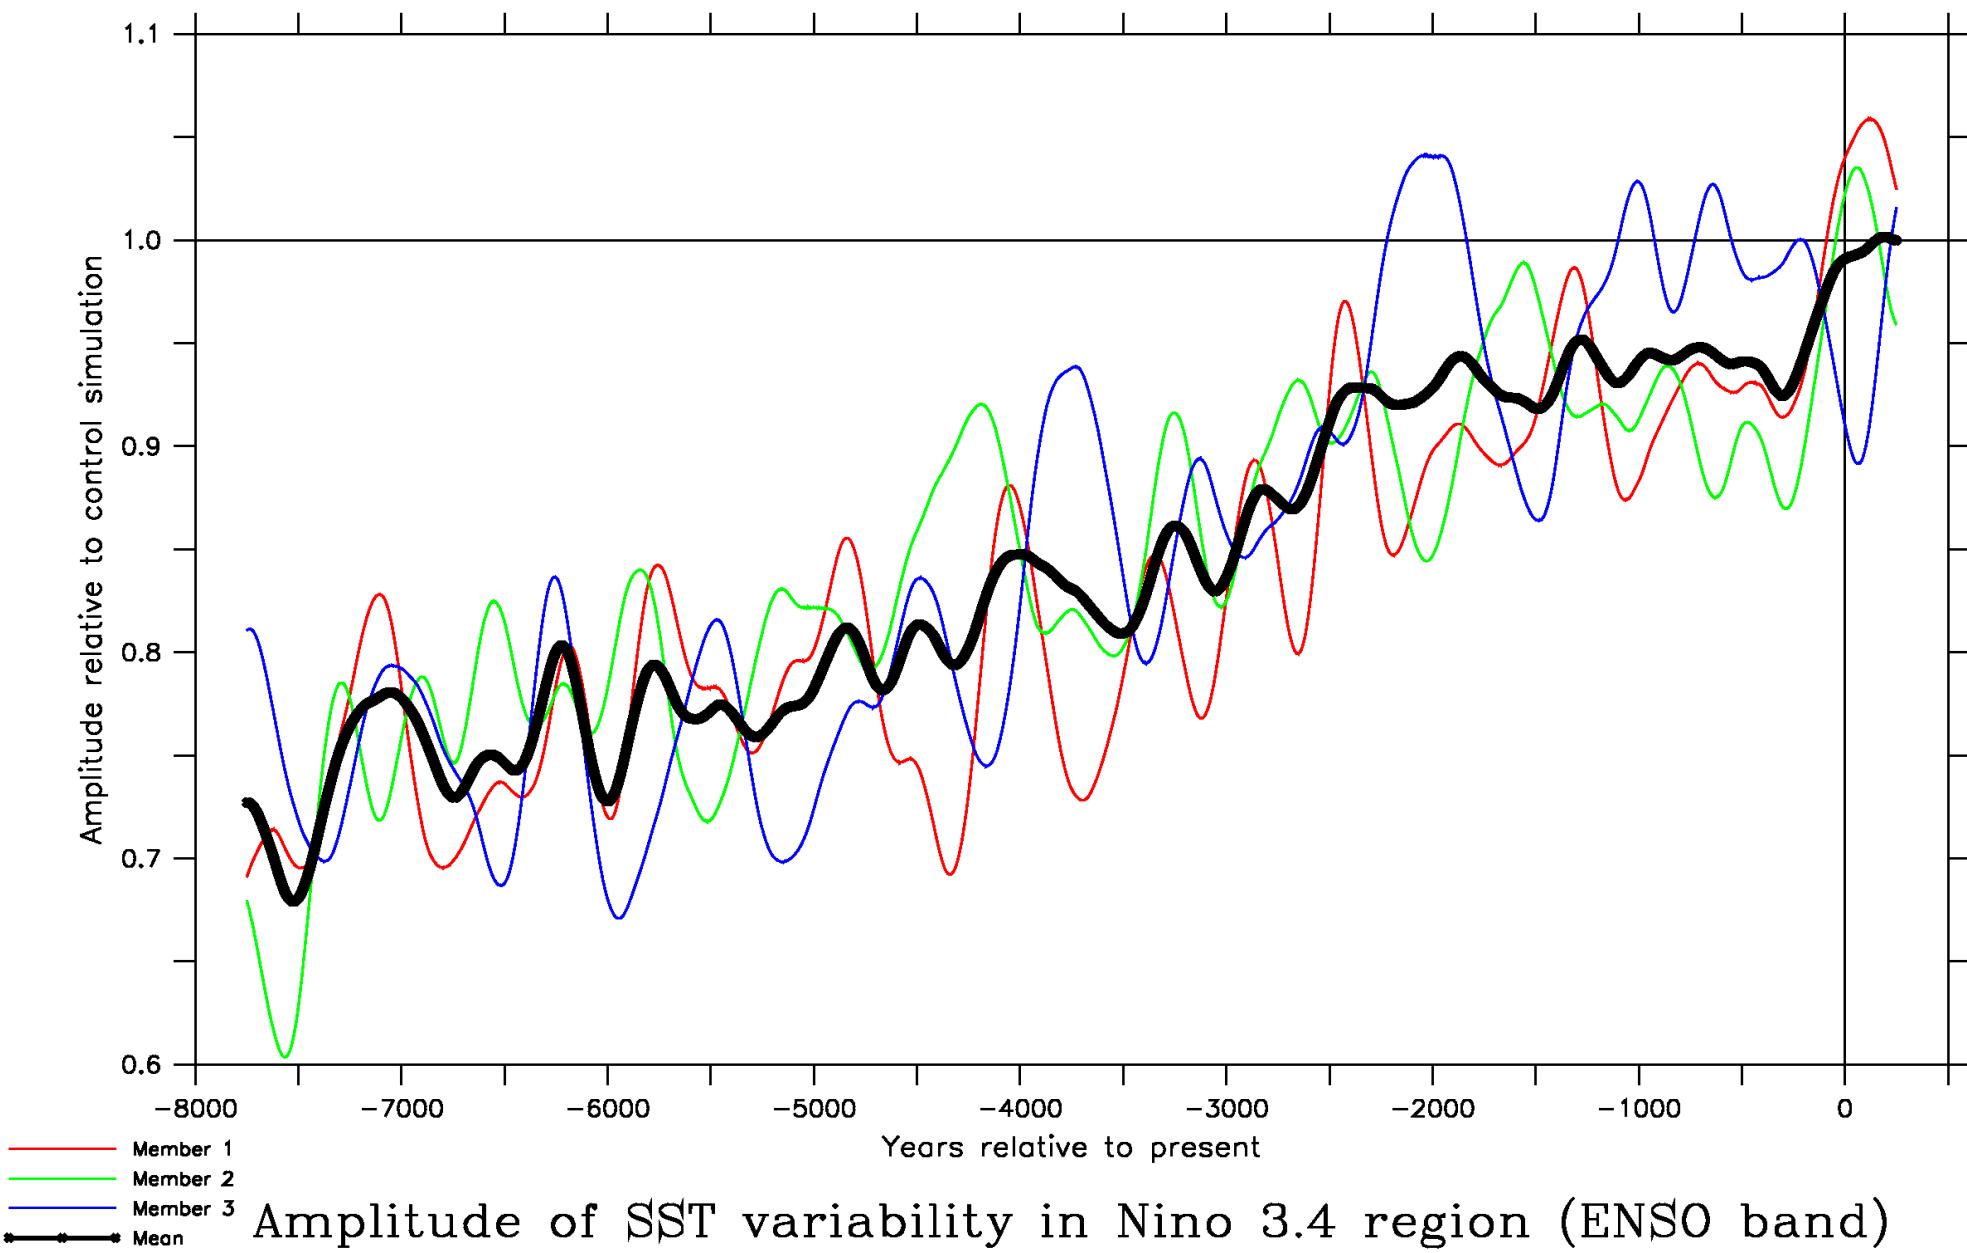

Transient climate model simulations

- CSIRO Mk3L climate system model v1.1:
 - Atmosphere: $5.6 \times 3.2^\circ$, 18 vertical levels
 - Ocean: $2.8 \times 1.6^\circ$, 21 vertical levels
 - Sea ice: Dynamic-thermodynamic
 - Land surface: Static vegetation
- 1 x 10,000-year control simulation
- 3 x transient simulations of the past 8,000 years (orbital forcing only)

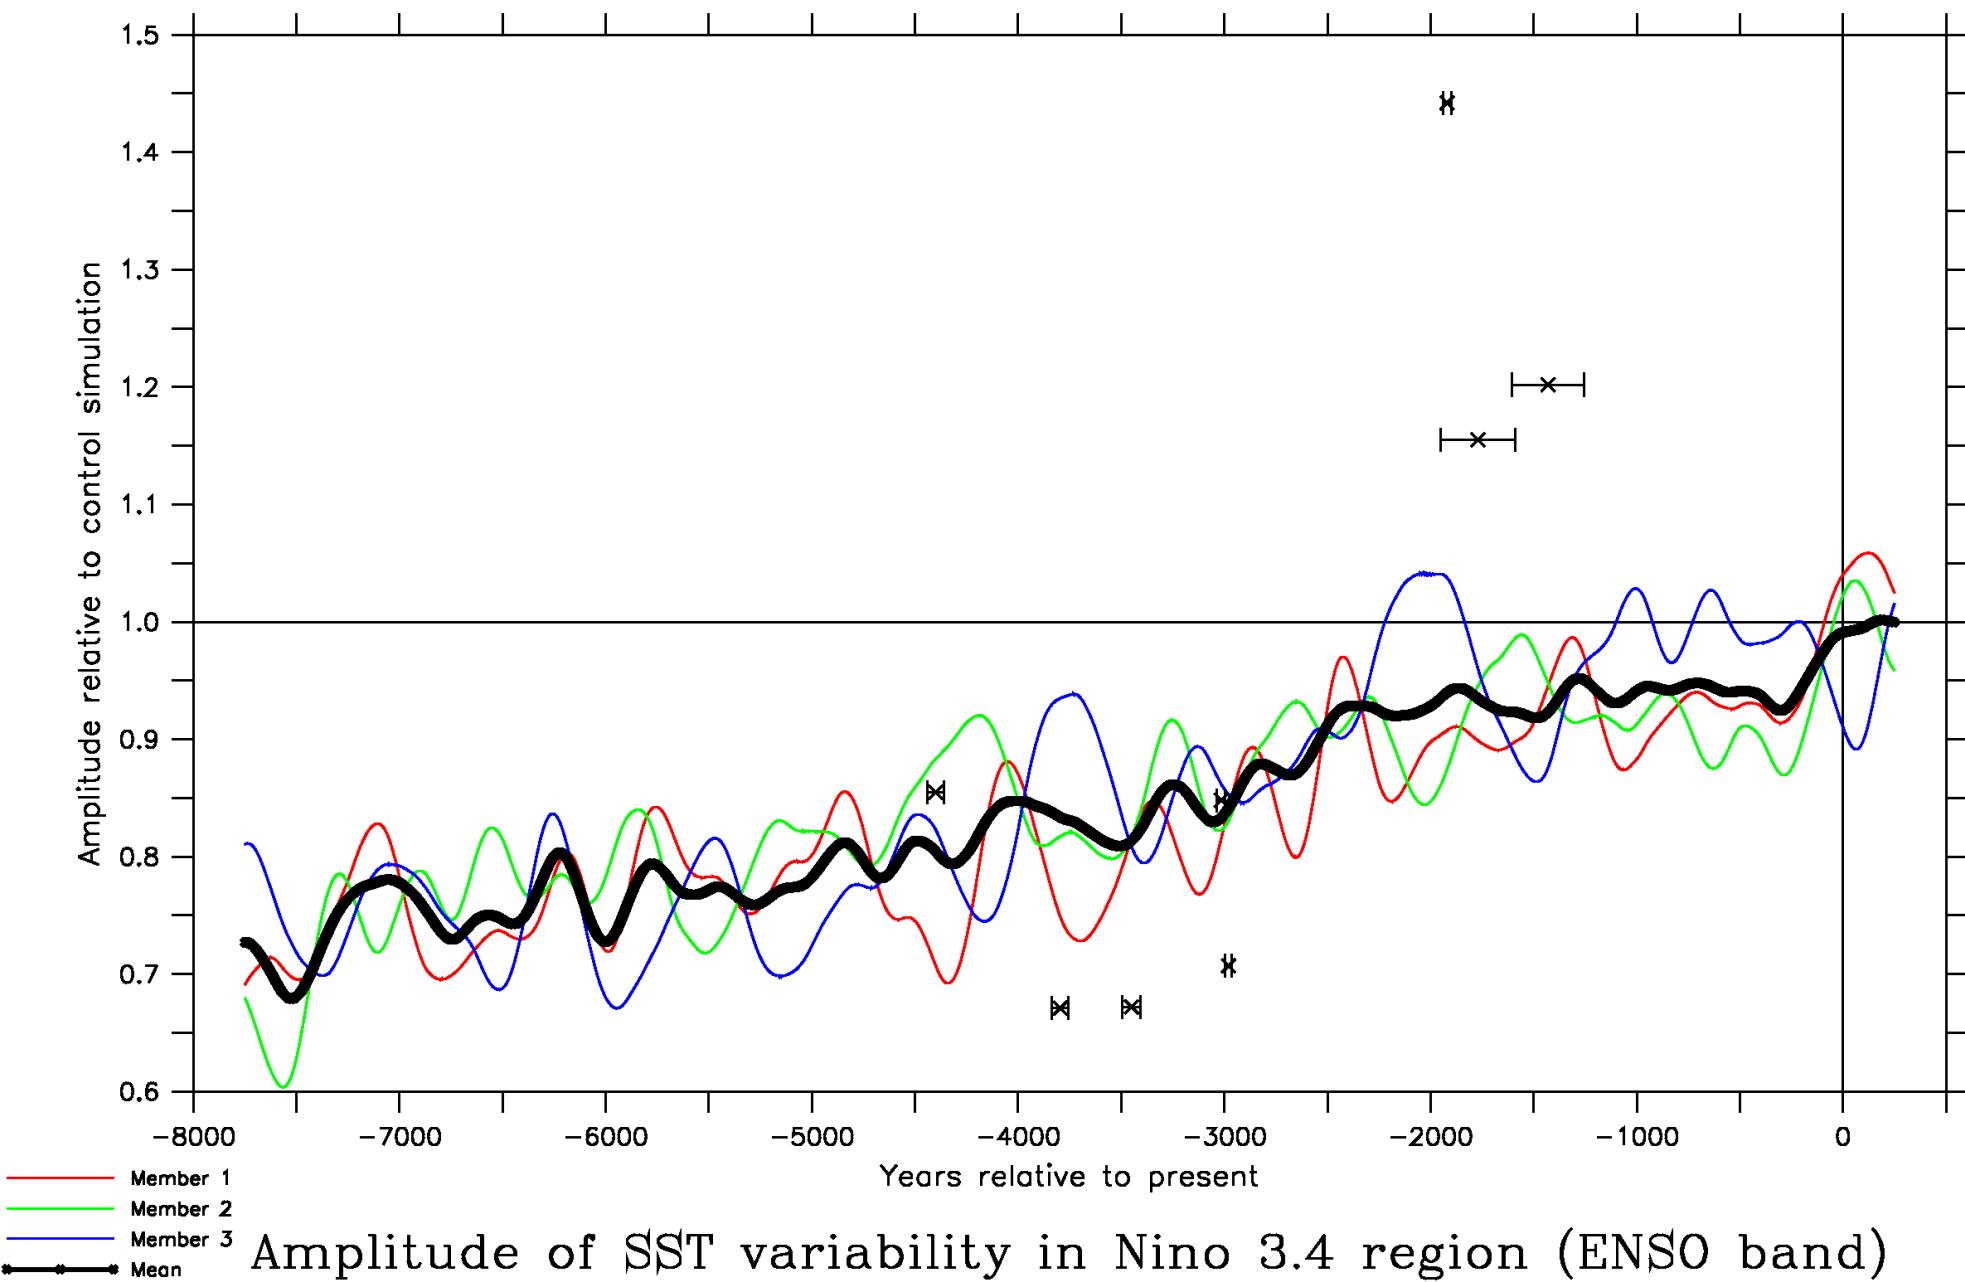

Pre-industrial control simulation: PC1 of monthly SST anomalies

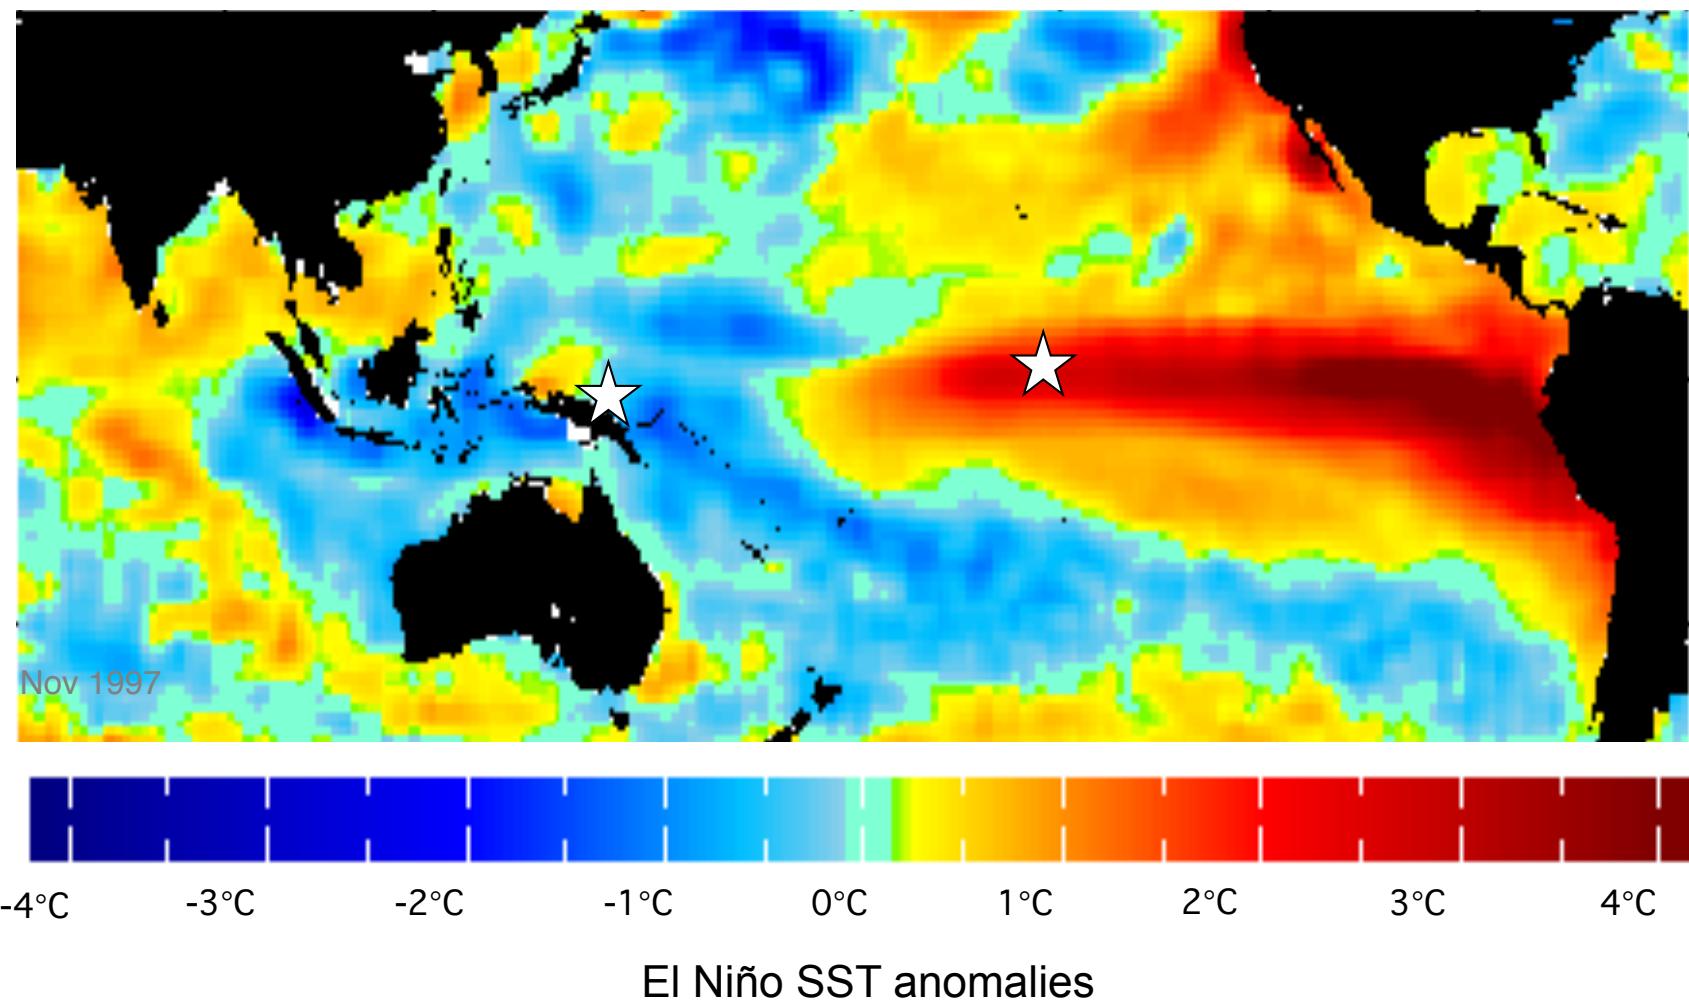

Simulated ENSO variability

Simulated ENSO variability

Target the same centuries at ~2 ka in different locations across the equatorial Pacific
