# Web Site Design

Posted on **December 1, 2002** by **Editor**

By **Jesse Snyder** <[snyderjw@pacificu.edu](mailto:snyderjw@pacificu.edu)>

BS, Computer Science, Pacific University

As I slowly evolve into a teacher, I have to come up with assignments for my students. One class I teach is web design, and I plan on using an “assignment” that I’ve used on faculty when teaching them about websites. Basically, the first day of class or a workshop, I have students search the web for at least three sites that they find appealing. A mentor teacher who is teaching the web design class for whom I’ll take over, tried this assignment out with her students. She was ready to launch into a unit on good design. As it turned out, most of the students went to sites that they had some cultural connection to, like Nike ([www.nike.com](http://www.nike.com)), or MTV ([www.mtv.com](http://www.mtv.com)). Some liked Yahoo ([www.yahoo.com](http://www.yahoo.com)) and Hotmail ([www.hotmail.com](http://www.hotmail.com)) since the students use it for email. What the teacher found was that students were going to sites based on content, rather than design. She was frustrated because students weren’t trying that hard to find good sites. I had to remind her that the sites the students are accessing are designed well. In fact, they had better be, since corporations are pouring millions of dollars into them.

So, what makes a good site anyway? When you go out on the web, what sites do you want to spend a lot of time exploring? Which ones make you uncomfortable? Often times, I’ll happen upon a site and leave without really checking the content out because “it doesn’t look creditable.” For instance, if I’m searching for some scientific facts and I come across someone’s personal web site that has “Last updated 1998,” (<http://www.unomaha.edu/~brasile/vita.htm>), odds are I won’t stay there long.

What should come to mind for positive attributes of websites can be applied to any type of design. Good use of space, attractive color schemes, usability, purposeful. However, there are a few extra things that go along with web design that may seem obvious, but that many people over look. For example, quickly loading pages, working links, current content, just to name a few.

If you're the one designing a site, you need to be mindful of who the site is for. That's usually the best place to start: your audience. The issue of audience has always been a contention for Universities. Should University websites be designed for the current students (accessing grades, news and events, finals schedules) or should the site be designed for recruiting new students (campus tours, pretty pictures, lots of content to "show-off" the school, etc.). Hopefully, you won't be building a site that has to cater to many different groups of people. If you're a teacher or professor, you might want to build a site with simple text formatting and simple hyperlinks. Maybe a few pictures. You probably don't want to add super fancy JavaScript cursors, animated gifs, and sound. (<http://www.mrair.net/>). It's over the top, unnecessary, and distracting. Make sure your site serves some useful purpose. This all comes from knowing your audience.

Once you start building your site, be ready to make changes along the way. Not a single site that I've made has ended the way I planned. There's always been at least one minor change that had to be made. Be ready to learn new things along the way. Even though I've been building sites for years, I still learn something new every time.

Anyway, with that said, you're going to want to keep your content recent, unless you're trying to archive some content. You'd be surprised how many people start a site, and then forget about it. This happens most often on free web hosting sites, such as Geocities (<http://www.geocities.com>). People (myself included) build a site, update for a bit, or not at all, then leave it to sink in the Ocean of the Internet. Sometimes, you find the darndest things. However, it's no fun to come across these types of sites when you're doing research. Also, if your audience needs lots of updates, keep them updated. If you run a small business make sure your web site has current dates on it. When I go to a site that runs a business and they haven't updated their site for a few years, I think twice about doing business with them.

Part of keeping your content updated is making sure your links still work. As we all know, the web is constantly in a state of flux. It's one big dynamic clump of information and more often than not, a site working one day might not be working the next. Often you'll find that sites run out of money, get sold to other people, or are simply moved. Sometimes, pages are renamed. If the author is nice, they'll put a page at the location of the old page telling the user where the new site can be found. Sometimes, web authors could care less. It's good practice to point your users in the right direction if you move pages on your site. On the flip side, you may have links in your site that go to other places on the Internet that no longer exist. You can check them by hand if you run a small site with a few pages, or you could download a program that will spider your site and check your pages for you.

By now, your site should have some direction and some purpose. You know what you want to do, and you might have your links in order. Now comes the hard part. Is your site easy to use? It's often easy to overlook major usability issues since you're the one that has made the site. It works for you, but potentially hundreds or thousands of different people will be using your site. Do you think they all think the same as you? Building a useable site is one of the most difficult things to do, and is usually where I spend the most time with web design. Especially since you're not

really sure how it will work until people start using it. The best situation is where you can get some random strangers to test the site for you. Your friends will sugar coat their testing, telling you that “It looks nice,” and what not, as not to hurt your feelings.

You’ll want to test your site for usability in a number of ways. First of all, there are some basic technical guidelines that most websites should follow. For example, you don’t want to use many different font sets, or fonts that aren’t found on all computers. Many students want to use fancy, cursive style fonts on their sites. (<http://www.gearheads.ca/>) They load them onto the web, and of course they see the fancy fonts since the font set is loaded on the machine they are working from. Then they tell a friend about their site, and their friend says something to the effect of “Dude... your site was cool but what was with the font being all messed up?” Then mass confusion ensues and sometimes the problem gets solved, and sometimes it doesn’t. I often use Ariel since it’s a non-serifed font. Serifed fonts, like Times and Courier can be hard on the eyes for massive use. A lot of it depends on the look of your site too.

Color is another issue. You’ll often find pages with 10 different colors, a background that is purple with blue links, etc. (<http://www.geocities.com/howellschool/sandy.html>) Remember, you may really like that picture of your baby in the black and white checkered shirt, but no text is going to look good on that background. It’s simply going to be too hard to read. For backgrounds, stick with simple colors. In general, you’ll want to use no more than three or four colors on any given page. (<http://www.whitehouse.org/>) More colors than that, unless there are special circumstances, can feel cluttered and unprofessional. (<http://www.geocities.com/leander1991/index.html>)

Back to fonts, you’ll want to make sure there aren’t a lot of changes in font size (<http://web.utk.edu/~gwhitney/awful/awful2.html>), or lots of caps, bolds, and blinking text. And absolutely no underlines. Underlines are reserved for hyperlinks, and I hate nothing more than clicking on underlined text that doesn’t respond to my input. Also, across different operating systems and browsers, text, and subsequently the rest of your content is going to look different. It will be rendered differently, and the text you see on your screen isn’t going to look that same as a potential customer in Japan on his Mac using Netscape. Make sure you test on a few different operating systems and browsers before you put your web site out for everyone to use.

I could go on and on. In any event, find a couple of sites that you like. Do they follow general design rules? Why do they appeal to you? Many well done sites that have a lot of money backing them, and you’ll find that those people making these sites are professionals. They don’t usually stray from good design principles, but when they do, they do it for a good reason (such as their boss telling them to). When you build your site, keep in mind some of these basic ideas, and you’ll save yourself a lot of time fixing problems down the road, and your users will love you.
